4. Develops and implements a program policy ***that requires:
   a) On-site corrective actions* as appropriate to the type of violation.
   b) Discussion of long-term control** of risk factor options, and
   c) Follow-up activities.
5. Establishes and implements written policies addressing code variance requests related to risk factors and interventions.
6. Establishes written policies regarding the verification and validation of HACCP plans when a plan is required by the code.
7. <u>Develops and implements a program policy to require the REGULATORY AUTHORITY to have a review and approval process for the construction plans*****, equipment specifications, and other information submitted by the PERMIT applicant or PERMIT HOLDER for the FOOD ESTABLISHMENT that is consistent with the requirements of the FDA Food Code. The policy should include a requirement that the REGULATORY AUTORITY discusses the establishments food safety management system**** as part of the plan review process. Contents of the PERMIT applicant's or PERMIT HOLDER's submission must include at least the following information:
   a) Intended menu
   b) Anticipated volume of FOOD to be stored, prepared, and sold or served
   c) Proposed layout, mechanical schematics, construction</u>

d) Proposed EQUIPMENT types, manufacturers, model numbers, locations, dimensions, performance capacities, and installation specifications
e) Standard operating procedures and HACCP plan if applicable, and
f) Other information that may be required by the REGULATORY AUTHORITY for the proper review of the proposed construction, conversion or modification, and procedures for operating a FOOD ESTABLISHMENT and
g) Documentation of all plan reviews conducted (approval, conditional, denial) or if the regulatory program does not conduct plan review or shares responsibility for the plan review with other entities or agencies, there are agreements in place and the process is documented.

Outcome

The desired outcome of this standard is a regulatory inspection system that uses HACCP principles to identify risk factors and to obtain immediate- and long-term corrective action for recurring risk factors.

Documentation

The quality records needed for this standard include:
1. Inspection form that requires the selection of IN, OUT, NO, or NA,
2. Written process used for grouping establishments based on food safety risk and the inspection frequency assigned to each category
3. Policy for on-site correction and follow-up activities,
4. Policy for addressing code variance requests related to risk factors and interventions,
5. Policy for verification and validation of HACCP plans required by code, and
6. Policy requiring the discussion of food safety control systems with management when out of control risk factors are recorded on subsequent inspections,
7. Documentation of the review and approval process for submission of a food safety management system plan, construction plans, equipment specifications, and other information that is consistent with the requirements of the FDA Food Code or if the plan review is conducted externally, documentation of the process (policy, contract, MOU). The review and approval should include at minimum:
a) Food safety management system plan discussion
b) Intended menu
c) Anticipated volume of FOOD to be stored, prepared, and sold or served
d) Proposed layout, mechanical schematics, construction
e) Proposed EQUIPMENT types, manufacturers, model numbers, locations, dimensions, performance capacities, and installation specifications
f) Standard operating procedures and HACCP plan if applicable, and
g) Documentation of all plan reviews conducted (approval, conditional, denial)

*Note: On-site corrective action as appropriate to the violation would include such things as:
a. Destruction of foods that have experienced extreme temperature abuse,
b. Embargo or destruction of foods from unapproved sources,
c. Accelerated cooling of foods when cooling time limits can still be met,
d. Reheating when small deviations from hot holding have occurred,
e. Continued cooking when proper cooking temperatures have not been met.

PSC15 Proposed Revised Standard 3 Requirement to Include Plan Review

f. Initiated use of gloves, tongs, or utensils to prevent hand contact with ready-to-eat foods, or
g. Required hand washing when potential contamination is observed.

Note: **Long-term control of risk factors requires a commitment by managers of food establishments to develop effective monitoring and control measures or system changes to address those risk factors most often responsible for foodborne illness. Risk control plans, standard operating procedures, buyer specifications, menu modification, HACCP plans and equipment or facility modification may be discussed as options to achieve the long-term control of risk factors.

***Note: Consideration of the elements outlined in Standard 4 will ensure a strong foundation for a quality and uniform inspection program.

*****Note 1: Through their committee process, the Conference for Food Protection has developed Plan Review for Food Establishment guidance on the CFP web site: www.foodprotect.org located under the icon titled, "Conference Developed Guides and Documents" and can be downloaded at http://www.foodprotect.org/guides-documents/plan-review-for-food-establishments-2016/.

**** Note 2: Food Safety Management System
refers to a specific set of actions (e.g., procedures, training, and monitoring) to help achieve active managerial control.

- **Procedures:** A defined set of actions adopted by food service management for accomplishing a task in a way that minimizes food safety risks. Procedures may be oral or written and include who, what, where, when, and how a task should be performed. The goal is to move toward complete, consistent, and primarily written procedures and may include topics such as when to wash your hands, how to set up a 3-compartment sink, how food temperatures are achieved and maintained/monitoring food temperatures.
- **Training:** The process of management's informing employees of the food safety procedures within the food service establishment and teaching employees how to carry them out. Information may be presented in formats such as a set of instructions/illustrations, recipe cards with process instructions, wall charts, wallet cards, or live demonstration. The goal is to provide and document training for all food safety tasks in a format and frequency adequate to ensure employees have the knowledge to carry out the procedures consistently and effectively.
- **Monitoring:** Routine observations and measurements conducted to determine if food safety procedures are being followed. Monitoring systems should include who, what, where, when, and how monitoring is to be performed and may be conducted visually or documented in writing. The goal is to move toward a well-documented system that can be verified and may include use of automated systems, digital thermometers, logs, charts, checklists, and other job aids and tools.

INSTRUCTIONS FOR COMPLETING THE PROGRAM SELF-ASSESSMENT AND VERIFICATION AUDIT FORM

STANDARD 3 – INSPECTION PROGRAM BASED ON HACCP PRINCIPLES

Program Self-Assessment & Verification Audit Form

The *Standard 3: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 3. The form is included at the end of these instructions. Whether one is performing a program self-assessment or conducting a verification audit, it is recommended that the form be available as a reference to the Standards 3 criteria.

Using the Program Self-Assessment and Verification Audit Form

Documenting the Findings from the Self Assessment

Jurisdictions conducting a self-assessment of Standard 3 must indicate on the form if each of the listed criteria is met. These responses are recorded under the column "Jurisdiction's Self Assessment."

Jurisdictions are not obligated to use this form. An equivalent form or process is acceptable provided that the results of the jurisdiction's self-assessment for the specific Standard 3 criteria listed on this form are available for review.

The *Standard 3: Program Self-Assessment and Verification Audit Form* is the only form a jurisdiction needs to use to record the results of their self-assessment. Standard 3 requires inspection policies to be established, written, and implemented. A policy without documentation of implementation does not meet the Standard 3 criteria.

The *Standard 3: Program Self-Assessment and Verification Audit Form* divides the Standard 3 criteria into seven steps:

1. Inspection Form Design
    a. The jurisdiction's inspection form identifies foodborne illness risk factors and *Food Code interventions*.
    b. The jurisdiction's inspection form documents actual observations using the convention IN, OUT, NA, and NO.
    c. The jurisdiction's inspection form documents compliance and enforcement activities.
2. Risk Assessment Categories
    a. A risk assessment is used to group food establishments into at least 3 categories based on their potential and inherent food safety risks.
3. Inspection Frequency
    a. The jurisdiction's inspection frequency is based on assigned risk categories.

4. Corrective Action Policy
    a. The jurisdiction has a written and implemented policy that requires on-site corrective action for foodborne illness risk factors observed to be out of compliance.
    b. The jurisdiction has a written and implemented policy that requires discussion for long-term control of foodborne illness risk factors.
    c. The jurisdiction has a written and implemented policy that requires follow-up activities on foodborne illness risk factor violations.

5. Variance Request Policy
    a. The jurisdiction has a written and implemented policy on variance requests related to foodborne illness risk factors and *Food Code* interventions.
6. Verification and Validation of HACCP Plan Policy
    a. The jurisdiction has a written and implemented policy for the verification and validation of HACCP plans, when a HACCP plan is required by the *Food Code*.
7. Plan Review
    a. The jurisdiction develops and implements a program policy to require the submission and review of food establishment construction plans, and equipment specifications that is consistent with the FDA Food Code, or the program maintains a written agreement with another entity that is responsible for the plan review process. The policy should include a requirement that the REGULATORY AUTHORTY discusses the establishments food safety management system as part of the plan review process.

        Specifically, plan review criteria for self-assessment and verification language:
        a) The jurisdiction develops and implements a program policy to require the discussion of the establishment food safety management system plan.
        b) The jurisdiction develops and implements a program policy to require the submission, review and approval of establishment construction plans consistent with the FDA Food Code.
        c) The jurisdiction develops and implements a program policy to require the submission, review and approval of equipment specifications consistent with the FDA Food Code.
        d) Or, the program maintains a written agreement with another entity that is responsible for the plan review process.

The self-assessor must review each Standard 3 criterion and determine if the jurisdiction's source documents confirm that the Standard criteria are met. If the criteria are met, the self-assessor must place an "X" in the "YES" box under the "Jurisdiction's Self-Assessment" column of the *Standard 3: Program Self-Assessment and Verification Audit Form*.

If a review of the jurisdiction's source documents does not confirm that the Standard 3 criteria are met, the self-assessor must place an "X" in the "NO" box under the "Jurisdict*ion's Self-Assessment" column of the* Standard 3: Program Self-Assessment and Verification Audit Form. The self-assessor may specify why the criteria are not met in the box provided.

The self-assessor should review the findings on the *Standard 3: Program Self-Assessment and*

Verification Form to ensure accuracy. The jurisdiction will be required to provide the auditor with their completed *Standard 3: Program Self-Assessment and Verification Audit Form* and any documents used to support and demonstrate that the Standard 3 criteria have been met.

Once all the criteria have been reviewed and documented on the form, the self-assessor must complete the Program Self-Assessment Summary section on page one of the *Standard 3: Program Self-Assessment and Verification Audit Form*. The self-assessor must:

- Enter their contact information;
- Document if the jurisdiction met the Standard 3 criteria in the appropriate boxes; and
- Sign the form where indicated.

It then will be up to the jurisdiction to determine its action plan and time frame for correcting any deficiencies in order to meet the Standard 3 criteria.

Documenting the Findings from the Verification Audit

The jurisdiction requesting the verification audit must provide their completed *Standard 3: Program Self-Assessment and Verification Audit Form* to the auditor for review. The auditor must indicate on the *Standard 3: Program Self-Assessment and Verification Audit Form* if the criteria were met.

If a review of the jurisdiction's source documents confirms the self-assessment conclusion that the Standard criteria are met, the verification auditor places an "X" in the "YES" box under the "Auditor's Verification" column of the form.

If a review of the jurisdiction's source documents does not confirm the self-assessment conclusion that the Standard criteria are met, the verification auditor places and "X" in the "NO" box under the "Auditor's Verification" column of the form. The verification auditor must specify why the criterion is not met in the box provided. Supplemental pages may be used to explain findings. The

jurisdiction must meet all six program performance criteria outlined in Standard 3.

The verification auditor must discuss their findings with the program manager or their appointed representative and provide constructive feedback at the conclusion of the verification audit. In particular, any Standard 3 criteria for which the auditor cannot confirm through a review of the self-assessment should be thoroughly discussed. Ample time should be allotted to ensure that there is a clear understanding of the reasons for the "non-conforming" finding. The auditor should be prepared to identify the elements required for the jurisdiction to meet the Standard.

Once the close out interview has been conducted, the auditor must complete the Verification Audit Summary section located on the first page of the *Standard 3: Program Self-Assessment and Verification Audit Form*. The auditor must:

- Enter their contact information;
- Document if the jurisdiction met the Standard 3 criteria in the appropriate boxes; and
- Sign the form where indicated.

It then will be up to the jurisdiction to determine its action plan and time frame for correcting any deficiencies in order to meet the Standard 3 criteria if the auditor does not confirm the self-assessment findings.

GENERAL NOTES PERTAINING TO THE PROGRAM SELF-ASSESSMENT OR THE VERIFICATION AUDIT

PSC16 Standard 5 Data Collection Template

Note: This document is a PDF document of a Excel spreadsheet with tabs for Instructions, Data_Entry, Summary and Lookup.

Instructions:

This workbook is designed to help a food regulatory program maintain the data needed for compliance with FDA Voluntary National Retail Food Regulatory Program Standards #5.	
For each outbreak complete a new row on the Data_Entry tab - Row 2 contains an example	
OutbreakID	Enter the local health department identifier for the outbreak - this could also be the NEARS or NORS outbreak reporting ID - If multiple facilities are implicated use the same outbreakID for all implicated facilities
Facility	Enter the name of the facility that was implicated, you can have multiple facilities per outbreak (e.g., a contaminated ingredient was distributed to multiple restaurants)
LicenseID	Enter the license/permit id for the implicated restaurant
Establishment Type	Enter the establishment type
Single Location	Indicate if a single location was implicated
Outbreak Status	For the outbreak identify if the agent was confirmed, suspected, unknown, or if the outbreak is still ongoing.
Date Notified	Enter the date that the food program was made aware of the potential outbreak
Date of First Contact	Enter the date that the food program first made contact with the implicated establishment

Date Completed	Enter the date that the food program completed their investigation
Implicated Food	Enter the name of the implicated food (please use the same spelling for the same food))
Food Process	Indicate the basic food preparation process for the implicated food (No cook - food is not cooked, Cook-Serve - Food is cooked and then served, Complex - Food is cooked then cooled and reheated)
Contributing Factors Identified	Enter the contributing factors (what went wrong) for the implicated food - this only needs to be entered for one establishment per outbreak. If you choose Other - include the specifics in the Notes column
Agent	Select the implicated agent
Agent Other	If you select Other for Agent then enter the name here
Intentional Contamination	Indicate if intentional contamination was suspected for this outbreak
NOTES	Record any notes about the outbreak that will be helpful for understanding what occurred
On the Summary tab, you can change the year to get a summary for the year.	

Data_Entry

OutbreakID	Facility	LicenseID	Establishment Type	Single Location	Outbreak Status	Date Notified	Date of First Contact	Date Completed	Implicated Food	Food Process
2022-02	John's Doe	ABC123	Restaurant	YES	Confirmed	1/23/1976	1/24/1976	1/31/1976	Venison	Complex

Contributing Factors Identified	Agent	Agent Other	Intentional Contamination	NOTES
C1, C2	Other	Brucella	No

Venison	0	0	0	0		No Cook	0	0	0	0
						Cook-Serve	0	0	0	0
						Complex	0	0	0	0

Frequency of Contributing Factors			**Frequency of Agent**	
		# times marked		# times identified
C1	Toxin or chemical agent naturally part of the tissue	0	Norovirus	0

C2	Poisonous substance or infectious agent intentionally added to food cause illness (does not include injury)	0	Hepatitis A virus	0
C3	Poisonous substance accidentally/inadvertently added to food	0	Salmonella	0
			Campylobacter	0
C4	Ingredient's toxic in large amounts accidentally added to food	0	Clostridium	0
C5	Container or equipment used to hold or convey food was made with toxic substances	0	STEC O157	0
C6	Food contaminated by animal or environmental source at point of final preparation/sale	0	Other STEC	0
C7	Food contaminated by animal or environmental source before arriving at point of final preparation (pre- or post-harvest)	0	Listeria	0
C8	Cross-contamination of foods, excluding infectious food workers/handlers	0	Shigella	0
C9	Contamination from infectious food worker/handler through bare hand contact with food	0	Yersinia	0
			Other	0
C10	Contamination from infectious food worker/handler through glove-hand contact with food	0	Unknown	0
C11	Contamination from infectious food worker/handler through unknown type of hand contact with food or indirect contact with food	0		
C12	Contamination from infectious non-food worker/handler through direct or indirect contact with food	0		

C13	Other sources of contamination (specify)	0		
P1	Allowing foods to remain out of temperature control for a prolonged period during preparation	0		
P2	Allowing foods to remain out of temperature control for a prolonged period during food service or display	0		
P3	Inadequate cold holding temperature due to malfunctioning refrigeration equipment	0		
P4	Inadequate cold holding temperature due to an improper practice	0		
P5	Inadequate hot holding temperature due to malfunctioning equipment	0		
P6	Inadequate hot holding temperature due to an improper practice	0		
P7	Improper cooling of food	0		
P8	Extended refrigeration of food for an unsafe amount of time, relative to the food product and pathogen	0		
P9	Inadequate reduced oxygen packaging (ROP) of food	0		
P10	Inadequate non-temperature dependent processes (e.g., acidification, water activity, fermentation) applied to a food to prevent pathogens from multiplying	0		
P11	Other situations that promoted or allowed microbial growth or toxic production (specify)	0		
S1	Inadequate time and temperature control during initial cooking/thermal processing of food	0		
S2	Inadequate time and temperature control during reheating of food	0		

S3	Inadequate time and temperature control during freezing of food designed for pathogen destruction	0		
S4	Inadequate non-temperature dependent processes (e.g., acidification, water activity, fermentation) applied to a food to prevent pathogens from surviving	0		
S5	No attempt was made to inactivate the contaminant through initial cooking/thermal processing, freezing, or chemical processes	0		
S6	Other process failures that permit pathogen survival (specify)	0

A sample roadmap for Retail Food Program Standard 5 Foodborne Illness and Food Defense Preparedness and Response

Establishing an FBI program from Start to Finish

The intent of this document is to assist with the development of a Foodborne Illness and Food Defense Program. Often time when a jurisdiction starts to develop their FBI/FD Program in conformance with Standard 5, the task can seem complicated and at times overwhelming. This document is intended to be used as a job aide to assist with the crafting and implementation of your own FBI/FD program by walking through the minimum requirements step by step. Some smaller jurisdictions may find that answering the step-by-step questions may provide sufficient details for development of their FBI/FD Program. Whereas, some larger jurisdictions may need expand beyond the minimum requirements to meet their needs for a functional FBI/FD Program. Each jurisdiction has unique challenges and opportunities that cannot be entirely addressed by a single document. Therefore, this document is not intended to be a blueprint or blank template to the development of your program but to assist with your FBI/FD Program development.

To conform to the requirements of Standard 5, your FBI/FD Program needs to contain 7 elements, which include the following:

1. Investigative Procedures
2. Reporting Procedures
3. Laboratory Support Documentations
4. Trace-Back Procedures
5. Recall Procedures
6. Media Management
7. Data Review and Analysis

These 7 elements can be completed in any sequence, and often times you may find some elements more challenging than others. It is recommended that the easier or most straightforward elements be addressed first. The more challenging elements usually take longer and may seem insurmountable to some jurisdictions trying to meet Standard 5, particularly smaller jurisdictions. Also, you may find that by addressing the easier elements, you will find answering the more complicated questions less challenging, since there are frequent overlapping components. It is important to remember any progress in developing an FBI/FD Program improves the security and safety of the people that we serve, as well as highlights gaps in our programs that can be addressed.

One of the essential lessons of this job aide is to understand that the role or roles that your jurisdiction plays in Foodborne Illness and Food Defense is part of a broader network of Programs and jurisdictions. In fact one of the easiest steps that a jurisdiction can start with is the development of a contact list of mission critical personnel in the event of a Foodborne Illness or Food Defense event.

DRAFT

The trip begins:

1. **Investigative Procedures**
   a. **The program has written operating procedures for responding to and/or conducting investigations of foodborne illness and food-related injury that clearly identify the roles, duties, and responsibilities of program staff and how the program interacts with other relevant departments and agencies.**

   (The procedures may be contained in a single source document or in multiple documents.)

It is critical that prior to an FBI/FD event that the role and roles that a jurisdiction may play in an event be determined and procedures developed. So, it is important to understand what role or roles your program may play. There are simple questions that can assist with this determination. These include the following:

- Who will receive the complaint(s)?
- Who conducts the illness interviews?
- Who will conduct the field inspections/ investigations?
- Who will liaise with federal agencies?
- Who will collect samples? Environmental, clinical, etc.
- Who will analyze collected samples?
- Who will coordinate the activities?
- Who will handle follow-up activities if needed?
- Who will write the final report?
- Who will determine when an FBI event has stopped?

is only investigations, decide how these inspections will be covered in general and by

Answering these questions can assist a jurisdiction to start understanding your role in investigating FBI/FD events. Some jurisdictions/ EHS units play a reduced role in these events, and others play a significant role or multiple roles in these events. Understand the scope of your activities and responsibilities in FBI/ FD events will help determine what procedures are needed to be developed and standardized. If a role(s) is outside your scope, then determine whose role is it. For example, if your role is limited to field inspections/ investigations, then you may not need to develop procedures for conducting illness interviews.

a. Next identify essential roles that are played in an FBI event.
b. Next if you do not perform all of the above roles, began to find out who does perform the role. Gather their contact information.
c. If no one is conducting an essential role, then this is a gap that should be worked on to be filled. Remember you do not necessarily need to fill the gap yourself, but recognizing a gap is a very good thing!
d. By now, you have a better understanding of your role(s) in an FBI event. Now start putting pen to paper and building your system. Remember that being general is ok. The key is developing a program that covers all of your responsibilities. If your role is

DRAFT

only investigations, decide how these inspections will be covered in general and by which staff but not specifically who.

e. Next decide how information will be shared. Teleconferences, individual phone calls, emails, etc.
f. Next decide who will lead the information sharing. Having a coordinator or a point person can make the process go smoother.

b. The program maintains contact lists for individuals, departments, and agencies that may be involved in the investigation of foodborne illnesses, food-related injuries, or contamination of food.

1. Knowing who to contact in an emergency is one of the first steps in navigating an emergency.
2. Maintain a list of State, local, Federal contacts. (can include law enforcement contacts needed in step h) Remember that list from above in section c?
    i. Note: in general, a contact list has already been established by someone else in your State. Your do not need to reinvent the wheel.
        1. Do you have a State Rapid Response Team (RRT)?
        2. Does your State have a Manufactured Food Regulatory Program Standards (MFRPS) program?
        3. State Public Health often maintains lists of emergency contacts.
        4. Are you a small jurisdiction or program? Reach out to other jurisdictions in your State?

c. The program maintains a written operating procedure or a Memorandum of Understanding (MOU) with the appropriate epidemiological investigation program / department to conduct foodborne illness investigations and to report findings. The operating procedure or MOU clearly identifies the roles, duties, and responsibilities of each party.

How complex or formal you wish to establish roles is up to you.

i. If you feel a formal MOU with everyone's roles, is your process, then feel free to go that route.
ii. If you prefer a less formal approach, then as long as each role is identified, particularly your specific role(s), you have met the expectation.

Remember all the hard work in section 1a? Now it we pay off again. Summarize the roles of each group in the essential roles list, particularly your group's role. Be specific when it comes to your role(s). Now you can take the contact information from section b and publish this summary.

Provide examples/templates

d. The program maintains logs or databases for all complaint or referral reports from other sources alleging food-related illness, food-related injury, or unintentional

DRAFT

food contamination. The final disposition for each complaint is recorded in the database or log and is filed in, or linked to, the establishment record for retrieval purposes.

This could be the Template that Adam Kramer developed.
Washtenaw County Template

e. **Program procedures describe the disposition, action, or follow-up and reporting required for each type of complaint or referral report.** What does this mean? Have a plan/procedure for each type of complaint you get. Lindy can ask Julie. Clinical, outbreak, suspect. Step by step instructions on what you would do based on the complaint type

f. **Program procedures require disposition, action or follow-up on each complaint or referral report alleging food-related illness or injury within 24 hours.**

This is where many smaller jurisdictions cannot meet the Standard.
Need to flesh out to provide some flexibility. What is the minimum to meet this. Depends on what the complaint reveals. (single complaint with only symptoms vs. confirmed lab illness, large numbers of ill. Define "initiate". Have at a minimum the "follow-up" step. Could be a simple as referring to the food person (text/email/phone call). Need to do some sort of follow-up. Need to figure out how to meet it. On call person without compensation may be a big challenge.

g. **The program has established procedures and guidance for collecting information on the suspect foods' preparation, storage or handling during on-site illness, food-injury, or outbreak investigations.**

The environmental investigation could involve another agency separate from the local jurisdiction. This should be included in the roles defined above.

This is a written procedure that could include a data collection form to document the collected information.
- Preparation
- Storage/handling

Develop flowchart for a small jurisdiction

h. **Program procedures provide guidance for immediate notification of appropriate law enforcement agencies if at any time intentional food contamination is suspected.**

Need to determine position within law enforcement to contact and include in the procedures. Written into the procedures include contact information for local/state/federal law enforcement agencies. Can be included in B-b.
Provide a template

DRAFT

i. **Program procedures provide guidance for the notification of appropriate state and/or federal agencies when a complaint involves a product that originated outside the agency's jurisdiction or has been shipped interstate.**

Contact FDA Customer Complaint Line
USDA
State Departments of Agriculture/Health

2. Reporting Procedures

a**. Possible contributing factors to the food-related illness, food-related injury or intentional food contamination are identified in each on-site investigation report.**

CDC 5213 NORs report (all states are participating in NOR's)
https://www.cdc.gov/nors/downloads/form-52-13.pdf

Investigation Collection form to have section to record this information.

Usually determine this after the investigation, during briefing meetings/teleconferences

Provide an example and a link to the CDC CF's
https://www.cdc.gov/nceh/ehs/nears/what-are-contributing-factors.htm

b**. The program shares final reports of investigations with the state epidemiologist and reports of confirmed foodborne disease outbreaks with CDC.**

Write this in your procedures. If above process is followed, State Epi and CDC will more than likely already be involved.

3. Laboratory Support Documentation

a. **The program has a letter of understanding, written procedures contract or MOU acknowledging that a laboratory is willing and able to provide analytical support to the jurisdiction's food program. The document describes the type of biological, chemical, radiological contaminants or other food adulterants that can be identified by the laboratory. The laboratory support available includes the ability to conduct environmental sample analysis, food sample analysis and clinical sample analysis.**

Smaller jurisdictions may not have the role to sample.

Labs that meet certain certifications then they will be capable of these tests.

Determine the capacity of your local or state labs. If they cannot provide the testing include the closest FDA lab. (Could provide a list/link of the FDA labs)

b. **The program maintains a list of alternative laboratory contacts from which assistance could be sought in the event that a food-related emergency exceeds the capability of the primary support lab(s) listed in paragraph 3.a. This list should also identify potential sources of laboratory support such as FDA, USDA, CDC, or environmental**

DRAFT

laboratories for specific analysis that cannot be performed by the jurisdiction's primary laboratory(s).

This can be included contact list in Part 1

4. **Trace-Back Procedures**

a. **Program management has an established procedure to address the trace-back of foods implicated in an illness, outbreak or intentional food contamination. The trace-back procedure provides for the coordinated involvement of all appropriate agencies and identifies a coordinator to guide the investigation. Trace-back reports are shared with all agencies involved and with CDC.**

a. Is there anything already written for this?

5. **Recalls**
   a. **Program management has an established procedure to address the recall of foods implicated in an illness, outbreak or intentional food contamination.**

Is there anything already written for this?

b. **When the jurisdiction has the responsibility to request or monitor a product recall, written procedures equivalent to 21 CFR, Part 7 are followed**

c. **Written policies and procedures exist for verifying the effectiveness of recall actions by firms (effectiveness checks) when requested by another agency.**

Is there existing documents for this

6. **Media Management**
   a. **The program has a written policy or procedure that defines a protocol for providing information to the public regarding a foodborne illness outbreak for food safety emergency. The policy/procedure should address the coordination and cooperation with other agencies involved in the investigation. A media person is designated in the protocol.**

7. **Data Review and Analysis**

a. **At least once per year, the program conducts a review of the data in the complaint log or database and the foodborne illness and food-related injury investigations to identify trends and possible contributing factors that are most likely to cause foodborne illness or food related injury. These periodic reviews of foodborne illness may suggest a need for further investigation and may suggest steps for illness prevention.**

NOTE: This data collection tool could be stated as a Pre-Requisite at the beginning of the Standard. Everything is built on having this data.

The data has been collected so an annual review of the data that is documented will suffice.

Example of how to do data review may be found in your existing inspection/complaint database (Excel data collection tool as an example)

DRAFT

b. **The review is conducted with prevention in mind and focuses on, but is not limited to the Food Borne Disease Outbreaks, Suspect Foodborne Outbreaks and Confirmed Foodborne Disease Outbreaks in the following:**
   - **Single establishment**
   - **Same establishment type**
   - **Implicating the same food**
   - **Associated with similar food preparation processes**

   Also determine:
   - **Number of confirmed foodborne disease outbreaks**
   - **Number of foodborne disease outbreaks (this seems the same as above??)**
   - **Number of suspect foodborne disease outbreaks**
   - **Contributing factors most often identified**
   - **Number of complaints involving real and alleged threats of international food contamination.**
   - **Number of complaints involving the same agent**
   - **Number of complaints involving unusual agents when identified.**

   This section can seem overwhelming especially for jurisdictions that rarely have outbreaks, suspected outbreaks or confirmed outbreaks and all the other things mentioned above. As long as you have a data collection tool with these fields to show that if it ever happens you would have the data to review.

Many jurisdictions will not have enough complaints to collect this data. Data collection tool will need to have these fields in the event the data is there.

c. **In the event that there have been no food-related illness or food-related injury outbreak investigations conducted during the twelve months prior to the data review and analysis, program management will plan and conduct a mock foodborne illness investigation to test program readiness. The mock investigation should simulate response to an actual confirmed foodborne illness disease outbreak and include on-site inspection, sample collection and analysis. A mock investigation must be completed once per year when no foodborne disease outbreak investigation occur.** (this last sentence is redundant to me)

   Is the on-site piece required? The on-site requirement seems onerous

Outcome

Documentation

The quality records required to meet this standard include:

1. Logs or databases of alleged food-related illness and food-related injury* complaints maintained and current.
2. Collection forms specified in the operating procedures.
3. Investigation reports of alleged food-related illness, food-related injury*, or incidents. Reports are retrievable by implicated establishment name.
4. The written procedures, contracts or MOU's with the supporting laboratories.

DRAFT

5. The procedure addressing the trace-back of food products implicated in an illness, outbreak, or contamination event.
6. 21 CFR, Part 7, or written procedures equivalent to 21 CFR, Part 7 for recalls.
7. Completed copies of the annual review and analysis (after 12 months of data).
8. Current written media policy/procedure and contact person.
9. The contact list for communicating with all relevant agencies.
10. Portions of any emergency response relevant to food safety and security.

STANDARD 2 TRAINED REGULATORY STAFF

This Standard applies to the essential elements of a training program for regulatory staff.

Requirement Summary

The regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have the knowledge, skills, and ability to adequately perform their required duties. The following is a schematic of a 5-step training and standardization process to achieve the required level of competency.

STEP 1
Completion of curriculum courses designated as "Pre" in Appendix B-1 prior to conducting and independent routine inspections.

STEP 2
Completion of the following:

- A minimum of 25 joint field training inspections (or a sufficient number of joint inspections determined by the trainer and verified through written documentation that the FSIO has demonstrated all performance elements and competencies to conduct independent inspections of retail food establishments); and
- Successful completion of the jurisdiction's FSIO Field Training Plan similar to the process outlined in *Appendix B-2: Conference for Food Protection (CFP) Field Training Manual*.

STEP 3
Completion of the following:

- A minimum of 25 independent inspections; and
- Remaining course curriculum (designated as "post" courses) outlined in *Appendix B-1: Curriculum for Retail Food Safety Inspection Officers*.

STEP 4
Completion of a standardization process similar to the FDA standardization procedures.

STEP 5
Completion of 20 contact hours of continuing food safety education every 36 months after the initial training is completed.

Description of Requirement

Ninety percent (90 %) of the regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have successfully completed the required elements of the 5-step training and standardization process:

- Steps 1 through 4 within 24 months of hire or assignment to the retail food regulatory program.
- Step 5 every 36 months after the initial 24 months of training.

Step 1: Pre-Inspection Curriculum

Prior to conducting any type of independent field inspections in retail food establishments, the FSIO must satisfactorily complete training in pre-requisite courses designated with a "Pre" in Appendix B-1, for the following curriculum areas:

1. Prevailing statutes, regulations, ordinances (specific laws and regulations to be addressed by each jurisdiction);
2. Public Health Principles;
3. Food Microbiology; and
4. Communication Skills.

There are two options for demonstrating successful completion of the pre-inspection curriculum.

OPTION 1: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- FDA ORA U pre-requisite courses identified as "Pre" in Appendix B-1; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances.

Note: *The estimated contact time for completion of the FDA ORA U pre-requisite ("Pre") courses is 42 hours.*

OPTION 2: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- Successful completion of courses deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the FDA ORA U pre- requisite (Pre") courses; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances; and
- Successful passing of one of the four written examination options (described later in this Standard) for determining if a FSIO has a basic level of food safety knowledge.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion is provided. The learning objectives for each of the listed ORA U courses are available from the web site link at: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners

> **Note:** *While certificates issued by course sponsors are the ideal proof of attendance, other official documentation can serve as satisfactory verification of attendance. The key to a document's acceptability is that someone with responsibility, such as a trainer/food program manager who has first-hand knowledge of employee attendance at the session, keeps the records according to an established protocol. An established protocol can include such items as:*
>
> - *Logs/records that are completed based on sign-in sheets; or*
> - *Information validated from the certificate at the time-of-issuance; or*
> - *A college transcript with a passing grade or other indication of successful completion of the course; or*
> - *Automated attendance records, such as those currently kept by some professional associations and state agencies, or*
> - *Other accurate verification of actual attendance.*

Regulatory retail food inspection staff submitting documentation of courses equivalent to the FDA ORAU courses – OPTION 2 – must also demonstrate a basic level of food safety knowledge by successfully passing one examination from the four written examination categories specified herein.

1. The Certified Food Safety Professional examination offered by the National Environmental Health Association; or

2. A state sponsored food safety examination that is based on the current version of the FDA Food Code (and supplement) and is developed using methods that are psychometrically valid and reliable; or

3. A food manager certification examination provided by an ANSI/CFP accredited certification organization; or

4. A Registered Environmental Health Specialist or Registered Sanitarian examination offered by the National Environmental Health Association or a State Registration Board.

Note: *Written examinations are part of a training process, not a standardization/certification process. The examinations listed are not to be considered equivalent to each other. They are to be considered as training tools and have been incorporated as part of the Standard because each instrument will provide a method of assessing whether a FSIO has attained a basic level of food safety knowledge. Any jurisdiction has the option and latitude to mandate a particular examination based on the laws and rules of that jurisdiction.*

Step 2: Initial Field Training and Experience

The regulatory staff conducting inspections of retail food establishments must conduct a minimum of 25 joint field inspections with a trainer who has successfully completed all training elements (Steps 1 – 3) of this Standard. The 25 joint field inspections are to be comprised of both "demonstration" (trainer led) and "training" (trainee led) inspections and include a variety of retail food establishment types available within the jurisdiction.

If the trainer determines that the FSIO has successfully demonstrated the required performance elements and competencies, a lower minimum number of joint field training inspections can be established for that FSIO provided there is written documentation, such as the completion of the CFP Field Training Plan in Appendix B-2, to support the exception.

Note: *The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."*

Demonstration inspections are those in which the jurisdiction's trainer takes the lead and the candidate observes the inspection process. Training inspections are those in which the candidate takes the lead, and their inspection performance is assessed and critiqued by the trainer. The jurisdiction's trainer is

responsible for determining the appropriate combination of demonstration and training inspections based on the candidate's food safety knowledge and performance during the joint field inspections.

The joint field inspections must be conducted using a field training process and forms similar to ones presented in the *CFP Field Training Manual* included as Appendix B-2. The *CFP Field Training Manual* consists of a training plan and log, trainer's worksheets, and procedures that may be incorporated into any jurisdiction's retail food training program. It is a national model upon which jurisdictions can design basic field training and provides a method for FSIOs to demonstrate competencies needed to conduct independent inspections of retail food, restaurant, and institutional foodservice establishments.

Jurisdictions are not required to use the forms or worksheets provided in the *CFP Field Training Manual*. Equivalent forms or training processes can be developed. To meet the intent of the Standard, documentation must be maintained that confirms FSIOs are trained on, and have demonstrated, the performance element competencies needed to conduct independent inspections of retail food and/or foodservice establishments.

> **Note:** *The CFP Field Training Manual is designed as a training approach providing a structure for continuous feedback between the FSIO and trainer on specific knowledge, skills, and abilities that are important elements of effective retail food, restaurant, and institutional foodservice inspections.*
>
> - *The CFP Field Training Manual is NOT intended to be used for certification or licensure purposes.*
> - *The CFP Field Training Manual is NOT intended to be used by regulatory jurisdictions for administrative purposes such as job classifications, promotions, or disciplinary actions.*

FSIOs must successfully complete a joint field training process, similar to that presented in the *CFP Field Training Manual*, prior to conducting independent inspections and re-inspections of retail food establishments in risk categories 2, 3, and 4 as presented in Appendix B-3 (taken from Annex 5, Table 1 of the 2013 *FDA Food Code*). The jurisdiction's trainer/food program manager can determine if the FSIO is ready to conduct independent inspections of risk category 1 establishments (as defined in Appendix B-3) at any time during the training process.

> **Note:** *The criterion for conducting a minimum of 25 joint field training inspections is intended for new employees or employees new to the food safety program. In order to accommodate an experienced FSIO, the supervisor/training officer can in lieu of the 25 joint field inspections:*
>
> - *Include a signed statement or affidavit in the employee's training file explaining the background or experience that justifies a waiver of this requirement; and*
> - *The supervisor/training officer must observe experienced FSIOs conduct inspections to determine any areas in need of improvement. An individual corrective action plan should be developed outlining how any training deficiencies will be corrected and the date when correction will be achieved.*

Step 3: Independent Inspections and Completion of ALL Curriculum Elements

Within 24 months of hire or assignment to the regulatory retail food program, Food Safety Inspection Officers must complete a minimum of 25 independent inspections of retail food, restaurant, and/or institutional foodservice establishments.

- If the jurisdiction's establishment inventory contains a sufficient number of facilities, the FSIO must complete 25 independent inspections of food establishments in risk categories 3 and 4 as described in Appendix B-3.
- For those jurisdictions that have a limited number of establishments which would meet the risk category 3 and/or 4 criteria, the FSIO must complete 25 independent inspections in food establishments that are representative of the highest risk categories within their assigned geographic region or training area.

In addition, all coursework identified in Appendix B-1, for the following eight curricula areas, must be completed within this 24-month time frame.

1. Prevailing statutes, regulations, ordinances (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
2. Public health principles (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
3. Communication skills (Step 1);
4. Food microbiology (some of the courses for this element are part of the pre-requisite curriculum outlined in Step 1);
5. Epidemiology;
6. Hazard Analysis Critical Control Points (HACCP);
7. Allergen Management
8. Emergency Management

All courses for each of the curriculum areas must be successfully completed within 24 months of hire or assignment to the regulatory retail food program in order for FSIOs to be eligible for the Field Standardization Assessment.

> **Note:** *The estimated contact time for completion of the FDA ORA U "post" courses is 26 hours. The term "post" refers to those courses in Appendix B-1 that were not included as part of the pre-requisite coursework. This includes all the courses in Appendix B-1 that do not have the designation "Pre" associated with them. All courses in Appendix B-1 must be successfully completed prior to conducting field standardizations.*

As with the pre-requisite inspection courses, the coursework pertaining to the above six curriculum areas can be successfully achieved by completing the ORA U courses listed under each curriculum area OR by completing courses, deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the comparable FDA ORA U courses.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion can be provided. The learning objectives for each of the listed ORA U courses are available from the FDA website: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners.

Step 4: Food Safety Inspection Officer – Field Standardization

Within 24 months of employment or assignment to the retail food program, staff conducting inspections of retail food establishments must satisfactorily complete four joint inspections with a "training standard" using a process similar to the "FDA Standardization Procedures." The jurisdiction's "training standard" must have met all the requirements for conducting field standardizations as presented in the definition section of these Standards. The standardization procedures shall determine the inspector's ability to apply the knowledge and skills obtained from the training curriculum, and address the five following performance areas:

1. Risk-based inspections focusing on the factors that contribute to foodborne illness;
2. Good Retail Practices;
3. Application of HACCP;
4. Inspection equipment; and
5. Communication.

Continuing standardization (re-standardization) shall be maintained by performing four joint inspections with the "training standard" every three years.

Note: *The field standardization and continuing standardization (re-standardization) criteria described in Step 4 is intended to provide a jurisdiction the flexibility to use their own regulation or ordinance. In addition, the reference to using standardization procedures similar to the FDA Procedures for Standardization of Retail Food Inspection Training Officers, is intended to allow the jurisdiction the option to develop its own written protocol to ensure that personnel are trained and prepared to competently conduct inspections. Any written standardization protocol must include the five performance areas outlined above in Step 4.*

It is highly beneficial to use the FDA Food Code, standardization forms and procedures even when a jurisdiction has adopted modifications to the Food Code. Usually, regulatory differences can be noted and discussed during the exercises, thereby enhancing the knowledge, and understanding of the candidate. The scoring and assessment tools presented in the FDA standardization procedures can be used without modification regardless of the Food Code enforced in a jurisdiction. The scoring and assessment tools are, however, specifically tied to the standardization inspection form and other assessment forms that are a part of the FDA procedures for standardizations.

FDA's standardization procedures are based on a minimum of 8 inspections. However, to meet Standard 2, a minimum of 4 standardization inspections must be conducted.

Jurisdictions that modify the limits of the standardization process by reducing the minimum number of inspections from 8 to 4 are cautioned that a redesign of the scoring assessment of the candidate's performance on the field inspections is required. This sometimes proves to be a very difficult task. A jurisdiction must consider both the food safety expertise of its staff, as well as the availability of personnel versed in statistical analysis before it decides to modify the minimum number of standardization inspections. The jurisdiction's standardization procedures need to reflect a credible process and the scoring assessment should facilitate

consistent evaluation of all candidates.

The five performance areas target the behavioral elements of an inspection. The behavioral elements of an inspection are defined as the manner, approach and focus which targets the most important public health risk factors and communicates vital information about the inspection in a way that can be received, understood, and acted upon by retail food management. The goal of standardization is to assess not only technical knowledge but also an inspector's ability to apply his or her knowledge in a way that ensures the time and resources spent within a facility offer maximum benefit to both the regulatory agency and the consuming public. Any customized standardization procedure must continue to meet these stated targets and goals.

Should a jurisdiction fall short of having 90% of its retail food program inspection staff successfully complete the Program Standard 2 criteria within the 24- month time frame, a written protocol must be established to provide a remedy so that the Standard can be met. This protocol would include a corrective action plan outlining how the situation will be corrected and the date when the correction will be achieved.

Step 5: Continuing Education and Training

A FSIO must accumulate 20 contact hours of continuing education in food safety every 36 months after the initial training (24 months) is completed. Within the scope of this standard, the goal of continuing education and training is to enhance the FSIO's knowledge, skills, and ability to perform retail food and foodservice inspections. The objective is to build upon the FSIO's knowledge base. Repeated coursework should be avoided unless justification is provided to, and approved by, the food program manager and/or training officer.

Training on any changes in the regulatory agency's prevailing statutes, laws and/or ordinances must be included as part of the continuing education (CE) hours within six months of the regulatory change. Documentation of the regulatory change date and date of training must be included as part of the individual's training record.

The candidate qualifies for one contact hour of continuing education for each clock hour of participation in any of the following nine ten activities that are related specifically to food safety or food inspectional work:

1. Attendance at FDA Regional seminars / technical conferences;
2. Professional symposiums / college courses;
3. Food-related training provided by government agencies (e.g., USDA, State, local);
4. Food safety related conferences and workshops; and
5. Distance learning opportunities that pertain to food safety, such as:
   - Web based or online training courses (e.g., additional food safety courses offered though ORA U, industry associations, universities); and
   - Satellite Broadcasts.
6. Foodborne illness training referenced in the Crosswalk Requirements for Foodborne Illness Training Programs - Standard 5.

A maximum of ten (10) contact hours may be accrued from the following activities:

1. Delivering presentations at professional conferences;
2. Providing classroom and/or field training to newly hired FSIOs, or being a course instructor in food safety; or
3. Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

Contact hours for a specified presentation, course, or training activity will be recognized only one time within a 3-year continuing education period[1].

Note: *Time needed to prepare an original presentation, course, or article may be included as part of the continuing education hours. If the FSIO delivers a presentation or course that has been previously prepared, only the actual time of the presentation may be considered for continuing education credit.*

A maximum of four (4) contact hours may be accrued for:

1. Reading technical publications related to food safety.

Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation include:

- certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- transcripts from a college or university;
- a letter from the administrator of the continuing education program attended;
- a copy of the peer-reviewed article or presentation made at a professional conference; or
- documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports.

Note: *The key to a document's acceptability is that someone with responsibility, such as a training officer or supervisor, who has first-hand knowledge of employee's continuing education activities, maintains the training records according to an established protocol similar to that presented in Step 1 for assessing equivalent courses.*

Outcome

The desired outcome of this Standard is a trained regulatory staff with the skills and knowledge necessary to conduct quality inspections.

Documentation

The quality records needed for this standard include:

1. Certificates or proof of attendance from the successful completion of all the course elements identified in the Program Standard curriculum (Steps 1 and 3);

2. Documentation of field inspection reports for twenty-five each joint and independent inspections (Steps 2 and 3);
3. Certificates or other documentation of successful completion of a field training process similar to that presented in Appendix B-2. **NOTE:** The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."
4. Certificates or other records showing proof of satisfactory standardization (Step 4);
5. Contact hour certificates or other records for continuing education (Step 5);
6. Signed documentation from the regulatory jurisdiction's food program supervisor or training officer that food inspection personnel attended and successful completed the training and education steps outlined in this Standard.
7. Date of hire records or assignment to the retail food program; and
8. Summary record of employees' compliance with the Standard.

The *Standard 2: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 2.

STANDARD 5
FOODBORNE ILLNESS AND FOOD DEFENSE PREPAREDNESS AND RESPONSE

This standard applies to the surveillance, investigation, response, and subsequent review of alleged food-related incidents and emergencies, either unintentional or deliberate, which results in illness, injury, and outbreaks.

Requirement Summary

The program has an established system to detect, collect, investigate, and respond to complaints and emergencies that involve foodborne illness, injury, and intentional and unintentional food contamination.

Description of Requirement

1. Investigative Procedures

a. The program has written operating procedures for responding to and /or conducting investigations of foodborne illness and food-related injury*. The procedures clearly identify the roles, duties, and responsibilities of program staff and how the program interacts with other relevant departments and agencies. The procedures may be contained in a single source document or in multiple documents.

b. The program maintains contact lists for individuals, departments, and agencies that may be involved in the investigation of foodborne illness, food-related injury* or contamination of food.

c. The program maintains a written operating procedure or a Memorandum of Understanding (MOU) with the appropriate epidemiological investigation program/department to conduct foodborne illness investigations and to report findings. The operating procedure or MOU clearly identifies the roles, duties, and responsibilities of each party.

d. The program maintains logs or databases for all complaints or referral reports from other sources alleging food-related illness, food-related injury* or intentional food contamination. The final disposition for each complaint is recorded in the log or database and is filed in or linked to the establishment record for retrieval purposes.

e. Program procedures describe the disposition, action or follow-up and reporting required for each type of complaint or referral report.

f. Program procedures require disposition, action or follow-up on each complaint or referral report alleging food-related illness or injury within 24 hours.

g. The program has established procedures and guidance for collecting information on the suspect food's preparation, storage or handling during on-site investigations of food-related illness, food-related injury*, or outbreak investigations.

h. Program procedures provide guidance for immediate notification of appropriate law enforcement agencies if at any time intentional food contamination is suspected.

i. Program procedures provide guidance for the notification of appropriate state and/or federal agencies when a complaint involves a product that originated outside the agency's jurisdiction or has been shipped interstate.

2. Reporting Procedures

a. Possible contributing factors to the food-related illness, food-related injury* or intentional food contamination are identified in each on-site investigation report.

b. The program shares final reports of investigations with the state epidemiologist and reports of confirmed foodborne disease outbreaks* with CDC.

3. Laboratory Support Documentation

a. The program has a letter of understanding, written procedures, contract, or MOU acknowledging, that a laboratory(s) is willing and able to provide analytical support to the jurisdiction's food program. The documentation describes the type of biological, chemical, radiological contaminants or other food adulterants that can be identified by the laboratory. The laboratory support available includes the ability to conduct environmental sample analysis, food sample analysis and clinical sample analysis.

b. The program maintains a list of alternative laboratory contacts from which assistance could be sought in the event that a food-related emergency exceeds the capability of the primary support lab(s) listed in paragraph 3.a. This list should also identify potential sources of laboratory support such as FDA, USDA, CDC, or environmental laboratories for specific analysis that cannot be performed by the jurisdiction's primary laboratory(s).

4. Trace-back Procedures

a. Program management has an established procedure to address the trace-back of foods implicated in an illness, outbreak, or intentional food contamination. The trace-back procedure provides for the coordinated involvement of all appropriate agencies and identifies a coordinator to guide the investigation. Trace-back reports are shared with all agencies involved and with CDC.

5. Recalls

a. Program management has an established procedure to address the recall of foods implicated in an illness, outbreak, or intentional food contamination.

b. When the jurisdiction has the responsibility to request or monitor a product recall, written procedures equivalent to 21 CFR, Part 7 are followed.

c. Written policies and procedures exist for verifying the effectiveness of recall actions by firms (effectiveness checks) when requested by another agency.

6. Media Management

a. The program has a written policy or procedure that defines a protocol for providing information to the public regarding a foodborne illness outbreak or food safety emergency. The policy/procedure should address coordination and cooperation with other agencies involved in the investigation. A media person is designated in the protocol.

7. Data Review and Analysis

a. At least once per year, the program conducts a review of the data in the complaint log or database and the foodborne illness and food-related injury* investigations to identify trends and possible contributing factors that are most likely to cause foodborne illness or food-related injury*. These periodic reviews of foodborne illnesses may suggest a need for further investigations and may suggest steps for illness prevention.

b. The review is conducted with prevention in mind and focuses on, but is not limited to, the following:

1) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* in a single establishment;
2) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Disease Outbreaks* in the same establishment type;
3) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* implicating the same food;
4) Foodborne Disease outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* associated with similar food preparation processes;
5) Number of confirmed foodborne disease outbreaks*;
6) Number of foodborne disease outbreaks* and suspect foodborne disease outbreaks*;
7) Contributing factors most often identified;
8) Number of complaints involving real and alleged threats of intentional food contamination; and
9) Number of complaints involving the same agent and any complaints involving unusual agents when agents are identified.

c. In the event that there have been no food-related illness or food-related injury* outbreak investigations conducted during the twelve months prior to the data review and analysis, program management will plan and conduct a mock foodborne illness investigation to test program readiness. The mock investigation should simulate response to an actual confirmed foodborne disease outbreak* and include on-site inspection, sample collection and analysis. A mock investigation must be completed at least once per year when no foodborne disease outbreak* investigations occur.

Note: *Regulatory Programs are encouraged to refer to the Crosswalk - Requirements for Foodborne Illness Training Programs located on the CFP website at www.foodprotect.org under the Conference-Developed Guides and Documents tab and to also participate in the CDC National*

Environmental Assessment Reporting System (NEARS). The Crosswalk is a table that identifies training resources that correlate to the requirements listed in Standard 5. NEARS is designed to provide a more comprehensive approach to foodborne disease outbreak investigation and response and will provide a data source to measure the impact of food safety programs to further research and understand foodborne illness causes and prevention. (The following link provides additional information regarding NEARS: http://www.cdc.gov/nceh/ehs/nears/index.htm)

Outcome

A food regulatory program has a systematic approach for the detection, investigation, response, documentation, and analysis of alleged food-related incidents that involve illness, injury, unintentional or deliberate food contamination.

Documentation

The quality records required to meet this standard include:

1. Logs or databases of alleged food-related illness and food-related injury* complaints maintained and current.
2. Collection forms specified in the operating procedures.
3. Investigation reports of alleged food-related illness, food-related injury*, or incidents. Reports are retrievable by implicated establishment name.
4. The written procedures, contracts, or MOUs with the supporting laboratories.
5. The procedure addressing the trace-back of food products implicated in an illness, outbreak, or contamination event.
6. 21 CFR, Part 7, or written procedures equivalent to 21 CFR, Part 7 for recalls.
7. Completed copies of the annual review and analysis (after 12 months of data).
8. Current written media policy/procedure and contact person.
9. The contact list for communicating with all relevant agencies.
10. Portions of any emergency response relevant to food safety and security.

*[*Note: See the Standards Definitions for the meaning of these defined terms.]*

Committee Progress Reports are considered DRAFT until accepted by the Executive Board

The Conference Chair, Executive Director, Council Chair, or Issue Chair may return committee reports, Issues, or attached documents requesting edits to improve clarity or understanding, or to include missing information.

Committee-submitted documents may impact the image, credibility and integrity of the Conference as an organization. With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME: Program Standards (PSC), Subcommittee 1

DATE OF REPORT: ☐ ***Initial fall progress report*** ☐***Spring progress report*** ☒ ***Second fall progress report***
Date submitted: 10/31/2022 **Date amended (if applicable):** *Click here to enter a date.* **Date accepted by Executive Board:** *Click here to enter a date.*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: *Kenesha Williamson and Michael Touhey*

COMMITTEE CHARGE(S):

***Issue* # 2020 -II-017 Charges 1 & 2**

1. Identify inconsistencies in language between all Standards in the Retail Program Standards.
2. Continue review of initiatives (existing, new or under development) involving the training, evaluation and/or certification of food safety inspection officers to ensure the sharing of information and eliminate unnecessary redundancy in the creation of work products or assignments of tasks/responsibilities.

COMMITTEE WORK PLAN AND TIMELINE:

An introductory meeting in January 2022 followed by bi-weekly meetings January - February 2022 then monthly meetings through September 2022. Workgroup documents will be shared via CFP Microsoft Teams and attached to calendar invitations. Microsoft Teams will be used for presenting workgroup material and reviewing documents, during monthly meetings. The committee's members will be assigned individual Standards to evaluate for discussion within the group. Polls will be forwarded via email, as needed, to voting members to finalize recommendations. Periodic reports will be prepared and submitted in March 2022, July 2022, and October 2022, in accordance with the CFP master calendar.

COMMITTEE ACTIVITIES:

1. ***Dates of committee meetings or conference calls:*** January 13, 2022, February 3, 2022, February 17, 2022, March 15, 2022, April 19, 2022, May 31, 2022, June 28, 2022, August 24, 2022, September 8, 2022.

2. ***Overview of committee activities:***

    a. The conference call on January 13, 2022 was used to review the committee charges, determine the timeline for addressing the charges, and it was decided that Microsoft Teams will be used for document sharing. There was preliminary discussion of the Standards and review of poll responses regarding initial feedback on any known gaps within the Standards. The conference call on February 3 addressed charge 2, and a list of training, evaluation and/or certification courses available to food safety inspection officers was reviewed based on the draft created during the last biennium. The conference call on February 17, 2022 addressed charges 1 and 2, and the committee started work on edits to the list of training, evaluation and/or certification courses. The addition and removal of entries to list of courses were completed through screen sharing during the meeting. Committee members provided feedback on their review assignments. Changes to the assignments were made from the feedback and overall experience with the Standards.

    b. At the request of our FDA consultants, a special meeting was held on March 15, 2022 for Standard 6 to discuss the Standardized Key Crosswalk to the 2017 FDA Food Code and the Compliance and Enforcement worksheet. For this discussion, we hosted issue submitter Dan Joseph from State of Colorado. The conference call on April 19, 2022 was another special session which focused on Standard 8. Issue submitter Jo Ann Monroy presented at the meeting to review their staffing model pilot study on Standard 8 – Program Resources. On May 31, 2022 we began discussing the updates from the workgroups to review their assigned Standards. As each workgroup presented, the group screenshared the notes and discussions within the CFP Microsoft Teams folder. On June 28, 2022, the workgroups screenshared notes within the CFP Microsoft Teams folders and discussed possible Issues to be drafted for Standard 2 and 3 in the coming months.

    c. The full committee met on August 18, 2022 to discuss updates from each subcommittee. During the full committee meeting, subcommittee 5 gave us feedback on a Standard 1 Issue from the previous biennium, 2020 II-031. Regarding that Issue, consensus was reached on drafting a new Issue that would assign 2020 II-031 to Program Standards Committee. Program Standards can then continue working on the Issue given that it was originally submitted by AFDO and needs further review within the committee process. During the conference call on August 24, 2022 with the subcommittee, we discussed updates from the workgroups on reviewing Standards 1 through 9 to address Charge 1. The group also discussed the list of training, evaluation, and certification resources for Charge 2. Discussion continued on the proposed CFP Issues and selecting Issue submitters and presenters. We reached consensus on all of the proposed Issues after voting not to proceed with recommending Appendix B-1

be removed from Standard 2. During our final meeting on September 8th, we identified three Standards which still needed to be reviewed for issue recommendations, Standards 1, 7, and 9. To complete charge 1, we reviewed created a table of proposed Issues and discussed public health significance for Issues drafted thus far. The group decided to continue communications via email or phone going forward to finalize their Issues. Individual workgroups would meet again as needed to assist completion of their Issues.

3. ***Charges COMPLETED and the rationale for each specific recommendation:***
    a. Charge 1: We identified gaps and inconsistencies in language between all the Standards in the Retail Program Standards.
        i. Reassign Issue 2020 II-031 to the PSC Committee (see attachment 2.j). Missing Priority and Priority Foundation items will lead to a significant increase of out-of-control foodborne illness risk factors in those jurisdictions that do not fully meet all the provisions in the FDA Food Code.
        ii. Tracking versions of Standard 2 Appendix B-1: Adding a version number and/or revision date to Appendix B-1, will clarify which required courses should appear in FSIO training records. Attachment 2.k shows that Appendix B-1 does not include a version number or revision date.
        iii. Changing Re-Standardization Frequency: Changing the frequency of re-standardization from three years to five years for inspection staff who do not standardize others and maintaining that standardization officers continue to be re-standardized every three years. Agencies are struggling with resources and need to focus on standardizing newer staff instead of the more experienced staff. Staff turnover also has a major impact on meeting Standard 2. For standardization officers, the existing re-standardization frequency of every three years should be maintained.
        iv. Add FD218 to Standard 2 "post" curriculum. Inspectors need proper training to conduct risk-based inspections. Risk-based inspection methodology is not currently included in the key learning objectives of the general education courses in Standard 2. Risk-Based Inspection Methods, FD218, is being considered as an advanced course. But it is foundational (see attachment 2.l). Attachment 2.m shows the key learning objectives for FDA 38 and 39 Basics of Inspection.
        v. Adding language to Program Standard 2 that references the FDA's National Curriculum Standard (NCS) as a blueprint for Food Safety Inspection Officer (FSIO) training. The National Curriculum Standard (NCS) as part of the Integrated Food Safety System (IFSS) identifies the competencies (knowledge, skills, and abilities) needed by regulatory food protection professionals to successfully perform their job functions, whether they are inspecting retail food, manufactured food, animal food, or unprocessed food facilities. See attachment 2.o. The NCS also provides behavioral anchors (performance indicators) that serve to clarify the competencies and can be used for assessment purposes. Attachment 1.b.i shows drafted language about the current NCS within Standard 2.
        vi. Correcting the order of the terms "Validation" and "Verification" in the Standard 3 – Self Assessment and Verification Audit form. The HACCP concepts of "Validation" and "Verification" can be confusing concepts. In addition, the reuse of the terms for a regulatory approval of a submitted HACCP plan adds additional confusion. In both cases, the term "Validation" comes before "Verification". By reversing the terminology (Verification and Validation) in the Standard 3 documents, unnecessary additional confusion can be caused.
        vii. Create Standard 4 Uniform Inspection Program verification audit instructions. Verification auditors do not have standardized instructions on how to conduct a verification audit on Standard 4 which may result in audits not being assessed equally. There is no guidance on:
            - How many retail food inspection staff may fall short of having three field reviews during the five-year self-assessment period and the jurisdiction still meet the Standard (90% of staff for field standardization in Standard 2).
            - How many employee quality assurance records to review.
            - When additional employee quality assurance records may need to be reviewed.
            - The rate of agreement between the verification auditor and the self-assessment to meet the Standard.
        viii. Edits to the primary Standard 5 document and the standards definitions document to correct errors and achieve consistency with the other Standards. Attachments 1.b.ii and 1.b.iii demonstrate suggested changes to Standard 5 and Program Standards Definitions. The following summarizes the proposed edits:
            1. Add the word "foodborne" in the Standard 5 Data Review and Analysis section. The term was unintentionally omitted.
            2. Remove the footnote from Standard 5 page 5-5 and all corresponding asterisks.
            3. Reformat all defined terms in Standard 5 to small caps as shown in Standard 9.
            4. Expand the definition of "Foodborne Disease Outbreak" to establish that both suspect and confirmed outbreaks fit under this term, on page iv of the Program Standards Definitions document.
            5. Expand the definition of "Suspect Foodborne Outbreak", on page vi of the Program Standards Definitions document, to differentiate it from "Foodborne Disease Outbreak" and to establish that it is a foodborne illness outbreak that is not confirmed.
        ix. Establishment file worksheet based on FDA Food Code Form 3-A: Standard 6 requires that the program must demonstrate credible follow-up for each violation noted during an inspection, with particular emphasis being placed on risk factors that most often contribute to foodborne illness and public health interventions intended to prevent foodborne illness. Standard 6 includes a Compliance and Enforcement Establishment File Worksheet based on the risk factors and interventions. Many jurisdictions use regulations based on the FDA Model Food Code and an inspection

report based on the model FDA inspection form found in Annex 7 of the FDA Food Code (Food Inspection Report Form 3-A). Items 1 – 29 on inspection report Form 3-A are based on the risk factors and interventions. An additional Compliance and Enforcement Establishment File Worksheet based on Form 3-A would help jurisdictions more easily assess the required provisions of Standard 6. Attachment 1.b.iv demonstrates suggested changes for an additional Compliance and Enforcement Establishment File Worksheet.

x. Update Standard 6 – Standardized Key Crosswalk to the 2017 FDA Food Code with the attached version and replacing "Quick Reference Applicable Food Code Risk Factor Provisions" with "Standard 6 – Standardized Key Crosswalk to the 2017 FDA Food Code". Attachment 1.b.v demonstrates suggested changes to the Standard 6 – Standardized Key Crosswalk to the 2017 FDA Food Code. This document having a file name and website link title which differ from the document's title is confusing. The crosswalk lists risk factors and public health interventions as identified on the model FDA inspection form found in Annex 7 of the 2017 FDA Food Code (Food Inspection Report Form 3-A) with corresponding Food Code references. It serves as a resource for jurisdictions conducting a self-assessment of Standard 6 in making comparisons with their code against the 2017 FDA Food Code. The current version of this document has some errors including:
    - The formatting references for PIC,
    - The references for adequate handwashing sinks, and
    - A typo in Consumer Advisory provided for raw/undercooked foods.

xi. Define Standard 8 Verification Audit parameters. Updated language in Standard 8 for "Section 1: Staffing Levels" was much needed. There are now three choices/options within the Standard for ways to ensure that there is adequate staff to ensure inspectional and surveillance system needs are met to reduce risk factors. Two of the choices have clearly defined metrics and parameters around conformance or non-conformance. The third option is vague.

b. Charge 2: We continued review of initiatives (existing, new or under development) involving the training, evaluation and/or certification of food safety inspection officers to ensure the sharing of information and eliminate unnecessary redundancy in the creation of work products or assignments of tasks/responsibilities. See Attachment 2.n.

COMMITTEE NAME ***Program Standards (PSC), Subcommittee 2***

DATE OF FINAL REPORT: *10/29/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: DeBrena Hilton and Jennifer Hutson, Co-chairs

COMMITTEE CHARGE(S):

Issue # Issue # 2020 II-017

3. Maintain the "Crosswalk – Requirements for Foodborne Illness Training Programs" document as a resource for content baseline for foodborne illness training.

Issue # Issue # 2020 II-033

5. Review the Center for Disease Control and Prevention's National Environmental Assessment Reporting System (NEARS), Environmental Assessment Training Series (EATS), and Council to Improve Foodborne Outbreak Response (CIFOR) to consider inclusion of specific components.

COMMITTEE WORK PLAN AND TIMELINE: Committee members initially began reviewing documents outlined in Issues #2020 II-017 and #2020 II-033 by splitting out sections amongst our workgroup. We initially planned to meet monthly to report any updates that were needed to the documents selected. During our second meeting, we decided to review of certain documents individually and then report back in July with any needed updates.

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***

   Sub-committee 2 met via conference call on April 19, 2022; July 19, 2022.

   The subcommittee found that there weren't any changes needed to be made to the Crosswalk or NEARS, EATS, and CIFOR that would necessitate changes at this time. Forwarded the following recommendations to PSC Subcommittee 4:

   - *Recommend that the Crosswalk be referenced as a resource document in VNRFRPS - Standard 2 & Standard to bring more awareness to the document.*
   - *Committee recommended that the reiterations of the Crosswalk posted on CFP website be updated so that only the most current version be posted to alleviate any confusion.*
   - *Recommend that NEHA IFITT-RR (directed to food industry), Epi-Ready course, and all other documents/resources be easier to find for review.*

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a.

3. ***Charges INCOMPLETE and to be continued to next biennium:***
   a. Issue 2020 II-033 Charge 5 has been submitted for continuation in the next biennium.
   b. Committee recommendation is that charges be continued to next biennium.

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.
2.

COMMITTEE NAME PSC Subcommittee 3 Final Report

DATE OF FINAL REPORT: *11/1/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: **Catherine Feeney and Amanda Anderson (Co-chairs)**

COMMITTEE CHARGE(S):

Issue # *2020 II-023*

1. *The Program Standards committee and FDA staff continue to explore the feasibility of incorporation of plan review functions into the standards either as a stand-alone standard or inserted into the existing standards in the Voluntary National Retail Food Regulatory Program Standards.*
2. *Acknowledgement of the Preliminary Plan Review Proposal document to be utilized as a starting point for the 2020-2022 Program Standards Committee work on this issue.*

COMMITTEE WORK PLAN AND TIMELINE:

COMMITTEE ACTIVITIES: **Dates of committee meetings or conference calls:**

1. ***Overview of committee activities:***

   1/25, 2/8, 2/28, 3/21, 4/11, 4/25, 10/25

   Reviewed previous committee's work. Utilized Preliminary Plan Review Proposal as a starting point to the discussion.

   Discussed options for adding Plan Review as a separate standard or incorporating it into one or more existing Standards.

   Unanimously agreed to include plan review into Standard 3- Inspection Program based on HACCP Principles.

   Worked on wording for the Standard Requirement, Documentation, and accompanying Self-Assessment and Verification Audit.

   Discussed options for agencies that do not do plan review independently or at all so that Standard 3 could still be met.

   Deliberated expanding the scope of plan review to include food safety plans as well as construction, equipment, and HACCP plans.

   Met with Food Safety Management Committee to align Plan Review subcommittee's work.

   Plan Review subcommittee met to decide on incorporating the FSMS terminology and concept into the plan review element being proposed for Standard 3.

   Two issues that been drafted:

   1- a. Request that Plan Review Committee be reformed to work on updating the CFP 2016 Plan Review for Food Establishments document, b. Align work with the Food Safety Management System Committee

   2- a. Add plan review to Standard 3. Revise the SA/VA to reflect the addition.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   - **a.** *Acknowledged Preliminary Plan Review Proposal document to be utilized as a starting point. This approach was taken to leverage work of previous plan review committee.*
   - **b.** *Recommendation to include Plan Review as an element of Standard 3. Language was added to the Standard and also the Self-Assessment and Verification Audit to reflect the addition for Council II's consideration. Plan review is a critical step in ensuring that an establishment is set up to ensure safe food. Submission, review, and approval of a food safety*

management system, construction plan, equipment specifications and location are key to a food businesses success in operating a safe food establishment.

c.

3. ***Charges INCOMPLETE and to be continued to next biennium:***

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.

2.

(1)

Committee Issue #2*:*

Request that Plan Review Committee be reformed to work on updating the CFP 2016 Plan Review for Food Establishments document, Align work with the Food Safety Management System Committee

Committee Issue #3:

Recommend including Plan Review as an element of Standard 3. Language was added to the Standard and also the Self-Assessment and Verification Audit to reflect the addition for Council II's consideration. Plan review is a critical step in ensuring that an establishment is set up to ensure safe food. Submission, review, and approval of a food safety management system, construction plan, equipment specifications and location are key to a food businesses success in operating a safe food establishment.

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME PSC Subcommittee 4 Final Report

DATE OF FINAL REPORT: *11/1/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: **Elizabeth A Nutt Co-Chair, Jeff Lindholm, Co-Chair**

COMMITTEE CHARGE(S):

Issue # 2020-II-033

1. Conduct a thorough review of Standard 5 "Foodborne Illness and Food Defense Preparedness and Response of the FDA Voluntary National Retail Food Regulatory Program Standards (VNRFRPS);
2. The review should include comparing the Standard to other similar FDA standards in food;
3. Review the "Description of Requirements" to ensure the requirements provide program flexibility and include items generally part of a retail food program;
4. Review Standard 5 "Data Review and Analysis" from a sampling of jurisdictions to determine if certain data analysis requirements typically have no or such limited data to make the information not valuable;
5. ~~Review the Center for Disease Control and Prevention's National Environmental Assessment Reporting System (NEARS), Environmental Assessment Training Series (EATS), and Council to Improve Foodborne Outbreak Response (CIFOR) to consider inclusion of specific components.~~ This Charge was reassigned to Subcommittee #2.
6. Propose amendments to Standard 5 of the VNRFRPS;
7. Report back committee findings and recommendations to the next Biennial Meeting.

COMMITTEE WORK PLAN AND TIMELINE:

Reviewing Charges
Comparing VNRFRPS (Retail Standards) and MFRPS (Manufacturing Standards) to determine if they can be aligned and achieve desired outcomes
Soliciting input from enrolled jurisdictions about concerns with Program Standard 5 and possible guidance on solutions.

COMMITTEE ACTIVITIES: **Dates of committee meetings or conference calls:**

1. ***Overview of committee activities:***
   Determined that Standard 5 was aligned with achieving the best approach to response to foodborne illness outbreaks but a Road Map to assist jurisdictions on how to meet the standard would be a resource to be available as an addendum. Road Map would provide steps to develop written procedures, MOU's, set up relationships with other agencies involved with outbreak response and tools to collect and track data.
2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a. Charge 1- Review of Standard 5 done by committee; no action
   b. Charge 2-Compared Retail food Standard 5 to Manufactured Foods Standards; no action.
   c. Charges 3 & 4- After reviewing these charges the committee determined that the creation of a Road Map would be the approach to assist jurisdictions in assessing the Standard.
3. ***Charges INCOMPLETE and to be continued to next biennium:***
   a. The subcommittee was unable to complete the road map and recommends continuation of Issue 2020 II-023. Specifically, the committee identified that a roadmap outlining the requirements of Standard 5 would be beneficial to assist enrolled jurisdictions in conducting self-assessments. Templates and examples of required documentation would accompany the roadmap. A first draft of the roadmap has been drafted but was not able to be finalized during this biennium.

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☐ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***
☒ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

Conclusion

STANDARD 1 REGULATORY FOUNDATION

Table of Contents

REQUIREMENT SUMMARY 2
DESCRIPTION OF REQUIREMENT 2
A. FDA Food Code Interventions and Risk Factor Control Measures 2
B. Good Retail Practices 2
C. Compliance and Enforcement 3
OUTCOME 3
DOCUMENTATION 3

STANDARD 1 REGULATORY FOUNDATION

This standard applies to the regulatory foundation used by a retail food program. Regulatory foundation includes any statute, regulation, rule, ordinance, or other prevailing set of regulatory requirements that governs the operation of a retail food establishment.

Requirement Summary

The regulatory foundation includes provisions for:

1. The public health interventions contained in the current published edition of the *Food Code* or one of the two most recent previous editions of the *Food Code;*
2. Control measures for the risk factors known to contribute to foodborne illness;
3. Good Retail Practices (GRP's) at least as stringent as the *Food Code* edition as specified in 1 above; and
4. Compliance and enforcement at least as stringent as the selected provisions from *Food Code* and Annex 1 of the *Food Code* edition as specified in 1 above.

Description of Requirement

A. *Food Code* Interventions and Risk Factor Control Measures

The regulatory foundation contains provisions that are at least as stringent as the public health interventions and the provisions that control risk factors known to contribute to foodborne illness contained in the current published edition of the *Food Code* or one of the two most recent previous editions of the *Food Code*. Jurisdictions that meet Standard 1 but who may become noncompliant due to the release of a new edition of the *Food Code* are considered to continue meeting the Standard for a period of two years from the release date of the new *Food Code* edition in order to complete the process of updating its regulations.

To meet this element of the Standard, regulations must have a corresponding requirement for the *Food Code* sections as listed and summarized in the *Standard 1: Self-Assessment Worksheet for Part I*, from #1 "Demonstration of Knowledge" through #11 "Highly Susceptible Populations." For initial listing, the regulatory foundation must contain at least 9 of the 11 interventions and risk factor controls. In order to meet fully the requirements of the Standard, the regulatory foundation must meet all 11 of the interventions and risk factor controls by the third audit.

B. Good Retail Practices

The regulations contain provisions that address Good Retail Practices that are at least as stringent as those described in the edition of the *Food Code* as specified in A. To meet this element of the Standard, regulations must have a corresponding requirement for 95 percent of the *Food Code* sections as listed and summarized in the *Standard 1: Self-Assessment Worksheet for Part II*, from #12 "Personnel" through #37 "Variance for Smoking."

C. Compliance and Enforcement

The regulations contain provisions that address Compliance and Enforcement requirements that are at least as stringent as those contained in the edition of the *Food Code* as specified in A. To meet this element of the Standard, regulations must have a corresponding requirement for each of the *Food Code* sections as listed in the *Standard 1: Self-Assessment Worksheet for Part III*, items 1 through 12; except item 12 pertaining to "Legal Remedies," where only one of the sections pertaining to criminal, injunctive, or civil penalties is required.

Outcome

The desired outcome of this standard is the adoption of a sound, science-based regulatory foundation for the public health program and the uniform regulation of industry.

Documentation

The quality records needed for this standard include:

1. The statute, regulation, rule, ordinance, or other prevailing set of regulatory requirements that govern the operation of a retail food establishment; and
2. The completed *Standard 1: Program Self-Assessment and Verification Audit Form*.
3. The completed *Standard 1: Self-Assessment Worksheet* for:
   - Part I – *Food Code* Intervention and Risk Factor Controls
   - Part II – Good Retail Practices
   - Part III – Compliance and Enforcement

Conference for Food Protection
2020 Issue Form

Issue: 2020 II-031

Council Recommendation:	Accepted as Submitted	_____	Accepted as Amended	_____	No Action	_____
Delegate Action:	Accepted	_____	Rejected	_____		

All information above the line is for conference use only.

Issue History:

This is a brand new Issue.

Title:

Standard 1 Update to Require 80% of Certain Provisions

Issue you would like the Conference to consider:

Many times policy makers such as state legislatures and others outside the retail food program make decisions that impact the ability of the retail food program to meet all of the interventions and risk factors. This proposes changing the evaluation component to eighty percent adopting a percentage standard similar to the Good Retail Practices and not requiring a full-adoption of all invention and risk factors after the second self-assessment. For example, a legislature may choose to not ban barehand contact of ready-to-eat foods and all regulatory programs with the state automatically do not meet one of the of the 11 areas and after the second self-assessment would no-longer meet the Standard 1, because of an action completed un-related to the conduct of the regulatory program.

Public Health Significance:

This Standard currently is evaluating not only the regulatory program, but also decisions policy makers are making outside the regulatory programs control. The revisions allows programs to conform to the Standard if 80% of currently 9 to 11 of the Foodborne illness risk factors and public health interventions are adopted. While we absolutely support full adoption of the Code, the Standards already allow for this lower number for the first two self-assessments and the amendment seeks to eliminate the subsequent requirement for 100% adoption.

Recommended Solution: The Conference recommends...:

Recommended Solution: The Conference recommends...:

that a letter be sent to the FDA requesting that the Voluntary National Retail Food Regulatory Program Standards (VNRFRPS), Standard 1 - Regulatory Foundation be amended as follows:

Many times policy makers such as state legislatures and others outside the retail food program make decisions that impact the ability of the retail food program to meet all of the interventions and risk factors. This proposes changing the evaluation component to eighty percent adopting a percentage standard similar to the Good Retail Practices and not requiring a full-adoption of all invention and risk factors after the second self-assessment. For example, a legislature may choose to not ban barehand contact of ready-to-eat foods and all regulatory programs with the state automatically do not meet one of the of the 11 areas and after the second self-assessment would no-longer meet the Standard 1, because of an action completed un-related to the conduct of the regulatory program.

1. Amend Standard 1, Description of Requirement, lettered paragraph "A" as follows (language to be deleted is in strikethrough format; language to be added is underlined):

A. *Food Code* Interventions and Risk Factor Control Measures
The regulatory foundation contains provisions that are at least as stringent as the public health interventions and the provisions that control risk factors known to contribute to foodborne illness contained in the current published edition of the *Food Code* or one of the two most recent previous editions of the *Food Code*. Jurisdictions that meet Standard 1 but who may become noncompliant due to the release of a new edition of the *Food Code* are considered to continue meeting the Standard for a period of two years from the release date of the new *Food Code* edition in order to complete the process of updating its regulations.

To meet this element of the Standard, regulations must have a corresponding requirement for the *Food Code* sections as listed and summarized in the *Standard 1: Self-Assessment Worksheet for Part I*, from #1 "Demonstration of Knowledge" through #11 "Highly Susceptible Populations." ~~For initial listing, the~~ The regulatory foundation must ~~contain~~ include at least 80% ~~9 of the 11~~ interventions and risk factor controls. ~~In order to meet fully the requirements of the Standard, the regulatory foundation must meet all 11 of the interventions and risk factor controls by the third audit.~~

1. Amend Standard 1 Instructions and Worksheet for Conducting a Self-Assessment as follows., Step 3, as follows (language to be deleted is in strikethrough format; language to be added is underlined):

STEP 3 - Document the Self-Assessment Results for Part I

A summary table is provided in Part I of the *Standard 1: Self-Assessment Worksheet* to document the results of the self-assessment for each of the 11 public health intervention and risk factor control measures. For80 each public health intervention and risk factor control measure, the self-assessor must record the findings from the self-assessment. If each *Food Code* section listed under an Intervention/ Risk Factor has a check in the "Full Intent is Met" column, the Standard criteria is met. Place an "X" in the Self-Assessment Results "YES" column.

If any of the *Food Code* sections are missing, or the jurisdiction's regulatory requirements only partially meet the intent of the language, place an "X" in the Self-Assessment Results "NO"
column for that intervention/risk factor control measure.

At the bottom of Part I of the *Standard 1: Self-Assessment Worksheet*, the self-assessor must record the jurisdiction's name and the number of interventions/risk factors that are

met. ~~For initial participation and listing purposes, the~~ The jurisdiction's self-assessment must indicate conformance with at least ~~9 of the 11~~ 80% of the intervention/risk factor categories. ~~By the third verification audit, the jurisdiction must meet 11 of the 11 intervention/risk factor control categories in order to meet the Standard 1 criteria.~~

Examples of documents that may be reviewed:
ØThe jurisdiction's statute, regulation, rule, ordinance or other prevailing set of regulatory requirements that govern the operation of its food establishments

ØVersion of the *Food Code* that was used for the self-assessment

ØCompleted *Standard 1: Self-Assessment Worksheet,* Part I - *Food Code* Interventions and Risk Factor Controls

ØIf applicable, documents discussing or comparing code provisions excepted if adoption was made by reference with exceptions.

1. Amend Standard 1 Instructions and Worksheet for Conducting a Verification Audit as follows Step 4, as follows (language to be deleted is in strikethrough format; language to be added is underlined):

STEP 4 - Document the Verification Audit Results for Part I

Part I of the *Standard 1: Self-Assessment Worksheet*, included at the end of these instructions, contains 11 public health interventions and risk factor controls:

1. Demonstration of Knowledge
2. Employee Health
3. Consumer Advisory
4. Approved Source
5. Time/Temperature
6. Protection from Contamination
7. Control of Hands as a Vehicle of Contamination
8. Good Hygienic Practices
9. Chemical
10. Conformance with Approved Procedures
11. Highly Susceptible Population

To meet any one of the 11 public health intervention and risk factor controls identified under the self-assessment process, the self-assessment must indicate that the jurisdiction's regulatory requirements address all *Food Code* sections listed for that area. ~~For initial listing, the~~ The jurisdiction's regulatory foundation must ~~contain~~ include at least ~~9 of the 11~~ 80% of public health interventions and risk factor controls. ~~In order to fully meet the requirement of the Standard, the regulatory foundation must meet all 11 of the interventions and risk factor controls by the third verification audit cycle.~~

If four or more of the 15 selected code sections reviewed during the audit process do not meet the stringency of language criteria, the Standard 1, Part I element fails to meet the criteria, and no further sampling is necessary. If one, two or three of the 15 selected code sections do not meet the stringency of the language criteria but the jurisdiction continues to meet the required number of interventions and risk factor controls to meet the Standard, then randomly select an additional 15 *Food Code* sections. No more than three total disagreements are acceptable in the thirty (30) Code sections drawn for comparison in

order for the audit to confirm the Part I element of Standard 1 as met. In addition, at least 9 out of the 11 (80%) interventions and risk factor controls must still be met at the end of the first audit after the disagreements are taken into account~~, and the jurisdiction must meet 11 out of the 11 interventions and risk factor controls by the third regular audit in order to meet the Standard 1 criteria~~.

Examples of documents that may be reviewed:

ØThe jurisdiction's statute, regulation, rule, ordinance or other prevailing set of regulatory requirements that govern the operation of its food establishments

ØVersion of the *FDA Food Code* that was used for the self-assessment Ø? Completed *Standard 1: Self-Assessment Worksheet*, Part I - *Food Code* Interventions and Risk Factor Controls
ØIf applicable, documents discussing or comparing code provisions excepted if adoption was made by reference with exceptions.

d) Amend any forms and instructions as needed to conform with the above changes.

STANDARD 2 TRAINED REGULATORY STAFF

This Standard applies to the essential elements of a training program for regulatory staff.

Requirement Summary

The regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have the knowledge, skills, and ability to adequately perform their required duties. The following is a schematic of a 5-step training and standardization process to achieve the required level of competency.

STEP 1
Completion of curriculum courses designated as "Pre" in Appendix B-1 prior to conducting and independent routine inspections.

STEP 2
Completion of the following:

- A minimum of 25 joint field training inspections (or a sufficient number of joint inspections determined by the trainer and verified through written documentation that the FSIO has demonstrated all performance elements and competencies to conduct independent inspections of retail food establishments); and
- Successful completion of the jurisdiction's FSIO Field Training Plan similar to the process outlined in *Appendix B-2: Conference for Food Protection (CFP) Field Training Manual*.

STEP 3
Completion of the following:

- A minimum of 25 independent inspections; and
- Remaining course curriculum (designated as "post" courses) outlined in *Appendix B-1: Curriculum for Retail Food Safety Inspection Officers*.

STEP 4
Completion of a standardization process similar to the FDA standardization procedures.

STEP 5
Completion of 20 contact hours of continuing food safety education every 36 months after the initial training is completed.

Description of Requirement

Ninety percent (90 %) of the regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have successfully completed the required elements of the 5-step training and standardization process:

- Steps 1 through 4 within 24 months of hire or assignment to the retail food regulatory program.
- Step 5 every 36 months after the initial 24 months of training.

Step 1: Pre-Inspection Curriculum

Prior to conducting any type of independent field inspections in retail food establishments, the FSIO must satisfactorily complete training in pre-requisite courses designated with a "Pre" in Appendix B-1, for the following curriculum areas:

1. Prevailing statutes, regulations, ordinances (specific laws and regulations to be addressed by each jurisdiction);
2. Public Health Principles;
3. Food Microbiology; and
4. Communication Skills.

There are two options for demonstrating successful completion of the pre-inspection curriculum.

OPTION 1: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- FDA ORA U pre-requisite courses identified as "Pre" in Appendix B-1; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances.

Note: *The estimated contact time for completion of the FDA ORA U pre-requisite ("Pre") courses is 42 hours.*

OPTION 2: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- Successful completion of courses deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the FDA ORA U pre- requisite (Pre") courses; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances; and
- Successful passing of one of the four written examination options (described later in this Standard) for determining if a FSIO has a basic level of food safety knowledge.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion is provided. The learning objectives for each of the listed ORA U courses are available from the web site link at: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners

> **Note:** *While certificates issued by course sponsors are the ideal proof of attendance, other official documentation can serve as satisfactory verification of attendance. The key to a document's acceptability is that someone with responsibility, such as a trainer/food program manager who has first-hand knowledge of employee attendance at the session, keeps the records according to an established protocol. An established protocol can include such items as:*
>
> - *Logs/records that are completed based on sign-in sheets; or*
> - *Information validated from the certificate at the time-of-issuance; or*
> - *A college transcript with a passing grade or other indication of successful completion of the course; or*
> - *Automated attendance records, such as those currently kept by some professional associations and state agencies, or*
> - *Other accurate verification of actual attendance.*

Regulatory retail food inspection staff submitting documentation of courses equivalent to the FDA ORAU courses – OPTION 2 – must also demonstrate a basic level of food safety knowledge by successfully passing one examination from the four written examination categories specified herein.

1. The Certified Food Safety Professional examination offered by the National Environmental Health Association; or

2. A state sponsored food safety examination that is based on the current version of the FDA Food Code (and supplement) and is developed using methods that are psychometrically valid and reliable; or

3. A food manager certification examination provided by an ANSI/CFP accredited certification organization; or

4. A Registered Environmental Health Specialist or Registered Sanitarian examination offered by the National Environmental Health Association or a State Registration Board.

Note: *Written examinations are part of a training process, not a standardization/certification process. The examinations listed are not to be considered equivalent to each other. They are to be considered as training tools and have been incorporated as part of the Standard because each instrument will provide a method of assessing whether a FSIO has attained a basic level of food safety knowledge. Any jurisdiction has the option and latitude to mandate a particular examination based on the laws and rules of that jurisdiction.*

Step 2: Initial Field Training and Experience

The regulatory staff conducting inspections of retail food establishments must conduct a minimum of 25 joint field inspections with a trainer who has successfully completed all training elements (Steps 1 – 3) of this Standard. The 25 joint field inspections are to be comprised of both "demonstration" (trainer led) and "training" (trainee led) inspections and include a variety of retail food establishment types available within the jurisdiction.

If the trainer determines that the FSIO has successfully demonstrated the required performance elements and competencies, a lower minimum number of joint field training inspections can be established for that FSIO provided there is written documentation, such as the completion of the CFP Field Training Plan in Appendix B-2, to support the exception.

Note: *The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."*

Demonstration inspections are those in which the jurisdiction's trainer takes the lead and the candidate observes the inspection process. Training inspections are those in which the candidate takes the lead, and their inspection performance is assessed and critiqued by the trainer. The jurisdiction's trainer is

responsible for determining the appropriate combination of demonstration and training inspections based on the candidate's food safety knowledge and performance during the joint field inspections.

The joint field inspections must be conducted using a field training process and forms similar to ones presented in the *CFP Field Training Manual* included as Appendix B-2. The *CFP Field Training Manual* consists of a training plan and log, trainer's worksheets, and procedures that may be incorporated into any jurisdiction's retail food training program. It is a national model upon which jurisdictions can design basic field training and provides a method for FSIOs to demonstrate competencies needed to conduct independent inspections of retail food, restaurant, and institutional foodservice establishments.

Jurisdictions are not required to use the forms or worksheets provided in the *CFP Field Training Manual*. Equivalent forms or training processes can be developed. To meet the intent of the Standard, documentation must be maintained that confirms FSIOs are trained on, and have demonstrated, the performance element competencies needed to conduct independent inspections of retail food and/or foodservice establishments.

> **Note:** *The CFP Field Training Manual is designed as a training approach providing a structure for continuous feedback between the FSIO and trainer on specific knowledge, skills, and abilities that are important elements of effective retail food, restaurant, and institutional foodservice inspections.*
>
> - *The CFP Field Training Manual is NOT intended to be used for certification or licensure purposes.*
> - *The CFP Field Training Manual is NOT intended to be used by regulatory jurisdictions for administrative purposes such as job classifications, promotions, or disciplinary actions.*

FSIOs must successfully complete a joint field training process, similar to that presented in the *CFP Field Training Manual*, prior to conducting independent inspections and re-inspections of retail food establishments in risk categories 2, 3, and 4 as presented in Appendix B-3 (taken from Annex 5, Table 1 of the 2013 *FDA Food Code*). The jurisdiction's trainer/food program manager can determine if the FSIO is ready to conduct independent inspections of risk category 1 establishments (as defined in Appendix B-3) at any time during the training process.

> **Note:** *The criterion for conducting a minimum of 25 joint field training inspections is intended for new employees or employees new to the food safety program. In order to accommodate an experienced FSIO, the supervisor/training officer can in lieu of the 25 joint field inspections:*
>
> - *Include a signed statement or affidavit in the employee's training file explaining the background or experience that justifies a waiver of this requirement; and*
> - *The supervisor/training officer must observe experienced FSIOs conduct inspections to determine any areas in need of improvement. An individual corrective action plan should be developed outlining how any training deficiencies will be corrected and the date when correction will be achieved.*

Step 3: Independent Inspections and Completion of ALL Curriculum Elements

Within 24 months of hire or assignment to the regulatory retail food program, Food Safety Inspection Officers must complete a minimum of 25 independent inspections of retail food, restaurant, and/or institutional foodservice establishments.

- If the jurisdiction's establishment inventory contains a sufficient number of facilities, the FSIO must complete 25 independent inspections of food establishments in risk categories 3 and 4 as described in Appendix B-3.
- For those jurisdictions that have a limited number of establishments which would meet the risk category 3 and/or 4 criteria, the FSIO must complete 25 independent inspections in food establishments that are representative of the highest risk categories within their assigned geographic region or training area.

In addition, all coursework identified in Appendix B-1, for the following eight curricula areas, must be completed within this 24-month time frame.

1. Prevailing statutes, regulations, ordinances (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
2. Public health principles (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
3. Communication skills (Step 1);
4. Food microbiology (some of the courses for this element are part of the pre-requisite curriculum outlined in Step 1);
5. Epidemiology;
6. Hazard Analysis Critical Control Points (HACCP);
7. Allergen Management
8. Emergency Management

All courses for each of the curriculum areas must be successfully completed within 24 months of hire or assignment to the regulatory retail food program in order for FSIOs to be eligible for the Field Standardization Assessment.

> **Note:** *The estimated contact time for completion of the FDA ORA U "post" courses is 26 hours. The term "post" refers to those courses in Appendix B-1 that were not included as part of the pre-requisite coursework. This includes all the courses in Appendix B-1 that do not have the designation "Pre" associated with them. All courses in Appendix B-1 must be successfully completed prior to conducting field standardizations.*

As with the pre-requisite inspection courses, the coursework pertaining to the above six curriculum areas can be successfully achieved by completing the ORA U courses listed under each curriculum area OR by completing courses, deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the comparable FDA ORA U courses.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion can be provided. The learning objectives for each of the listed ORA U courses are available from the FDA website: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners.

Step 4: Food Safety Inspection Officer – Field Standardization

Within 24 months of employment or assignment to the retail food program, staff conducting inspections of retail food establishments must satisfactorily complete four joint inspections with a "training standard" using a process similar to the "FDA Standardization Procedures." The jurisdiction's "training standard" must have met all the requirements for conducting field standardizations as presented in the definition section of these Standards. The standardization procedures shall determine the inspector's ability to apply the knowledge and skills obtained from the training curriculum, and address the five following performance areas:

1. Risk-based inspections focusing on the factors that contribute to foodborne illness;
2. Good Retail Practices;
3. Application of HACCP;
4. Inspection equipment; and
5. Communication.

Continuing standardization (re-standardization) shall be maintained by performing four joint inspections with the "training standard" every three years.

Note: *The field standardization and continuing standardization (re-standardization) criteria described in Step 4 is intended to provide a jurisdiction the flexibility to use their own regulation or ordinance. In addition, the reference to using standardization procedures similar to the FDA Procedures for Standardization of Retail Food Inspection Training Officers, is intended to allow the jurisdiction the option to develop its own written protocol to ensure that personnel are trained and prepared to competently conduct inspections. Any written standardization protocol must include the five performance areas outlined above in Step 4.*

It is highly beneficial to use the FDA Food Code, standardization forms and procedures even when a jurisdiction has adopted modifications to the Food Code. Usually, regulatory differences can be noted and discussed during the exercises, thereby enhancing the knowledge, and understanding of the candidate. The scoring and assessment tools presented in the FDA standardization procedures can be used without modification regardless of the Food Code enforced in a jurisdiction. The scoring and assessment tools are, however, specifically tied to the standardization inspection form and other assessment forms that are a part of the FDA procedures for standardizations.

FDA's standardization procedures are based on a minimum of 8 inspections. However, to meet Standard 2, a minimum of 4 standardization inspections must be conducted.

Jurisdictions that modify the limits of the standardization process by reducing the minimum number of inspections from 8 to 4 are cautioned that a redesign of the scoring assessment of the candidate's performance on the field inspections is required. This sometimes proves to be a very difficult task. A jurisdiction must consider both the food safety expertise of its staff, as well as the availability of personnel versed in statistical analysis before it decides to modify the minimum number of standardization inspections. The jurisdiction's standardization procedures need to reflect a credible process and the scoring assessment should facilitate

consistent evaluation of all candidates.

The five performance areas target the behavioral elements of an inspection. The behavioral elements of an inspection are defined as the manner, approach and focus which targets the most important public health risk factors and communicates vital information about the inspection in a way that can be received, understood, and acted upon by retail food management. The goal of standardization is to assess not only technical knowledge but also an inspector's ability to apply his or her knowledge in a way that ensures the time and resources spent within a facility offer maximum benefit to both the regulatory agency and the consuming public. Any customized standardization procedure must continue to meet these stated targets and goals.

Should a jurisdiction fall short of having 90% of its retail food program inspection staff successfully complete the Program Standard 2 criteria within the 24- month time frame, a written protocol must be established to provide a remedy so that the Standard can be met. This protocol would include a corrective action plan outlining how the situation will be corrected and the date when the correction will be achieved.

Step 5: Continuing Education and Training

A FSIO must accumulate 20 contact hours of continuing education in food safety every 36 months after the initial training (24 months) is completed. Within the scope of this standard, the goal of continuing education and training is to enhance the FSIO's knowledge, skills, and ability to perform retail food and foodservice inspections. The objective is to build upon the FSIO's knowledge base. Repeated coursework should be avoided unless justification is provided to, and approved by, the food program manager and/or training officer.

Training on any changes in the regulatory agency's prevailing statutes, laws and/or ordinances must be included as part of the continuing education (CE) hours within six months of the regulatory change. Documentation of the regulatory change date and date of training must be included as part of the individual's training record.

The candidate qualifies for one contact hour of continuing education for each clock hour of participation in any of the following nine activities that are related specifically to food safety or food inspectional work:

1. Attendance at FDA Regional seminars / technical conferences;
2. Professional symposiums / college courses;
3. Food-related training provided by government agencies (e.g., USDA, State, local);
4. Food safety related conferences and workshops; and
5. Distance learning opportunities that pertain to food safety, such as:
    - Web based or online training courses (e.g., additional food safety courses offered though ORA U, industry associations, universities); and
    - Satellite Broadcasts.

A maximum of ten (10) contact hours may be accrued from the following activities:

1. Delivering presentations at professional conferences;
2. Providing classroom and/or field training to newly hired FSIOs, or being a course instructor in food safety; or
3. Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

Contact hours for a specified presentation, course, or training activity will be recognized only one time within a 3-year continuing education period[1].

Note: *Time needed to prepare an original presentation, course, or article may be included as part of the continuing education hours. If the FSIO delivers a presentation or course that has been previously prepared, only the actual time of the presentation may be considered for continuing education credit.*

A maximum of four (4) contact hours may be accrued for:

1. Reading technical publications related to food safety.

Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation include:

- certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- transcripts from a college or university;
- a letter from the administrator of the continuing education program attended;
- a copy of the peer-reviewed article or presentation made at a professional conference; or
- documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports.

Note: *The key to a document's acceptability is that someone with responsibility, such as a training officer or supervisor, who has first-hand knowledge of employee's continuing education activities, maintains the training records according to an established protocol similar to that presented in Step 1 for assessing equivalent courses.*

Outcome

The desired outcome of this Standard is a trained regulatory staff with the skills and knowledge necessary to conduct quality inspections.

Documentation

The quality records needed for this standard include:

1. Certificates or proof of attendance from the successful completion of all the course elements identified in the Program Standard curriculum (Steps 1 and 3);

2. Documentation of field inspection reports for twenty-five each joint and independent inspections (Steps 2 and 3);
3. Certificates or other documentation of successful completion of a field training process similar to that presented in Appendix B-2. **NOTE:** The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."
4. Certificates or other records showing proof of satisfactory standardization (Step 4);
5. Contact hour certificates or other records for continuing education (Step 5);
6. Signed documentation from the regulatory jurisdiction's food program supervisor or training officer that food inspection personnel attended and successful completed the training and education steps outlined in this Standard.
7. Date of hire records or assignment to the retail food program; and
8. Summary record of employees' compliance with the Standard.

The *Standard 2: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 2.

- Identify the activities that occur during an inspection
- Identify the types of evidence that may be collected during an inspection
- Recognize the importance of taking good notes during an inspection
- Identify the remedies that are available if the establishment repeatedly fails to comply with the law
- Identify the behaviors that you should demonstrate when testifying in court
- Identify the role of hearsay in a trial

Return to Page Top: Page Top

FDA38 – Basics of Inspection: Beginning an Inspection
After completing this course, you will be able to identify how to prepare for an inspection. You will also recognize how to properly deal with management and recognize initial observations you should make at the start of an inspection. In addition, you will identify the purpose of a Hazard Analysis Critical Control Point (HACCP) plan. You will also recognize what to look for when searching for potential food contaminants, and you will identify examples of chemical and physical hazards. Finally, you will recognize the purpose of corrective actions.
Length: 90 mins
CEUs: 0.2
Available at http://www.eduneering.com/Partners/fdaora (http://www.eduneering.com/Partners/fdaora) (http://www.fda.gov/about-fda/website-policies/website-disclaimer)

Objectives:

- Recognize what to look for when reviewing the history of the facility to be inspected.
- Identify recommended equipment and supplies needed during an inspection.
- Recognize the proper attire for an inspection.
- Recognize how to best deal with management when beginning an inspection.
- Identify initial observations during an inspection.
- Identify the definition of HACCP.
- Recognize observations for food flow cycles.
- Recognize observations for time/temperature controls.
- Recognize how to identify if a food is potentially hazardous.
- Recognize where and what to look for when searching for product cross-contamination.
- Identify the definition of a chemical hazard.

Top ()

- Recognize examples of chemical hazards.
- Identify the definition of a physical hazard.
- Recognize examples of physical hazards.
- Recognize why corrective actions are needed.
- Recognize the importance of a recall/traceback program.

Return to Page Top: Page Top

FDA39 – Basics of Inspections: Issues and Observations
After completing this course, you will be able to identify the unsatisfactory practices that lead to contaminated food, including: processing equipment issues; employee practices; food storage/display issues; contamination; and water supply and plumbing concerns. You will also be able to recognize proper sampling procedures. In addition, you will be able to identify what to include in an inspection report and how to conduct a closing conference at the conclusion of an inspection.
Length: 90 mins
CEUs: 0.2
Available at http://www.eduneering.com/Partners/fdaora (http://www.eduneering.com/Partners/fdaora) (http://www.fda.gov/about-fda/website-policies/website-disclaimer)

Objectives:

- Recognize poor hygienic practices.
- Recognize what constitutes bare-hand contact with ready-to-eat foods.
- Recognize proper handwashing procedures.
- Recognize the potential contamination that may come from ill employees.
- Recognize the importance of food safety training programs.
- Recognize cleaning and sanitation issues to look for while inspecting processing equipment.
- Recognize how to identify equipment condition issues.
- Recognize what constitutes improper use of equipment.
- Recognize the need for equipment to perform as desired.
- Recognize approved source requirements.
- Recognize typical observations of conditions that may indicate a problem with foods offered for sale.
- Recognize proper label compliance procedures.

Top ()

- Recognize examples of poor practices that result in cross-contamination.
- Recognize proper storage and disposal of objectionable products.
- Recognize conditions that indicate the presence of pests.
- Recognize how to determine if a water source is approved.
- Recognize proper water temperatures for various activities that use water.
- Recognize proper plumbing systems for food facilities.
- Recognize proper warewashing procedures.
- Recognize the purpose of a sample.
- Identify the steps in sampling and the properties of each step.
- Recognize information that should be included in the inspection report.
- Identify the purpose of evidence documentation in the inspection report.
- Recognize the usefulness of photographs in the inspection report.
- Recognize how to handle corrections to the inspection report.
- Identify supporting documents that should be reviewed.
- Recognize the critical elements of the closing conference.
- Identify the individual(s) that should be present during the closing conference.
- Recognize how to handle disputes.

Return to Page Top: Page Top

FDA16 – Basics of HACCP: Overview of HACCP
Hazard Analysis and Critical Control Point (HACCP) is a food safety management system designed for use in all segments of the food industry. This course provides an introduction to HACCP and is the first in the three-part Basics of HACCP series. Basics of HACCP is intended for individuals involved with the control of food safety at any point in the food industry. There are no prerequisites.
Length: 60 mins
CEUs: 0.1
Available at http://www.eduneering.com/Partners/fdaora (http://www.eduneering.com/Partners/fdaora) (http://www.fda.gov/about-fda/website-policies/website-disclaimer)

Objectives:

- Recall characteristics of HACCP and CCP.
- Recall characteristics of a HACCP plan and a HACCP system.

Top ()

- Recall key developments involved in the origin of HACCP.
- Identify factors that make HACCP important to the U.S. and global food supply.
- Identify the benefits gained from using HACCP.
- Recall specific U.S. and foreign government organizations that utilize HACCP.

Return to Page Top: Page Top

FDA17– Basics of HACCP: Prerequisite Programs and Preliminary Steps
After completing this course, you will be able to recognize important prerequisite programs for a HACCP system, including basic sanitation, good facility design, and proper personal hygiene practices, and recognize how these prerequisite programs help make a HACCP system successful. You will also be able to identify the five preliminary steps to developing a HACCP plan and recognize how those steps benefit HACCP plan development. Finally, you will recognize other practices that must be in place before you implement a HACCP plan.
Length: 60 mins
CEUs: 0.1
Available at http://www.eduneering.com/Partners/fdaora (http://www.eduneering.com/Partners/fdaora) (http://www.fda.gov/about-fda/website-policies/website-disclaimer)

Objectives:

- Recall specific prerequisite programs.
- Identify characteristics of prerequisite programs.
- Recognize the benefits of prerequisite programs.
- Recognize how prerequisite programs provide a foundation for a successful HACCP system.
- Recognize the five preliminary steps to developing a HACCP plan.
- Identify appropriate members of the HACCP team.
- Recognize the benefit of assembling a HACCP team.
- Recognize how to describe the food and its distribution.
- Recognize the benefit of describing the food and its distribution.
- Recognize how to describe the intended use and consumers of the product.
- Recognize the benefit of describing the intended use and consumers of the product.
- Recognize how to develop a flow diagram describing the process under consideration.
- Recognize the benefit of developing and verifying the flow diagram.

MANY PERSPECTIVES, ONE VOICE SINCE 1896

Risk-Based Inspection Methods in Retail (FD218)

Upcoming Courses

Registration Process

Questions about FD218

This workshop builds upon concepts learned in FD215 Managing Retail Food Safety and is designed to further enhance the knowledge, skills, and abilities of food safety inspection officers in conducting risk-based inspections.

Topics include:

- Key terms, applicable laws/policies, and necessary equipment
- Food microbiology
- Three common food preparation processes and their associated hazards and control measures
- Communication techniques related to risk-based inspections including establishing rapport, active listening, asking strategic questions, and oral versus print culture communication styles
- Strategies used to focus the inspection, set priorities, and determine inspection flow
- Differences between assessing code compliance and active managerial control (AMC) of foodborne illness risk factors during inspections and the reasons why assessing AMC is essential to public health
- Techniques for determining code compliance and AMC of foodborne illness risk factors
- Determining the most appropriate immediate corrective actions for out-of-control foodborne illness risk factors
- Determining the most appropriate long-term intervention strategies for out-of-control risk factors

AFDO is a regulatory organization that connects food and medical-products safety stakeholders and impacts the regulatory environment by shaping sound, science-based rules, law, regulations, and sharing best practices that protect public health. Or simply put: connect, share, impact, and protect.

National Curriculum Standard

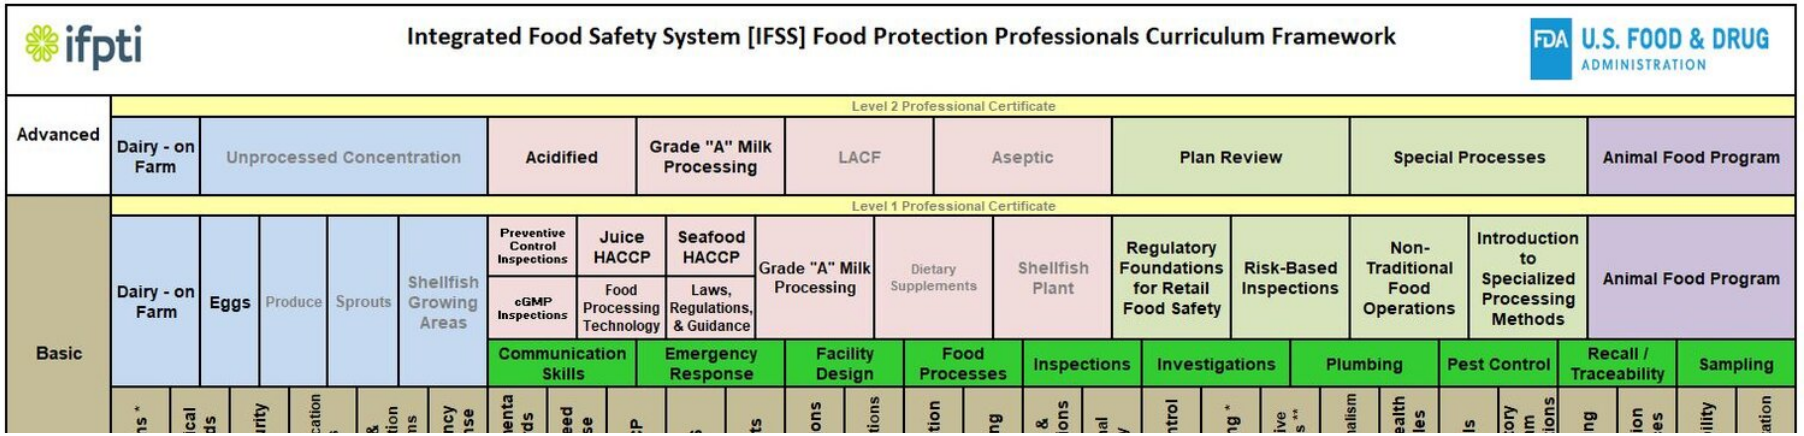
Through a Cooperative Agreement* with the US Food and Drug Administration (FDA), IFPTI is leading the development and build-out of the National Curriculum Standard (NCS). The NCS is a key element of the ***Integrated Food Safety System*** (IFSS), a seamless partnership and collaboration among human and animal food regulatory jurisdictions: Federal, State, Local, Tribal, and Territorial.

The NCS represents a ***national competency standard*** for human and animal food regulatory professionals, across their entire careers. The NCS depicts the ***knowledge, skills, and abilities*** needed by these regulators in

By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

order to successfully perform their jobs, thereby assuring a ***competent regulatory workforce doing comparable work*** across all jurisdictions.

A key component of the NCS is the IFSS Curriculum Framework, shown below. The IFSS Framework is a color-coded schematic of the human and animal food regulatory profession, demonstrating the interrelationship between and among professional career levels, program areas, and content or topic areas. The Framework is a living, breathing document, and is consistently being revised and updated as buildout of the Framework continues.



By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

The NCS, along with the IFSS Framework, serve three primary purposes: 1. Creating “blueprints” for training development, 2. Acting as a cataloging system, and 3. Helping with assessment.

Blueprint for course development

One of the foundational processes used by training developers in the instructional systems design (ISD) field is the ADDIE model, which outlines the five steps for developing effective training. The chronological steps in the model are: Analysis, Design, Development, Implementation, and Evaluation.

When we build out a particular content or topic area within the IFSS Framework, we are essentially creating a “blueprint” for training

By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

Taken together, the competencies and behavioral anchors provide all the details concerning what should be covered in a training course.

ISD professionals, therefore, can use these content or topic area “blueprints” and, in close collaboration with appropriate subject matter experts, can create course learning objectives (which are often modified versions of the competencies), build course content, course activities, learner interactions, and knowledge checks, all of which are recommended components of any learning event.

Looking back at the ADDIE model, then, we can see that these “blueprints” represent the Analysis and Design phases of the process. The Analysis involves identifying what the regulator needs to know or be able to do, and the Design relates to arranging the competencies and behavioral anchors into a sequenced, organized blueprint that can be utilized during the next step of the ADDIE process, the Development phase.

By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

Cataloging system and gap analysis/inventory

The IFSS Framework is a carefully organized schematic, arranged by professional levels (Basic, Advanced, etc.), specific program areas or concentrations such as Retail Food, Manufactured Food, Unprocessed Food, and Animal Food, and focused content or topic areas tailored to each professional level.

As such, the Framework can serve as a unique, open-source system to be

By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

training developers to arrange existing materials into their appropriate slot, much like a book is placed on a particular shelf in a library.

This cataloging system can be used to organize any existing training courses, guidance documents, and reference materials. Additionally, the system can help identify gaps in existing training across the US, and can help identify learning events in need of development.

Assessment against competencies

The content area “blueprints” aid in the assessment process.
Remember, the blueprints comprise a set of:

1. competencies (knowledge, skills,

By using this website, you agree to our use of cookies. We use cookies to provide you with a great experience and to help our website run effectively.

regulatory professionals to successfully perform their job functions; and

2. behavioral anchors tailored to each competency, which are indicators that an individual can actually demonstrate the particular knowledge, skills, or ability.

Taken together, the competencies and behavioral anchors can be used by an *assessor* to help measures an individual's level of competency and help identify any competency gaps that can be addressed through training, mentoring, job shadowing, or field experience. For example, an individual can conduct a self-assessment to determine if he or she possesses competencies necessary at a particular career level, and can use the results of the self-assessment to determine their progress within a particular career path.

Additionally, a supervisor or manager can assess an entire staff against a set of competencies, to help determine if any new or refresher training is

STANDARD 3
INSPECTION PROGRAM BASED ON HACCP PRINCIPLES

Table of Contents

REQUIREMENT SUMMARY 2
DESCRIPTION OF REQUIREMENT 2
OUTCOME 2
DOCUMENTATION 2

STANDARD 3
INSPECTION PROGRAM BASED ON HACCP PRINCIPLES

This standard applies to the utilization of HACCP principles to control risk factors in a retail food inspection program.

Requirement Summary

An inspection program that focuses on the status of risk factors, determines, and documents compliance, and targets immediate- and long-term correction of out-of-control risk factors through active managerial control.

Description of Requirement

Program management:

1. Implements the use of an inspection form that is designed for:
    a) The identification of risk factors and interventions.
    b) Documentation of the compliance status of each risk factor and intervention (i.e., a form with notations indicating IN compliance, OUT of compliance, Not Observed, or Not Applicable for risk factors)
    c) Documentation of all compliance and enforcement activities and
    d) Requires the selection of IN, OUT, NO, or NA for each risk factor.
2. Develops and uses a process that groups food establishments into at least three categories based on potential and inherent food safety risks.
3. Assigns the inspection frequency based on the risk categories to focus program resources on food operations with the greatest food safety risk.
4. Develops and implements a program policy ***that requires:
    a) On-site corrective actions* as appropriate to the type of violation.
    b) Discussion of long-term control** of risk factor options, and
    c) Follow-up activities.
5. Establishes and implements written policies addressing code variance requests related to risk factors and interventions.
6. Establishes written policies regarding the verification and validation of HACCP plans when a plan is required by the code.

Outcome

The desired outcome of this standard is a regulatory inspection system that uses HACCP principles to identify risk factors and to obtain immediate- and long-term corrective action for recurring risk factors.

Documentation

The quality records needed for this standard include:

1. Inspection form that requires the selection of IN, OUT, NO, or NA,
2. Written process used for grouping establishments based on food safety risk and the inspection frequency assigned to each category,

3. Policy for on-site correction and follow-up activities,
4. Policy for addressing code variance requests related to risk factors and interventions,
5. Policy for verification and validation of HACCP plans required by code, and
6. Policy requiring the discussion of food safety control systems with management when out of control risk factors are recorded on subsequent inspections.

*Note: **On-site** corrective action as appropriate to the violation would include such things as:

a. Destruction of foods that have experienced extreme temperature abuse,
b. Embargo or destruction of foods from unapproved sources,
c. Accelerated cooling of foods when cooling time limits can still be met,
d. Reheating when small deviations from hot holding have occurred,
e. Continued cooking when proper cooking temperatures have not been met.
f. Initiated use of gloves, tongs, or utensils to prevent hand contact with ready-to-eat foods, or
g. Required hand washing when potential contamination is observed.

Note: **Long-term control of risk factors requires a commitment by managers of food establishments to develop effective monitoring and control measures or system changes to address those risk factors most often responsible for foodborne illness. Risk control plans, standard operating procedures, buyer specifications, menu modification, HACCP plans and equipment or facility modification may be discussed as options to achieve the long-term control of risk factors.

***Note: Consideration of the elements outlined in Standard 4 will ensure a strong foundation for a quality and uniform inspection program.

STANDARD 3 – INSPECTION PROGRAM BASED ON HACCP PRINCIPLES INSTRUCTIONS FOR COMPLETING THE PROGRAM SELF-ASSESSMENT AND VERIFICATION AUDIT FORM

Program Self-Assessment & Verification Audit Form

The *Standard 3: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 3. The form is included at the end of these instructions. Whether one is performing a program self-assessment or conducting a verification audit, it is recommended that the form be available as a reference to the Standards 3 criteria.

Using the Program Self-Assessment and Verification Audit Form

Documenting the Findings from the Self-Assessment

Jurisdictions conducting a self-assessment of Standard 3 must indicate on the form if each of the listed criteria is met. These responses are recorded under the column "Jurisdiction's Self-Assessment."

Jurisdictions are not obligated to use this form. An equivalent form or process is acceptable provided that the results of the jurisdiction's self-assessment for the specific Standard 3 criteria listed on this form are available for review.

The *Standard 3: Program Self-Assessment and Verification Audit Form* is the only form a jurisdiction needs to use to record the results of their self-assessment. Standard 3 requires inspection policies to be established, written, and implemented. A policy without documentation of implementation does not meet the Standard 3 criteria.

The *Standard 3: Program Self-Assessment and Verification Audit Form* divides the Standard 3 criteria into six steps:

1. Inspection Form Design
    a. The jurisdiction's inspection form identifies foodborne illness risk factors and *Food Code interventions*.
    b. The jurisdiction's inspection form documents actual observations using the convention IN, OUT, NA, and NO.
    c. The jurisdiction's inspection form documents compliance and enforcement activities.
2. Risk Assessment Categories
    a. A risk assessment is used to group food establishments into at least 3 categories based on their potential and inherent food safety risks.
3. Inspection Frequency
    a. The jurisdiction's inspection frequency is based on assigned risk categories.
4. Corrective Action Policy
    a. The jurisdiction has a written and implemented policy that requires on-site corrective action for foodborne illness risk factors observed to be out of compliance.
    b. The jurisdiction has a written and implemented policy that requires discussion for long- term control of foodborne illness risk factors.
    c. The jurisdiction has a written and implemented policy that requires follow-up activities on foodborne illness risk factor violations.
5. Variance Request Policy
    a. The jurisdiction has a written and implemented policy on variance requests related to foodborne illness risk factors and *Food Code* interventions.

6. Verification and Validation of HACCP Plan Policy
    a. The jurisdiction has a written and implemented policy for the verification and validation of HACCP plans, when a HACCP plan is required by the *Food Code*.

The self-assessor must review each Standard 3 criterion and determine if the jurisdiction's source documents confirm that the Standard criteria are met. If the criteria are met, the self-assessor must place an "X" in the "YES" box under the "Jurisdiction's Self-Assessment" column of the *Standard 3: Program Self-Assessment and Verification Audit Form*.

If a review of the jurisdiction's source documents does not confirm that the Standard 3 criteria are met, the self-assessor must place an "X" in the "NO" box under the "Jurisdict*ion's Self-Assessment" column of the* Standard 3: Program Self-Assessment and Verification Audit Form. The self-assessor may specify why the criteria are not met in the box provided.

The self-assessor should review the findings on the *Standard 3: Program Self-Assessment and Verification Form* to ensure accuracy. The jurisdiction will be required to provide the auditor with their completed *Standard 3: Program Self-Assessment and Verification Audit Form* and any documents used to support and demonstrate that the Standard 3 criteria have been met.

Once all the criteria have been reviewed and documented on the form, the self-assessor must complete the Program Self-Assessment Summary section on page one of the *Standard 3: Program Self-Assessment and Verification Audit Form*. The self-assessor must:

- Enter their contact information;
- Document if the jurisdiction met the Standard 3 criteria in the appropriate boxes; and
- Sign the form where indicated.

It then will be up to the jurisdiction to determine its action plan and time frame for correcting any deficiencies in order to meet the Standard 3 criteria.

Documenting the Findings from the Verification Audit
The jurisdiction requesting the verification audit must provide their completed *Standard 3: Program Self-Assessment and Verification Audit Form* to the auditor for review. The auditor must indicate on the *Standard 3: Program Self-Assessment and Verification Audit Form* if the criteria were met.

If a review of the jurisdiction's source documents confirms the self-assessment conclusion that the Standard criteria are met, the verification auditor places an "X" in the "YES" box under the "Auditor's Verification" column of the form.

If a review of the jurisdiction's source documents does not confirm the self-assessment conclusion that the Standard criteria are met, the verification auditor places and "X" in the "NO" box under the "Auditor's Verification" column of the form. The verification auditor must specify why the criterion is not met in the box provided. Supplemental pages may be used to explain findings.

The jurisdiction must meet all six program performance criteria outlined in Standard 3.

The verification auditor must discuss their findings with the program manager or their appointed representative and provide constructive feedback at the conclusion of the on-site visit. In particular, any

Standard 3 criteria for which the auditor cannot confirm through a review of the self-assessment should be thoroughly discussed. Ample time should be allotted to ensure that there is a clear understanding of the reasons for the "non-conforming" finding. The auditor should be prepared to identify the elements required for the jurisdiction to meet the Standard.

Once the close out interview has been conducted, the auditor must complete the Verification Audit Summary section located on the first page of the *Standard 3: Program Self-Assessment and Verification Audit Form*. The auditor must:

- Enter their contact information;
- Document if the jurisdiction met the Standard 3 criteria in the appropriate boxes; and
- Sign the form where indicated.

It then will be up to the jurisdiction to determine its action plan and time frame for correcting any deficiencies in order to meet the Standard 3 criteria if the auditor does not confirm the self-assessment findings.

Standard 3: Inspection Program based on HACCP Principles
Program Self-Assessment and Verification Audit Form

Jurisdiction Name: _____

Criteria	Element	Jurisdiction's Self-Assessment YES	Jurisdiction's Self-Assessment NO	Self-Assessor's General Comments	Auditor's Verification YES	Auditor's Verification NO	If NO, Auditor is to specify why criterion is not met
1. Inspection Form Design	a) The jurisdiction's inspection form identifies foodborne illness risk factors and Food Code interventions						
1. Inspection Form Design	b) The jurisdiction's inspection form documents actual observations using the convention (IN, OUT, NO, and NA).						
1. Inspection Form Design	c) The jurisdiction's inspection form documents compliance and enforcement activities.						
2. Risk Assignment Categories	a) A risk assessment is used to group food establishments into at least 3 categories based on their potential and inherent food safety risks.						
3. Inspection Frequency	a) The jurisdiction's inspection frequency is based on the assigned risk categories.						

Criteria	Element	Jurisdiction's Self-Assessment YES	Jurisdiction's Self-Assessment NO	Self-Assessor's General Comments	Auditor's Verification YES	Auditor's Verification NO	If NO, Auditor is to specify why criterion is not met
4. Written and Implemented Corrective Action Policy	a) The jurisdiction has a written and implemented policy that requires on-site corrective actions for foodborne illness risk factors observed to be out of compliance.						
4. Written and Implemented Corrective Action Policy	b) The jurisdiction has a written and implemented policy that requires discussion for long-term control of foodborne illness risk factors.						
4.Written and Implemented Corrective Action Policy	c) The jurisdiction has a written and implemented policy that requires follow-up activities on foodborne illness risk factor violations.						
5. Variance Requests	a) The jurisdiction has a written and implemented policy on variance requests related to foodborne illness risk factors and Food Code interventions.						
6. Verification and Validation of HACCP Plans	a) The jurisdiction has a written and implemented policy for the verification and validation of HACCP plans, when a HACCP plan is required by the Code.						

GENERAL NOTES PERTAINING TO THE PROGRAM SELF-ASSESSMENT OR THE VERIFICATION AUDIT

STANDARD 2-TRAINED REGULATORY STAFF

INSTRUCTIONS AND WORKSHEET FOR CONDUCTING A VERIFICATION AUDIT

STEP 1 – Verify Employees Training Records

The jurisdiction should document and retain a training record for each employee. The training record must include the date of hire or assignment to the retail food program. The Standard 2 Self-Assessment Worksheet may be used by the jurisdiction as a training record. The worksheet is included at the end of these instructions. In lieu of the Standard 2 Self-Assessment Worksheet, other manual forms or automated records may be used by the jurisdiction to retain training records related to the self- assessment as long as the information required in the Standard 2 criteria is documented in some manner.

STEP 2 – Verify Jurisdiction's Worksheet Percentage Calculation

Review the jurisdiction's Standard 2 Self-Assessment Worksheet, or equivalent documentation, to determine if the results of the jurisdiction's self-assessment indicate that ninety percent (90%) of the retail food program staff successfully completed all the Standard 2 training and standardization elements within the required time frames. If audit calculations result in a percentage that is less than 90%, the auditor can conclude that the jurisdiction does not meet the Standard 2 criteria. If this conclusion is reached, the audit process for Standard 2 is completed. There is no need to randomly select and review individual employee training records.

STEP 3 – Determine the Number of Employee Training Records to Review

If the jurisdiction used the Standard 2: Self-Assessment Worksheet, the employees will be listed in numerical order. The verification auditor must use a random selection method to determine which employees' training records will be reviewed. Employees should be substituted during the random selection process if they meet one of the following criteria:

1. The employee has been employed or worked in the retail food program for less than 24 months; or
2. The employee is no longer assigned to the retail food program; or
3. The self-assessor indicated on the Self-Assessment Worksheet that the employee did not meet each Standard 2 element.

The number of training records that must be randomly selected is based on the number of employees conducting retail food establishment inspections. Use the chart below to determine the number of employee training records to review.

Number of Employees	Number of Files to Select
5 or less	All
20 or less	5
21 or more	25 percent

STEP 4 – Obtain Random Numbers

A list of random numbers can be obtained from the following web site: www.randomizer.org
Record the random numbers generated from the web site (or from an alternate random number selection process) on the Standard 2 Verification Audit Worksheet. The worksheet is included at the end of these instructions.

STEP 5 – Select Employee Training Records to Review

Using the jurisdiction's Standard 2 Self-Assessment Worksheet, or equivalent documentation, the verification auditor must identify the employee training records that correspond to the randomly selected numbers recorded on the Standard 2 Verification Audit Worksheet. Record the employee's name adjacent to the corresponding random number on the Standard 2 Verification Audit Worksheet.

Only those employees' training records that the jurisdiction reports as meeting all the Standard 2 training and standardization elements are to be reviewed. If an employee is randomly selected but the jurisdiction indicated that employee does not meet the Standard 2 criteria, the verification auditor should randomly select a substitute employee training record to review.

STEP 6 – Verify Documentation of the Completion of the Standard Training Criteria

The verification auditor must review the training file for each of the randomly selected employees to confirm completion of the following items:

- coursework related to the Standard 2 Pre-requisite ("Pre") curriculum;
- a minimum of 25 joint field training inspection, including documentation that confirms Food Safety Inspection Officers (FSIOs) are trained on, and have demonstrated, the performance element competencies needed to conduct independent inspections of retail food and/or foodservice establishments;
- a minimum of 25 independent inspections and ALL the Standard 2 ("Post") curriculum requirements;
- field standardization within 18 months of hire or re-standardization every three years after initial standardization, and
- 20 hours of food safety related continuing education every three years

NOTE: For new hires or employees newly assigned to the retail food protection program, the date recorded in the "Completion of Field Standardization" column must be within 18 months of the date recorded in the "Date of Hire or Assignment to the Retail Food Protection Program."

For experienced employees, however, the completion date for standardization may be in excess of 18 months of their date of hire. This is because the jurisdiction may not have been standardizing their retail food protection program staff prior to enrollment in the Program Standards. Keep in mind that the Standard 2 language was written to establish a training and standardization process for new employees. As long as the experienced FSIO has successfully completed standardization at the time of the self-assessment the Standard 2 criteria is met.

STEP 7 – Making a Determination Based on the Results of the Audit

For each employee training file reviewed, the verification auditor must mark the appropriate box on the Standard 2 Verification Audit Worksheet. The auditor must indicate "YES –Standard 2 criteria are met" or "NO" – Standard 2 criteria is not met." If the verification auditor determines an employee training record did not meet the Standard 2 criteria, an explanation must be provided noting any deficiencies. A jurisdiction meets the Standard 2 criteria if ninety percent (90%) of the retail food program inspection staff fulfilled all the training and standardization requirements within the specified time frames.

STANDARD 6 – COMPLIANCE AND ENFORCEMENT

INSTRUCTIONS AND WORKSHEET FOR CONDUCTING A VERIFICATION AUDIT

Using the Standard 6: Verification Audit Worksheet

The auditor should have the *Standard 6: Verification Audit Worksheets* available as a reference when reading through this guidance. The following worksheet is provided at the end of these instructions:

- *Standard 6: Verification Audit Worksheet*

The Standard 6: Verification Audit Worksheet is designed to provide a listing of the establishments randomly selected from the jurisdiction's inventory that were reviewed as part of the self-assessment process. This worksheet provides a summary as to whether or not the inspection file/records for each of the randomly selected establishments meet the Standard 6 criteria.

The Standard 6: Establishment File Worksheet provides a systematic way of collecting the compliance and enforcement history for each of the randomly selected establishments. Jurisdictions do not have to use this form. However, a jurisdiction must provide documentation of the review process. The documentation must indicate if appropriate compliance and enforcement actions were taken for out-of-control risk factors and *Food Code* interventions at each establishment randomly selected for the self-assessment.

STEP 1 – Verify the Elements in the Written Compliance & Enforcement Program

To meet the criteria of Standard 6, the jurisdiction must have written step-by-step procedures outlining its compliance and enforcement process. The verification auditor should review its compliance and enforcement policies and procedures to ensure that there is clear guidance for staff. The policies and procedures should provide steps and actions to be taken when various categories of violations occur. The policies and procedures should also provide a progression of steps to be taken when violations are not corrected within regulatory or administratively established time frames.

Standard 6 does not dictate a required compliance process. The jurisdiction is free to determine any actions to be taken for violations of its regulations and the progression of consequences for repeated violations. The time frames and triggers for additional actions are also left to the discretion of the jurisdiction.

In addition, to meet the requirements of Standard 6, the jurisdiction's inspection form must use the IN compliance, OUT of compliance, Not Applicable, and Not Observed conventions to record the compliance status of the foodborne illness risk factors and the public health interventions identified in the *Food Code*.

Jurisdictions that have not adopted all the recommended foodborne illness risk factors and *Food Code* interventions are not penalized under Standard 6 for these omissions.

STEP 2 – Verify the Effectiveness of the Compliance & Enforcement Program

Randomly selected establishment files must be reviewed to determine if documented violations were resolved satisfactorily. The results of the review will be used to assess the success of the compliance and enforcement program. This section of the self-assessment process has been broken down into the following four parts:

Part I Verify that the jurisdiction reviewed the appropriate number of files

Part II Randomly select establishment files from the jurisdiction's *Standard 6: Self-Assessment Summary Worksheet*

Part III Verify Self-Assessment findings for each selected establishment file

Part IV Verify that 80% of selected establishment files adhere to the jurisdiction's written compliance and enforcement procedures

Part I - Verify that the jurisdiction reviewed the appropriate number of files

The number of establishment files a jurisdiction must review as part of the Standard 6 self-assessment process is based on the size of their establishment inventory. Jurisdictions with less than 800 total establishments must select at least 40 files for review. If a jurisdiction has less than 40 establishments in the inventory, then all files will be reviewed. Jurisdictions with 800 or more establishments must select a sample size equal to 5% of the total establishments up to a maximum of 70 files.

Establishment Inventory	Number of Files to Review for the Self-Assessment
Less than 800	40 establishment files
800 or more	5% of the total number of establishments (Up to a maximum of 70 files)

Some of the randomly selected establishment files listed on the *Standard 6: Self-Assessment Summary Worksheet* may not qualify for the self-assessment process. Deletion of an establishment from the sample of files to be reviewed as part of the self-assessment process is limited to those establishments where:

1. The selected establishment has not been in business long enough to have at least three regularly scheduled routine inspections; or
2. A review of inspection reports in the selected establishment file reveals that there were no risk factor or *Food Code* intervention violations documented on the "start-point" inspection

The jurisdiction's self-assessment process must include a listing of the substitute establishment files that were reviewed as replacements for those that did not qualify. When an establishment does not qualify for the self-assessment process, the substitute establishment must not be recorded on the *Standard 6: Self-Assessment Summary Worksheet*, but instead on the *Standard 6: Self-Assessment Summary Worksheet Substitute Establishment Files Worksheet*. The auditor should verify this.

Part II - Randomly select establishment files from the jurisdiction's *Standard 6: Self-Assessment Summary Worksheet*

Using a table of random numbers or a random number generator is the preferred method of sample selection. The random selection will be made from the establishment files listed on the jurisdiction's *Standard 6: Self-Assessment Summary Worksheet*. The number of establishment files that must be selected for review as part of the verification audit process is indicated in the chart below.

Establishment Inventory	Number of Files to Review for the Self-Assessment	Number of Files to Select for the Verification Audit
Less than 800	40 establishment files	5
800 or more	5% of the total number of establishments (Up to a maximum of 70 files)	10

Using the jurisdiction's *Standard 6: Self-Assessment Summary Worksheet*, the verification auditor will identify the establishment files that correspond to the randomly selected number recorded on the *Standard 6: Verification Audit Worksheet*. The verification auditor must record the establishment name or identification number for each of the randomly selected numbers on the *Standard 6: Verification Audit Worksheet.*

The verification auditor must only review establishment files that the jurisdiction has indicated as meeting all the elements of their compliance and enforcement procedures. This will require the verification auditor to eliminate establishment files that are marked "NO" on the jurisdiction's Self-Assessment Summary Worksheet. (An "X" placed in the "NO" box indicates that the self-assessment review process determined that the inspection history documented in the establishment file did not meet, or only partially met, the Standard 6 criteria and all the elements in the jurisdiction's written compliance and enforcement procedures.)

In instances where the verification auditor has randomly selected an establishment file from the jurisdiction's *Standard 6: Self-Assessment Summary Worksheet* that did not qualify (D.N.Q.) for the self-assessment review process, the substitute establishment that the jurisdiction selected for that disqualified establishment should be used.

Note: There are two types of substitutes for the audit process, which are treated differently:

1. If the auditor selects an establishment that was previously failed by the self-assessor, then use the auditor-generated substitute list of random numbers to select a substitute establishment.
2. If the auditor selects an establishment that "did not qualify" for the original self-assessment, then use the substituted establishment that was already assigned in the original self- assessment review.

Part III - Verify Self-Assessment findings for each selected establishment file

Using the jurisdiction's written compliance and enforcement procedures, the verification auditor will review the Establishment File Worksheet for each of the establishments randomly selected for the verification audit.

The *Standard 6: Establishment File Worksheet* provides a systematic way of documenting the compliance and enforcement history for each of the randomly selected establishments. Jurisdictions do not have to use this form but must provide documentation of the review process conducted to determine whether the appropriate compliance and enforcement actions for out-of-control risk factors and *Food Code* interventions were taken for each selected establishment.

Review the inspection history in each selected file beginning with the identified "start-point" inspection and moving forward through two additional inspections. Verify that either on-site corrective action, follow-up corrective action or enforcement action occurred by the end of the third inspection for each out-of-compliance risk factor or intervention marked on the start point inspections. In addition, verify that the actions taken on each violation documented on the "start-point" inspection followed the jurisdiction's written compliance policy and procedures.

In order for an establishment file to meet the Standard 6 criteria, each column marked with a violation at the "start-point" inspection must have a subsequent indication that at least one type of follow-up action was taken, and the jurisdiction's written procedures must have been followed. A single violation on the "start-point" inspection without a final resolution, either correction or compliance/enforcement activity, will result in a determination that the establishment file does not meet the Standard 6 criteria. In any instances where the auditor disagrees with the jurisdiction's self-assessment of a file, the auditor must meet with the jurisdiction's program manager or representative to gain a full understanding of the rationale used for the self-assessment determination.

The verification auditor will record his or her findings for each of the establishment files reviewed on the *Standard 6: Verification Audit Worksheet*. If the verification audit of the establishment file review indicates that the full intent of the Standard 6 criteria is met, place an "X" in the "YES" box. If full intent of the Standard 6 criteria is not met, place an "X" in the "NO" box. If the verification auditor disagrees with the jurisdiction's self-assessment decision, an explanation must be provided in the last column of the *Standard 6: Verification Audit Worksheet*. Additional sheets can be used to document the need for expanded explanations.

Part IV - Verify that 80% of selected establishment files adhere to the jurisdiction's written compliance and enforcement procedures

The criteria for Standard 6 requires that 80 percent of the files with an identified violation of a foodborne illness risk factor or a *Food Code* intervention on the "start-point" inspection adhere to the jurisdiction's written compliance and enforcement procedures. Files that "did not qualify" (D.N.Q.) for the self-assessment review are not used in the calculation of the percentage.

Legitimate differences of opinion regarding stringency of language may occur during the verification audit process. An approximate ten percent (10%) discrepancy allowance is made to accommodate potential differences in interpretations.

Jurisdictions with less than 800 Establishments - If two or more of the five audited establishment files rated as passing by the jurisdiction are not verified by the auditor as having met the Standard 6 criteria, the Part III element fails to meet the criteria, and no further sampling is necessary. Even if no additional disagreements are found by sampling an additional set of randomly drawn establishment files, the dilution of agreements to disagreements will be insufficient to meet the approximate ten percent (10%) disagreement allowance.

Determine the need for supplemental sampling. If only one establishment file from the initial sample is determined by auditor to have not met the Standard 6 criteria, then randomly select an additional 5 establishment files. Follow the same audit process used to review the first set of establishment files. The *Standard 6: Verification Audit Worksheet* for substitute establishment files, provided on a following page, can be used to record all the information related to the supplemental sampling of establishment files.

If no additional disagreements in the review of establishment files are noted, then the jurisdiction meets the Standard 6 criteria. If one or more additional establishment files fails the audit review, then the Standard 6 criteria are not met, since the dilution of agreements to disagreements will be insufficient to meet the approximate ten percent (10%) disagreement allowance.

Jurisdictions with more than 800 Establishments - If three or more of the ten audited establishment files rated as passing by the jurisdiction are not verified by the auditor as having met the Standard 6 criteria, then the jurisdiction fails to meet Standard 6. Even if no additional disagreements are found by sampling an additional set of randomly drawn establishment files, the dilution of agreements to disagreements will be insufficient to meet the approximate ten percent (10%) disagreement allowance.

Determine the need for supplemental sampling. If one or two establishment files from the initial sample are determined by auditor to have not met the Standard 6 criteria, then randomly select an additional 10 establishment files. Follow the same audit process used to review the first set of establishment files. The *Standard 6: Verification Audit Worksheet* for substitute establishment files, provided on a following page, can be used to record all the information related to the supplemental sampling of establishment files.

No more than a total of two of 20 establishment files drawn can be determined by the auditor as not meeting the Standard 6 criteria. If more than two establishment files fail the audit review, then the Standard 6 criteria are not met, since the dilution of agreements to disagreements will be insufficient to meet the approximate ten percent (10%) disagreement allowance.

STANDARD 5
FOODBORNE ILLNESS AND FOOD DEFENSE PREPAREDNESS AND RESPONSE

This standard applies to the surveillance, investigation, response, and subsequent review of alleged food-related incidents and emergencies, either unintentional or deliberate, which results in illness, injury, and outbreaks.

Requirement Summary

The program has an established system to detect, collect, investigate, and respond to complaints and emergencies that involve foodborne illness, injury, and intentional and unintentional food contamination.

Description of Requirement

1. Investigative Procedures

a. The program has written operating procedures for responding to and /or conducting investigations of foodborne illness and food-related injury*. The procedures clearly identify the roles, duties, and responsibilities of program staff and how the program interacts with other relevant departments and agencies. The procedures may be contained in a single source document or in multiple documents.

b. The program maintains contact lists for individuals, departments, and agencies that may be involved in the investigation of foodborne illness, food-related injury* or contamination of food.

c. The program maintains a written operating procedure or a Memorandum of Understanding (MOU) with the appropriate epidemiological investigation program/department to conduct foodborne illness investigations and to report findings. The operating procedure or MOU clearly identifies the roles, duties, and responsibilities of each party.

d. The program maintains logs or databases for all complaints or referral reports from other sources alleging food-related illness, food-related injury* or intentional food contamination. The final disposition for each complaint is recorded in the log or database and is filed in or linked to the establishment record for retrieval purposes.

e. Program procedures describe the disposition, action or follow-up and reporting required for each type of complaint or referral report.

f. Program procedures require disposition, action or follow-up on each complaint or referral report alleging food-related illness or injury within 24 hours.

g. The program has established procedures and guidance for collecting information on the suspect food's preparation, storage or handling during on-site investigations of food-related illness, food-related injury*, or outbreak investigations.

h. Program procedures provide guidance for immediate notification of appropriate law enforcement agencies if at any time intentional food contamination is suspected.

i. Program procedures provide guidance for the notification of appropriate state and/or federal agencies when a complaint involves a product that originated outside the agency's jurisdiction or has been shipped interstate.

2. Reporting Procedures

a. Possible contributing factors to the food-related illness, food-related injury* or intentional food contamination are identified in each on-site investigation report.

b. The program shares final reports of investigations with the state epidemiologist and reports of confirmed foodborne disease outbreaks* with CDC.

3. Laboratory Support Documentation

a. The program has a letter of understanding, written procedures, contract, or MOU acknowledging, that a laboratory(s) is willing and able to provide analytical support to the jurisdiction's food program. The documentation describes the type of biological, chemical, radiological contaminants or other food adulterants that can be identified by the laboratory. The laboratory support available includes the ability to conduct environmental sample analysis, food sample analysis and clinical sample analysis.

b. The program maintains a list of alternative laboratory contacts from which assistance could be sought in the event that a food-related emergency exceeds the capability of the primary support lab(s) listed in paragraph 3.a. This list should also identify potential sources of laboratory support such as FDA, USDA, CDC, or environmental laboratories for specific analysis that cannot be performed by the jurisdiction's primary laboratory(s).

4. Trace-back Procedures

a. Program management has an established procedure to address the trace-back of foods implicated in an illness, outbreak, or intentional food contamination. The trace-back procedure provides for the coordinated involvement of all appropriate agencies and identifies a coordinator to guide the investigation. Trace-back reports are shared with all agencies involved and with CDC.

5. Recalls

a. Program management has an established procedure to address the recall of foods implicated in an illness, outbreak, or intentional food contamination.

b. When the jurisdiction has the responsibility to request or monitor a product recall, written procedures equivalent to 21 CFR, Part 7 are followed.

c. Written policies and procedures exist for verifying the effectiveness of recall actions by firms (effectiveness checks) when requested by another agency.

6. Media Management

a. The program has a written policy or procedure that defines a protocol for providing information to the public regarding a foodborne illness outbreak or food safety emergency. The policy/procedure should address coordination and cooperation with other agencies involved in the investigation. A media person is designated in the protocol.

7. Data Review and Analysis

a. At least once per year, the program conducts a review of the data in the complaint log or database and the foodborne illness and food-related injury* investigations to identify trends and possible contributing factors that are most likely to cause foodborne illness or food-related injury*. These periodic reviews of foodborne illnesses may suggest a need for further investigations and may suggest steps for illness prevention.

b. The review is conducted with prevention in mind and focuses on, but is not limited to, the following:

1) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* in a single establishment;
2) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Disease Outbreaks* in the same establishment type;
3) Foodborne Disease Outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* implicating the same food;
4) Foodborne Disease outbreaks*, Suspect Foodborne Outbreaks* and Confirmed Foodborne Disease Outbreaks* associated with similar food preparation processes;
5) Number of confirmed foodborne disease outbreaks*;
6) Number of foodborne disease outbreaks* and suspect foodborne disease outbreaks*;
7) Contributing factors most often identified;
8) Number of complaints involving real and alleged threats of intentional food contamination; and
9) Number of complaints involving the same agent and any complaints involving unusual agents when agents are identified.

c. In the event that there have been no food-related illness or food-related injury* outbreak investigations conducted during the twelve months prior to the data review and analysis, program management will plan and conduct a mock foodborne illness investigation to test program readiness. The mock investigation should simulate response to an actual confirmed foodborne disease outbreak* and include on-site inspection, sample collection and analysis. A mock investigation must be completed at least once per year when no foodborne disease outbreak* investigations occur.

Note: *Regulatory Programs are encouraged to also participate in the CDC National Environmental Assessment Reporting System (NEARS). NEARS is designed to provide a more*

comprehensive approach to foodborne disease outbreak investigation and response and will provide a data source to measure the impact of food safety programs to further research and understand foodborne illness causes and prevention. (The following link provides additional information regarding NEARS: http://www.cdc.gov/nceh/ehs/nears/index.htm)

Outcome

A food regulatory program has a systematic approach for the detection, investigation, response, documentation, and analysis of alleged food-related incidents that involve illness, injury, unintentional or deliberate food contamination.

Documentation

The quality records required to meet this standard include:

1. Logs or databases of alleged food-related illness and food-related injury* complaints maintained and current.
2. Collection forms specified in the operating procedures.
3. Investigation reports of alleged food-related illness, food-related injury*, or incidents. Reports are retrievable by implicated establishment name.
4. The written procedures, contracts, or MOUs with the supporting laboratories.
5. The procedure addressing the trace-back of food products implicated in an illness, outbreak, or contamination event.
6. 21 CFR, Part 7, or written procedures equivalent to 21 CFR, Part 7 for recalls.
7. Completed copies of the annual review and analysis (after 12 months of data).
8. Current written media policy/procedure and contact person.
9. The contact list for communicating with all relevant agencies.
10. Portions of any emergency response relevant to food safety and security.

*[*Note: See the Standards Definitions for the meaning of these defined terms.]*

Voluntary National Retail Food Regulatory Program Standards

DEFINITIONS

The following definitions apply in the interpretation and application of these Standards.

1) **Active Managerial Control** – The purposeful incorporation of specific actions or procedures by industry management into the operation of a business to attain control over foodborne illness risk factors.
2) **Auditor** – Any authorized city, county, district, state, federal, tribal, or other third-party person who has no responsibilities for the day-to-day operations of that jurisdiction and is charged with conducting a verification audit, which confirms the accuracy of the self-assessment.
3) **Baseline Survey** – See Risk Factor Study.
4) **Candidate** - A regulatory officer whose duties include the inspection of retail food establishments.
5) **Compliance and Enforcement** – Compliance includes all voluntary or involuntary conformity with provisions set forth by the regulatory authority to safeguard public health and ensure that food is safe. Enforcement includes any legal and/or administrative procedures taken by the regulatory authority to gain compliance.
6) **Confirmed Foodborne Disease Outbreak** – means a foodborne disease outbreak in which laboratory analysis of appropriate specimens identifies a causative agent and epidemiologic analysis implicates the food as the source of the illness or epidemiological analysis alone implicates the food as the source of the illness.
7) **Direct Regulatory Authority (DRA) –** The organizational level of government that is immediately responsible for the management of the retail program. This may be at the city, county, district, state, federal, territorial, or tribal level.
8) **Enforcement Actions –** Actions taken by the regulatory authority such as, but not limited to, warning letters, revocation or suspension of permit, court actions, monetary fines, hold orders, destruction of food, etc., to correct a violation found during an inspection.
9) **Follow-up Inspection –** An inspection conducted after the initial routine inspection to confirm the correction of a violation(s).
10) **Food Code Interventions** – the preventive measures to protect consumer health stated below:
    1. management's demonstration of knowledge;
    2. employee health controls;
    3. controlling hands as a vehicle of contamination;
    4. time / temperature parameters for controlling pathogens; and
    5. consumer advisory.
11) **Food-Related Injury** – Means an injury from ingesting food containing a physical hazard such as bone, glass, or wood.
12) **Foodborne Disease Outbreak** – The occurrence of two or more cases of a similar illness resulting from the ingestion of a common food.
13) **Good Retail Practices (GRP's)** – Preventive measures that include practices and procedures to effectively control the introduction of pathogens, chemicals, and physical objects into food, that are prerequisites to instituting a HACCP or Risk Control Plan and are not addressed by the *FDA Food Code* interventions or risk factors.
14) **Hazard** – A biological, chemical, or physical property that may cause food to be unsafe for human consumption.

15) **National Registry of Retail Food Protection Programs (National Registry) – A** listing of retail food safety programs that have voluntarily enrolled as participants in the *Voluntary National Retail Food Regulatory Program Standards*.
16) **Person in charge (PIC)** – The individual present at a food establishment who is responsible for the operation at the time of inspection.
17) **Program Element –** One of the program areas for which a National Standard has been established such as regulations, training, inspection system, quality assurance, foodborne illness investigation, compliance and enforcement, industry and consumer relations, and program resources.
18) **Program Manager** – The individual responsible for the oversight and management of a retail food regulatory program.
19) **Quality Records –** Documentation of specific elements of program compliance with the National Standards as specified in each Standard.
20) **Risk Control Plan (RCP)** – a concisely written management plan developed by the retail or food service operator with input from the health inspector that describes a management system for controlling specific out-of-control risk factors.
21) **Risk Factors** – the improper employee behaviors or improper practices or procedures in retail food and food service establishments stated below which are most frequently identified by epidemiological investigation as contributing to foodborne illness or injury:
    1. improper holding temperature;
    2. inadequate cooking;
    3. contaminated equipment;
    4. food from unsafe source; and
    5. poor personal hygiene.
22) **Risk Factor Study** (formerly Baseline Survey) – A study on the occurrence of foodborne illness risk factors within institutional, foodservice, restaurants, and retail food facility types under a jurisdiction's regulatory authority. Criteria for a Risk Factor Study are detailed in Standard 9, including at a minimum:
    1. Data Collection, analysis, and a written report;
    2. A collection instrument with data items pertaining to the five foodborne illness risk factors;
    3. A collection instrument that uses the convention of IN, OUT, NA and NO to document observations;
    4. All facility types identified by FDA's national study that are under the jurisdiction's regulatory authority; and
    5. Studies subsequent to the initial study repeated at 5-year intervals.
23) **Routine Inspection – A** full review and evaluation of a food establishment's operations and facilities to assess its compliance with Food Safety Law, at a planned frequency determined by the regulatory authority. This does not include re-inspections and other follow-up or special investigations.
24) **Self-Assessment** – An internal review by program management to determine whether the existing retail food safety program meets the *Voluntary National Retail Food Regulatory Program Standards*.
25) **Self-Assessment Update** – Comparison of one or more program elements against the *Voluntary National Retail Food Regulatory Program Standards* between the required 60-month periodic self-assessment.

26) **Standardization Inspection** – An inspection used to demonstrate a candidate's knowledge, communication skills, and ability to identify violations of all regulatory requirements and to develop a risk control plan for identified, uncontrolled risk factors.
27) **Suspect Foodborne Outbreak** – Means an incident in which two or more persons experience a similar illness after ingestion of a common food or eating at a common food establishment/gathering.
28) **Trainer** – An individual who has successfully completed the following training elements as outlined in Steps 1 – 3, Standard 2, and is recognized by the program manager as having the field experience and communication skills necessary to train new employees.
    1. Satisfactory completion of the prerequisite curriculum;
    2. Completion of a field training process similar to that contained in Appendix B-2; and
    3. Completion of a minimum of 25 independent inspections and satisfactory completion of the remaining course curriculum.
29) **Training Standard** – An individual who has successfully completed the following training elements AND standardization elements in Standard 2 and is recognized by the program manager as having the field experience and communication skills necessary to train new employees. The training and standardization elements include:
    1. Satisfactory completion of the prerequisite curriculum;
    2. Completion of a field training process similar to that contained in Appendix B-2;
    3. Completion of a minimum of 25 independent inspections and satisfactory completion of the remaining course curriculum;
    4. Successful completion of a standardization process based on a minimum of eight inspections that includes development of HACCP flow charts, completion of a risk control plan, and verification of a HACCP plan, similar to the FDA standardization procedures;
    5. Completion of a minimum of 20 contact hours of continuing education in food safety every 36 months after the initial training is completed as outlined in Standard 2; and
    6. Standardization maintained every three (3) years as outlined in Standard 2.
30) **Verification Audit** – A systematic, independent examination by an external party to confirm the accuracy of the Self-Assessment.

STANDARD 8 PROGRAM SUPPORT AND RESOURCES

This standard applies to the program resources (budget, staff, equipment, etc.) necessary to support an inspection and surveillance system that is designed to reduce risk factors and other factors known to contribute to foodborne illness.

Requirement Summary

The program provides funding, staff, and equipment necessary to accomplish compliance with the Voluntary National Retail Food Regulatory Program Standards.

Description of Requirement

The program budget provides the necessary resources to develop and maintain a retail food safety program that meets the following criteria:

1. Staffing Level

Note: Jurisdictions can achieve conformance using one of two methods. Both methods can be accessed for downloading from the Conference for Food Protection (CFP) web site: www.foodprotect.org and located under the icon titled, "Conference Developed Guides and Documents."

Option 1: Standard 8 Staffing Level Assessment

A staffing level of one full-time equivalent (FTE) devoted to food for every 280 – 320 inspections performed. Inspections for purposes of this calculation include routine inspections, re- inspections, complaint investigations, outbreak investigations, compliance follow-up inspections, risk assessment reviews, process reviews, variance process reviews and other direct establishment contact time such as on-site training.

A process should exist for the regulated food establishments to be grouped into at least three categories based on food safety risk (See Standard 3). The number of inspections assigned per FTE should be adjusted within the 280 – 320 range depending upon the composition of low- to high –risk establishments in the assigned inventory. When an FTE is divided between program areas, the total number of food inspections planned for that FTE should be adjusted to compensate for the additional training time required to maintain competency in multiple program areas. An adjustment of planned inspections per FTE should also occur when food establishments are geographically dispersed due to increased travel time. Through their committee process, the CFP has developed an assessment tool and instruction guide as resources that can be used by a jurisdiction to calculate the FTE to inspection ratio.

Option 2: Standard 8 Staffing Level Alternative Conformance Method

Jurisdictions may access an alternative model for achieving conformance with Standard 8 from the Conference for Food Protection (CFP) web site: www.foodprotect.org and located under the icon titled, "Conference Developed Guides and Documents."

2. Inspection Equipment

Inspection equipment of each inspector to include head covers, thermocouples, flashlights, sanitization test kits, heat sensitive tapes or maximum registering thermometers, necessary forms, and administrative materials. The following equipment must be available for use by inspectors when needed: computers, cameras, black lights, light meters, pH meters, foodborne illness investigation kits, sample collection kits, data loggers and cell phones.

3. Administrative Program Support

Equipment for administrative staff to include computers, software and/or items necessary to support the record keeping system utilized by the program. A system is in place to collect, analyze, retain, and report pertinent information.

4. Regulatory Foundation

Staff and resources to adopt a sound, science-based regulatory foundation for the public health program and the uniform regulation of industry required in Standard No. 1.

5. Trained Regulatory Staff

Training and training documentation for all regulatory staff to meet the level specified in Standard No. 2.

6. Inspection Program Based on HACCP Principles

Staff to meet all of the requirements in Standard No. 3, inspection based on HACCP principles.

7. Uniform Inspection Program

Administrative and supervisory staff to administer and monitor a uniform inspection program based on HACCP principles that meet Standards No. 3 and 4.

8. Foodborne Illness & Food Defense Preparedness & Response

Staff and resources to maintain a foodborne illness investigation and response system that meets Standard No. 5.

9. Compliance & Enforcement

A program that demonstrates follow-though on all compliance and enforcement actions initiated according to the written step-by-step procedures required in Standard No. 6.

10. Industry & Community Relations

An industry and consumer relations program as specified in Standard No. 7.

11. Program Assessment

Sufficient staff and resources to conduct regular program self-assessment and risk factor surveys as specified in Standard No. 9.

12. Accredited Laboratory

Funds to provide access to accredited laboratory resources in support of the program as specified under these nine Standards.

The essential program elements required to demonstrate compliance with this standard are:

A. Full-time equivalent (FTE) personnel to inspections accomplished ratio as described in section 1.
B. Inspection equipment assigned or available as described in section 2.
C. Equipment and/or supplies required for administering the program as described in Section 3.
D. A full and accurate completion of the *Standard 8: Self-Assessment Worksheet* or equivalent whether or not those standards are met.

Outcome

The desired outcome of this standard is that resources are available to support a risk-based retail food safety program designed to reduce the risk factors known to contribute to foodborne illness.

Documentation

The quality records needed for this standard include:

1. Documentation of FTE to inspections ratio,
2. Inventory of assigned and available inspection equipment,
3. Documentation and demonstration of records system and adequacy of support,
4. The completed Standard 8 Self-Assessment Worksheet

*[*NOTE: An average workload figure of 150 establishments per FTE with two inspections per year was originally recommended in the 1976 Food Service Sanitation Manual, the standard originating from a book entitled, "Administration of Community Health Services." Annex 4 of the Code since 1993 has included a recommendation that 8 to 10 hours be allocated for each establishment per year to include all the activities reflected here in the definition of an inspection. The range of 280 – 320 broadly defined inspections per FTE is consistent with these previous recommendations. A measure of resources defined as inspections per FTE rather than establishments per FTE allows for the same unit of measure to be used for any jurisdiction regardless of the frequency of routine inspections conducted among the various priority categories.]*

Standard 8 Staffing Level

Purpose of Standard 8 staffing level section:

Standard 8 Section 1. Staffing Level requires a health department (HD) to demonstrate that they have the staff "necessary to support an inspection and surveillance system that is designed to reduce risk factors and other factors know to contribute to foodborne illness"

Current criteria to pass Standard 8:

A HD currently meets this standard if they demonstrate an inspection to FTE ratio range of 280-320 inspections per FTE. The Conference for Food Protection (CFP) developed an assessment tool and instruction guide that can be used by a HD if desired. If not the HD has to calculate their inspection to FTE ratio through their own method and see if it falls within the required range.

Problem with inspection to FTE ratio range:

It has been agreed by upon by subcommittee that this range is problematic as it's based on the idea that every inspection should take 4 hours. The subcommittee has also agreed that a range is problematic as it allows for an adequately staffed health department to fail the standard as they could fall below the range.

Recommendations:

We are recommending removing the range and allowing HDs to demonstrate to independent auditors that they are adequately staffed in a more appropriate way. The following are the 3 options we think are reasonable that a HD can use to demonstrate staffing levels.

1. A HD can use their own method they feel is appropriate for them to demonstrate adequate staffing levels

2. A HD can use the current assessment tool (with inspection to FTE section removed) developed by CFP to assess if they're adequately staffed

3. A health department can use the updated CFP assessment tool that calculates staffing levels by risk category
    a. Using the updated vs. current assessment tool may make it easier for a HD to prove to their auditor that they are adequately staffed because:
        i. It has a section that calculates how many FTEs a HD *should* have based on risk categories (current assessment does not do this)
        ii. It then automatically compares how many FTEs a health department *currently* has with how many they *should* have (the current assessment only calculates *current* FTE, so it may be challenging to convince an auditor that a current calculated FTE # demonstrates a HD to be adequately staffed)

Updated CFP Assessment Tool

The following is an example of how to use the updated assessment tool to calculate if a health department is adequately staffed.

Discussion on Table 1. The risk category column is broken into three categories, the minimum required by Standard 8. The number of establishments will be unique to each health department. The rows in the remaining columns show values that are based off of survey data of 100 local and state health departments throughout the country (see footnotes for more details). A HD should feel free to use these values or input ones that more appropriately fit their organization.

Table 1.

Risk Category	Number of Establishments	Inspection Frequency[1]	Average Inspection Time (does not include travel)[2]	Reinspection frequency[3]	FBI Inspection Frequency[4]	Other Frequency[5]
Low	1,000	1	45 minutes	15%	1%	10%
Medium	2,000	2	75 minutes	15%	1%	10%
High	1,000	3	120 minutes	15%	1%	10%

Step 1. Calculate available annual inspection time per full time equivalent (FTE) using assessment tool. 1200 hours a year will be used for this example.

Step 2. Calculate number of FTE currently available at health department. This # is calculated in the current and updated assessment tools.

Step 3. Calculate total number of hours required to inspect each risk category. Formula for calculating # of inspection hours per risk type below (low risk type used for example):

(1000 establishments x 1 inspection a year = 1000 inspections) + (1000 establishments x 15 % reinspections a year = 150 inspections) + (1000 establishments x 1% FBI inspections a year = 10 inspections) + (1000 inspections x 10% other inspections a year = 100 inspections) = 1260 inspections a year x 45 minutes an inspection = 945 hours a year

Medium risk = 4520 inspections a year x 75 minutes = 5650 hours

High Risk = 3260 inspections a year x 120 minutes =6520 hours

Total inspection time = 945 + 5650 + 6520 = 13,115 inspection hours a year

Step 4. Calculate number of FTE's required

13,115 total inspection time hours /1200 inspection hours available per FTE = 10.93 FTEs

Step 5. Calculate if health department is adequately staffed

If FTEs currently available >= 10.93 FTEs that a HD should have then that HD is adequately staffed

---

[1] Median inspection frequencies of 100 health departments from 2017 survey
[2] Median inspection times of 100 health departments from 2017 survey
[3] Median reinspection frequency %s of 60 health departments form 2017 survey2
[4] Median food borne illness inspection frequency %s of 60 health departments from 2017 survey2
[5] Final % value still being calculated, 10% being used for this demonstration

Appendix 8.2 Calculation for determining a required number of inspectors

This appendix is an example of how to calculate the number of field staff required to conduct inspections[21] of food plants. The data in the following table will vary significantly based on local or regional conditions. The State program may use the risk categories and inspection frequencies found in the statement of work for the food contract as a basis for determining the required number of inspectors.

Risk category	Number in inventory	Inspection frequency	Average inspection time (includes travel) [22]	Reinspection frequency
High	1,000	12 months	7.2 hours	10%
Medium	2,000	18 months	5.7 hours	10%
Low	1,000	24 months	4.2 hours	10%

1. Calculate available annual inspection time per full time equivalent (FTE).

For example, the State agency determines that after allowances for annual leave, sick leave, holidays, training, administrative time, and other activities each State program FTE has 1200 hours available for conducting inspections.

2. Calculate the number of hours required to inspect establishments in each risk category.

Formula for high risk establishment inspection time:
1000 firms x 100% coverage = 1000 inspections + 10% reinspection = 1100 total inspections per year x 7.2 hours = 7920 hours

Formula for medium risk establishment inspection time:
2000 firms x 66.6% coverage = 1333 inspections + 10% reinspection = 1466 total inspections per year x 5.7 hours = 8356 hours

Formula for low risk establishment inspection time:
1000 firms x 50% coverage = 500 inspections + 10% reinspection = 550 inspection total inspections x 4.2 hours = 2320 hours

3. Calculate the number of FTE's required.

Formula:
7920 hours for high risk + 8356 hours for medium risk + 2320 hours for low risk = 18596 inspection hours required / 1200 inspection hours available per FTE = **15.5 FTEs**

[19] Includes routine surveillance, reinspections, complaint or outbreak investigations, compliance follow-up investigations, risk assessment reviews, process reviews, and other direct establishment contact time such as on-site training.

[20] Inspection times based on calculations presented in "DHHS Office of Inspector General's FDA Oversight of State Food Firm Inspections" dated June 2000.

IFSS Curriculum Framework

Intended Audience: U.S. government human and animal food protection employees who conduct regulatory activities.

Basic Level	Human and animal food protection professionals who are newly hired in a local, state or federal feed/food protection program. These individuals have developed their investigational and communications knowledge and skills through formal education, training courses, and on-the-job-training activities, often working with more experienced inspectors.
Allergens	An overview of food allergens, including labeling requirements, preventive controls, and societal impact
Biological Hazards	Introductory knowledge, skills, and abilities related to biological hazards, focusing on sources of contamination, growth factors, and control methods.
Biosecurity	Introductory knowledge, skills, and abilities related to controlling disease transmission between people, animals and plants.
Communication Skills	Skills required for an effective communicator in the regulatory field.
Data & Information Systems	Introductory knowledge, skills, and abilities related to systems used by regulatory agencies to store, process, and manage data and information.
Emergency Response	Foundational knowledge related to reacting to emergency public health situations.

Environmental Hazards	Introductory knowledge, skills, and abilities related to environmental hazards focusing on sources of contamination and associated control methods.
Food/Feed Defense	Introductory knowledge, skills, and abilities related to the reduction of intentional contamination of the feed or food supply.
HACCP	Introductory knowledge, skills, and abilities related to the hazard analysis and critical control points (HACCP) system.
IFSS	Introductory knowledge, skills, and abilities related to the regulation of feed and food products grown, produced, or manufactured outsie of or returned to the U.S.
Imports	Introductory knowledge, skills, and abilities related to the concept of a national collaborative and cooperative network of federal, state, local, tribal, and territorial feed and food protection agencies working in concert to protect the U.S. feed and food supply.
Inspections, Compliance, and Enforcement	Introductory knowledge, skills, and abilities related to ensuring regulatory compliance through inspection and enforceent activities.
Investigations	Introductory knowledge, skills, and abilities related to conducting an investigation of a feed or food safety-related event.
Jurisdiction	Introductory knowledge, skills, and abilities related to various regulatory agencies and their authority over feed and food.
Labeling	Introductory knowledge, skills, and abilities related to labeling requirements, and the components of feed and food product labels.

Laws & Regulations	Inroductory knowledge, skills, and abilities related to the system of federal, state, and local laws that provide the authority to regulate feed and food, and associated policies and procedures.
Personal Safety	Introductory knowledge, skills, and abilities related to hazards encountered by regulators, and appropriate protective actions to mitigate hazards.
Pest control	The management of pests that can be perceived to be detrimental to the production of safe human food and food for animals.
Plumbing	Knowledge, skills, and abilities related to the deliver, distribution or storage of potable and non-potable water in a manufacturing food facility and retail food establishment.
Preventive Controls	Introductory knowledge, skills, and abilities related to measures implemented by feed and food manufacturing facilities to ensure feed and food safety.
Professionalism	Introductory knowledge, skills, and abilities related to ethics, integrity, and personal conduct during job-related activities.
Public Health Principles	Introductory knowledge, skills, and abilities related to how regulatory agencies promote health and prevent and control feed and food-related illness.
Recalls	Introductory knowledge, skills, and abilities related to the process of removing a product from commerce.
Regulatory Program Foundations	Introductory knowledge, skills, and abilities related to the elements of feed and food regulatory programs

Sampling	Introductory knowledge, skills, and abilities related to feed and food sample collection, and the role of the laboratory.
Sanitation Practices	Introductory knowledge, skills, and abilities related to cleaning, sanitizing, and disinfecting, and the importance of facility and euqipment sanitary design.
Traceability	Introductory knowledge, skills, and abilities related to tracking feed and food throughout the supply chain.
Transportation	Introductory knowledge, skills, and abilities realted to preventing contamination of feed and food during transport.
Dairy On-farm	Regulatory activities related to dairy on-farm operations.
Eggs	Regulator activities related to egg operations.
Produce	
Sprouts	
Shellfish Growing Areas	
Communication Skills	Knowledge, skill, and abilities to follow policies that guide communication practices across all commodities.
Emergency Response	Knowledge, skills, and abilities to prepare for, execute, and recover from events that affect public health.
Facility Design	Knowledge related to the design and construction of a faciity.
Food Processes	Knowledge of how food is porcessed.
Inspections, Compliance, and Enforcement	Knowledge, skills, and abilities to evaluate food safety.
Investigations	Knowledge, skills, and abilities to participate in an investigation.
Plumbing	Knowledge, skills, and abilities related to reviewing the water and wastewater systems.

Pest Control	Knowledge, skills and abilities realted to assessing pest management systems.
Recall/Traceability	Knowledge, skills, and abilities needed to trace product and remove products from commerce.
Sampling	Knowledge, skills, and abilities realted to sampling.
cGMP Inspections	Knowledge, skills, and abilities related to ensuring regulatory compliance through inspection.
Food Processing Technology	Knowledge, skills, and abilities related to the evaluation of food processes.
Laws, Regulations, and Guidance	Knowledge and application of regulations and guidance related to manufactured food.
Preventive Controls Inspections	Knowledge, skills, and abilities related to conducting a preventive controls inspection.
Juice HACCP	Control strategies and practices associated with juice products.
Seafood HACCP	Control strategies and practices associated with fish and fishery products.
Grade A Dairy Processing	Regulatory activities realted to milk plant operations.
Non-Grade A Dairy Processing	
Dietary Supplements	
Shellfish Plant	
Regulatory Foundations for Retail Food Safety	The public health rationale and science behind the guidance incorporated into the FDA Food Code that can be used by federal, state, local, tribal, and territorial agencies to regulate retail food operations.

Risk-based Inspections	An inspectional approach to assess the occurrence and daily control of foodborne illness risk factors. The methodology provides a structure for prioritizing time based on risk; evaluating code compliance and active managerial control; obtaining immediate, science-based corrective actions for out-of-control risk factors; and implementing intervention strategies for long-term compliance.
Non-traditional Food Operations	Food operations not fitting the model of a typical brick and mortar restaurant or supermarket.
Introduction to Specialized Food Processing Methods	Introduction to food processes at retail.
Animal Food & Ingredients	Product used in the production of animal food.
Animal Food Safety Plans and Preventive Controls	Regulatory requirements to mitigate hazards in animal food
Animal Nutrition	Basic knowledge of animal nutrition.
Animal Species and Classes	The different species, classes, and life stages of livestock, poultry, and pets.
BSE Inspections	Conducting Bovine Spongiform Encephalopathy inspections.
Current Good Manufacturing Practices	Regulatory requirements for producing safe feed.
Feed Mill Overview	Introductory knowledge related to feed mills.
Labeling	Required components of product labeling for animal food.
Laws and Regulations	Regulatory authority related to animal food.
Medicated Feed Overview	An introduction to feed that contains medication.
Sampling	Agency-approved procedures to collect, prepare, and transport animal food samples.

Advanced	Human and animal food protection professionals who are able to independently perform sanitary inspections at a variety of facilities in addition to performing more complex investigations than inspectors at the basic level. These professionals would normally comprise the bulk of the feed/food inspection workforce and perform most of the core feed/food protection activities for their program.
Communication Skills	Adapting content, style, tone, and medium of communication in order to convey feed/food safety-related information to a variety of stakeholders.
Emergency Response	Minimizing the impact of an adverse event related to feed/food safety, public health or animal health.
Enforcement	Regulatory actions taken to address non-compliance
Evidence	Legally defensible items and information used to support regulatory actions.
Food/Feed Defense	Assessing systems for the potential of intentional adulteration, determining if intentional adulteration has occurred and responding to intentional adulteration.
Imports	
IFSS	Advanced knowledge, skills, and abilities related to a collaborative and cooperative global feed/food safety network.
Inspections	Advanced knowledge, skills, and abilities to conduct integrated, multi-faceted inspections in a flexible manner.
Instructor Skills	

Investigative Techniques	Advanced knowledge, skills, and abilities related to conducting an investigation.
Leadership Skills	
Laboratories	Knowledge of the interface between laboratory and regulatory activities.
Outbreak Investigation	Using a systematic approach to identify the source of an outbreak and mitigate the impact on public health.
Product Disposition	Knowledge, skills, and abilities to address salvage, diversion, and disposal of feed/food.
Risk Analysis	Basic knowledge, skills, and abilities related to risk analysis in feed/food protection.
Sampling	Advanced knowledge, skills, and abilities related to feed/food sample collection.
Transportation	Advanced knowledge, skills, and abilities related to preventing contamination of feed and food during transport.
Dairy On-farm	Regulatory activities related to dairy-on farm operations.
Unprocessed Concentration	
Acidified	
LACF	
Aseptic	
Plan Review	A regulatory procedure intended to ensure that retail food facilities and proposed operational processes are properly designed and that sanitary practices are implemented in order to serve their intended purposes.
Special Processes	Knowledge, skills, and abilities related to the inspection of special food processes at retail as defined in the Food Code.
Animal Food & Ingredients	Products used in the production of animal feed, including complete feed, supplements, minerals, medication, and by-products.

Animal Food Safety Plans and Preventive Controls	Advanced resource for internal training and external education related to food safety plans and preventive controls.
Animal Nutrition	Advanced knowledge of animal nutrition, including complex rations, micro-ingredients, and uncommon feed ingredients.
Aseptic Sampling	Procedures to collect non-routine feed samples.
Complaints	Feed related issues reported by consumers and/or industry.
Compliance and Enforcement Actions	Activities to achieve compliance with relevant laws and regulations.
Labeling	
Medicated Feed Mill Overview	Inspections at FDA-licensed medicated feed manufacturing facilities.
Safety Issues	Hazards associated with production and distribution of feed.
Technical Specialist	Human and animal food protection professionals with knowledge in a specific technical area, and who may or may not have a great deal of field experience. These professionals are able to conduct complex, high risk inspections and investigations, coordinate or convene key stakeholders in process development/improvement activities and will be engaged in problem solving activities. These professionals are depended upon to provide assistance and advanced or specialized support to inspectors at the Basic and Advanced Levels.
Audit	
Communication Skills	
Critical Thinking	
Emergency Response	

Rood Defense Vulnerability Assessment	
IFSS	
Leadership Skills	
Legal Proceedings Preparation	
Management Skills	
Policy Development	
Professional Development Planning	
Program Evaluation	
Program Management	
Reference Materials	
Report Evaluation	
Risk Analysis	
Supervision Skills	
Researvh Design	
Statistical Analysis	
Dairy On-farm	
Unprocessed Concentration	
Manufactured Concentration	
FDA Retail Program Standards	
Special Processes	
Animal Food & Ingredients	Feed ingredient expertise to support agency personnel and industry.
Animal Food Safety Plans & Preventive Controls	Providing expertise to agency personnel and industry related to preventive controls.
Animal Nutrition	Animal nutrition expertise provided to agency personnel and industry.
Complex Feed Labeling	Expertise in all labeling issues to support agency personnel and industry.
Compliance & Enforcement Actions	Developing strategies to achieve compliance with relevant laws and regulatrions.
Investigation Management	Managing a multi-agency response during a large-scale feed incident.
Laboratory Services	Managing the coordination between laboratory services and feed regulatory programs.

Safety Issues	Expertise applied in response to complex food safety issues.
Leadership	Human and animal food protection professionals who design, improve, and prioritize program activities, and communicate these activities within the program and to external stakeholders. Human and animal food protection professionals at the Leadership Level are involved in strategic planning and policy making for their program, and often serve as mentors and role models for other feed/food protection professionals.
Advocacy	Providing information, conducting outreach and education, and justifying program resource needs to influence decisions within politiacl, economic, and social systems.
Communication Management	Crafting and controlling program messaging.
Communication Skills	
Compliance	Influencing industry to adhere to laws and regulations.
Emergency Response	
Human Resource Management	Overseeing the employee performance system to maximize efficiency based on program priorities, ensuring that the program meets its objectives, making decisions related to staffing, and addressing employee/employer concerns.
IFSS	Ensuring alignment with a shared feed and food safety vision.
Laws & Regulations	Managing the application and understanding the impact of legal authorities on program functions and activities.
Leadership Skills	

Legislative Affairs	Regulatory program interactions with the executive and lawmaking branches of government.
Mediation	Facilitating the process of finding solutions to disagreements, disputes, or conflicts.
Organizational Design	Creating and operationalizing organizational structures.
Program Resources	Planning and overseeing the personnel, physical, and financial assets necessary to carry out program activities.
Risk Management	Balancing program policies, strategies, and activities to address public health concerns.
Strategic Planning	The process of defining the mission, and assessing the current landscape, to determine the program's future direction.

PREFACE

The FOOD Establishment Plan Review Manual was developed to assist the REGULATORY AUTHORITY and architects, FOOD consultants and other interested professionals in the plan review process when proposing to build or remodel a FOOD ESTABLISHMENT. However, it does not establish regulatory requirements and the recommendations contained herein are not intended to supplant, or otherwise serve as, the rules and regulations applicable to FOOD ESTABLISHMENTs in a given Federal, State, local, or tribal jurisdiction.

- This Manual is intended as a training tool for individuals responsible for conducting plan reviews and can be used in Food and Drug Administration (FDA)-sponsored training courses on Plan Review.
- Is intended to be consistent with the recommendations of the FDA as contained in the FDA 2013 Food Code. The FDA Food Code contains requirements for safeguarding public health and ensuring FOOD is unadulterated and honestly presented when offered to the consumer. Terminology with respect to the word "shall" is based on the recommendations within the FDA Food Code.
- Was developed by the Conference for Food Protection's 2014-2016 Plan Review Committee to update the 2008 Plan Review for Food Establishments Document.

INTRODUCTION

The plan review process presents a unique opportunity to discuss and prepare a proper foundation that will enable a FOOD ESTABLISHMENT to be successful, remain in compliance over time, and protect public health. Quality plan review, process improvement and the dedication to providing excellent customer service are high priorities for this Manual. Plan review assists in providing greater uniformity, technical assistance, and is essential for customer success and avoiding future establishment problems. Poor design, repair, and maintenance will compromise the functionality of the PHYSICAL FACILITIES and its operations. Plan review is intended to ensure PHYSICAL FACILITIES and proposed operational processes are properly designed and sanitary practices implemented in order to serve their intended purposes.

The plan review process provides the REGULATORY AUTHORITY with the opportunity to complete an effective evaluation of a FOOD ESTABLISHMENT's ability to ensure the following:

- Minimum standards are met for the protection of environmental health and safety of the public.
- Prevention of environmental health related illness and promote public health.
- Minimum standards are met for the sanitary design, facility layout, operational and product flow, menus, construction, operation and maintenance of regulated establishments, PREMISES, and surroundings.
- Food Code violations are eliminated prior to construction or implementation.
- Conditions are corrected and prevented that may adversely affect persons utilizing regulated establishments.

- Technical assistance is provided to industry to establish organized and efficient operations.
- Meets consumer expectations for the safe operation of a permitted FOOD ESTABLISHMENT.

No establishment is to be constructed and no major alteration or addition is to be made until detailed plans and specifications for such construction, alteration or addition have been submitted to and APPROVED by the REGULATORY AUTHORITY.

The REGULATORY AUTHORITY may impose specific requirements and provisions in addition to the requirements contained in codes that are authorized by law that are necessary to protect against public health hazards or nuisances. The REGULATORY AUTHORITY shall document the conditions that necessitate the imposition of additional requirements and the underlying public health rationale.

The function of plan review, construction inspections, pre-operational inspections, and the permit approval process is to provide a comprehensive overview of proposed operations with an emphasis on contents of plans, EQUIPMENT specifications, architectural design, and operational procedures. The end goal of the plan review process is to prevent foodborne illness resulting from poor sanitary facility design and/or floor plans, and, where applicable, when the process is based on menu, FOOD preparation, and FOOD product flow.

DEFINITIONS

The following definitions as used in this document are intended to assist in the understanding of this manual.

Definitions found within the FDA Food Code have been identified in CAPS within this document. A link to the FDA Food Code is included for your reference.
http://www.fda.gov/FOOD/GuidanceRegulation/RetailFOODProtection/FOODCode/ucm374275.htm

"Easily Disassembled Equipment" means EQUIPMENT that is accessible for cleaning and inspection by:

(1) Disassembling without the use of tools, or

(2) Disassembling with the use of handheld tools commonly available to maintenance and cleaning personnel such as screwdrivers, pliers, open-end wrenches, and Allen wrenches.

"Flashing" means an impervious sheet of material placed in construction to prevent water penetration or direct flow of water.

"Service Sink" means a curbed cleaning facility or janitorial sink used for the disposal of mop water and similar liquid wastes.

CONTENTS AND FORMAT OF PLANS AND SPECIFICATIONS

Proper plan review submittal with EQUIPMENT listed and located on floor plans as well as specifications for finish and plumbing schedules will highlight potential problems on paper while allowing for modifications to be made before costly purchases, installations, and construction are performed.

All facilities, systems, processes, and menus, when applicable, will be evaluated to determine minimum operational requirements. Refer to Appendix A for a copy of the Plan Review Application.

The following is a summary of what should be included in the plan submittal:

- Legible plans at minimum of 11 x 14 inches in size drawn to scale (scale - ¼ inch = 1 foot)
- Proposed menu, seating capacity, and projected daily meal volume for the FOOD ESTABLISHMENT.
- Provisions for adequate rapid cooling, including ice baths and refrigeration, and for hot and cold-holding of TIME/TEMPERATURE CONTROL for SAFETY (TCS) FOOD.
- Location of all FOOD EQUIPMENT. Each piece of EQUIPMENT must be clearly labeled, marked, or identified. Provide EQUIPMENT schedule that identifies the make and model numbers and listing of EQUIPMENT that is certified or classified for sanitation by an ANSI accredited certification program (when applicable). Elevation drawings may be requested by the REGULATORY AUTHORITY.
- Location of all required sinks: HANDWASHING SINKS, WAREWASHING sinks, Utility Sink and FOOD preparation sinks (if required).
- Auxiliary areas such as storage rooms, garbage rooms, toilets, basements and/or cellars used for storage or FOOD preparation.
- Entrances, exits, loading/unloading areas and delivery docks.
- Complete finish schedules for each room including floors, walls, ceilings and coved juncture bases.
- Plumbing schedule including location of floor drains, floor sinks, water supply lines, overhead waste-water lines, hot water generating EQUIPMENT with capacity and recovery rate, backflow prevention, and wastewater line connections.
- Location of lighting fixtures.
- Source of water and method of SEWAGE disposal.
- A color coded flow chart may be requested by the REGULATORY AUTHORITY demonstrating flow patterns for:
  - FOOD (receiving, storage, preparation, service);
  - UTENSILS (clean, soiled, cleaning, storage); and
  - REFUSE (service area, holding, storage, and disposal).
- Storage of Employee Personal Items.
- Ventilation.

MENU REVIEW AND FOOD FLOW

The menu review and the flow of FOOD through the FOOD ESTABLISHMENT are integral parts of the plan review process. The menu or a listing of all of the FOOD and beverage items to be offered at the FOOD ESTABLISHMENT must be submitted as part of the plan review application to the REGULATORY AUTHORITY.

As with the inspection process, the plan review process should focus on the FOOD and its flow through receipt, storage, preparation and service. The source and quantity of FOOD to be served should be reviewed along with the preparation and post-preparation operations. It is imperative to have knowledge of this information so that a proper assessment of the PHYSICAL FACILITIES can be made.

The food that flows through retail FOOD ESTABLISHMENT operations can be placed into the 3 following processes:

- **FOOD PROCESSES WITH NO COOK STEP**
  - **Receive – Store - Prepare – Hold – Serve**

  (Other processes may occur, but there is **NO cooking step**)
  - Examples: Salads, deli meats, cheeses, sashimi, raw oysters

- **FOOD PREPARATION FOR SAME DAY SERVICE**
  - **Receive – Store - Prepare - Cook – Hold – Serve**

  (Other processes may occur, including thawing)
  - Examples: Hamburgers, fried chicken, hot dogs

- **COMPLEX PROCESSES**
  - **Receive – Store - Prepare – Cook – Cool – Reheat – Hot Hold – Serve** (Other processes may occur, but the key is repeated trips through the temperature danger zone)
  - Examples: Refried beans, leftovers

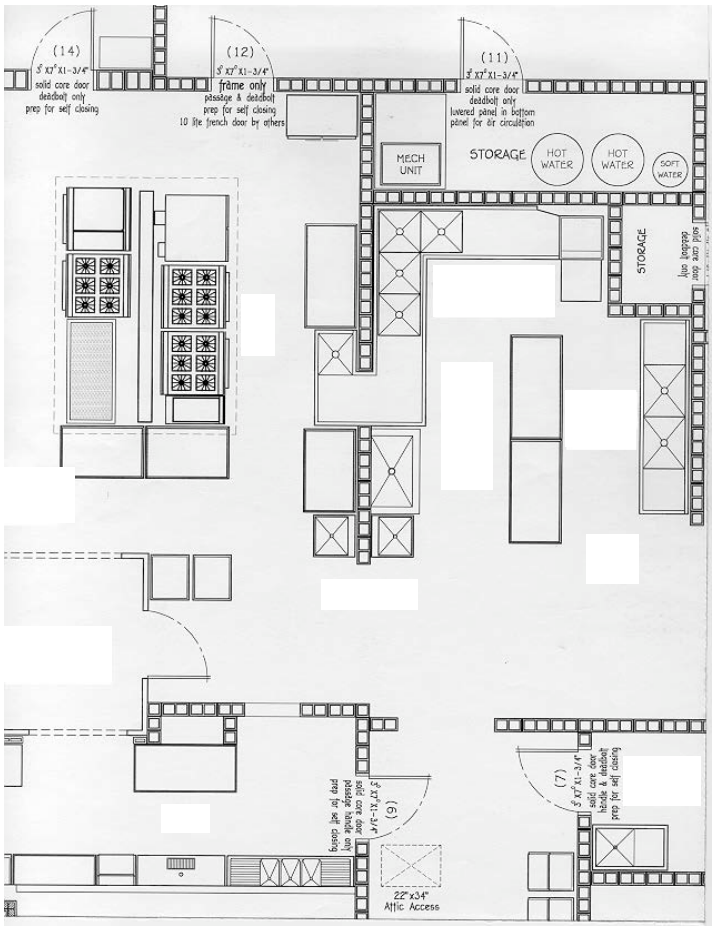
Knowledge of how the FOOD is intended to flow through the FOOD ESTABLISHMNET is very useful since the CRITICAL CONTROL POINTS for each process remain the same regardless of the individual menu ingredients.

Special attention should be given to the review of complex FOOD processes which involve:

- Multiple ingredients being assembled or mixed
- TIME/TEMPERATURE CONTROL FOR SAFETY(TCS) FOODs
- FOODs which will be prepared or held for several hours prior to service
- FOODs requiring cooling and reheating
- Multiple step processing (passing through the Time Temperature Danger Zone,

135˚F - 41˚F more than once)

The process approach can be described as dividing the many flows in a FOOD ESTABLISHMENT into broad categories, analyzing the risks, and placing manager controls on each grouping of FOOD processes. These groupings will also impact the facility design; FOOD flow; and the numbers, types, function and placement of EQUIPMENT.



The drawing above is an example of a fixture plan submitted for plan review. It is a handy tool when following the FOOD process as described by the FOOD ESTABLISHMENT operator or their representative.

Layout, flow and menu (including FOOD preparation processes) should be major considerations to help facilitate an operator's Active Managerial Control (AMC) of the risk factors for foodborne illness. Strategic layout and placing of facilities and EQUIPMENT will separate different FOOD preparation processes, a major step towards preventing contamination of FOOD that may result from poor personal hygiene, contaminated EQUIPMENT, and improper holding temperatures. Adequate and convenient storage will also enhance operations.

The menu for a FOOD ESTABLISHMENT dictates the space and EQUIPMENT requirements for the safe preparation and service of various FOOD items. The menu will determine if the proposed receiving and delivery areas, storage area, preparation and handling areas, and thawing, cooking and reheating areas are available and adequate to handle the types and volumes of FOODs being prepared and served.

When reviewing the menu, it is important to evaluate the flow patterns for the preparation of the FOOD to be sure that the lay-out of the facility provides an adequate separation of raw ingredients from READY-TO-EAT FOODs, and that the traffic patterns are not crossing paths with waste items and other sources of contamination. Cross contamination can be minimized when the flow of FOOD is considered during plan review.

With a proper understanding of the menu and flow, the plans for FOOD ESTABLISHMENTS can be reviewed to help assure that the FOOD items being considered can be protected during all aspects of the FOOD operation.

FOOD Process and Steps Required

	Receive	Store	Prepare	Cook	Cool	Reheat	Hold	Service
NO COOK	X	X	X				X	X
SAME DAY SERVICE	X	X	X	X			X	X

PREVENTIVE TOOLS FOR THE FOOD ESTABLISHMENT

Active Managerial Control (AMC)

To effectively reduce the occurrence of foodborne illness risk factors, operators of FOOD ESTABLISHMENTs must focus their efforts on achieving active managerial control. The term "active managerial control" is used to describe industry's responsibility for developing and implementing FOOD safety management systems to prevent, eliminate, or reduce the occurrence of foodborne illness risk factors.

Elements of an effective FOOD safety management system may include the following:

- Certified FOOD protection managers who have shown a proficiency in required information by passing a test that is part of an accredited program
- Standard operating procedures (SOPs) for performing critical operational steps in a FOOD preparation process, such as cooling.
- Recipe cards that contain the specific steps for preparing a FOOD item and the FOOD safety critical limits, such as final cooking temperatures, that need to be monitored and verified.
- Purchase specifications

HACCP

Hazard Analysis and Critical Control Points (HACCP) plays a vital role in proper FOOD ESTABLISHMENT design. However, the risk management tool is not considered a "stand-alone" FOOD safety system. Design and construction are essential pre-requisites and must be put in place prior to the implementation and operation of effective FOOD production practices. The purpose of quality plan review is to ensure that FOOD ESTABLISHMENTs are safe, sanitary, and efficient. Proper design, construction, and HACCP principles work to achieve these purposes and minimize the aforementioned hazards.

Effective HACCP principles are essential to a successful FOOD ESTABLISHMENT and begin with the design and layout of the facility, monitoring the FOOD flow throughout the establishment, from delivery, storage, preparation, cooking, service and consumption. A well-designed progressive FOOD flow system will minimize cross-contamination and maximize efficiency in an establishment.

Good manufacturing policies or practices, standard operating procedures (SOPs), and documentation are essential to an establishment's HACCP-based FOOD safety program and control over potential hazards. HACCP policies specifically address requirements set out in the FDA Food Code. Additional standards or good retail practices are required as foundation for FOOD safety and are detailed in the FDA Food Code. Examples include employee hygiene, employee restriction or exclusion, general sanitation, design, etc. HACCP/VARIANCE under the Plan Review & Construction Program is responsible for the review of HACCP procedures and VARIANCE applications in order for establishments to conduct specialized operations.

The FDA Food Code requires an APPROVED HACCP PLAN to be in place for some specialized processes not listed under §3-502.11. A formal HACCP PLAN review is required and needs to be APPROVED prior to conducting these operations. For information on creating a HACCP PLAN, contact the local regulatory plan reviewer or visit one of these informational hyperlinks: FDA Guidance to Implement HACCP Systems or USDAHACCPGuidelines.

FACILITIES TO MAINTAIN PRODUCT TEMPERATURE

Refrigerators and freezers are required to maintain TCS FOOD at or below 41°F and 0°F (frozen) respectively. It is recommended that refrigerators be maintained between 36°F and 38°F. All refrigeration units must have numerically scaled indicating thermometers accurate to ±3°F. Sufficient refrigeration and freezers shall be provided to support the intended menu. Consideration must be taken with the placement and installation of refrigeration units to allow for adequate ventilation. Air circulation within refrigeration and freezer units should not be obstructed and should allow for an even and consistent flow of cold air throughout the units

Refrigeration and freezer storage involves five major areas:

1. Storage for short-term holding of perishable and TCS FOOD.
2. Long-term storage.
3. Storage space for quick chilling of FOODs.
4. Space for assembling and processing of TCS FOOD.
5. Display storage for customer service.

If TCS foods are prepared a day or more in advance of service, a rapid cooling procedure capable of cooling TCS foods from 135°F to 41°F within 6 hours (135°F to 70°F within 2 hrs.) must be provided. The capacity of the rapid cooling facilities must be sufficient to accommodate the volume of food required to be cooled to 41°F within 6 hours. The location of the rapid cooling facilities (e.g., sinks for ice baths, freezer storage for ice wands, blast chillers) must be identified. Refrigerators and freezers at work stations for operations requiring preparation and handling of TCS foods should be considered. For example, it may be necessary to locate a freezer near the fryer where frozen products will be deep-fried. Refrigeration units, unless designed for such use, should not be located directly adjacent to cooking EQUIPMENT or other high heat producing EQUIPMENT which may adversely impact the cooling system's operation.

A. Refrigeration Storage Calculations

Calculating the amount of refrigeration and freezer space should be based on the menu and expected FOOD volume. The amount and location of refrigeration and freezer EQUIPMENT should complement the FOOD flow of the operation from receiving, storage and FOOD processing, to the point of service.

To plan refrigeration storage, the following items should be considered: menu, type of FOOD

operation, number of meals per day, number of deliveries per week, and adequate ventilation in the areas where the refrigeration systems will be located. When assessing the refrigeration needs, shelving space within the refrigeration and freezer units should be designed to prevent the cross-contamination of FOODs. Separating raw meats and poultry from ready-to-eat FOODs such as produce and prepared FOOD items. Thermometers must be conspicuously located in all units. Thermometer sensing elements should be located near the door

Formulas can be used to estimate refrigerated storage space. To calculate, you will need information on number of meals estimated to be served per day, days between deliveries and storage area availability. Links to example calculators can be found in Appendix C.

B. Walk-in Cooler/Freezer Units

Walk-in units should meet an ANSI accredited certification or equivalent, or deemed acceptable by the Regulatory Authority. A walk-in beverage or beer cooler is not recommended for FOOD storage. APPROVED flooring and integral cove bases need to be provided. Quarry tile, ceramic, and galvanized flooring are not recommended flooring materials for walk-in units. All gaps, cracks, penetrations, seams, and plug holes shall be SEALED SMOOTH and flush with the surface material.

Walk-in units should be installed when there is a need for long-term storage of perishable and TCS FOOD or when cooling space is needed for prepared and cooked FOODs. These coolers should be located near delivery or receiving areas. EASILY CLEANABLE curtain strips are recommended at walk-in doors. This not only helps in maintaining the temperature of the walk-in but also leads to an energy cost savings.

Exterior walk-in unit locations shall be properly designed for exterior installation and consideration given varied environmental concerns. Walk-in units should be designed with a roof, APPROVED overhead waterproof protection, and walkways shall be provided for the transportation of FOOD items. Walk-in units shall be APPROVED by the local building official and are evaluated and APPROVED on a case-by-case basis by the REGULATORY AUTHORITY.

If the walk-in floors will be water-flushed for cleaning or receive the discharge of liquid waste or excessive melt water, the floors should be sloped to drain. If the structure of the walk-in is integral with the building, properly installed floor drains may be installed inside the unit.

Each walk-in unit shall be equipped with lighting that provides 10 foot candles of light throughout the unit when it is full of product. Lights must be properly shielded or shatter resistant.

Condensate lines from walk-in units shall drain to APPROVED floor drains or alternative method APPROVED by the REGULATORY AUTHORITY. Without prior approval floor sinks or floor drain sinks shall not be installed in walk-in units. All walk-in units shall be properly

flashed off and SEALED to the ceiling and side walls. Walk-in units are not to be confused with refrigerated FOOD processing rooms. Refer to Item G-Refrigerated Processing Rooms.

C. Reach-in Refrigerators

These units are for short-term storage of perishable and TCS FOODs. These units should be considered to meet the daily storage demands of the kitchen operation. They are to be conveniently located at points of FOOD preparation and FOOD assembly. These units are not to be considered for the quick chilling of cooked and prepared FOODs.

D. Reach-in Freezers

Freezers are for long-term storage. They are not designed to be used as quick-chill units. These units should be located near delivery and DRY STORAGE AREAs.

E. Blast Chillers/Rapid Chill Units

These units are recommended for use when handling large volumes of FOOD that require quick chilling. A blast chiller is an efficient cooling mechanism for any amount of FOOD to be chilled, and where refrigeration cooling space is limited.

F. Refrigerated Worktables

These units are suggested when the menu includes assembling TCS FOODs. These units provide easy access of FOODs from the top of the unit. These units are not designed for long-term storage of FOOD or cooling.

G. Refrigerated Processing Rooms

These areas (e.g. meat cutting rooms) should be considered when there is extensive handling of cold TCS FOOD. APPROVED hand sinks should be located in these areas.

H. Display Storage Refrigerators

These units are designed to display TCS FOOD under refrigeration. Examples of these units are deli display, fresh fish, and meat and poultry cases.

I. Customer Service Display Units/ Cold Buffet Units

These units are designed for holding FOOD under refrigeration for customer access. They are designed for short-term display and are not designed for the cooling of FOOD. Beverage display coolers are not APPROVED for storing open TCS FOODs.

Cold buffets and salad bars are designed for short-term display. They should be mechanically refrigerated, and have APPROVED sneeze guards with side panel protection.

J. Ice Machines

If ice is to be used as a cooling medium for FOOD and beverage items the unit should be adequately designed and sized to meet all operational needs in an APPROVED location. Ice machines designed for outdoor dispensing will need National Automatic Merchandising Association (NAMA) certification

K. General Cooking and Hot Holding

Cooking and hot holding units are designed to heat FOOD to a required temperature within a required amount of time for FOOD safety. Cooking and reheating temperatures have been determined using scientific analysis. The time and temperature requirements are based on the pathogens that are likely to be present on the product. It is recommended that the units are commercial grade and meet NSF/ANSI standards. Consideration must be taken with the placement and installation of cooking/reheating/hot holding EQUIPMENT to ensure that proper ventilation and sanitation can occur. Construction of these units should be durable and EASILY CLEANABLE

NOTE: The commercial appliances described in this section are placed under a vent hood to evacuate grease, steam, and fumes, which could pose a potential fire or health risk. Refer to the topic on Ventilation of this Manual or your REGULATORY AUTHORITY for specific requirements.

Units used to heat FOOD are divided into two categories:

1. Cooking/Reheating
2. Hot Holding

All units in use must be able to meet the minimum required heated temperatures outlined in the FDA Food Code, Chapter 3-4 Destruction of Organisms of Public Health Concern. http://www.fda.gov/FOOD/GuidanceRegulation/RetailFOODProtection/FOODCode/default.htm

L. Stovetops and Grills

Gas, electric, or wood-burning stoves are used to cook and reheat product in pots or pans. A grill is similar to a stove with the ability to place the FOOD directly over the flame.

M. Ovens

Ovens are thermally insulated chambers used for cooking or reheating FOODs. They can be gas, electric, or wood-burning units.

N. Combination Oven/Steamer (Combi Oven)

A Combi oven/steamer is similar to a convection oven with the ability to produce dry heat, moist heat, or a combination of the two.

O. Rice Cooker/Warmer

The unit is an electric appliance that is capable of cooking rice and then hot holding the rice at 135°F or above. Scoops or ladles for serving may be stored in a running dipper well.

P. Kettle

Kettles are cooking pots used to boil large quantities of FOOD products. The units are generally clean-in-place and should have the necessary tools for sanitation. Adequate floor drains must be present for disposal of spent water.

Q. Rotisserie

Rotisseries are self-contained units that include a heat source and racks for skewers or spits. Beef, pork, or poultry is rotated over the fire to cook the FOOD to the required temperature.

R. Small Appliances

Small appliances (table top) include microwaves, Panini press, broilers, and toasters. These units are used to heat FOOD to the required cook or reheat temperature depending on the application.

S. Fryers

Fryers are cooking devices that use oil heated to a high temperature. The hot oil has a flash point that can result in a fire. Follow the manufacturer's instructions for operation, maintenance and cleaning to prevent a fire incident.

T. Hot Tables

Hot tables are gas or electrically heated units that are design to maintain temperature. They should never be used to cook or reheat TCS FOODs. The design should allow for disassembly and deep cleaning of interior surfaces. These units must be able to maintain a minimum temperature of 135°F.

U. Customer Service Display Units/Hot Buffet Units

These are gas or electrically heated units that are designed to maintain temperature. They should never be used to cook or reheat TCS FOODs. They should be constructed of durable and EASILY CLEANABLE materials. The design should allow for disassembly and deep cleaning of interior surfaces. The design should protect FOOD from contamination that could occur from the environment or customers by using sneeze shields or covers. The units must be able to maintain a minimum temperature of 135°F

EQUIPMENT AND INSTALLATION

All EQUIPMENT in a FOOD ESTABLISHMENT must comply with the design and construction standards contained in Chapter 4 of the FDA Food Code. FOOD EQUIPMENT that is certified or classified for sanitation by an ANSI accredited program is deemed to comply with Parts 4-1 and 4-2 of the FDA Food Code.

EQUIPMENT including ice makers and ice storage EQUIPMENT, shall not be located under exposed or unprotected sewer lines, open stairwells or other sources of contamination.

The following EQUIPMENT installation recommendations will help ensure proper spacing and sealing allowing for adequate and easy cleaning.

A. Floor-Mounted Equipment

EQUIPMENT should be mounted on APPROVED lockable casters, gliders or wheels to facilitate easy moving, cleaning, and flexibility of operation whenever possible. Moveable EQUIPMENT requiring utility services such as gas or electrical connections should be provided with easily accessible quick-disconnects or the utility service lines should be flexible and of sufficient length to permit moving the EQUIPMENT for cleaning. If a flexible utility line is used, a safety chain that is shorter than the utility line must be installed. Check with local fire safety and building codes to ensure that such installations are acceptable.

Floor-mounted EQUIPMENT that is not mounted on wheels or casters with the above utility connections should be:

1. Permanently SEALED to the floor around the entire perimeter of the EQUIPMENT. The sealing compound should be pliable and non-shrinking. It should retain its elasticity and provide a water- and vermin-tight joint; or
2. Installed on a solid, SMOOTH, non-absorbent masonry base. Masonry bases and curbs should have a minimum height of 2" and be coved at the junction of the platform and the floor with at least a 1/4" radius. The EQUIPMENT should overhang the base by at least 1" but not more than 4". Spaces between the masonry base and the EQUIPMENT must be SEALED as above; or
3. Elevated on legs to provide at least a 6" clearance between the floor and EQUIPMENT. The legs shall contain no hollow open ends.
4. For EQUIPMENT not readily moveable by one person, spacing between and behind EQUIPMENT must be sufficient to permit cleaning under and around the unit. EQUIPMENT shall be spaced to allow access for cleaning along the sides, behind and above. At least 6" of clear, unobstructed space under each piece of EQUIPMENT must be provided or EQUIPMENT must be SEALED to the floor.
5. If EQUIPMENT is against a wall and is not movable, the EQUIPMENT must be joined to and/or SEALED to the wall in a manner to prevent liquid waste, dust and debris from collecting between the wall and the EQUIPMENT.
6. When EQUIPMENT is joined together, or spreader plates are used between

EQUIPMENT, the resultant joint must be SEALED to prevent liquid waste, dust and debris from collecting between the EQUIPMENT.

Unobstructed and functional aisle and working spaces must be provided. A minimum width of 36" is required by fire and building codes.

All utility and service lines and openings through the floor and walls must be adequately SEALED. Penetrations through walls and floors must be minimized. Exposed vertical and horizontal pipes and lines must be kept to a minimum. The installation of exposed horizontal utility lines and pipes on the floor is prohibited. Any insulation materials used on utility pipes or lines in the FOOD preparation or dishwashing areas must be SMOOTH, non-absorbent, and easy to clean. Electrical units which are installed in areas subject to splash from necessary cleaning operations or FOOD preparation should be water-tight and washable.

B. Counter-Mounted Equipment

COUNTER-MOUNTED EQUIPMENT is defined as EQUIPMENT that is not portable and is designed to be mounted off the floor on a table, counter, or shelf. All COUNTER-MOUNTED EQUIPMENT shall be:

- SEALED to the table or counter; or
- Elevated on APPROVED legs to provide at least a 4" clearance between the table or counter and the EQUIPMENT to facilitate cleaning.

C. Other

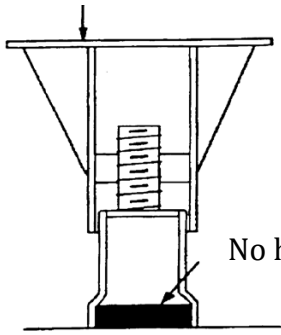
EQUIPMENT that is open underneath, such as drain boards, dish tables, and other tables that are not moveable should be spaced to allow for ease of cleaning or should be SEALED to the wall.

Non-FOOD contact surfaces of EQUIPMENT that are exposed to splash, spillage, or other FOOD soiling or that require frequent cleaning shall be constructed of corrosion-resistant, non-absorbent, and SMOOTH material.

Legs of all EQUIPMENT should not have hollow, open ends.

If running water dipper wells are installed, methods for filling and draining the units must be identified.

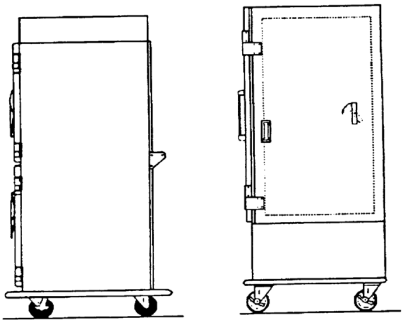
Equipment sealed to floor



No hollow open ends

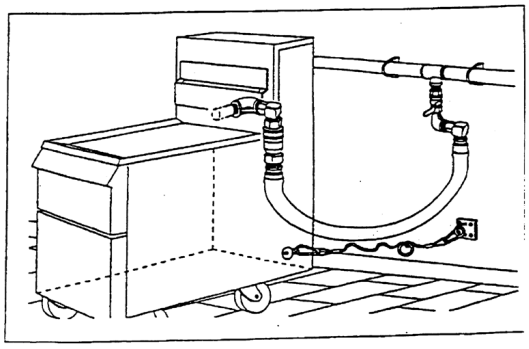
Elevate equipment for effective cleaning.

Sanitary Leg Example



Mobile Kitchen equipment mounted on Castor

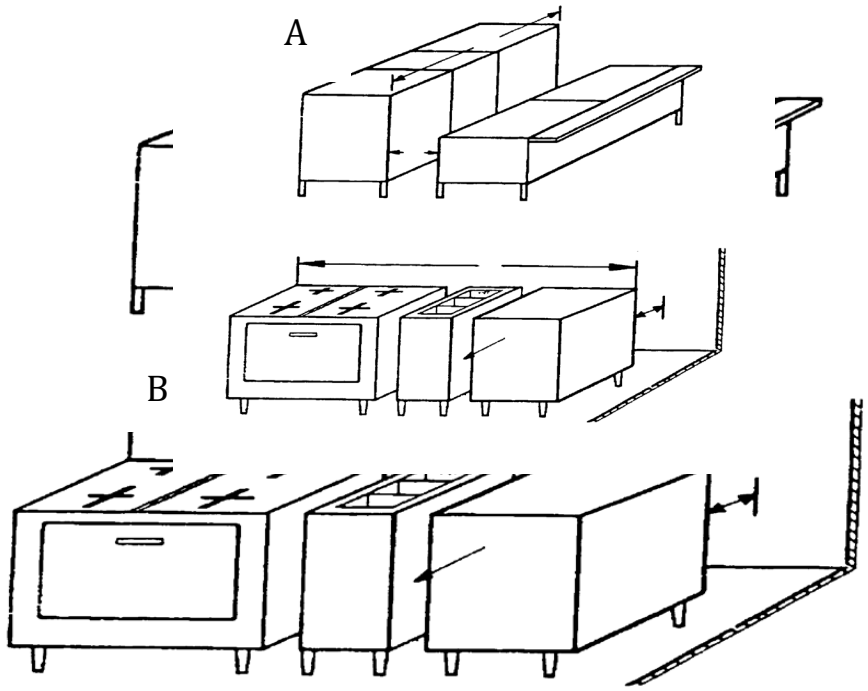
Holding Cabinet & a Reach-in Refrigerator



Refer to your Local Regulatory Authority for Gas Code Requirements

Flexible Gas Connection with Safety Chain

Equipment Spacing



Recommended EQUIPMENT spacing; provided access is available from both ends:

EQUIPMENT Length (A)	Space From Walls and Adjacent EQUIPMENT (B)
4' or less	6"
4' - 8'	12"
8' or more	18

WAREWASHING FACILITIES

The minimum requirement for WAREWASHING in a FOOD ESTABLISHMENT is a three-compartment sink. A mechanical WAREWASHING machine may be installed in addition to the three-compartment sink.

A. Manual Ware washing

For manual WAREWASHING, a stainless steel sink with no fewer than three compartments must be provided, with the exception that a two-compartment sink may be allowed by the REGULATORY AUTHORITY under certain conditions.

- The sink compartments shall be large enough to completely immerse the largest pot, pan or piece of EQUIPMENT to be used in the establishment that will not be cleaned in-place.
- Each compartment shall be supplied with adequate hot and cold potable running water, temperature of the wash solution shall be maintained at not less than 110°F, or the temperature specified on the cleaning agent manufacturer's label instructions.
- Drain boards, UTENSIL racks or tables large enough to accommodate clean and soiled UTENSILs shall be provided. The drain boards shall be self-draining.
- Adequate facilities for pre-flushing or pre-scrapping EQUIPMENT and UTENSILs must be provided.
- If hot water is used to sanitize EQUIPMENT and UTENSILs, the means for heating the water to 171°F in the 3rd compartment must be identified. The racks for the immersion of EQUIPMENT and UTENSIL must be specified.

B. Mechanical Ware washing

WAREWASHING machines shall be installed in accordance with the manufacturer's recommendations and applicable code requirements. If used, the hot water booster for WAREWASHING machines must be identified during plan review.

Adequate facilities shall be provided to air dry washed EQUIPMENT and UTENSILs. Drain boards, UTENSIL racks or tables must be large enough to allow proper and sufficient air drying of EQUIPMENT and UTENSILs.

Storage facilities shall be provided to store cleaned and sanitized UTENSILs and EQUIPMENT at least 6" above the floor; protected from splash, dust, overhead plumbing or other contamination. The plan must specify the location and facilities used for storing all UTENSILs and EQUIPMENT.

PLUMBING

A. Water Supply

The primary concerns relative to the water supply in a FOOD ESTABLISHMENT are:
1. Ensure the facility is supplied with a safe and adequate water supply, including adequate supply of hot water; and
2. Verify that the water can remain safe while it is in the facility.

Safe Source: Start at the water source. Determine if the water is potable or non-potable. The availability of an APPROVED public water supply must be verified. Any use of a non-public water source (well water) shall comply with local, state, and/or federal laws, and construction and testing standards.

Sufficient potable water: Potable water shall be provided from a source constructed and

operated according to law that meets the peak water demands of the FOOD ESTABLISHMENT.

B. Hot Water Supply:

The hot water supply shall be sufficient to satisfy peak hot water demands of the FOOD ESTABLISHMENT. Hot water for hand washing and most FOOD ESTABLISHMENT uses shall be at least 100°F. Hot water for mechanical WAREWASHING must be boosted up to 150°F-165°F for washing and 165°F-180°F for sanitizing or according to the manufacturer's data plate on the machine. The temperature of the wash solution for spray-type ware washers that use chemicals to sanitize may not be less than 120°F.
The temperature of the wash solution for manual WAREWASHING must be maintained to not be less than 110°F. The water temperature for manual hot water sanitization must be at least 171°F.

Tank less water heaters shall be installed and used in accordance with the manufacturer's recommendations.

For guidance on calculating Hot Water Requirements see Appendix C – Model Calculations

C. Sewage Disposal, Grease Interceptors/Traps

All SEWAGE including liquid waste shall be disposed into a public SEWAGE system or an individual SEWAGE disposal system constructed and operated according to law. Where individual SEWAGE disposal systems are utilized, the location shall be noted on the plans and certification of compliance with state and local regulations shall be provided.

A grease trap/interceptor is a chamber designed for wastewater to pass through and allow any grease to float to the top for retention as the remainder of the wastewater passes through. If used, a grease trap shall be located to be easily accessible for cleaning; FOOD solids entering the grease trap/interceptor should be minimized.

It is recommended that waste water from fixtures or drains which would allow fats, oils, and grease to be discharged be directed to a grease trap/interceptor. Local municipalities/jurisdictions will determine the number and size of grease traps, grease interceptors or catch basins. If installed, grease traps shall be properly spaced so they are easily accessible for servicing and cleaning. Refer to the local municipality/jurisdiction for the installation requirements.

D. Backflow Protection

Plumbing shall be sized and installed according to applicable codes. There shall be no cross connections between the potable water supply and any non-potable system or a system of unknown quality. Where non-potable water systems are permitted for purposes such as air conditioning and fire protection, the non-potable water must not contact directly or

indirectly: FOOD, potable water or EQUIPMENT that contacts FOOD or UTENSILs. The piping of any non-potable water system shall be durably identified so that it is readily distinguishable from piping that carries potable water.

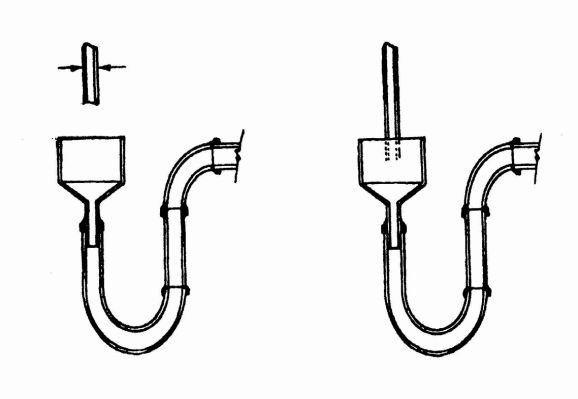
A connection to a sewer line may be direct or indirect. A direct connection may not exist between the sewerage system and any drains originating from EQUIPMENT in which FOOD, portable EQUIPMENT, or UTENSILs are placed, except if otherwise required by law. When a WAREWASHING machine is located within 5 feet of a trapped floor drain, the dishwasher waste outlet may be connected directly on the inlet side of a properly vented floor drain trap.

An **indirect connection** may be one of two types, air gap or air break:

1. For a potable water supply, an **air gap** means the unobstructed, vertical air space that separates a potable system from a non-potable system.

2. An **air break** is a waste line from a fixture that discharges used water or liquid waste to a drain where the waist line terminates below flood level.

AIR GAP AIR BREAK



A connection to a sewer line may be direct or indirect. A direct connection may not exist between the sewerage system and any drains originating from EQUIPMENT in which FOOD, portable EQUIPMENT, or UTENSILs are placed, except if otherwise required by law. When a WAREWASHING machine is located within 5 feet of a trapped floor drain, the dishwasher waste outlet may be connected directly on the inlet side of a properly vented floor drain.

HYGIENE FACILITIES

A. Handwashing

Handwashing is a critical factor to prevent contamination of FOODs. Proper handwashing reduces the amount of pathogens that can be transmitted via cross contamination from raw

FOODs to READY-TO-EAT-FOODS. It is imperative to have adequate numbers and conveniently placed HANDWASHING SINKS to ensure employees are washing hands. It is important that handwashing be done only at properly equipped HANDWASHING SINKS to help ensure that employees effectively clean their hands and minimize contamination of FOOD and FOOD-CONTACT SURFACES.

A HANDWASHING SINK, hand drying device or disposable towels, hand cleanser and waste receptacle shall be located for convenient use by employees who work in FOOD preparation, FOOD dispensing, and WAREWASHING areas.

Nothing must block the approach to a HANDWASHING SINK.

HANDWASHING SINKS must also be located in or immediately adjacent to toilet rooms.

HANDWASHING SINKS shall be of sufficient number and conveniently located for use by all employees in FOOD preparation, FOOD dispensing, and WAREWASHING areas.

HANDWASHING SINKS shall be easily accessible and may not be used for purposes other than handwashing. Sinks used for FOOD preparation, washing EQUIPMENT or UTENSILs, or service (mop) sinks shall not be used for handwashing.

Each handwashing sink shall be provided with hot and cold water tempered by means of a mixing valve or a combination faucet to provide water at a temperature of at least 100˚F. If used, self-closing, slow-closing or metering faucets shall be designed to provide a flow of water for at least 15 seconds without the need to reactivate the faucet.

Splash from use of a handwashing sink may not contaminate FOOD, FOOD-CONTACT SURFACES, clean EQUIPMENT or UTENSILs. A washable baffle or barrier may be needed if the handwashing sink is located next to a FOOD preparation area, UTENSIL or EQUIPMENT storage, or FOOD-CONTACT SURFACE and if the space between the handwashing sink and FOOD, FOOD preparation, FOOD-CONTACT SURFACES, and clean UTENSILs and EQUIPMENT does not provide adequate protection.

Similarly, the location of soap and paper towel dispensers at HANDWASHING SINKS must be reviewed during plan review so that their use does not contaminate FOOD, FOOD-CONTACT SURFACES, UTENSILs and EQUIPMENT. In addition, the distance that employees would have to reach the faucet handles, soap and paper towels must be reviewed during plan review to assure that they will have proper access to the HANDWASHING SINKS and will not have to reach across dirty surfaces while washing their hands.

B. Toilet Rooms

Properly functioning toilet facilities must be accessible to employees at all times.

If required by federal, state, local or tribal laws and regulations, toilet facilities must be made available to the customers. If the public toilet facilities are used by employees,

separate toilet facilities may not have to be installed for the employees. Toilet facilities must be made accessible in accordance with the Americans with Disabilities Act (ADA) of 1990.

The floors, walls, and ceiling in toilet rooms shall be SMOOTH and EASILY CLEANABLE. The walls around toilets, urinals, toilet paper dispensers, soap dispensers, and paper towel dispensers should be water resistant and durable for frequent cleaning.

The minimum requirements for toilet facilities shall include:

- **Toilet:** At least one toilet and not fewer than the number of toilets required by law shall be provided. If authorized by law, urinals may be substituted for additional toilets in men's toilet rooms.
- **HANDWASHING SINK:** Each HANDWASHING SINK shall be provided with hot and cold water tempered by means of a mixing valve or a combination faucet to provide water at a temperature of at least 100˚F. If used, self-closing, slow-closing or metering faucets shall be designed to provide a flow of water for at least 15 seconds without the need to reactivate the faucet.
- **Handwashing cleanser:** Each HANDWASHING SINK or group of two adjacent HANDWASHING SINKS shall be provided with hand cleaning liquid, powder, foam or bar soap. A dispenser shall be provided for handwashing cleanser provided in liquid or powder form.
- **Hand drying facility:** Each HANDWASHING SINK or group of adjacent HANDWASHING SINKS shall be provided with individual, disposable towels; a continuous towel system that supplies the user with a clean towel; heated-air hand drying device; or hand drying device with air-knife, high velocity air at ambient temperatures.
- **Toilet paper:** A supply of toilet paper shall be provided in a dispenser at each toilet.
- **Waste receptacle:** If disposable towels are used, a waste receptacle shall be located at each sink or group of sinks. At least one covered waste receptacle shall be provided in toilet rooms used by females.
- **Ventilation:** Toilet rooms must be vented to the outside. Mechanical Ventilation shall be installed in toilet rooms according to law. If allowed by law, operable screened windows may be used in lieu of mechanical ventilation devices.
- **Toilet room doors:** Toilet room doors shall be tight-fitting and self-closing.
- **Lighting:** At least 215 lux (20 foot candles) shall be provided in toilet rooms.

STORAGE

A. Dry Storage-

The dry storage space needed depends on the menu, number of meals served between deliveries, frequency of deliveries, and the amount and type of SINGLE-SERVICE ARTICLES to be stored. The location of dry storage should be adjacent to the FOOD preparation area and convenient to receiving. Adequate ventilation should be provided. FOOD should not be

stored under exposed sewer lines. Similarly, a cabinet that is used for the storage of FOOD, shall not be located under exposed or unprotected sewer lines, open stairwells or other sources of contamination. Stationary shelving needs to have a minimum 6" floor clearance.

Shelving, dollies, racks, pallets and skids shall be corrosion-resistant, non- absorbent and SMOOTH. Pallets, racks and skids used for bulk cased or overwrapped items shall be designed to be moved by hand or by conveniently located hand trucks or forklifts. Shelving, dollies, racks, pallets and skids should be spaced away from walls to allow for cleaning and pest monitoring/inspection.

APPROVED FOOD containers with tight-fitting covers and dollies should be used for storing bulk FOODs such as flour, cornmeal, sugar, dried beans, rice and similar.

B. Dry Storage Calculations

Formulas can be used to estimate the amount of dry storage space that may be needed. To determine, you will need information on number of meals estimated to be served per day, days between deliveries and storage area availability. Links to example calculators can be found in Appendix C.

C. Poisonous or Toxic Materials Storage

Designate an area for POISONOUS OR TOXIC MATERIAL storage that is away from FOOD and clean UTENSILs. These include detergents, sanitizers, related cleaning or drying agents and caustics, acids, polishes and other chemicals. Install cabinets, cages, or physically separate shelves for storing chemicals.

D. Clean Equipment, Utensil and Linen Storage

Designate areas for clean cooking UTENSILs, cutting boards, glassware and dishware. Store them at least 6-inches off the floor in a clean, dry location where they will be protected from dust and splash.

LIGHTING

A. Intensity

The light intensity shall be at least 108 lux (10 foot candles) at a distance of 75 cm (30 inches) above the floor, in walk-in refrigeration units and dry FOOD storage areas and rooms during periods of cleaning.

The light intensity shall be at least 215 lux (20 foot candles) at a surface FOOD is provided for consumer self-service such as buffets and salad bars or where fresh product or packaged FOODS are sold or offered for consumption; inside EQUIPMENT such as reach-in

and under-counter refrigerators; at a distance of 75 cm (30 inches) above the floor in areas used for handwashing, WAREWASHING, and UTENSIL storage, and in toilet rooms.

The light intensity shall be at least 540 lux (50 foot candles) at a surface where a FOOD EMPLOYEE is working with FOOD or working with UTENSILs or EQUIPMENT such as knives, slicers, grinders, or saws where employee safety is a factor.

B. Protective Light Shielding

Shielding such as plastic shields, plastic sleeves with end caps, shatterproof bulbs and/or other APPROVED devices shall be provided for all artificial lighting fixtures located in areas where there is exposed FOOD; clean EQUIPMENT, UTENSILs, and LINENS; or unwrapped single-service and single-use articles.

Heat lamps shall be protected against breakage by a shield surrounding and extending beyond the bulb, leaving only the face of the bulb exposed.

FINISHES

A. Floors

Example floor materials are as follows:

- Quarry tile, ceramic tile
- SEALED curbed concrete
- Seamless poured epoxy minimum 3/16-inch thick.
- Commercial-grade sheet vinyl **(no felt backing)**
- Commercial-grade vinyl composition tile (VCT)

Pre-approval from the REGULATORY AUTHORITY should be obtained prior to use of carpet and/or wood.

B. Walls

Example wall materials are as follows:

- Stainless steel
- Ceramic tile
- Aluminum
- Fiber-glassed reinforced panels (FRP)
- SEALED Concrete blocks or bricks
- Epoxy or glazed drywall

C. Ceilings

Example ceiling materials may include wall finish material listed above along with the following:

- EASILY CLEANABLE, non-absorbent ceiling tiles
- Painted drywall

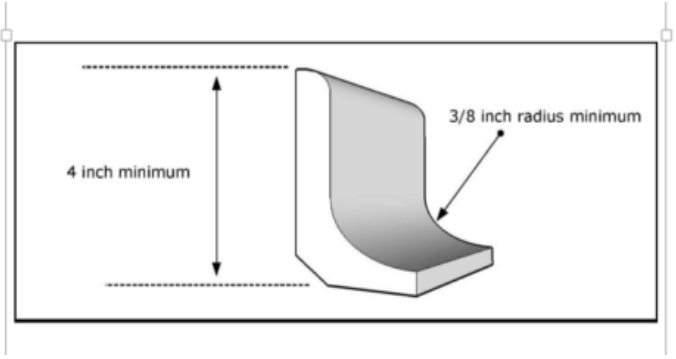
D. Coving

Coving is the floor material found at the base of walls (wall/floor junctures) and is required in most areas of the FOOD ESTABLISHMENT, such as:
FOOD preparation, storage, handling, and packaging areas

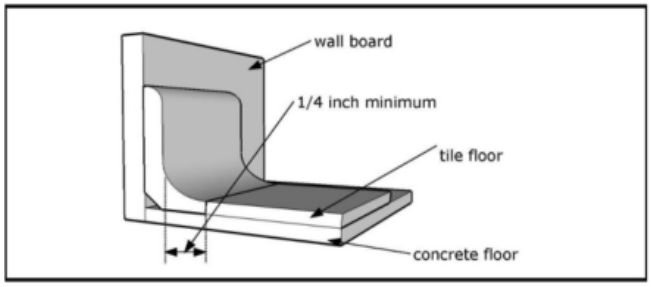
- UTENSIL washing and storage areas
- Interior waste disposal areas (garbage, REFUSE, grease)
- Restrooms
- Hand washing areas
- Janitorial facilities
- Walk-in refrigerator and freezer units (inside and outside)
- Bars (employee side)
- Customer self-serve areas where non-individually prepackaged FOODs or beverages are sold or dispensed (e.g., salad bars, buffets, bulk FOOD sales, beverage stations)
- Employee change and storage areas
- Wait stations

Coved flooring material should extend integrally up the walls. Integral coving is not required in areas used exclusively for dining, point-of-sale, or the storage of UTENSILs or FOODs contained in the original **un-opened** container

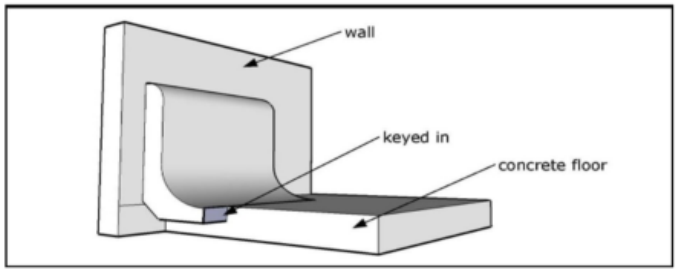
Floor Installation Diagrams



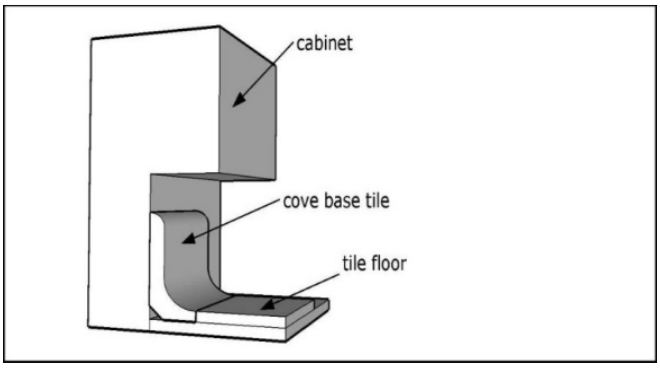
Example of quarry tile cove base.



Example of quarry tile cove base flush with floor.



Example of quarry tile cove base integral to concrete floor.



Example cove base; cabinet toe-kick

PEST CONTROL

All openings to the outside shall be effectively protected against the entrance of insects and rodents. All roller doors, sliding or bi-fold doors, or similar movable wall systems that are not self- closing and create a continuous opening to the exterior must have an effective means of pest control.

Some examples of effective barriers include:

- Solid, tight fitting, self-closing doors.
- Fixed or self-closing screens of #16 mesh or finer.
- Effective air curtains.

Example Air Curtain

This may not apply if a FOOD ESTABLISHMENT opens into a larger completely enclosed structure such as a coliseum, arena, warehouse, shopping mall, superstores, airport, or office building, where the outer openings from the larger structure are protected against the entry of insects and rodents.

A. Building

All masonry or cement foundations must be rodent proof. Seal all openings into the foundation and exterior walls, including openings & penetrations around wall and ceiling penetrations.

Cover all building vents with a minimum #16 mesh screen. Effectively seal all air ducts, skylight, transoms, and other openings to the outside.

B. Windows

Windows that open to the outside must be properly protected with minimum #16 mesh screen, with the exception of service windows.

Drive-thru and walk-up service windows must have effective means to prevent pest entry, to include minimum #16 mesh screens, properly designed and installed air curtains, or other effective means such as self-closing devices (spring-loaded, bump pad, electronic opener, or gravity operated).

C. Delivery, Customer, and Toilet Room Doors

Exterior doors: All outside doors shall be self-closing and tight fitting. Install a door sweep and weather stripping to prevent the entrance of insects and rodents. *Note: Daylight shall not be visible around the perimeter of the door.*

Garage Doors, Roller Doors, and Loading Docks: Garage and roller type delivery doors must be protected against pests. Loading docks shall have properly installed tight fitting dock seals at all loading bays. If the location of one of these doors exposes the kitchen or other FOOD service, air curtains will be required.

Toilet Room (Restroom) doors: All toilet rooms located in or adjacent to a FOOD ESTABLISHMENT shall be provided with tight fitting, self-closing doors. This requirement does not apply to a toilet room that is located outside a FOOD ESTABLISHMENT and does not open directly into the FOOD ESTABLISHMENT such as a toilet room that is provided by the management of a shopping mall.

D. Insect Control Devices, Design and Installation

Insect control devices that are used to electrocute or stun flying insects shall be designed to retain the insect within the device. These devices must not be located above FOOD preparation areas and installed to prevent the contamination of exposed FOOD, clean EQUIPMENT, UTENSILs, and LINENS, from insect fragments

MECHANICAL VENTILATION

A. Mechanical Ventilation Requirements

Commercial cooking or display EQUIPMENT, which produces smoke, steam, grease, mists, particulate matter, condensation, vapors, fumes, odors, or create sanitation or indoor air quality problems, will require a hood.

Hoods shall be designed and installed to prevent grease and condensation from collecting on walls, ceilings, and dripping into FOOD or onto FOOD contact surfaces. All hoods should comply with the current International Mechanical Code (IMC) and/or all local building and fire safety codes.

Balancing of the exhaust and make-up air must be ensured so that the system can be operated efficiently.

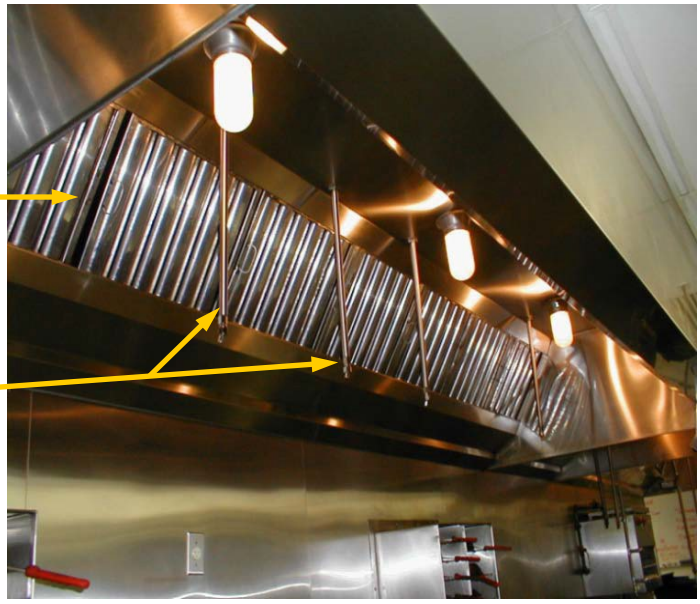
B. Mechanical Ventilation Hood Systems

Type I hoods are required over EQUIPMENT that produce grease, smoke, excessive steam, heat, condensation, particulate matter, odors, or create indoor sanitation or indoor quality problems. Examples of equipment requiring installation under a hood include: Kettles, pasta cookers, hot plates, salamanders, Mongolian-style grills, gas cooking EQUIPMENT, tableside cooking EQUIPMENT, such as Teppanyaki-style cooking, Tandoori ovens, rotisserie units, Panini grills, etc.

Type I Hood over Cook Line

Grease filters

Fire suppression system



The National Fire Protection Association provides a resource for FOOD ESTABLISHMENTS to reduce the potential fire hazard of commercial cooking operations. Refer to the NFPA link below or your local/State Fire Protection regulations.

http://www.nfpa.org/codes-and-standards/document-information-pages?mode=code&code=96

Type II hoods shall be installed over EQUIPMENT that produce steam, heat, mists, condensation, fumes, vapors, and non-grease laden FOODs.

Type II Hood over WAREWASHING Machine

Vapor hood

Vent less Hood Systems or ventilation systems integral to the cooking EQUIPMENT need to be reviewed and APPROVED by the local mechanical code, and other applicable fire safety codes.

The following documents must be submitted along with this application:

☐ Proposed menu or complete list of food and beverages to be offered (including seasonal, catering and banquet menus) – ***Standard Operating Procedures or HACCP plans may be required.***

☐ Plans must be clearly drawn to scale (minimum 11 x 14 inches in size) and include these items below:

- The floor plan must identify: food preparation, serving and seating areas, restrooms, office, employee change room, storage, warewashing, janitorial and trash area. Include location of any outside equipment or facilities (dumpsters, well, septic system-if applicable).
- Provide equipment layout and specifications, clearly numbered and cross-keyed with the equipment list. *Elevation drawings may be requested by the Regulatory Authority.*
- Identify handwashing, warewashing and food preparation sinks.
- Provide plumbing layout showing the sewer lines, cleanouts, floor drains, floor sinks, vents, grease trap or grease interceptor, hot and cold water lines, and direction of flow to sanitary sewer.
- Provide exhaust ventilation layout including location of hood and make-up air returns and ducts, if applicable.
- Lighting plan, indicating the exact foot candles for each area as required by the FDA Food Code (§6-303.11).
- Finish schedule showing floor, coved base, wall and ceilings for each area shown on the plans.

Note: A color coded flow chart may be requested by the Regulatory Authority demonstrating flow patterns for: food (receiving, storage, preparation, service); dishes (clean, soiled, cleaning, storage); trash (service area, holding, storage, disposal).

Appendix B – REGULATORY COMPLIANCE REVIEW LIST
FOOD PREPARATION PROCEDURES

FOOD DELIVERY

1. How often will frozen foods be delivered? □ Daily □ Weekly □ Other: _____
2. How often will refrigerated foods be delivered? □ Daily □ Weekly □ Other: _____
3. How often will dry foods or supplies be delivered? □ Daily □ Weekly □ Other: _____

FOOD STORAGE* - Identify amount of space (in cubic feet) allocated for:

Dry Storage _____; Refrigerated Storage (41°F) _____; Frozen Storage _____; Utensil Storage _____

* Identify on plans where storage will be located.

INSTRUCTIONS: Describe the following with as much detail as possible. Indicate Not Applicable (NA) as appropriate.

PROCESS	IDENTIFY FOOD ITEMS	INDICATE LOCATION AND EQUIPMENT	MEETS CRITERIA (RA to circle and Initial)
Washing FDA Food Code §3-302.15			YES/NO
Thawing FDA Food Code §3-501.13			YES/NO
Cooking FDA Food Code §3-401			YES/NO
Hot Holding Hot food maintained at 135°F			YES/NO
Cooling Time/Temperature Control for Safety food will be cooled to 41°F within 6 hours; 135°F to			YES/NO
Reheating Food must be reheated to a temperature of 165° for 15 seconds within 2 hours			YES/NO

FINISH SCHEDULE

INSTRUCTIONS: Indicate which materials (quarry tile, stainless steel, fiberglass reinforced panels (RFP), ceramic tile, 4" plastic coved molding, etc.). Indicate Not Applicable (NA) as appropriate.

ROOM/AREA	FLOOR	FLOOR/WALL JUNCTURE	WALLS	CEILING	MEETS CRITERIA (RA to circle and Initial)
Food Preparation					YES/NO
Dry Food Storage					YES/NO
Warewashing Area					YES/NO
Walk-in Refrigerators and Freezers					YES/NO
Service Sink					YES/NO
Refuse Area					YES/NO
Toilet Rooms and Dressing Rooms					YES/NO
Other: Indicate					YES/NO
Identify the finishes of cabinets, countertops, and shelving:					

PHYSICAL FACILITIES

INSTRUCTIONS: Explain the following with as much detail as possible. Indicate Not Applicable (NA) as appropriate.

TOPIC	MINIMUM CRITERIA	MEETS CRITERIA (Circle and Initial)
Handwashing facilities	• Identify number of the handwashing sinks in food preparation and warewashing areas: _____Food Preparation _____ Warewashing Area • Type of hand drying device? Disposable towels □ Hand-drying device □	YES/NO
Warewashing Facilities	**MANUAL DISHWASHING** • Identify the length, width, and depth of the compartments of the 3-compartment sink: _____ • Will the largest pot/ pan fit into each compartment of the 3-compartment sink? □ Yes □ No If No, what will be the procedure for manual cleaning and sanitizing of items that will not fit into sink compartments? _____ • Describe size, location and type (drainboards, wall-mounted or overhead shelves, stationary or portable racks) of air drying space: _____ • What type of sanitizer will be used? □ Chemical Type:_____ □ Hot Water **MECHANICAL DISHWASHING** • Identify the make and model of the mechanical dishwasher:_____ • What type of sanitizer will be used? □ Chemical Type:_____ □ Hot Water • Will ventilation be provided? Yes □ No □	YES/NO
Water Supply	• Is the water supply public or non-public/private? public □ non-public/private □ o If private, has source been approved? Yes □* No □ o Attach copy of written approval and/or permit. • Is ice made on premises or purchased commercially? Made on-site □ Purchased □ • Will there be an ice bagging operation? Yes □ No □	YES/NO

Sewage Disposal	• Is the sewage system public or non-public/private? public □ non-public/private □ If private, has the sewage system been approved? Yes □* No □ Attach copy of written approval and/or permit. • Will grease traps/interceptors be provided? Yes □* No □ *Identify location on plan.	YES/NO
Backflow Prevention	• Will all potable water sources be protected for backflow? Yes □ No □ • Are all floor drains identified on the submit floor plan? Yes □ No □	YES/NO
Toilet Facilities	• Identify locations and number of toilet facilities: _____ • Hot and cold water provided? Yes □ No □	YES/NO
Dressing Rooms	• Will dressing rooms be provided? Yes □ No □ • Describe storage facilities for employee personal belongings_____	YES/NO
Linens	• Will linens be laundered on site? Yes □ No □ If yes, what will be laundered and where? _____ If no, how and where will linens be cleaned? _____ • Identify location of clean and dirty linen storage:_____ • How often will linens be delivered and picked up?	YES/NO
Poisonous/Cleaning Storage	• Identify the location and storage of poisonous or toxic materials • Where will cleaning and sanitizing solutions be stored at workstations? _____ • How will these items be separated from food and food-contact surfaces? _____	YES/NO

Pest Control	• Will all outside doors be self-closing and rodent proof? □ Yes □ No □ NA • Will screens be provided on all entrances left open to the outside? □ Yes □ No □ NA • Will all openable windows have a minimum #16 mesh screening? □ Yes □ No □ NA • Will insect control devices be used? □ Yes □ No □ NA • Will air curtains be used? If yes, where? _____ Note: All pipes and electrical conduit chases must be sealed to prevent rodent access.	YES/NO
Refuse, Recyclables, and Returnables	• Will refuse/garbage be stored inside? □ Yes □ No If yes, where _____ • Identify how and where garbage cans and floor mats will be cleaned? _____ • Will a dumpster or a compacter be used? □ Dumpster □ Compactor • Identify locations of grease storage containers:_____ • Will there be an area to store recyclables? □ Yes □ No If yes, where _____ • Will there be an area to store returnable damaged goods? □ Yes □ No If yes, where _____	YES/NO

PLAN REVIEW FORMULAS

WALK-IN REFRIGERATED STORAGE

$$\text{Estimated Space Needed (Cu. ft.)} = \frac{\text{Volume per Meal [Cu. ft.]} \times \text{Number Meals Served between Deliveries}}{0.40}$$

NOTE: Only 40% of any walk-in unit actually provides usable space

$$\frac{\text{Estimated Space (Cu. ft.)}}{\text{Height of Cooler (ft.)}} = \text{Size of Cooler Needed (Sq. ft.)}$$

Examples:

1. The number of meals between deliveries = 1000 (100 meals per day X 10 days between deliveries). Volume per meal = 0.1 cubic feet.

$$0.1 \text{ ft}^3 \text{ vol.} \times 1000 \text{ meals} = 100 \text{ ft}^3$$

$$\frac{100 \text{ ft}^3}{0.40} = 250 \text{ ft}^3 \text{ Usable Space Needed}$$

2. The usable space needed for the walk-in is 250 cubic feet. The cooler has a 6 foot high ceiling.

$$\frac{250 \text{ ft}^3 \text{ usable space needed}}{6 \text{ ft ceiling height}} = 41 \text{ ft}^2 \text{ Sized Cooler Needed}$$

REACH IN REFRIGERATED STORAGE

$$\text{Estimated Space Needed (Cu. ft.)} = \frac{\text{Volume per Meal [Cu. ft.]} \times \text{Number Meals Served between Deliveries}}{0.75}$$

NOTE: Only 75% of any reach-in unit actually provides usable space

Example:

1. The number of meals between deliveries = 1000 (100 meals per day X 10 days between deliveries). Volume per meal = 0.1 cubic feet.

$$0.1 \text{ ft}^3 \text{ vol.} \times 1000 \text{ meals} = 100 \text{ ft}^3$$

$$\frac{100 \text{ ft}^3}{0.75} = 133.3 \text{ ft}^3 \text{ Estimated Space Needed}$$

PLAN REVIEW FORMULAS

HOT WATER DEMAND

$$\text{Gallons Per Hour (GPH)} = \frac{\text{Sink Size in}^3 \times 7.5 \text{ gal/ft}^3 \times (\text{Number of compartments} \times 0.75 \text{ capacity})}{1728 \text{ in}^3/\text{ft}^3}$$

OR

$$\text{Sink Size in}^3 \times \text{Number components} \times 0.003255 \text{ in}^3$$

$$\text{British Thermal Units (BTU)} = \frac{\text{GPH} \times \text{°Rise} \times 8.33 \text{ lb/gal of water}}{\text{Thermal Efficiency}}$$

$$\text{Kilo-Watt (KW) Input} = \frac{\text{GPH} \times \text{°Rise} \times 8.33 \text{ lb/gal of water}}{3412 \text{ BTU per KW}}$$

Example:

1. How many BTU's or KW's will the booster heater need to raise the incoming hot water (140°F) to 180°F for the final rinse temperature if the dishwasher requires 64 GPH?

$$\frac{64 \text{ GPH} \times 40°\text{F Rise} \times 8.33}{0.70 \text{ (operating efficiency)}} = 30{,}464 \text{ BTU}$$

$$\frac{64 \text{ GPH} \times 40°\text{F Rise} \times 8.33}{3412 \text{ BTU per KW}} = 6.2 \text{ KW}$$

PLAN REVIEW FORMULAS

DRY STORAGE

$$\text{Required Storage Area (sq. ft)} = \frac{\text{Volume per Meal (0.1 cu. ft.)} \times \text{Number Meals between Deliveries}}{\text{Avg. Height of Area (ft.)} \times \text{Fraction of Usable Floor Area}}$$

Example: 7 ft. high ceiling, shelves 6" off the floor, 18" from ceiling
Usable Height 5 ft.

Usable Floor Space:
Depends on door swings, overhead sewer lines, electrical boxes, etc.

Examples:

1. The number of meals between deliveries = 1,000 (100 meals per day X 10 days between deliveries). A ***small fraction (3/10ths) of usable storage space*** in a store room that has 5 feet in usable height

$$\frac{0.1 \text{ cu. ft.} \times 1000 \text{ meals}}{5\text{ft} \times 0.3} = 66.67 \text{ ft}^2 \text{ Required Storage Area}$$

2. The number of meals between deliveries =1,000 (100 meals per day X 10 days between deliveries). A ***larger fraction (6/10ths) of usable storage space*** in a store room that has 5 feet in usable height

$$\frac{0.1 \text{ cu. ft.} \times 1000 \text{ meals}}{5\text{ft} \times 0.6} = 33 \text{ ft}^2 \text{ Required Storage Area}$$

LINEAR FEET OF SHELVING

$$\text{Linear Feet of Shelving Required (ft.)} = \frac{\text{Volume per Meal (0.1 cu. ft.)} \times \text{Number Meals between Deliveries}}{D \times H \times C}$$

D =Depth of Shelves (ft.)

H =Clearance bewteen shelves (ft.)

C =80% effective capacity of shelf height

Examples:

1. Assume 400 meals per day and a 10 day storage between deliveries = 4,000 meals.
   Volume of 0.1 cu. Ft. per meal, shelf depth of 18 inches, clearance of **12 inches** between shelves and 80% effective capacity of shelf height

$$\frac{0.1 \text{ cu. ft.} \times 4000 \text{ meals}}{1.5 \text{ ft.} \times 1 \text{ ft.} \times 0.80} = 333 \text{ ft. Shelving Needed}$$

2. Assume 400 meals per day and a 10 day storage between deliveries = 4,000 meals.
   Volume of 0.1 cu. Ft. per meal, shelf depth of 18 inches, clearance of **18 inches** between shelves and 80% effective capacity of shelf height

$$\frac{0.1 \text{ cu. ft.} \times 4000 \text{ meals}}{1.5 \text{ ft.} \times 1.5 \text{ ft.} \times 0.80} = 222 \text{ ft. Shelving Needed}$$

8-201.12 Contents of the Plans and Specifications.
8-203.10 Preoperational Inspections.

In conjunction with the Conference for Food Protection Plan Review committee, FDA has participated in developing a document that is intended to assist regulators in reviewing food establishment plans, and industry in understanding what is expected in the plan review process. For several years, this FDA/CFP Food Establishment Plan Review Guide – 2000 has been used in the FDA State Training Team Plan Review courses. It can be accessed through http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm101639.htm.

At the plan review stage, the regulatory authority may be dealing with an agent of the permit applicant who is seeking a building permit and who is not in a position to discuss plans for safely conducting the food operation. Nonetheless, the plan review step presents a unique opportunity to lay a foundation that enables the proposed operation to proactively sustain compliance with the Code over time. Standard operating

procedures (SOPs) are a part of that foundation and ideally are developed in tandem with designing the facility. Consequently, as an integral part of the plan review process, discussion needs to occur about such procedures and their scope.

SOPs need to be developed by the time of the preoperational inspection and put into effect when the food operation begins. It is recommended that such procedures be written, available for reference by the person in charge, conveyed to the appropriate employees, and available for review by the regulatory authority during inspections. Operating procedures should include definitive practices and expectations that ensure that:

(1) The transmission of foodborne disease is prevented by managing job applicants and food employees as specified under Subpart 2-201,

(2) Food is received from approved sources as specified under § 3-201.11,

(3) Food is managed so that the safety and integrity of the food from the time of delivery to the establishment throughout its storage, preparation, and transportation to the point of sale or service to the consumer is protected,

(4) Time/temperature control for safety food is maintained, including freezing, cold holding, cooking, hot holding, cooling, reheating, and serving in conformance with the temperature and time requirements specified under Parts 3-4 and 3-5,

(5) Warewashing is effective, including assurance that the chemical solutions and exposure times necessary for cleaning and sanitizing utensils and food-contact surfaces of equipment are provided as specified under Parts 4-6 and 4-7, and

(6) Records that are specified under §§ 3-203.11, 3-203.12, and 5-205.13 are retained for inspection.

During the plan review stage, the regulatory authority and a management representative of the proposed food establishment should discuss available training options that may be used to train food employees and the person in charge regarding food safety as it relates to their assigned duties. By the time of the preoperational inspection, operating procedures for training should include definitive practices and expectations of how the management of the proposed food establishment plans to comply with paragraph 2-103.11(N) of this Code which requires the person in charge to assure that food employees are properly trained in food safety as it relates to their assigned duties.

All information above the line is for conference use only.

Title:

Refer Standard 5 to Program Standards Committee for Review and Updating

Recommended Solution: The Conference recommends...

that the Program Standards Committee, a CFP standing committee, be charged with the following during the next biennium:

1. Conduct a thorough review of Standard 5 "Foodborne Illness and Food Defense Preparedness and Response of the FDA Voluntary National Retail Food Regulatory Program Standards (VNRFRPS);
2. The review should include comparing the Standard to other similar FDA standards in food;
3. Review the "Description of Requirements" to ensure the requirements provide program flexibility and include items generally part of a retail food program;
4. Review Standard 5 "Data Review and Analysis" from a sampling of jurisdictions to determine if certain data analysis requirements typically have no or such limited data to make the information not valuable;
5. Review the Center for Disease Control and Prevention's National Environmental Assessment Reporting System (NEARS), Environmental Assessment Training Series (EATS), and Council to Improve Foodborne Outbreak Response (CIFOR) to consider inclusion of specific components.
6. Propose amendments to Standard 5 of the VNRFRPS;
7. Report back committee findings and recommendations to the next Biennial Meeting.

It is the policy of the Conference for Food Protection to not accept Issues that would endorse a brand name or a commercial proprietary process.

STANDARD No. 2
Training Program

2.1 Purpose

This standard defines the essential elements of a training program for inspectors.

2.2 Requirement Summary

The State program uses a written training plan that promotes development and demonstrates that all inspectors who will conduct manufactured food inspections complete course curriculums, field training, and continuing education to adequately perform their work.

2.3 Program Elements

2.3.1 Training Plan and Training Records

2.3.1.1 The State program uses a written training plan that ensures all inspectors receive training required to adequately perform their work assignments. The training plan includes course curriculums which provides for basic and advanced food inspection training as well as continuing education.

2.3.1.2 Appendix 2.2 or equivalent form must be used to document and summarize all training provided to inspectors.

2.3.1.3 The State program maintains a training history for active inspectors. The training history for all inactive inspectors must be kept for three years or per the state's record retention policy.

2.3.1.4 Appendix 2.3 or equivalent form must be used to document training for each inspector.

2.3.1.5 The State training record summary and individual training records must include the inspector's START DATE. Equivalent forms including electronic records may be used for required appendices.

2.3.2 Basic Food Inspection Training

The State program requires that each inspector complete a basic food inspection training curriculum that consists of coursework and field training described here.

2.3.2.1 Timeframe

The Basic Food Inspection Training course curriculum shall be successfully completed within 24 months of the inspector's START DATE with the manufactured food program.

2.3.2.2 Course Curriculum:

The Basic Food Inspection Training consists of coursework in the subject areas listed in this section.

2.3.2.2.1 Prevailing statutes, regulations, and ordinances
2.3.2.2.2 Public health principles
2.3.2.2.3 Emergency management
2.3.2.2.4 Communications skills
2.3.2.2.5 Microbiology
2.3.2.2.6 Epidemiology
2.3.2.2.7 Basics of HACCP
2.3.2.2.8 Allergen management
2.3.2.2.9 Basic food labeling
2.3.2.2.10 Food defense awareness training
2.3.2.2.11 Sampling technique and preparation

Note: States may further subdivide their basic training by identifying courses required for inspectors who only inspect non high risk warehouses. These courses must be clearly defined in the state training plan.

Note: Appendix 2.4 provides a list of available Basic Food Inspection Training Coursework that may be used to satisfy the requirements in 2.3.2.2.

2.3.2.3 Field training

2.3.2.3.1 Each inspector who will inspect general manufactured food firms must complete:
- 2.3.2.3.1.1 Ten JOINT FIELD TRAINING INSPECTION, FIELD INSPECTION AUDITS, or EVALUATIONS with a QUALIFIED FIELD INSPECTION TRAINER; and
- 2.3.2.3.1.2 Of the ten, two must be acceptable FIELD INSPECTION AUDITS or EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.2 Each inspector who will only inspect non high risk food warehouses must complete:
- 2.3.2.3.2.1 Five JOINT FIELD TRAINING INSPECTION, FIELD INSPECTION AUDITS, or EVALUATIONS with a QUALIFIED FIELD INSPECTION TRAINER; and
- 2.3.2.3.2.2 Of the five, two must be acceptable FIELD INSPECTION AUDITS or

EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.3 Inspectors who meet 2.3.2.3.2 and advance to conduct general manufactured food firms must complete:

2.3.2.3.3.1 Five additional JOINT FIELD TRAINING INSPECTIONS, FIELD INSPECTION AUDITS, or EVALUATIONS to fulfill requirements identified in 2.3.2.3.1; and

2.3.2.3.3.2 Of the five, two must be acceptable FIELD INSPECTION AUDITS or EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.4 JOINT FIELD TRAINING INSPECTION or FIELD INSPECTION AUDITS/EVALUATIONS are conducted in firms that are representative of the firms to be inspected by the inspector. Each inspector will complete the minimum field training requirements prior to conducting independent inspections.

2.3.3 Advanced Food Inspection Training

The State program requires each inspector who will conduct specialized food inspections to complete an advanced inspection training curriculum which consists of relevant coursework and field training as described here.

2.3.3.1 Coursework

The state program requires each inspector who will perform specialized food inspections to successfully complete the coursework specific to the type of specialized food inspections they will be performing. Specialized food inspection courses include, but not limited to:

2.3.3.1.1 Acidified foods
2.3.3.1.2 Low acid canned foods
2.3.3.1.3 Juice HACCP
2.3.3.1.4 Seafood HACCP
2.3.3.1.5 Traceback Investigations[7]
2.3.3.1.6 Foodborne Illness Investigations[7]

2.3.3.2 Field training

[7] These advanced food inspection training courses are not subject to 2.3.3.2 Field Training requirements.

The State program requires that each inspector successfully complete the following before performing independent specialized food inspections.

2.3.3.2.1 Participate in two JOINT FIELD TRAINING INSPECTIONS;

2.3.3.2.2 After successful completion of the course participate in one EVALUATION or FIELD INSPECTION AUDIT that is found to be acceptable by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR prior to conducting independent inspections; and

2.3.3.2.3 Within one year after being released to do specialized food inspections complete a second EVALUATION or FIELD INSPECTION AUDIT that is found to be acceptable by QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR in the area of specialty.

2.3.4 Experienced Inspectors

The criterion for conducting a minimum of 10 JOINT FIELD TRAINING INSPECTIONS and/or required coursework is intended for new employees or employees new to the food safety program. For CURRENT EXPERIENCED STAFF or NEWLY HIRED EXPERIENCED STAFF, a State program's training plan shall include the following unless the state determines in their training plan that all staff will be required to complete the program elements in 2.3.2 and 2.3.3:

2.3.4.1 CURRENT EXPERIENCED STAFF

	Missing Record	Documentation in Employee Training File
2.3.4.1.1	JOINT FIELD TRAINING INSPECTIONS	Statement or affidavit explaining the background or experience that justifies a waiver of the basic or specialized JOINT FIELD TRAINING INSPECTIONS.
2.3.4.1.2	Basic Course Work	Document training records available. Create a statement or affidavit explaining the background or experience that justifies a waiver of the missing Basic Course Work.
2.3.4.1.3	Specialized Food Inspection Course Work Certificates	Statement or affidavit explaining the date and location that they have successfully completed the specialized training.

2.3.4.2 NEWLY EXPERIENCED STAFF

	Missing Record	Documentation in Employee Training File
2.3.4.2.1	JOINT FIELD TRAINING INSPECTIONS	Statement or affidavit explaining the background or experience that justifies a waiver of some or all of the basic or specialized JOINT FIELD TRAINING INSPECTIONS. Conduct two successful EVALUATION or FIELD INSPECTION AUDIT within 6 months of the Inspector's QUALIFIED DATE.
2.3.4.2.2	Basic Course Work	Document training records available. Statement or affidavit explaining the background or experience that justifies a waiver of the Basic Course Work.
2.3.4.2.3	Specialized Food Inspection Course Work Certificates	Statement or affidavit explaining the date and location that they have successfully completed the specialized training.

2.3.5 Continuing education

Within the scope of this standard, the goal of continuing education and training is to enhance the inspector's knowledge, skills, and ability to perform manufactured food inspections. The objective is to build upon the inspector's knowledge base.

2.3.5.1 Each inspector must accumulate 20 CONTACT HOURS of continuing education in food safety every 36 months.

2.3.5.2 The 36-month continuing education interval starts at the QUALIFIED DATE, when the basic training cycle is completed.

2.3.5.3 The program may establish an alternate timeframe to track continuing education as long as the alternate timeframe and how that timeframe still meets or exceeds the intent of the standard (at least 20 CONTACT HOURS every 36 months) are clearly identified in program procedures.

2.3.5.4 The inspector qualifies for CONTACT HOURS for participation in any of the following activities that are related specifically to manufactured food safety or manufactured food inspectional work:

- Attendance at national or regional seminars / technical conferences;
- Professional symposiums / college courses;
- Food-related training provided by government agencies (e.g., USDA, State, local);
- Food safety related conferences and workshops;
- Distance learning opportunities that pertain to food safety; or

- Training approved by a QUALIFIED FIELD INSPECTION TRAINER.

2.3.5.5 Of the accumulated 20 CONTACT HOURS of continuing education, a maximum of ten (10) CONTACT HOURS may be accrued from the following activities:

- Delivering presentations at professional conferences;
- Providing classroom and/or field training to newly hired inspectors, or being a course instructor in food safety; or
- Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

2.3.5.6 Of the accumulated 20 CONTACT HOURS of continuing education, a maximum of four (4) CONTACT HOURS may be accrued for reading technical publications related to manufactured food safety.

2.3.5.7 Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation may include:

- Certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- Transcripts from a college or university;
- A letter from the administrator of the continuing education program attended;
- A copy of the peer-reviewed article or presentation made at a professional conference; or documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports; and
- An agenda and attendance roster.
- Documentation approved by the QUALIFIED FIELD INSPECTION TRAINER.

2.3.6 Coursework Sources

Basic, advanced, and continuing education coursework must be obtained from one of the sources listed here:

2.3.6.1 Training provided by a government agency (including in house training);

2.3.6.2 Distance learning, for example, satellite downlinks or web-based training[8];

2.3.6.3 Colleges, schools, research centers, and institutes;

[8] FDA/ORA U classroom and long distance learning courses are listed at: http://www.fda.gov/ora/training/course_ora.html

Step 5: Continuing Education and Training 8
OUTCOME 9
DOCUMENTATION 9

STANDARD 2 TRAINED REGULATORY STAFF

This Standard applies to the essential elements of a training program for regulatory staff.

Requirement Summary

The regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have the knowledge, skills, and ability to adequately perform their required duties. The following is a schematic of a 5-step training and standardization process to achieve the required level of competency.

STEP 1
Completion of curriculum courses designated as "Pre" in Appendix B-1 prior to conducting and independent routine inspections.

STEP 2
Completion of the following:

- A minimum of 25 joint field training inspections (or a sufficient number of joint inspections determined by the trainer and verified through written documentation that the FSIO has demonstrated all performance elements and competencies to conduct independent inspections of retail food establishments); and
- Successful completion of the jurisdiction's FSIO Field Training Plan similar to the process outlined in *Appendix B-2: Conference for Food Protection (CFP) Field Training Manual*.

STEP 3
Completion of the following:

- A minimum of 25 independent inspections; and
- Remaining course curriculum (designated as "post" courses) outlined in *Appendix B-1: Curriculum for Retail Food Safety Inspection Officers*.

STEP 4
Completion of a standardization process similar to the FDA standardization procedures.

STEP 5
Completion of 20 contact hours of continuing food safety education every 36 months after the initial training is completed.

Description of Requirement

Ninety percent (90 %) of the regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have successfully completed the required elements of the 5-step training and standardization process:

- Steps 1 through 4 within 24 months of hire or assignment to the retail food regulatory program.
- Step 5 every 36 months after the initial 24 months of training.

Step 1: Pre-Inspection Curriculum

Prior to conducting any type of independent field inspections in retail food establishments, the FSIO must satisfactorily complete training in pre-requisite courses designated with a "Pre" in Appendix B-1, for the following curriculum areas:

1. Prevailing statutes, regulations, ordinances (specific laws and regulations to be addressed by each jurisdiction);
2. Public Health Principles;
3. Food Microbiology; and
4. Communication Skills.

There are two options for demonstrating successful completion of the pre-inspection curriculum.

OPTION 1: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- FDA ORA U pre-requisite courses identified as "Pre" in Appendix B-1; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances.

Note: *The estimated contact time for completion of the FDA ORA U pre-requisite ("Pre") courses is 42 hours.*

OPTION 2: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- Successful completion of courses deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the FDA ORA U pre- requisite (Pre") courses; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances; and
- Successful passing of one of the four written examination options (described later in this Standard) for determining if a FSIO has a basic level of food safety knowledge.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion is provided. The learning objectives for each of the listed ORA U courses are available from the web site link at: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners

> **Note:** *While certificates issued by course sponsors are the ideal proof of attendance, other official documentation can serve as satisfactory verification of attendance. The key to a document's acceptability is that someone with responsibility, such as a trainer/food program manager who has first-hand knowledge of employee attendance at the session, keeps the records according to an established protocol. An established protocol can include such items as:*
>
> - *Logs/records that are completed based on sign-in sheets; or*
> - *Information validated from the certificate at the time-of-issuance; or*
> - *A college transcript with a passing grade or other indication of successful completion of the course; or*
> - *Automated attendance records, such as those currently kept by some professional associations and state agencies, or*
> - *Other accurate verification of actual attendance.*

Regulatory retail food inspection staff submitting documentation of courses equivalent to the FDA ORAU courses – OPTION 2 – must also demonstrate a basic level of food safety knowledge by successfully passing one examination from the four written examination categories specified herein.

1. The Certified Food Safety Professional examination offered by the National Environmental Health Association; or

2. A state sponsored food safety examination that is based on the current version of the FDA Food Code (and supplement) and is developed using methods that are psychometrically valid and reliable; or

3. A food manager certification examination provided by an ANSI/CFP accredited certification organization; or

4. A Registered Environmental Health Specialist or Registered Sanitarian examination offered by the National Environmental Health Association or a State Registration Board.

Note: *Written examinations are part of a training process, not a standardization/certification process. The examinations listed are not to be considered equivalent to each other. They are to be considered as training tools and have been incorporated as part of the Standard because each instrument will provide a method of assessing whether a FSIO has attained a basic level of food safety knowledge. Any jurisdiction has the option and latitude to mandate a particular examination based on the laws and rules of that jurisdiction.*

Step 2: Initial Field Training and Experience

The regulatory staff conducting inspections of retail food establishments must conduct a minimum of 25 joint field inspections with a trainer who has successfully completed all training elements (Steps 1 – 3) of this Standard. The 25 joint field inspections are to be comprised of both "demonstration" (trainer led) and "training" (trainee led) inspections and include a variety of retail food establishment types available within the jurisdiction.

If the trainer determines that the FSIO has successfully demonstrated the required performance elements and competencies, a lower minimum number of joint field training inspections can be established for that FSIO provided there is written documentation, such as the completion of the CFP Field Training Plan in Appendix B-2, to support the exception.

Note: *The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."*

Demonstration inspections are those in which the jurisdiction's trainer takes the lead and the candidate observes the inspection process. Training inspections are those in which the candidate takes the lead, and their inspection performance is assessed and critiqued by the trainer. The jurisdiction's trainer is

responsible for determining the appropriate combination of demonstration and training inspections based on the candidate's food safety knowledge and performance during the joint field inspections.

The joint field inspections must be conducted using a field training process and forms similar to ones presented in the *CFP Field Training Manual* included as Appendix B-2. The *CFP Field Training Manual* consists of a training plan and log, trainer's worksheets, and procedures that may be incorporated into any jurisdiction's retail food training program. It is a national model upon which jurisdictions can design basic field training and provides a method for FSIOs to demonstrate competencies needed to conduct independent inspections of retail food, restaurant, and institutional foodservice establishments.

Jurisdictions are not required to use the forms or worksheets provided in the *CFP Field Training Manual*. Equivalent forms or training processes can be developed. To meet the intent of the Standard, documentation must be maintained that confirms FSIOs are trained on, and have demonstrated, the performance element competencies needed to conduct independent inspections of retail food and/or foodservice establishments.

> **Note:** *The CFP Field Training Manual is designed as a training approach providing a structure for continuous feedback between the FSIO and trainer on specific knowledge, skills, and abilities that are important elements of effective retail food, restaurant, and institutional foodservice inspections.*
>
> - *The CFP Field Training Manual is NOT intended to be used for certification or licensure purposes.*
> - *The CFP Field Training Manual is NOT intended to be used by regulatory jurisdictions for administrative purposes such as job classifications, promotions, or disciplinary actions.*

FSIOs must successfully complete a joint field training process, similar to that presented in the *CFP Field Training Manual*, prior to conducting independent inspections and re-inspections of retail food establishments in risk categories 2, 3, and 4 as presented in Appendix B-3 (taken from Annex 5, Table 1 of the 2013 *FDA Food Code*). The jurisdiction's trainer/food program manager can determine if the FSIO is ready to conduct independent inspections of risk category 1 establishments (as defined in Appendix B-3) at any time during the training process.

> **Note:** *The criterion for conducting a minimum of 25 joint field training inspections is intended for new employees or employees new to the food safety program. In order to accommodate an experienced FSIO, the supervisor/training officer can in lieu of the 25 joint field inspections:*
>
> - *Include a signed statement or affidavit in the employee's training file explaining the background or experience that justifies a waiver of this requirement; and*
> - *The supervisor/training officer must observe experienced FSIOs conduct inspections to determine any areas in need of improvement. An individual corrective action plan should be developed outlining how any training deficiencies will be corrected and the date when correction will be achieved.*

Step 3: Independent Inspections and Completion of ALL Curriculum Elements

Within 24 months of hire or assignment to the regulatory retail food program, Food Safety Inspection Officers must complete a minimum of 25 independent inspections of retail food, restaurant, and/or institutional foodservice establishments.

- If the jurisdiction's establishment inventory contains a sufficient number of facilities, the FSIO must complete 25 independent inspections of food establishments in risk categories 3 and 4 as described in Appendix B-3.
- For those jurisdictions that have a limited number of establishments which would meet the risk category 3 and/or 4 criteria, the FSIO must complete 25 independent inspections in food establishments that are representative of the highest risk categories within their assigned geographic region or training area.

In addition, all coursework identified in Appendix B-1, for the following eight curricula areas, must be completed within this 24-month time frame.

1. Prevailing statutes, regulations, ordinances (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
2. Public health principles (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
3. Communication skills (Step 1);
4. Food microbiology (some of the courses for this element are part of the pre-requisite curriculum outlined in Step 1);
5. Epidemiology;
6. Hazard Analysis Critical Control Points (HACCP);
7. Allergen Management
8. Emergency Management

All courses for each of the curriculum areas must be successfully completed within 24 months of hire or assignment to the regulatory retail food program in order for FSIOs to be eligible for the Field Standardization Assessment.

> **Note:** *The estimated contact time for completion of the FDA ORA U "post" courses is 26 hours. The term "post" refers to those courses in Appendix B-1 that were not included as part of the pre-requisite coursework. This includes all the courses in Appendix B-1 that do not have the designation "Pre" associated with them. All courses in Appendix B-1 must be successfully completed prior to conducting field standardizations.*

As with the pre-requisite inspection courses, the coursework pertaining to the above six curriculum areas can be successfully achieved by completing the ORA U courses listed under each curriculum area OR by completing courses, deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the comparable FDA ORA U courses.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion can be provided. The learning objectives for each of the listed ORA U courses are available from the FDA website: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners.

Step 4: Food Safety Inspection Officer – Field Standardization

Within 24 months of employment or assignment to the retail food program, staff conducting inspections of retail food establishments must satisfactorily complete four joint inspections with a "training standard" using a process similar to the "FDA Standardization Procedures." The jurisdiction's "training standard" must have met all the requirements for conducting field standardizations as presented in the definition section of these Standards. The standardization procedures shall determine the inspector's ability to apply the knowledge and skills obtained from the training curriculum, and address the five following performance areas:

1. Risk-based inspections focusing on the factors that contribute to foodborne illness;
2. Good Retail Practices;
3. Application of HACCP;
4. Inspection equipment; and
5. Communication.

Continuing standardization (re-standardization) shall be maintained by performing four joint inspections with the "training standard" every three years.

Note: *The field standardization and continuing standardization (re-standardization) criteria described in Step 4 is intended to provide a jurisdiction the flexibility to use their own regulation or ordinance. In addition, the reference to using standardization procedures similar to the FDA Procedures for Standardization of Retail Food Inspection Training Officers, is intended to allow the jurisdiction the option to develop its own written protocol to ensure that personnel are trained and prepared to competently conduct inspections. Any written standardization protocol must include the five performance areas outlined above in Step 4.*

It is highly beneficial to use the FDA Food Code, standardization forms and procedures even when a jurisdiction has adopted modifications to the Food Code. Usually, regulatory differences can be noted and discussed during the exercises, thereby enhancing the knowledge, and understanding of the candidate. The scoring and assessment tools presented in the FDA standardization procedures can be used without modification regardless of the Food Code enforced in a jurisdiction. The scoring and assessment tools are, however, specifically tied to the standardization inspection form and other assessment forms that are a part of the FDA procedures for standardizations.

FDA's standardization procedures are based on a minimum of 8 inspections. However, to meet Standard 2, a minimum of 4 standardization inspections must be conducted.

Jurisdictions that modify the limits of the standardization process by reducing the minimum number of inspections from 8 to 4 are cautioned that a redesign of the scoring assessment of the candidate's performance on the field inspections is required. This sometimes proves to be a very difficult task. A jurisdiction must consider both the food safety expertise of its staff, as well as the availability of personnel versed in statistical analysis before it decides to modify the minimum number of standardization inspections. The jurisdiction's standardization procedures need to reflect a credible process and the scoring assessment should facilitate

consistent evaluation of all candidates.

The five performance areas target the behavioral elements of an inspection. The behavioral elements of an inspection are defined as the manner, approach and focus which targets the most important public health risk factors and communicates vital information about the inspection in a way that can be received, understood, and acted upon by retail food management. The goal of standardization is to assess not only technical knowledge but also an inspector's ability to apply his or her knowledge in a way that ensures the time and resources spent within a facility offer maximum benefit to both the regulatory agency and the consuming public. Any customized standardization procedure must continue to meet these stated targets and goals.

Should a jurisdiction fall short of having 90% of its retail food program inspection staff successfully complete the Program Standard 2 criteria within the 24- month time frame, a written protocol must be established to provide a remedy so that the Standard can be met. This protocol would include a corrective action plan outlining how the situation will be corrected and the date when the correction will be achieved.

Step 5: Continuing Education and Training

A FSIO must accumulate 20 contact hours of continuing education in food safety every 36 months after the initial training (24 months) is completed. Within the scope of this standard, the goal of continuing education and training is to enhance the FSIO's knowledge, skills, and ability to perform retail food and foodservice inspections. The objective is to build upon the FSIO's knowledge base. Repeated coursework should be avoided unless justification is provided to, and approved by, the food program manager and/or training officer.

Training on any changes in the regulatory agency's prevailing statutes, laws and/or ordinances must be included as part of the continuing education (CE) hours within six months of the regulatory change. Documentation of the regulatory change date and date of training must be included as part of the individual's training record.

The candidate qualifies for one contact hour of continuing education for each clock hour of participation in any of the following nine activities that are related specifically to food safety or food inspectional work:

1. Attendance at FDA Regional seminars / technical conferences;
2. Professional symposiums / college courses;
3. Food-related training provided by government agencies (e.g., USDA, State, local);
4. Food safety related conferences and workshops; and
5. Distance learning opportunities that pertain to food safety, such as:
    - Web based or online training courses (e.g., additional food safety courses offered though ORA U, industry associations, universities); and
    - Satellite Broadcasts.

A maximum of ten (10) contact hours may be accrued from the following activities:

1. Delivering presentations at professional conferences;
2. Providing classroom and/or field training to newly hired FSIOs, or being a course instructor in food safety; or
3. Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

Contact hours for a specified presentation, course, or training activity will be recognized only one time within a 3-year continuing education period[1].

Note: *Time needed to prepare an original presentation, course, or article may be included as part of the continuing education hours. If the FSIO delivers a presentation or course that has been previously prepared, only the actual time of the presentation may be considered for continuing education credit.*

A maximum of four (4) contact hours may be accrued for:

1. Reading technical publications related to food safety.

Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation include:

- certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- transcripts from a college or university;
- a letter from the administrator of the continuing education program attended;
- a copy of the peer-reviewed article or presentation made at a professional conference; or
- documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports.

Note: *The key to a document's acceptability is that someone with responsibility, such as a training officer or supervisor, who has first-hand knowledge of employee's continuing education activities, maintains the training records according to an established protocol similar to that presented in Step 1 for assessing equivalent courses.*

Outcome

The desired outcome of this Standard is a trained regulatory staff with the skills and knowledge necessary to conduct quality inspections.

Documentation

The quality records needed for this standard include:

1. Certificates or proof of attendance from the successful completion of all the course elements identified in the Program Standard curriculum (Steps 1 and 3);

2. Documentation of field inspection reports for twenty-five each joint and independent inspections (Steps 2 and 3);
3. Certificates or other documentation of successful completion of a field training process similar to that presented in Appendix B-2. **NOTE:** The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."
4. Certificates or other records showing proof of satisfactory standardization (Step 4);
5. Contact hour certificates or other records for continuing education (Step 5);
6. Signed documentation from the regulatory jurisdiction's food program supervisor or training officer that food inspection personnel attended and successful completed the training and education steps outlined in this Standard.
7. Date of hire records or assignment to the retail food program; and
8. Summary record of employees' compliance with the Standard.

The *Standard 2: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 2.

STANDARD 4
UNIFORM INSPECTION PROGRAM

Table of Contents

REQUIREMENT SUMMARY 2
DESCRIPTION OF REQUIREMENT 2
OUTCOME 4
DOCUMENTATION 4

STANDARD 4
UNIFORM INSPECTION PROGRAM

This standard applies to the jurisdiction's internal policies and procedures established to ensure uniformity among regulatory staff in the interpretation of regulatory requirements, program policies and compliance / enforcement procedures.

Requirement Summary

Program management has established a quality assurance program to ensure uniformity among regulatory staff in the interpretation and application of laws, regulations, policies, and procedures.

Description of Requirement

1) Program Management implements an on-going quality assurance program that evaluates inspection uniformity to ensure inspection quality, inspection frequency and uniformity among the regulatory staff. The quality assurance program shall:

   A. The quality assurance program shall assure that each inspector:
      1. Has required equipment and forms to conduct the inspection.
      2. Reviews the contents of the establishment file, including the previous inspection report, reported complaints on file, and, if applicable, required HACCP Plans or documents supporting the issuance of a variance.
      3. Verifies that the establishment is in the proper risk category and that the required inspection frequency is being met. Informs the supervisor when the establishment is not in the proper risk category or when the required frequency is not met.
      4. Provides identification as a regulatory official to the person in charge and states the purpose of the visit.
      5. Interprets and applies the jurisdiction's laws, rules, policies, procedures, and regulations required for conducting retail food establishment inspections.
      6. Uses a risk-based inspection methodology to conduct the inspection.
      7. Accurately determines the compliance status of each risk factor and Food Code intervention (i.e., IN compliance, OUT of compliance, Not Observed, or Not Applicable).
      8. Obtains corrective action for out-of-compliance risk factors and Food Code interventions in accordance with the jurisdiction's policies.
      9. Discuss options for the long-term control of risk factors with establishment mangers, when the same out-of-control risk factor occurs on consecutive inspections, in accordance with the jurisdiction's policies. Options may include, but are not limited to; risk control plans, standard operating procedures, equipment and/or facility modification, menu modification, buyer specifications, remedial training, or HACCP plans.
      10. Verifies correction of out-of-compliance observations identified during the previous inspection. In addition, follows through with compliance and enforcement in accordance with the jurisdiction's policies.
      11. Conducts an exit interview that explains the out-of-compliance observations, corrective actions, and timeframes for correction, in accordance with the jurisdiction's policies.

12. Provides the inspection report and, when necessary, cross-referenced documents, to the person in charge or permit holder, in accordance with the jurisdiction's policies.
13. Demonstrates proper sanitary practices as expected from a food service employee.
14. Completes the inspection form per the jurisdiction's policies (i.e., observations, public health reasons, applicable code reference, compliance dates).
15. Documents the compliance status of each risk factor and intervention (IN, OUT, NA, NO).
16. Cites the proper code provisions for risk factors and Food code interventions, in accordance with the jurisdiction's policies.
17. Documents corrective action for out-of-compliance risk factors and Food Code interventions in accordance with the jurisdiction's policies.
18. Documents that option for the long-term control of risk factors were discussed with establishment managers when the same out-of-control risk factor occurs on consecutive inspections. Options may include, but are not limited to, risk control plans, standard operating procedures, equipment and/or facility modification, menu modification, buyer specifications, remedial training, or HACCP Plans.
19. Compliance or regulatory documents (i.e., exhibits, attachments, sample forms) are accurately completed, appropriately cross-referenced within the inspection report, and included with the inspection report, in accordance with the jurisdiction's policies.
20. Files reports and other documentation in a timely manner, in accordance with the jurisdiction's policies.

B. The quality assurance program shall describe the actions that will be implemented when the program analysis identifies deficiencies in quality or consistency in any program element listed above in 1) (A).

2) The quality assurance program must achieve an overall inspection program performance rating for each of the twenty measured elements [Items1-20] of at least 75% using the self-assessment procedure and the appropriate table provided in the *Standard 4: Self-Assessment Instructions and Worksheet.*

An assessment review of each inspector's work shall be made during at least three joint on-site inspections, with a corresponding file review of at least the three most recent inspection reports of the same inspected establishments, during every self-assessment period.

[*NOTE: *Staff members who are within their initial 24 months of training and have not completed all prerequisite courses, 25 joint inspections and 25 independent inspections as required in Standard 2, are exempt from the joint on-site inspections and file reviews used in the performance measurement rating calculation in the Standard 4 Self-Assessment Worksheet.*]

Outcome

A quality assurance program exists that ensures uniform, high-quality inspections.

Documentation

The quality records needed for this standard include:

1. A written procedure that describes the jurisdiction's quality assurance program that meets the criteria under the Description of Requirement section 1) (A), including corrective actions for deficiencies, and
2. Documentation that the program achieves a 75 percent performance rating on each element using the self-assessment procedures described above.

State Enforcement Policy

Keywords: STD-03, FDA

Issue Description

Background

As a result of 2019 legislation, our state implemented a new, progressive methodology for enforcement that became effective on January 1, 2020. This protocol takes into consideration not only the severity of the identified violation but also the prevalence of violations observed. The legislation provides for a uniform system to communicate inspection results which is based on an overall point system driven by assigned values of low, medium, and high pervasiveness. This point system establishes the criteria by which resources are to be directed for additional full re-inspections or enforcement activities.

Pervasiveness is the overall evaluation of specific issues observed to determine how prevalent the violation is. Using all available information such as active managerial control, previous inspection records, long term controls, and overall risk/severity of the specific situation, an inspector assigns a violation pervasiveness. This system then classifies routine and re-inspections into one of three ratings ("Pass," "Re-inspection," or "Closed") based on the total cumulative violations/ points. This rating is then used to determine the next required action: no required action (the next routine inspections is scheduled), a full facility re-inspection, or the immediate suspension of a license to operate. Facilities that score less than 50 points pass the inspection and do not have to demonstrate correction of risk factor or intervention violations through re-inspection or other follow-up activities.

We are seeking clarification for criteria 4 of standard 3 – the requirement for an implemented policy that requires on-site corrective actions or follow-up activities for out of compliance foodborne illness risk factors. The policies established in Standard 3 for onsite and long-term corrective actions link to Standard 6, Compliance and Enforcement. The violations in the Standard 6 CFP crosswalk outlines violations that should have corrective actions, these violations include interventions and core violations as well as risk factors.

Question/Problem

The CFP cross-walk contains very specific code citations within items 1-29 of the FDA inspection form for risk factors and interventions that include Priority, Priority Foundation, and Core violations. Are core and intervention violations intended to be included in the requirement for on-site corrective actions and follow-up activities?

Does our inspection program meet standard 3 if we do not require corrective action or follow-up activities for violations that pose a low risk to public health?

Rationale

Standard 3 specifically does not appear to align with Standard 6 for State and Local programs that have developed alternative systems of assessment that can also accomplish the same goal. There are situations where appropriate corrective actions cannot occur at the time of the inspection and the

violation has a low risk to the public's health. Because of the nuances in the code and a focus on mitigating risk and assessing active managerial control, it does not seem appropriate to require corrective action and follow-up activities for every situation in which risk-factors are out of compliance.

Standard 3 – Criteria 4

4. Corrective Action Policy

a) The jurisdiction has a written and implemented policy that requires on-site corrective action for foodborne illness risk factors observed to be out of compliance.

b) The jurisdiction has a written and implemented policy that requires discussion for long- term control of foodborne illness risk factors.

c) The jurisdiction has a written and implemented policy that requires follow-up activities on foodborne illness risk factor violations.

Response from the Clearinghouse (11-30-22)

No. Standard 3 requires that a jurisdiction develop and implement a policy that requires timely corrective actions as appropriate to the type of violation. In some cases, an actual physical visit to an establishment may not be necessary, however documented activities should lead to a desired outcome where a regulatory inspection system uses HACCP principles to identify risk factors and to obtain immediate and long-term corrective action for recurring risk factors. Core violations do not require an immediate on-site correction but follow up should be performed.

According to the 2017 FDA Food Code, the following is required: 8-406.11 Time Frame for Correction.
(A) Except as specified in (B) of this section, the PERMIT HOLDER shall correct CORE ITEMS by a date and time agreed to or specified by the REGULATORY AUTHORITY but no later than 90 calendar days after the inspection.
(B) The REGULATORY AUTHORITY may approve a compliance schedule that extends beyond the time limits specified under (A) of this section if a written schedule of compliance is submitted by the PERMIT HOLDER and no health HAZARD exists or will result from allowing an extended schedule for compliance.

STANDARD No. 2
Training Program

2.1 Purpose

This standard defines the essential elements of a training program for inspectors.

2.2 Requirement Summary

The State program uses a written training plan that promotes development and demonstrates that all inspectors who will conduct manufactured food inspections complete course curriculums, field training, and continuing education to adequately perform their work.

2.3 Program Elements

2.3.1 Training Plan and Training Records

2.3.1.1 The State program uses a written training plan that ensures all inspectors receive training required to adequately perform their work assignments. The training plan includes course curriculums which provides for basic and advanced food inspection training as well as continuing education.

2.3.1.2 Appendix 2.2 or equivalent form must be used to document and summarize all training provided to inspectors.

2.3.1.3 The State program maintains a training history for active inspectors. The training history for all inactive inspectors must be kept for three years or per the state's record retention policy.

2.3.1.4 Appendix 2.3 or equivalent form must be used to document training for each inspector.

2.3.1.5 The State training record summary and individual training records must include the inspector's START DATE. Equivalent forms including electronic records may be used for required appendices.

2.3.2 Basic Food Inspection Training

The State program requires that each inspector complete a basic food inspection training curriculum that consists of coursework and field training described here.

2.3.2.1 Timeframe

The Basic Food Inspection Training course curriculum shall be successfully completed within 24 months of the inspector's START DATE with the manufactured food program.

2.3.2.2 Course Curriculum:

The Basic Food Inspection Training consists of coursework in the subject areas listed in this section.

2.3.2.2.1 Prevailing statutes, regulations, and ordinances
2.3.2.2.2 Public health principles
2.3.2.2.3 Emergency management
2.3.2.2.4 Communications skills
2.3.2.2.5 Microbiology
2.3.2.2.6 Epidemiology
2.3.2.2.7 Basics of HACCP
2.3.2.2.8 Allergen management
2.3.2.2.9 Basic food labeling
2.3.2.2.10 Food defense awareness training
2.3.2.2.11 Sampling technique and preparation

Note: States may further subdivide their basic training by identifying courses required for inspectors who only inspect non high risk warehouses. These courses must be clearly defined in the state training plan.

Note: Appendix 2.4 provides a list of available Basic Food Inspection Training Coursework that may be used to satisfy the requirements in 2.3.2.2.

2.3.2.3 Field training

2.3.2.3.1 Each inspector who will inspect general manufactured food firms must complete:
- 2.3.2.3.1.1 Ten JOINT FIELD TRAINING INSPECTION, FIELD INSPECTION AUDITS, or EVALUATIONS with a QUALIFIED FIELD INSPECTION TRAINER; and
- 2.3.2.3.1.2 Of the ten, two must be acceptable FIELD INSPECTION AUDITS or EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.2 Each inspector who will only inspect non high risk food warehouses must complete:
- 2.3.2.3.2.1 Five JOINT FIELD TRAINING INSPECTION, FIELD INSPECTION AUDITS, or EVALUATIONS with a QUALIFIED FIELD INSPECTION TRAINER; and
- 2.3.2.3.2.2 Of the five, two must be acceptable FIELD INSPECTION AUDITS or

EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.3 Inspectors who meet 2.3.2.3.2 and advance to conduct general manufactured food firms must complete:

2.3.2.3.3.1 Five additional JOINT FIELD TRAINING INSPECTIONS, FIELD INSPECTION AUDITS, or EVALUATIONS to fulfill requirements identified in 2.3.2.3.1; and

2.3.2.3.3.2 Of the five, two must be acceptable FIELD INSPECTION AUDITS or EVALUATIONS by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR.

2.3.2.3.4 JOINT FIELD TRAINING INSPECTION or FIELD INSPECTION AUDITS/EVALUATIONS are conducted in firms that are representative of the firms to be inspected by the inspector. Each inspector will complete the minimum field training requirements prior to conducting independent inspections.

2.3.3 Advanced Food Inspection Training

The State program requires each inspector who will conduct specialized food inspections to complete an advanced inspection training curriculum which consists of relevant coursework and field training as described here.

2.3.3.1 Coursework

The state program requires each inspector who will perform specialized food inspections to successfully complete the coursework specific to the type of specialized food inspections they will be performing. Specialized food inspection courses include, but not limited to:

2.3.3.1.1 Acidified foods
2.3.3.1.2 Low acid canned foods
2.3.3.1.3 Juice HACCP
2.3.3.1.4 Seafood HACCP
2.3.3.1.5 Traceback Investigations[7]
2.3.3.1.6 Foodborne Illness Investigations[7]

2.3.3.2 Field training

[7] These advanced food inspection training courses are not subject to 2.3.3.2 Field Training requirements.

The State program requires that each inspector successfully complete the following before performing independent specialized food inspections.

2.3.3.2.1 Participate in two JOINT FIELD TRAINING INSPECTIONS;

2.3.3.2.2 After successful completion of the course participate in one EVALUATION or FIELD INSPECTION AUDIT that is found to be acceptable by a QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR prior to conducting independent inspections; and

2.3.3.2.3 Within one year after being released to do specialized food inspections complete a second EVALUATION or FIELD INSPECTION AUDIT that is found to be acceptable by QUALIFIED FIELD INSPECTION TRAINER or QUALIFIED FIELD INSPECTION AUDITOR in the area of specialty.

2.3.4 Experienced Inspectors

The criterion for conducting a minimum of 10 JOINT FIELD TRAINING INSPECTIONS and/or required coursework is intended for new employees or employees new to the food safety program. For CURRENT EXPERIENCED STAFF or NEWLY HIRED EXPERIENCED STAFF, a State program's training plan shall include the following unless the state determines in their training plan that all staff will be required to complete the program elements in 2.3.2 and 2.3.3:

2.3.4.1 CURRENT EXPERIENCED STAFF

	Missing Record	Documentation in Employee Training File
2.3.4.1.1	JOINT FIELD TRAINING INSPECTIONS	Statement or affidavit explaining the background or experience that justifies a waiver of the basic or specialized JOINT FIELD TRAINING INSPECTIONS.
2.3.4.1.2	Basic Course Work	Document training records available. Create a statement or affidavit explaining the background or experience that justifies a waiver of the missing Basic Course Work.
2.3.4.1.3	Specialized Food Inspection Course Work Certificates	Statement or affidavit explaining the date and location that they have successfully completed the specialized training.

2.3.4.2 NEWLY EXPERIENCED STAFF

	Missing Record	Documentation in Employee Training File
2.3.4.2.1	JOINT FIELD TRAINING INSPECTIONS	Statement or affidavit explaining the background or experience that justifies a waiver of some or all of the basic or specialized JOINT FIELD TRAINING INSPECTIONS. Conduct two successful EVALUATION or FIELD INSPECTION AUDIT within 6 months of the Inspector's QUALIFIED DATE.
2.3.4.2.2	Basic Course Work	Document training records available. Statement or affidavit explaining the background or experience that justifies a waiver of the Basic Course Work.
2.3.4.2.3	Specialized Food Inspection Course Work Certificates	Statement or affidavit explaining the date and location that they have successfully completed the specialized training.

2.3.5 Continuing education

Within the scope of this standard, the goal of continuing education and training is to enhance the inspector's knowledge, skills, and ability to perform manufactured food inspections. The objective is to build upon the inspector's knowledge base.

2.3.5.1 Each inspector must accumulate 20 CONTACT HOURS of continuing education in food safety every 36 months.

2.3.5.2 The 36-month continuing education interval starts at the QUALIFIED DATE, when the basic training cycle is completed.

2.3.5.3 The program may establish an alternate timeframe to track continuing education as long as the alternate timeframe and how that timeframe still meets or exceeds the intent of the standard (at least 20 CONTACT HOURS every 36 months) are clearly identified in program procedures.

2.3.5.4 The inspector qualifies for CONTACT HOURS for participation in any of the following activities that are related specifically to manufactured food safety or manufactured food inspectional work:

- Attendance at national or regional seminars / technical conferences;
- Professional symposiums / college courses;
- Food-related training provided by government agencies (e.g., USDA, State, local);
- Food safety related conferences and workshops;
- Distance learning opportunities that pertain to food safety; or

- Training approved by a QUALIFIED FIELD INSPECTION TRAINER.

2.3.5.5 Of the accumulated 20 CONTACT HOURS of continuing education, a maximum of ten (10) CONTACT HOURS may be accrued from the following activities:

- Delivering presentations at professional conferences;
- Providing classroom and/or field training to newly hired inspectors, or being a course instructor in food safety; or
- Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

2.3.5.6 Of the accumulated 20 CONTACT HOURS of continuing education, a maximum of four (4) CONTACT HOURS may be accrued for reading technical publications related to manufactured food safety.

2.3.5.7 Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation may include:

- Certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- Transcripts from a college or university;
- A letter from the administrator of the continuing education program attended;
- A copy of the peer-reviewed article or presentation made at a professional conference; or documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports; and
- An agenda and attendance roster.
- Documentation approved by the QUALIFIED FIELD INSPECTION TRAINER.

2.3.6 Coursework Sources

Basic, advanced, and continuing education coursework must be obtained from one of the sources listed here:

2.3.6.1 Training provided by a government agency (including in house training);

2.3.6.2 Distance learning, for example, satellite downlinks or web-based training[8];

2.3.6.3 Colleges, schools, research centers, and institutes;

[8] FDA/ORA U classroom and long distance learning courses are listed at: http://www.fda.gov/ora/training/course_ora.html

STANDARD No. 3
Inspection Program

3.1 Purpose

This standard describes the elements of an effective inspection program for manufactured food establishments.

3.2 Requirement Summary

The State program has a manufactured food inspection system. This system provides the foundation for inspecting food firms to determine compliance with the laws administered by Federal, State, and local governments. In addition, the State program has: (1) a risk based inspection program, (2) an inspection procedure, (3) an inspection report procedure, (4) a system to respond to CONSUMER COMPLAINTS, (5) a system to resolve INDUSTRY COMPLAINTS about inspections, (6) a recall system, and (7) a sampling procedure.

3.3 Program Elements

3.3.1 Risk-based Inspection Program

The State program has an inventory of food establishments for which the State has regulatory oversight. The inventory is categorized by the risk associated with the likelihood that a food safety or defense incident will occur.

3.3.1.1 Inspections are prioritized and frequencies assigned based on established risk categories. The State program has written procedure documenting their classification criteria and inspection frequencies.

3.3.1.2 The state program must use the risk factors and classification criteria as described in:

- Appendix 3.2; or
- FD&C Act, Section 421 (a)(1); or
- Develop its own risk factor and classification criteria. If the state chooses to develop its own risk factor and classification criteria a written rationale must be provided that demonstrates how public health is protected.

3.3.2 Inspection Procedure

The State program has a written procedure for inspecting food plants that require the inspectors to:

3.3.2.1 Review the previous inspection report and CONSUMER COMPLAINTS.

3.3.2.2 Have appropriate equipment[9] and forms (if necessary). Equipment must be verified and maintained as defined by the State's standard operating procedures or manufacture's recommendations.

3.3.2.3 Make appropriate introductions, and explain the purpose and scope of the inspection.

3.3.2.4 Establish jurisdiction.

3.3.2.5 Select an appropriate product for the inspection and, if necessary, make appropriate adjustments based on what the plant is producing.

3.3.2.6 Assess employee practices critical to the safe and sanitary production and storage of food.

3.3.2.7 Properly evaluate the likelihood that conditions, practices, components, and/or labeling could cause the product to be adulterated or misbranded or otherwise in violation of applicable law.

3.3.2.8 Recognize significant violative conditions or practices, if present, and record findings consistent with State program procedures.

3.3.2.9 Distinguish between significant and insignificant observations, and isolated incidents versus trends.

3.3.2.10 Review and evaluate the appropriate records and procedures for the establishment's operation and effectively apply the information obtained from this review [during the inspection].

3.3.2.11 Collect adequate evidence and documentation to support inspection observations in accordance with State program procedures.

3.3.2.12 Verify correction of deficiencies identified during the previous inspection.

3.3.2.13 Behave professionally and demonstrate proper sanitary practices during the inspection.

3.3.2.14 Use current versions of applicable hazard guides or other guidance, to identify and evaluate the HAZARDS associated with product(s) and process(es) when conducting inspections of specialized food and processes.

3.3.2.15 Assess the firm's implementation of sanitation monitoring for the applicable eight key areas of sanitation when required by regulation.

3.3.2.16 When appropriate review the firm's: scheduled process; HACCP plan or necessary process controls in the absence of a HACCP plan; food safety control plan and applicable monitoring, verification and deviation or corrective action records, including those related to sanitation.

3.3.2.17 Recognize deficiencies in the firm's monitoring controls and sanitation procedures through in-plant observations.

3.3.2.18 Use suitable interviewing techniques.

3.3.2.19 Explain findings clearly and adequately throughout the inspection.

3.3.2.20 Alert the firm's person in charge when an immediate corrective action is necessary.

[9] Standard number 8, Appendix 8.3 Inspection Equipment

3.3.2.21 Answer questions and provide information in an appropriate manner.
3.3.2.22 Write findings accurately, clearly, and concisely on the State document and provide a copy to the firm's person in charge.

3.3.3 Inspection Report

The State program has a written inspection report procedure that requires inspectors to:

3.3.3.1 Submit the inspection report within designated timeframes;
3.3.3.2 Complete the inspection report form completely and accurately;
3.3.3.3 Document violations and observations clearly, legibly, and concisely; and
3.3.3.4 Follow up with corrective action, compliance and enforcement.

3.3.4 Food Recalls[10]

The State program has a food recall system with written recall procedures for:

3.3.4.1 Sharing information about recalls with relevant agencies;
3.3.4.2 Ensuring recalled products are removed promptly from the market; and
3.3.4.3 Performing RECALL AUDIT CHECKS.

3.3.5 Consumer Complaints

The State program has a system for handling CONSUMER COMPLAINTS. The system contains written procedures for:

3.3.5.1 Receiving;
3.3.5.2 Tracking;
3.3.5.3 Evaluating;
3.3.5.4 Responding to; and
3.3.5.5 Closing CONSUMER COMPLAINTS.

3.3.6 Complaints Resulting from State Program Inspection Activities

The State program has a system for handling INDUSTRY COMPLAINTS about inspections. The system contains written procedures for:

3.3.6.1 Receiving;
3.3.6.2 Evaluating; and
3.3.6.3 Responding to INDUSTRY COMPLAINTS.

[10] Reference: PFP Best Practices for Improving FDA and State Communication During Recalls can be found: http://www.fda.gov/downloads/ForFederalStateandLocalOfficials/FoodSafetySystem/PartnershipforFoodProtectionPFP/UCM460013.pdf?source=govdelivery&utm_medium=email&utm_source=govdelivery

3.3.7 Sampling Procedure[11]

The State program has a written sampling procedure to ensure its SAMPLING PROGRAM is carried out in a manner that is consistent with state procedure. The sampling procedures must be reflective of the types of food and samples that the state collects and must include:

3.3.7.1 Procedures that require sample collectors to:

- 3.3.7.1.1 Use the appropriate method and equipment to collect the sample.
- 3.3.7.1.2 Record sample chain of custody per state procedure.
- 3.3.7.1.3 Handle, package, and ship sample using procedures appropriate to prevent compromising condition of the sample and ensuring security of the sample.
- 3.3.7.1.4 Deliver or ship sample to the appropriate laboratory program within prescribed timeframes.

3.3.7.2 Instructions for documenting the sample collection must include the following unless specified by the State's SAMPLING PROGRAM:

- 3.3.7.2.1 Date of Sample Collection
- 3.3.7.2.2 Product Identification Including:
  - 3.3.7.2.2.1 Name of Product
  - 3.3.7.2.2.2 Unique Manufacturing Identification references
- 3.3.7.2.3 Description of the product
- 3.3.7.2.4 Collection information including:
  - 3.3.7.2.4.1 Method of Collection
  - 3.3.7.2.4.2 Lot Sampled
  - 3.3.7.2.4.3 Lot Size
  - 3.3.7.2.4.4 Special Sample techniques if used to collect the sample
- 3.3.7.2.5 Location where sample was collected.
- 3.3.7.2.6 Name and address of responsible party, guarantor, possessor, or distributor.
- 3.3.7.2.7 Sample type
- 3.3.7.2.8 Analysis requested *if applicable*.
- 3.3.7.2.9 Product labels or specific labeling information that is collected or reproduced per state policies.

[11] Reference: PFP Food/Feed Testing Laboratories Best Practices Manual can be found: http://www.fda.gov/downloads/ForFederalStateandLocalOfficials/FoodSafetySystem/PartnershipforFoodProtectionPFP/UCM404716.pdf

3.3.7.2.10 Identification of the sample with the sample number assigned by the sampler at the time of collection.

3.3.7.3 State programs are not required to have a written sampling procedure unless they collect samples. However, these programs must have a statement in lieu of sampling procedures that explains why a SAMPLING PROGRAM is not supported and how the public health is protected in the absence of such a program. An example may include: Stating that public health is protected because another state or federal agency collects samples and fulfills this need. The statement should include the name of the agency and the type of samples that it collects.

3.3.8 Records Retention

The State program must maintain records as required under Section 9.3.2.2 for the following:

3.3.8.1 Inspection reports which includes follow up activities;
3.3.8.2 Essential recall information;
3.3.8.3 CONSUMER COMPLAINTS;
3.3.8.4 INDUSTRY COMPLAINTS about inspections[12]; and
3.3.8.5 Documentation associated with sample collection.

3.4 Outcome

The State program is based on an inspection program that reduces the occurrence of foodborne illness, injury, or allergic reaction.

3.5 Documentation

The State program maintains the records listed here.

3.5.1 Appendix 3.1 Self-Assessment Worksheet
3.5.2 An inventory of food plants for which the state has regulatory oversight[13]
3.5.3 Written procedure documenting the classification criteria and inspection frequencies
3.5.4 Written rationale of the risk factor and classification criteria if a State program develops its own risk factor and classification criteria
3.5.5 Written procedures for inspecting food plants.
3.5.6 Written inspection reports procedure

[12] Records dealing with personnel actions are not subject to review during an ASSESSMENT.

[13] Refer to PFP Document Data Elements and Definitions for recommended but not required data elements for each food plant. http://www.fda.gov/downloads/ForFederalStateandLocalOfficials/FoodSafetySystem/PartnershipforFoodProtectionPFP/UCM404717.pdf

3.5.7 Written inspection reports, which includes follow-up activities
3.5.8 Written procedures for food recalls
3.5.9 Essential recall information
3.5.10 Written procedures for CONSUMER COMPLAINTS
3.5.11 CONSUMER COMPLAINTS
3.5.12 Written procedures for INDUSTRY COMPLAINTS about inspections
3.5.13 INDUSTRY COMPLAINTS about inspections[14]
3.5.14 Written procedures for sampling or, in the absence of any SAMPLING PROGRAM, a statement stating how public health is protected
3.5.15 Sample collection reports
3.5.16 Documentation associated with sample collection

[14] Records dealing with personnel actions are not subject to review during an ASSESSMENT.

STANDARD 2 TRAINED REGULATORY STAFF

REQUIREMENT SUMMARY 2
DESCRIPTION OF REQUIREMENT 2
Step 1: Pre-Inspection Curriculum 3
Step 2: Initial Field Training and Experience 4
Step 3: Independent Inspections and Completion of ALL Curriculum Elements 6
Step 4: Food Safety Inspection Officer – Field Standardization 7
Step 5: Continuing Education and Training 8
OUTCOME 9
DOCUMENTATION 9

STANDARD 2 TRAINED REGULATORY STAFF

This Standard applies to the essential elements of a training program for regulatory staff.

Requirement Summary

The regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have the knowledge, skills, and ability to adequately perform their required duties. The following is a schematic of a 5-step training and standardization process to achieve the required level of competency.

STEP 1
Completion of curriculum courses designated as "Pre" in Appendix B-1 prior to conducting and independent routine inspections.

STEP 2
Completion of the following:

- A minimum of 25 joint field training inspections (or a sufficient number of joint inspections determined by the trainer and verified through written documentation that the FSIO has demonstrated all performance elements and competencies to conduct independent inspections of retail food establishments); and
- Successful completion of the jurisdiction's FSIO Field Training Plan similar to the process outlined in *Appendix B-2: Conference for Food Protection (CFP) Field Training Manual*.

STEP 3
Completion of the following:

- A minimum of 25 independent inspections; and
- Remaining course curriculum (designated as "post" courses) outlined in *Appendix B-1: Curriculum for Retail Food Safety Inspection Officers*.

STEP 4
Completion of a standardization process similar to the FDA standardization procedures.

STEP 5
Completion of 20 contact hours of continuing food safety education every 36 months after the initial training is completed.

Description of Requirement

Ninety percent (90 %) of the regulatory retail food program inspection staff (Food Safety Inspection Officers - FSIO) shall have successfully completed the required elements of the 5-step training and standardization process:

- Steps 1 through 4 within 24 months of hire or assignment to the retail food regulatory program.
- Step 5 every 36 months after the initial 24 months of training.

Step 1: Pre-Inspection Curriculum

Prior to conducting any type of independent field inspections in retail food establishments, the FSIO must satisfactorily complete training in pre-requisite courses designated with a "Pre" in Appendix B-1, for the following curriculum areas:

1. Prevailing statutes, regulations, ordinances (specific laws and regulations to be addressed by each jurisdiction);
2. Public Health Principles;
3. Food Microbiology; and
4. Communication Skills.

There are two options for demonstrating successful completion of the pre-inspection curriculum.

OPTION 1: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- FDA ORA U pre-requisite courses identified as "Pre" in Appendix B-1; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances.

Note: *The estimated contact time for completion of the FDA ORA U pre-requisite ("Pre") courses is 42 hours.*

OPTION 2: Completion of the pre-inspection curriculum may be demonstrated by successful completion of the following:

- Successful completion of courses deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the FDA ORA U pre- requisite (Pre") courses; and
- Training on the jurisdiction's prevailing statutes, regulations, and/or ordinances; and
- Successful passing of one of the four written examination options (described later in this Standard) for determining if a FSIO has a basic level of food safety knowledge.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion is provided. The learning objectives for each of the listed ORA U courses are available from the web site link at: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners

> **Note:** *While certificates issued by course sponsors are the ideal proof of attendance, other official documentation can serve as satisfactory verification of attendance. The key to a document's acceptability is that someone with responsibility, such as a trainer/food program manager who has first-hand knowledge of employee attendance at the session, keeps the records according to an established protocol. An established protocol can include such items as:*
>
> - *Logs/records that are completed based on sign-in sheets; or*
> - *Information validated from the certificate at the time-of-issuance; or*
> - *A college transcript with a passing grade or other indication of successful completion of the course; or*
> - *Automated attendance records, such as those currently kept by some professional associations and state agencies, or*
> - *Other accurate verification of actual attendance.*

Regulatory retail food inspection staff submitting documentation of courses equivalent to the FDA ORAU courses – OPTION 2 – must also demonstrate a basic level of food safety knowledge by successfully passing one examination from the four written examination categories specified herein.

1. The Certified Food Safety Professional examination offered by the National Environmental Health Association; or

2. A state sponsored food safety examination that is based on the current version of the FDA Food Code (and supplement) and is developed using methods that are psychometrically valid and reliable; or

3. A food manager certification examination provided by an ANSI/CFP accredited certification organization; or

4. A Registered Environmental Health Specialist or Registered Sanitarian examination offered by the National Environmental Health Association or a State Registration Board.

Note: *Written examinations are part of a training process, not a standardization/certification process. The examinations listed are not to be considered equivalent to each other. They are to be considered as training tools and have been incorporated as part of the Standard because each instrument will provide a method of assessing whether a FSIO has attained a basic level of food safety knowledge. Any jurisdiction has the option and latitude to mandate a particular examination based on the laws and rules of that jurisdiction.*

Step 2: Initial Field Training and Experience

The regulatory staff conducting inspections of retail food establishments must conduct a minimum of 25 joint field inspections with a trainer who has successfully completed all training elements (Steps 1 – 3) of this Standard. The 25 joint field inspections are to be comprised of both "demonstration" (trainer led) and "training" (trainee led) inspections and include a variety of retail food establishment types available within the jurisdiction.

If the trainer determines that the FSIO has successfully demonstrated the required performance elements and competencies, a lower minimum number of joint field training inspections can be established for that FSIO provided there is written documentation, such as the completion of the CFP Field Training Plan in Appendix B-2, to support the exception.

Note: *The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."*

Demonstration inspections are those in which the jurisdiction's trainer takes the lead and the candidate observes the inspection process. Training inspections are those in which the candidate takes the lead, and their inspection performance is assessed and critiqued by the trainer. The jurisdiction's trainer is

responsible for determining the appropriate combination of demonstration and training inspections based on the candidate's food safety knowledge and performance during the joint field inspections.

The joint field inspections must be conducted using a field training process and forms similar to ones presented in the *CFP Field Training Manual* included as Appendix B-2. The *CFP Field Training Manual* consists of a training plan and log, trainer's worksheets, and procedures that may be incorporated into any jurisdiction's retail food training program. It is a national model upon which jurisdictions can design basic field training and provides a method for FSIOs to demonstrate competencies needed to conduct independent inspections of retail food, restaurant, and institutional foodservice establishments.

Jurisdictions are not required to use the forms or worksheets provided in the *CFP Field Training Manual*. Equivalent forms or training processes can be developed. To meet the intent of the Standard, documentation must be maintained that confirms FSIOs are trained on, and have demonstrated, the performance element competencies needed to conduct independent inspections of retail food and/or foodservice establishments.

> **Note:** *The CFP Field Training Manual is designed as a training approach providing a structure for continuous feedback between the FSIO and trainer on specific knowledge, skills, and abilities that are important elements of effective retail food, restaurant, and institutional foodservice inspections.*
>
> - *The CFP Field Training Manual is NOT intended to be used for certification or licensure purposes.*
> - *The CFP Field Training Manual is NOT intended to be used by regulatory jurisdictions for administrative purposes such as job classifications, promotions, or disciplinary actions.*

FSIOs must successfully complete a joint field training process, similar to that presented in the *CFP Field Training Manual*, prior to conducting independent inspections and re-inspections of retail food establishments in risk categories 2, 3, and 4 as presented in Appendix B-3 (taken from Annex 5, Table 1 of the 2013 *FDA Food Code*). The jurisdiction's trainer/food program manager can determine if the FSIO is ready to conduct independent inspections of risk category 1 establishments (as defined in Appendix B-3) at any time during the training process.

> **Note:** *The criterion for conducting a minimum of 25 joint field training inspections is intended for new employees or employees new to the food safety program. In order to accommodate an experienced FSIO, the supervisor/training officer can in lieu of the 25 joint field inspections:*
>
> - *Include a signed statement or affidavit in the employee's training file explaining the background or experience that justifies a waiver of this requirement; and*
> - *The supervisor/training officer must observe experienced FSIOs conduct inspections to determine any areas in need of improvement. An individual corrective action plan should be developed outlining how any training deficiencies will be corrected and the date when correction will be achieved.*

Step 3: Independent Inspections and Completion of ALL Curriculum Elements

Within 24 months of hire or assignment to the regulatory retail food program, Food Safety Inspection Officers must complete a minimum of 25 independent inspections of retail food, restaurant, and/or institutional foodservice establishments.

- If the jurisdiction's establishment inventory contains a sufficient number of facilities, the FSIO must complete 25 independent inspections of food establishments in risk categories 3 and 4 as described in Appendix B-3.
- For those jurisdictions that have a limited number of establishments which would meet the risk category 3 and/or 4 criteria, the FSIO must complete 25 independent inspections in food establishments that are representative of the highest risk categories within their assigned geographic region or training area.

In addition, all coursework identified in Appendix B-1, for the following eight curricula areas, must be completed within this 24-month time frame.

1. Prevailing statutes, regulations, ordinances (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
2. Public health principles (all courses for this element are part of the pre-requisite curriculum outlined in Step 1);
3. Communication skills (Step 1);
4. Food microbiology (some of the courses for this element are part of the pre-requisite curriculum outlined in Step 1);
5. Epidemiology;
6. Hazard Analysis Critical Control Points (HACCP);
7. Allergen Management
8. Emergency Management

All courses for each of the curriculum areas must be successfully completed within 24 months of hire or assignment to the regulatory retail food program in order for FSIOs to be eligible for the Field Standardization Assessment.

> **Note:** *The estimated contact time for completion of the FDA ORA U "post" courses is 26 hours. The term "post" refers to those courses in Appendix B-1 that were not included as part of the pre-requisite coursework. This includes all the courses in Appendix B-1 that do not have the designation "Pre" associated with them. All courses in Appendix B-1 must be successfully completed prior to conducting field standardizations.*

As with the pre-requisite inspection courses, the coursework pertaining to the above six curriculum areas can be successfully achieved by completing the ORA U courses listed under each curriculum area OR by completing courses, deemed by the regulatory jurisdiction's food program supervisor or training officer to be equivalent to the comparable FDA ORA U courses.

A course is deemed equivalent if it can be demonstrated that it covers at least 80% of the learning objectives of the comparable ORA U course AND verification of successful completion can be provided. The learning objectives for each of the listed ORA U courses are available from the FDA website: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners.

Step 4: Food Safety Inspection Officer – Field Standardization

Within 24 months of employment or assignment to the retail food program, staff conducting inspections of retail food establishments must satisfactorily complete four joint inspections with a "training standard" using a process similar to the "FDA Standardization Procedures." The jurisdiction's "training standard" must have met all the requirements for conducting field standardizations as presented in the definition section of these Standards. The standardization procedures shall determine the inspector's ability to apply the knowledge and skills obtained from the training curriculum, and address the five following performance areas:

1. Risk-based inspections focusing on the factors that contribute to foodborne illness;
2. Good Retail Practices;
3. Application of HACCP;
4. Inspection equipment; and
5. Communication.

Continuing standardization (re-standardization) shall be maintained by performing four joint inspections with the "training standard" every three years.

Note: *The field standardization and continuing standardization (re-standardization) criteria described in Step 4 is intended to provide a jurisdiction the flexibility to use their own regulation or ordinance. In addition, the reference to using standardization procedures similar to the FDA Procedures for Standardization of Retail Food Inspection Training Officers, is intended to allow the jurisdiction the option to develop its own written protocol to ensure that personnel are trained and prepared to competently conduct inspections. Any written standardization protocol must include the five performance areas outlined above in Step 4.*

It is highly beneficial to use the FDA Food Code, standardization forms and procedures even when a jurisdiction has adopted modifications to the Food Code. Usually, regulatory differences can be noted and discussed during the exercises, thereby enhancing the knowledge, and understanding of the candidate. The scoring and assessment tools presented in the FDA standardization procedures can be used without modification regardless of the Food Code enforced in a jurisdiction. The scoring and assessment tools are, however, specifically tied to the standardization inspection form and other assessment forms that are a part of the FDA procedures for standardizations.

FDA's standardization procedures are based on a minimum of 8 inspections. However, to meet Standard 2, a minimum of 4 standardization inspections must be conducted.

Jurisdictions that modify the limits of the standardization process by reducing the minimum number of inspections from 8 to 4 are cautioned that a redesign of the scoring assessment of the candidate's performance on the field inspections is required. This sometimes proves to be a very difficult task. A jurisdiction must consider both the food safety expertise of its staff, as well as the availability of personnel versed in statistical analysis before it decides to modify the minimum number of standardization inspections. The jurisdiction's standardization procedures need to reflect a credible process and the scoring assessment should facilitate

consistent evaluation of all candidates.

The five performance areas target the behavioral elements of an inspection. The behavioral elements of an inspection are defined as the manner, approach and focus which targets the most important public health risk factors and communicates vital information about the inspection in a way that can be received, understood, and acted upon by retail food management. The goal of standardization is to assess not only technical knowledge but also an inspector's ability to apply his or her knowledge in a way that ensures the time and resources spent within a facility offer maximum benefit to both the regulatory agency and the consuming public. Any customized standardization procedure must continue to meet these stated targets and goals.

Should a jurisdiction fall short of having 90% of its retail food program inspection staff successfully complete the Program Standard 2 criteria within the 24- month time frame, a written protocol must be established to provide a remedy so that the Standard can be met. This protocol would include a corrective action plan outlining how the situation will be corrected and the date when the correction will be achieved.

Step 5: Continuing Education and Training

A FSIO must accumulate 20 contact hours of continuing education in food safety every 36 months after the initial training (24 months) is completed. Within the scope of this standard, the goal of continuing education and training is to enhance the FSIO's knowledge, skills, and ability to perform retail food and foodservice inspections. The objective is to build upon the FSIO's knowledge base. Repeated coursework should be avoided unless justification is provided to, and approved by, the food program manager and/or training officer.

Training on any changes in the regulatory agency's prevailing statutes, laws and/or ordinances must be included as part of the continuing education (CE) hours within six months of the regulatory change. Documentation of the regulatory change date and date of training must be included as part of the individual's training record.

The candidate qualifies for one contact hour of continuing education for each clock hour of participation in any of the following nine activities that are related specifically to food safety or food inspectional work:

1. Attendance at FDA Regional seminars / technical conferences;
2. Professional symposiums / college courses;
3. Food-related training provided by government agencies (e.g., USDA, State, local);
4. Food safety related conferences and workshops; and
5. Distance learning opportunities that pertain to food safety, such as:
    - Web based or online training courses (e.g., additional food safety courses offered though ORA U, industry associations, universities); and
    - Satellite Broadcasts.

A maximum of ten (10) contact hours may be accrued from the following activities:

1. Delivering presentations at professional conferences;
2. Providing classroom and/or field training to newly hired FSIOs, or being a course instructor in food safety; or
3. Publishing an original article in a peer-reviewed professional or trade association journal/periodical.

Contact hours for a specified presentation, course, or training activity will be recognized only one time within a 3-year continuing education period[1].

Note: *Time needed to prepare an original presentation, course, or article may be included as part of the continuing education hours. If the FSIO delivers a presentation or course that has been previously prepared, only the actual time of the presentation may be considered for continuing education credit.*

A maximum of four (4) contact hours may be accrued for:

1. Reading technical publications related to food safety.

Documentation must accompany each activity submitted for continuing education credit. Examples of acceptable documentation include:

- certificates of completion indicating the course date(s) and number of hours attended or CE credits granted;
- transcripts from a college or university;
- a letter from the administrator of the continuing education program attended;
- a copy of the peer-reviewed article or presentation made at a professional conference; or
- documentation to verify technical publications related to food safety have been read including completion of self-assessment quizzes that accompany journal articles, written summaries of key points/findings presented in technical publications, and/or written book reports.

Note: *The key to a document's acceptability is that someone with responsibility, such as a training officer or supervisor, who has first-hand knowledge of employee's continuing education activities, maintains the training records according to an established protocol similar to that presented in Step 1 for assessing equivalent courses.*

Outcome

The desired outcome of this Standard is a trained regulatory staff with the skills and knowledge necessary to conduct quality inspections.

Documentation

The quality records needed for this standard include:

1. Certificates or proof of attendance from the successful completion of all the course elements identified in the Program Standard curriculum (Steps 1 and 3);

2. Documentation of field inspection reports for twenty-five each joint and independent inspections (Steps 2 and 3);
3. Certificates or other documentation of successful completion of a field training process similar to that presented in Appendix B-2. **NOTE:** The CFP Field Training Manual is available for the Conference for Food Protection web site: http://www.foodprotect.org/ and is located under the icon titled "Conference Developed Guides and Documents."
4. Certificates or other records showing proof of satisfactory standardization (Step 4);
5. Contact hour certificates or other records for continuing education (Step 5);
6. Signed documentation from the regulatory jurisdiction's food program supervisor or training officer that food inspection personnel attended and successful completed the training and education steps outlined in this Standard.
7. Date of hire records or assignment to the retail food program; and
8. Summary record of employees' compliance with the Standard.

The *Standard 2: Program Self-Assessment and Verification Audit Form* is designed to document the findings from the self-assessment and the verification audit process for Standard 2.

Standard 2: Trained Regulatory Staff
APPENDIX B-1: Curriculum for Retail Food Safety Inspection Officers

NOTE about course information: The courses listed below are updated and moved across different learning management systems over time. The latest information will be posted on the FDA Program Standards Landing Page at https://www.fda.gov/food/voluntary-national-retail-food-regulatory-program-standards/voluntary-national-retail-food-regulatory-program-standards-november-2019

For state, local, tribal, & territorial (SLTT) regulators to register on-line for free access to web courses, go to: https://www.fda.gov/training-and-continuing-education/office-training-education-and-development-oted/state-local-tribal-and-territorial-regulatory-partners

Pre-requisite ("Pre") Curriculum Courses

(To be completed during the 25 joint inspection period AND prior to conducting any independent inspections)

PUBLIC HEALTH PRINCIPLES

Courses	Course Number
1-Public Health Principles	FDA36 (90)

MICROBIOLOGY

Courses	Course Number
1-Overview of Microbiology	MIC01 (60)
2A-Gram Negative Rods	MIC02 (60)
2B-Gram-Positive Rods & Cocci	MIC03 (90)
3- Foodborne Viruses	MIC04 (60)
4- Foodborne Parasites	MIC05 (90)
Mid-Series Exam	MIC16 (30)
5- Controlling Growth Factors	MIC06 (90)
6-Control by Refrigeration & Freezing	MIC07 (60)
7A-Control by Thermal Processing	MIC08 (90)
7B- Control by Pasteurization	MIC09 (90)
10- Aseptic Sampling	MIC13 (90)
12-Cleaning & Sanitizing	MIC15 (90)

PREVAILING STATUTES, REGULATIONS, ORDINANCES

Courses	Course Number
1. Basic Food Law for State Regulators	FDA35 (60)
2. Basics of Inspection: Beginning an Inspection	FDA38 (90)
3. Basics of Inspection: Issues & Observations	FDA39 (90)
4. An Introduction to Food Security Awareness	FD251 (60) A PDF/READABLE VERSION at (https://www.fda.gov/training-and- continuing-education/office-training-education-and-development-oted/introduction-food-security-awareness) Note: Required exam is available via www.compliancewire.com.

5. FDA Food Code: Specific SLTT laws and regulations to be addressed by each jurisdiction.	**Note:** Some jurisdictions may require the FDA Food Code Course in addition to SLTT food code training.

COMMUNICATION SKILLS

Courses	Course Number
1. Communication Skills	CC8030W **NOTE**: Course must be accessed through LearnEd at: https:// fdaoted.csod.com/

Curriculum ("Post") Courses

(To be completed any time prior to Food Code Standardization AND within 24 months of hire or assignment to the regulatory retail food program)

MICROBIOLOGY

Courses	Course Number
7C-Control by Retorting	MIC10 (90)
8-Technology-Based Food Processes	MIC11 (120)
9-Natural Toxins	MIC12 (90)

HACCP

Courses	Course Number
1. Overview of HACCP	FDA16 (60)
2. Prerequisite Programs & Preliminary Steps	FDA17 (60)
3. The Principles	FDA18 (60)

ALLERGEN MANAGEMENT

Courses	Course Number
1. Allergens	CC8029W Course must be accessed through LearnEd at: https:// fdaoted.csod.com/

EPIDEMIOLOGY

Courses	Course Number
1. Collecting Surveillance Data	FI01 (90)
2. Beginning the Investigation	FI02 (90)
3. Expanding the Investigation	FI03 (90)
4. Conducting a Food Hazard Review	FI04 (90)
5. Epidemiological Statistics	FI05 (90)
6. Final Report	FI06 (30)

EMERGENCY MANAGEMENT – FEMA

Incident Command System and National Incident Management System: Course available from FEMA web link http://training.fema.gov/IS/NIMS.asp

Courses	Course Number
1. Introduction to Incident Command System	IS-100.C, Introduction to the Incident Command System, (180) ICS-100 for FDA
2. Basic Incident Command System for Initial Response	IS-200.C, Basic Incident Command System for Initial Response (180)
3. An Introduction to NIMS	IS 700.B, An Introduction to NIMS, (180) ICS-700

( ) Average time in minutes required to take the course, 60 minutes equals .1 CEU, 90-120 minutes equals .2 CEUs

Estimated total hours for "Pre" courses are 42 hours.

Estimated total hours for "Post" courses are 26 hours.

Estimated total hours for completion of all Program Standard #2 coursework are 68 hours

CFP – Employee Food Safety Training (EFST) Committee

Template approved: 7/13/2021

Committee Final Reports are considered DRAFT until acknowledged by Council or accepted by the Executive Board

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME **CFP – EFST Committee**

DATE OF FINAL REPORT: 12/4/2022

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Tara Paster Cammarata and Ki Straughn

COMMITTEE CHARGE(S):

Issue # 2018-II-001

1. *Review the CFP "Employee Food Safety Training Guidance Document" for possible updates (assigned via Issue 2018-II-001); and*
2. *Report recommendations at the 2023 Biennial Meeting.*

COMMITTEE WORK PLAN AND TIMELINE:

- **A.** *Historical perspective review and acknowledgement of the 2016 - 2018 Employee Food Safety Training Committee Final Report*
- **B.** *Thank the past committee members for the completed work and recognize their commitment to CFP*
- **C.** *Welcome and organize the new committee members to complete the assigned charge using collaboration and transparency*
- **D.** *Divide and review the CFP "Employee Food Safety Training Guidance Document" for possible updates*

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

- ✓ *Friday, November 5, 2021*
  Ki Straughn, Dr. Ben Chapman from NC State, and Tara Paster Cammarata reviewed the historical perspective of the 2016 - 2018 Employee Food Safety Training Committee Final Report
- ✓ *Friday, December 10, 2021 – Committee Virtual Meeting*
  Recognized and thanked past committee members; Welcome; Orientation to Committee; Legal review; Expectations; Champions volunteered to lead the different sections of the Guidance Document and the committee accepted the plan calendar for success
- ✓ *Friday, January 14, 2022 – Committee Virtual Meeting:* ***Section 1***
- ✓ *Friday, February 11, 2022 – Committee Virtual Meeting:* ***Section 2***
- ✓ *Friday, March 11, 2022 – Committee Virtual Meeting:* ***Sections 2 & 3***
- ✓ *Friday, April 8, 2022 – Committee Virtual Meeting:* ***Section 4***
- ✓ *Friday, May 13, 2022 – Committee Virtual Meeting:* ***Section 4 and 5***
- ✓ *Friday, June 10, 2022 – Committee Virtual Meeting:* ***Sections 6***
- ✓ *Friday, July 8, 2022 – Committee Virtual Meeting:* ***Sections 5 and 6***
- ✓ *Friday, August 12, 2022 – Committee Virtual Meeting:* ***Sections 7***
- ✓ *Friday, September 9, 2022 – Meeting canceled because all sections were completed*
- ✓ *October 2022 – November 2022 –* ***Final review of all seven sections and development of issues*** *were completed via e-mail collaboration and consensus.*
- ✓ *Sunday, December 4, 2022 –* ***Final recommendations*** *were completed after receiving e-mail consensus.*

1. ***Overview of committee activities:***

*Section 1: Foundations of Food Safety review and updates were completed under the leadership of Champion **Janet Buffer**.*

*Section 2: Employee Health review and updates were completed under the leadership of two Champions **Ashley Eisenbeiser** and **Clay Hosh**.*

*Section 3: Personal Hygiene and Handwashing review and updates were completed under the leadership of Champion **Rachel Scanlan**.*

*Section 4: Preventing Cross-Contamination review and updates were completed under the leadership of Champion **Debbie Pickle**.*

*Section 5: Allergen Control review and updates were completed under the leadership of Champion **Jeff Hawley**.*

*Section 6: Time and Temperature Control for Safety (TCS) review and updates were completed under the leadership of Champion **Sharon Unkart**.*

*Section 7: Cleaning and Sanitizing review and updates were completed under the leadership of Champion **Tara Paster Cammarata**.*

2. ***Charges COMPLETED and the rationale for each specific recommendation:***

   ***Yes**, the charges were successfully completed by the Employee Food Safety Training Committee Members.*

   ***Rationale:** One of the essential elements needed for protecting public health is food employee training. It is critical to take a proactive approach in preventing food employee skill gaps, this is done by imparting knowledge to further develop the food employee's new skills and providing updates on existing skills.*

   The Employee Food Safety Committee updated and addressed food employee knowledge, skills, and abilities (KSA) in the following areas:

   1. *Foundations of Food Safety*
   2. *Employee Health Outcomes*
   3. *Personal Hygiene and Handwashing*
   4. *Preventing Cross-Contamination*
   5. *Allergen Control*
   6. *Time and Temperature Control for Safety (TCS)*
   7. *Cleaning and Sanitizing*

The bench marking of food employee training assists in identifying KSAs; as well as any gaps that may exist. Once these gaps are identified then mitigation strategies can be performed ultimately strengthening the global food supply and protecting public health.

In closing, the Employee Food Safety Training Committee Members worked diligently on both charges according to our committee's calendar of events. The committee members are passionate subject matter experts with "excellence" as the standard. The enthusiasm and engagement are best-in-class with collaboration and consensus as the driving force to complete the committee work.

*The final recommendation of this committee is to **immediately publish** the "Employee Food Safety Training Guidance Document" on the CFP website for all to use.*

3. ***Charges INCOMPLETE and to be continued to next biennium:***

*None. The recommendation is to **disband** the Employee Food Safety Training Committee.*

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.

2.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

1. ***Committee Issue #1***: *Employee Food Safety Training Committee Final Report*

   Acknowledging the Employee Food Safety Training (EFST) Committee final report with attachments and recognize by extending our sincerest gratitude and appreciation to the Committee members for their commitment and hard work.

   Attachments:

   Content Documents:

   Attachment: EFST Committee Final Report (Issues)

   Attachment: Employee Food Safety Training Guidance Document (2017 FDA Food Code)

   Supporting Attachments:

   Attachment: A 10.08.2021 Report

   Attachment: B 03.30.2022 Report

   Attachment: C 09.11.2022 Report

   Attachment: D Roster

2. ***Committee Issue #2***: *Publishing the "**Employee Food Safety Training Guidance Document** (2017 FDA Food Code)"*

   The Employee Food Safety Training (EFST) Committee recommends publishing the "Employee Food Safety Training Guidance Document (2017 FDA Food Code)" on the CFP website.

   Content Documents:

   Attachment: Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Updated 12.04.2022

The Conference for Food Protection Employee Food Safety Training Committee was re-created and assigned **Issue #2018-II-01** from previous Issue 2016 II-001 that continued work initiated during the 2014 – 2016 biennium from the original Issue 2014-II-011.

The specific charges for the 2021-2023 biennium were to:

1. Review the CFP **"Employee Food Safety Training Guidance Document"** for possible updates; and
2. Report recommendations at the 2023 Biennial Meeting

Each topic category has been placed in its own section, grouped by contributing factor and foundational knowledge, based on the learning objectives. Objectives have been defined, as a roadmap for instructional designers and regulators; each objective has been assigned a KSA type (knowledge, skill, or ability).

KSA definitions:

- **Knowledge:** Understanding each of the Objectives and Measures in the Employee Food Safety Training program.
- **Skills:** Through training and experience, being able to apply each of the Objectives and Measures in the Employee Food Safety Training program.
- **Abilities:** Being able to apply effectively and efficiently each of the Objectives and Measures in the Employee Food Safety Training program in real-world applications.

One of the essential elements needed for protecting public health is **food employee training**. The Employee Food Safety Committee **updated** food employee knowledge, skills, and abilities (KSA)**.** In addition, the references to the 2017 FDA Model Food Code have been noted and specific measures provided in the following seven areas:

1. Foundations of Food Safety
2. Employee Health Outcomes
3. Personal Hygiene and Handwashing
4. Preventing Cross-Contamination
5. Allergen Control
6. Time and Temperature Control for Safety (TCS)
7. Cleaning and Sanitizing

This bench marking of food employee training assists in identifying KSAs; as well as any gaps that may exist. Once these gaps are identified then mitigation strategies can be performed ultimately strengthen the global food supply and protecting public health.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 1: Foundations of Food Safety

Section 1: Foundations of Food Safety	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
1.1	**K**	Identify food hazards (including biological, chemical, and physical).	**1-201.10** Definition: • Hazard	Lists known food hazards as it relates to employee duties: • Identifies foodborne illness as a disease transmitted to people through food.
	S	Applies methods to prevent the contamination of food from biological, chemical, and physical hazards.		• Implements appropriate corrective actions to reduce the risks of food hazards.
1.2	**K**	Identify employee role in controlling food hazards and the impact of their behavior.	**Preface ii**	• Describes the relationship between employee health and hand hygiene, time and temperature control, prevention of cross contamination, cleaning, sanitizing, allergen control and the prevention of cross-contact, and food safety.
1.3	**K**	Understands that some foods will **not** require a pathogen kill step prior to consumption.	**1-201.10** Definition: • Ready-to-Eat	• Explains ready-to-eat food as it relates to employee duties.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 2: Employee Health Outcomes

Section 2: Employee Health Outcomes	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
2.0	**K**	Identify the relationship between working when sick and foodborne illness and the importance of notifying management of reportable illness symptoms, diagnoses, or illness exposure.	**Annex 3** **2-201.11(E)**	• Recognizes that failing to notify management of reportable illness symptoms, diagnoses, and illness exposure may result in the transmission of a disease through food being prepared. • Explains role in reporting process (as required by FDA Food Code).
2.1	**K**	Identify illness symptoms, diagnoses (i.e., Big Six), and illness exposure, which are easily transmissible through food, that must be reported to management.	**2-201.11**	• Lists the illness symptoms, diagnoses, and exposures that must be reported to management.
2.2	**S**	Report required illness symptoms, diagnoses, and illness exposure to management.	**2-201.11(F)**	• Informs management when experiencing illness symptoms, diagnoses, or illness exposures that are reportable.
2.3	**A**	Food employees are aware that they are required to report required illnesses and symptoms to PIC.	**2-103.11(O)**	

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 3: Personal Hygiene and Handwashing

Section 3: Personal Hygiene and Handwashing	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
3.1	**K**	Identify the role of clean outer clothing in preventing contamination of food, equipment, utensils, linens, and single-service and single-use articles.	**2-304.11**	• Wears clean outer clothing.
3.2	**K, S**	Identify when, where, and how to wash hands according to the FDA Food Code.	**2-103.11(D)** **2-301.12** **2-301.14** **2-301.15**	• Washes hands according to the FDA Food Code.
3.3	**S**	Apply FDA Food Code standards for fingernails and jewelry.	**2-302.11** **2-303.11**	• Applies FDA Food Code standards for fingernails and jewelry.
3.4	**K**	Recognize where eating, drinking, and tobacco use is allowed.	**2-401.11**	• Eats, drinks, and smokes only in designated areas.
3.5	**K**	Identify when to use hair restraints to avoid food contamination and which restrains are appropriate according to the FDA Food Code.	**2-402.11**	• Wears appropriate hair restraints when necessary.

3.6	**K** **S**	Describe how to correctly cover a bandage, finger cot, or finger stall located on the wrists, hands, or fingers. Distinguish when and how to use and replace single-use gloves according to the FDA Food Code.	**2-401.13** **3-304.15**	• Covers bandages, finger cots, or finger stalls according to the FDA Food Code. • Uses and replaces single-use gloves according to the FDA Food Code.
3.7	**K**	Describe how to correctly cover infected wound on the hands or forearms.	**2-201.13(I)** **2-401.13**	• Covers infected wounds according to the FDA Food Code.
3.8	**K**	Understands food workers may not care for or handle animals.	**2-403.11**	• Food employees do not handle or care for animals unless allowed by the Food Code.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 4: Preventing Cross-Contamination

Section 4: Preventing Cross-Contamination	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
4.1	**A**	Prevent contamination of all food, including ice, during preparation, storage, and display. Prevent contamination of in-use utensils.	**3-304.12** **3-307.11**	• Prepares, stores, and displays all food in a manner that prevents contamination. • Store in-use utensils in a manner that prevents contamination.
4.2	**A**	Identify potential for food contamination associated with consumer self-service areas.	**3-306.13(B)** **3-306.13(C)** **3-304.17**	• Monitors and notifies a person in charge when a self-service area has potentially become contaminated.
4.3	**A**	Determine when to replace equipment and utensils with clean and sanitized equipment and utensils.	**4-601.11**	• Replaces equipment and utensils with clean and sanitized utensils.
4.4	**K**	Identify how to correctly store cleaned and sanitized utensils and equipment.	**3-304.12**	• Stores cleaned and sanitized utensils in a manner that prevents contamination.
4.5	**S**	Prevent contamination of fruits and vegetables by avoiding bare hand contact after washing raw, uncut fruits and vegetables.	**3-302.15**	• Washes raw, uncut fruits and vegetables prior to preparation or service and avoids bare hand contact once washed.
4.6	**S**	Describe proper storage of food, food containers, single service, and single use articles to prevent contamination.	**3-305.11** **3-305.12** **4-401.11**	• Properly stores food, food containers, single service, and single use articles to prevent contamination.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 5: Allergen Control

Section 5: Allergen Control	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
5.1	**K**	Identify the major food allergens as defined by the FDA Food Code 2017, which includes milk, egg, fish, crustacean shellfish, tree nuts, wheat, peanuts, soybeans, and sesame (upon inclusion in the Food Code).	**1-201.10** Definition: • Major Food Allergen	• Lists the major food allergens as defined by the FDA Food Code.
5.2	**K**	Describe how food employees should communicate with customers to prevent allergic reactions.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, effectively executes on the training to prevent customer exposure to food allergens.
5.3	**K**	Identify methods for preventing cross-contact when preparing food.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, effectively executes on the training to prevent customer exposure to food allergens.
5.4	**K**	Recognize the signs of an allergic reaction and respond accordingly.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, and effectively executes on the training by properly describing how to respond to an allergen emergency.
5.5	**K**	Identify major food allergens on labels; is knowledgeable of proper allergen labeling.	**3-602.11 (B)(5)**	• Receives food allergen awareness training from person in charge, and effectively executes on the training by adhering to proper food allergen labeling.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 6: Time and Temperature Control for Safety (TCS)

Section 6 Time and Temperature Control for Safety	KSA Type	Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
6.1	**K**	Identify foods requiring time and temperature control to reduce the risk of foodborne illness.	**1-201.10** Definition • Time / Temperature Control for Safety Food	• Applies time/temperature controls to TCS foods such as but not limited to the following items: raw or heat-treated animal FOOD, plant FOOD that has been heat treated, raw seed sprouts, cut melons, cut leafy greens, cut tomatoes or mixtures of cut tomatoes that are not modified, or garlic in oil mixtures that are not modified.
6.2	**K**	Identify the requirements for noncontinuous cooking of TCS foods.	**3-401.14**	• Partially cooks TCS foods according to requirements.
6.3	**A**	Identify how to monitor TCS food temperatures using appropriate temperature measuring devices. Recognize that the temperature of TCS foods must be routinely monitored during cooking, holding, and cooling using a thermometer that meets requirements.	**1-201.10** Definition • Temperature measuring device **2-103.11(G)** **2-103.11(H)** **2-103.11(I)** **Annex 5:** The correct temperature measuring device and technique are essential in accurately determining the temperatures of TCS foods. The geometric center or thickest part of a product are the points of measurement of	• Use temperature measuring devices to monitor temperatures of TCS food. • Routinely monitors temperatures when cooking, holding, and cooling TCS food.

			product temperature particularly when measuring critical limits for cooking.	
6.4	**K**	Identify the appropriate cooking times and temperatures for TCS foods to reduce the risk of foodborne illness.	**3-401** (Raw animal FOOD) **3-401.13** (Plant FOOD for hot holding)	• Cooks TCS food to required minimum internal cooking times/ temperatures.
6.5	**S, A**	Identify the time/temperature requirements for cooling TCS food. Identify proper methods for cooling TCS food.	**3-501.14** **3-501.15**	• Cools TCS food according to time/temperature requirements. • Cools TCS food using a proper cooling method.
6.6	**A**	Apply corrective action to food that has fallen outside time/temperature control.	**3-501.18(A)(1)**	• Applies proper corrective action to food that has fallen outside time / temperature control.
6.7	**K**	Identify methods for safely thawing food according to the FDA Food Code.	**3-501.13**	• Thaws food safely following an approved method.
6.8	**K**	Identify time/temperature requirements for reheating TCS food for hot holding.	**3-403.11**	• Reheats TCS food for hot holding following time and temperature requirements.
6.9	**K**	Identify the time or temperature requirements for holding AND STORING hot and cold TCS food.	**3-501.16** **3-501.19**	• Holds and stores hot and cold TCS food according to time/temperature requirements.
6.10	**K**	Identify the requirements for date marking TCS food.	**3-501.17**	• Date marks TCS food according to requirements.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 7: Cleaning and Sanitizing

Section 7: Cleaning and Sanitizing	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
7.1	**K**	Identify the difference between cleaning and sanitizing.	**1-201.10** Definitions: • Easily Cleanable • Sanitization	Lists cleaning and sanitizing responsibilities as relates to employee duties: • Identifies equipment and facility cleaning activities • Identifies equipment and facility sanitizing activities.
	S	Applies appropriate cleaning and sanitizing methods to reduce the risks to food hazards.	**6-501.12** **6-501.13** **6-501.15** **6-501.16** **6-501.19**	• Demonstrates proper cleaning and sanitizing procedures to reduce the risks to food hazards.
7.2	**K**	Identify the need to follow the specific procedures when using chemicals according to the manufacturer's guidelines and properly storing chemicals in a food establishment.	**7-101.11** **7-102.11** **7-202.11** **7-202.12** **7-203.11** **7-204.11**	• Follows manufacturer's guideline when using chemicals and properly storing chemicals according to the FDA Food Code.
	S	Applies appropriate procedures when using and storing chemicals in a food establishment.		• Demonstrates proper cleaning and sanitizing procedures to reduce the risks to food hazards.

7.3	**K**	Identify food-contact surfaces.	**1-201.10** Definition: • Food-contact surface	• Lists food employee responsibilities and duties as it relates to food contact surfaces.
	S	Applies appropriate procedures on when and how to clean and sanitize food contact surfaces.	**2-103.11(K)** **4-601.11** **4-602.11** **4-602.12** **4-602.13** **4-603.11** **4-701,10** **4-702.11** **4-703.11**	• Demonstrates proper cleaning and sanitizing procedures to prevent, eliminate, and reduce hazards to a safe level when cleaning and sanitizing food contact surfaces.
7.4	**K**	Identify the need to follow the specific procedures when cleaning and sanitizing utensils and equipment.	**1-201.10** Definitions: • Utensil • Equipment • CIP cleaned in place • Counter-mounted equipment • Easily moveable **4-601.11** **4-602.11** **4-602.12** **4-602.13** **4-603.11**	• Follows specific procedures when cleaning and sanitizing utensils and equipment according to the FDA Food Code.

	S	Applies appropriate procedures when cleaning and sanitizing utensils and equipment.	**2-103.11(K)** **3-304.11**	• Demonstrates proper cleaning and sanitizing procedures to reduce the risks to food hazards when cleaning and sanitizing utensils and equipment.
7.5	**K**	Identify the need to follow the specific procedures when using mechanical warewashing.	**1-201.10** Definition: • Warewashing **4-603.12** **4-603.13** **4-603.14**	• Follows specific procedures when using mechanical warewashing according to the FDA Food Code.
	S	Applies appropriate procedures when performing mechanical warewashing.		• Demonstrates proper cleaning and sanitizing procedures to prevent, eliminate, and reduce hazards to a safe level when performing mechanical warewashing.
7.6	**K**	Identify the need to follow the specific procedures when using manual warewashing.	**1-201.10** Definition: • Warewashing **4-301.12** **4-302.14** **4-603.14** **4-603.15** **4-603.16**	• Follows specific procedures when using manual warewashing according to the FDA Food Code.
	S	Applies appropriate procedures when performing manual warewashing.		• Demonstrates proper cleaning and sanitizing procedures to prevent, eliminate, and reduce hazards to a safe level when performing manual warewashing.

7.7	**K**	Identify the need to follow the specific procedures when using and storing wiping cloths.	**3-304.14**	• Follows specific procedures when using and storing wiping cloths according to the FDA Food Code.
	S	Applies appropriate procedures when using and storing wiping cloths.		• Demonstrates proper cleaning and sanitizing procedures to reduce the risks to food hazards when using and storing wiping cloths.
7.8	**K**	Identify the need to follow specific procedures when responding to vomiting and diarrheal events in the food establishment.	**2-501.11**	• Follows specific procedures when responding to vomiting and diarrheal events in the food establishment according to the FDA Food Code.
	S	Applies appropriate procedures when responding to vomiting and diarrheal events in the food establishment.		• Recognizes that failing to follow appropriate procedures when responding to vomiting and diarrheal events in the food establishment may result in the transmission of a disease.

Committee Progress Reports are considered DRAFT until accepted by the Executive Board

The Conference Chair, Executive Director, Council Chair, or Issue Chair may return committee reports, Issues, or attached documents requesting edits to improve clarity or understanding, or to include missing information.

Committee-submitted documents may impact the image, credibility and integrity of the Conference as an organization. With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

DATE OF REPORT: ☒ ***Initial fall progress report*** ☐ ***Spring progress report*** ☐ ***Second fall progress report***
Date submitted: 10/8/2021 **Date amended (if applicable):** *Click here to enter a date.* **Date accepted by Executive Board:** *Click here to enter a date.*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY:

COMMITTEE CHARGE(S):

Issue # 2018-II-001

1. *Review the CFP "Employee Food Safety Training Guidance Document" for possible updates (assigned via Issue 2018-II-001); and*
2. *Report recommendations at the 2023 Biennial Meeting.*

COMMITTEE WORK PLAN AND TIMELINE:

1. *Historical perspective review and acknowledgement of the 2016 - 2018 Employee Food Safety Training Committee Final Report*
2. *Thank the past committee members for the completed work and recognize their commitment to CFP*
3. *Welcome and organize the new committee members to complete the assigned charge using collaboration and transparency*
4. *Divide and review the CFP "Employee Food Safety Training Guidance Document" for possible updates*

COMMITTEE ACTIVITIES:

1. ***Dates of committee meetings or conference calls:***

   To be determined once committee is approved by the CFP Executive Board
2. ***Overview of committee activities:***

   Proposed committee roster attached pending CFP Executive Board approval
3. ***Charges COMPLETED and the rationale for each specific recommendation:***

   To be determined
4. ***Status of charges still PENDING and activities yet to be completed:***

   To be determined

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☐ ***Board Action is NOT required and therefore the report can be placed on the consent calendar for Board review and acceptance.***
☒ ***Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.***

1. *Please approve attached committee roster*

ATTACHMENTS:

1. ***Content Documents:***

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Updated 12.04.2022

The Conference for Food Protection Employee Food Safety Training Committee was re-created and assigned **Issue #2018-II-01** from previous Issue 2016 II-001 that continued work initiated during the 2014 – 2016 biennium from the original Issue 2014-II-011.

The specific charges for the 2021-2023 biennium were to:

1. Review the CFP **"Employee Food Safety Training Guidance Document"** for possible updates; and
2. Report recommendations at the 2023 Biennial Meeting

Each topic category has been placed in its own section, grouped by contributing factor and foundational knowledge, based on the learning objectives. Objectives have been defined, as a roadmap for instructional designers and regulators; each objective has been assigned a KSA type (knowledge, skill, or ability).

KSA definitions:

- **Knowledge:** Understanding each of the Objectives and Measures in the Employee Food Safety Training program.
- **Skills:** Through training and experience, being able to apply each of the Objectives and Measures in the Employee Food Safety Training program.
- **Abilities:** Being able to apply effectively and efficiently each of the Objectives and Measures in the Employee Food Safety Training program in real-world applications.

One of the essential elements needed for protecting public health is **food employee training**. The Employee Food Safety Committee **updated** food employee knowledge, skills, and abilities (KSA)**.** In addition, the references to the 2017 FDA Model Food Code have been noted and specific measures provided in the following seven areas:

1. Foundations of Food Safety
2. Employee Health Outcomes
3. Personal Hygiene and Handwashing
4. Preventing Cross-Contamination
5. Allergen Control
6. Time and Temperature Control for Safety (TCS)
7. Cleaning and Sanitizing

This bench marking of food employee training assists in identifying KSAs; as well as any gaps that may exist. Once these gaps are identified then mitigation strategies can be performed ultimately strengthen the global food supply and protecting public health.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 1: Foundations of Food Safety

Section 1: Foundations of Food Safety	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
1.1	**K**	Identify food hazards (including biological, chemical, and physical).	**1-201.10** Definition: • Hazard	Lists known food hazards as it relates to employee duties: • Identifies foodborne illness as a disease transmitted to people through food.
	S	Applies methods to prevent the contamination of food from biological, chemical, and physical hazards.		• Implements appropriate corrective actions to reduce the risks of food hazards.
1.2	**K**	Identify employee role in controlling food hazards and the impact of their behavior.	**Preface ii**	• Describes the relationship between employee health and hand hygiene, time and temperature control, prevention of cross contamination, cleaning, sanitizing, allergen control and the prevention of cross-contact, and food safety.
1.3	**K**	Understands that some foods will **not** require a pathogen kill step prior to consumption.	**1-201.10** Definition: • Ready-to-Eat	• Explains ready-to-eat food as it relates to employee duties.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 2: Employee Health Outcomes

Section 2: Employee Health Outcomes	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
2.0	**K**	Identify the relationship between working when sick and foodborne illness and the importance of notifying management of reportable illness symptoms, diagnoses, or illness exposure.	**Annex 3** **2-201.11(E)**	• Recognizes that failing to notify management of reportable illness symptoms, diagnoses, and illness exposure may result in the transmission of a disease through food being prepared. • Explains role in reporting process (as required by FDA Food Code).
2.1	**K**	Identify illness symptoms, diagnoses (i.e., Big Six), and illness exposure, which are easily transmissible through food, that must be reported to management.	**2-201.11**	• Lists the illness symptoms, diagnoses, and exposures that must be reported to management.
2.2	**S**	Report required illness symptoms, diagnoses, and illness exposure to management.	**2-201.11(F)**	• Informs management when experiencing illness symptoms, diagnoses, or illness exposures that are reportable.
2.3	**A**	Food employees are aware that they are required to report required illnesses and symptoms to PIC.	**2-103.11(O)**	

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 3: Personal Hygiene and Handwashing

Section 3: Personal Hygiene and Handwashing	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
3.1	**K**	Identify the role of clean outer clothing in preventing contamination of food, equipment, utensils, linens, and single-service and single-use articles.	**2-304.11**	• Wears clean outer clothing.
3.2	**K, S**	Identify when, where, and how to wash hands according to the FDA Food Code.	**2-103.11(D)** **2-301.12** **2-301.14** **2-301.15**	• Washes hands according to the FDA Food Code.
3.3	**S**	Apply FDA Food Code standards for fingernails and jewelry.	**2-302.11** **2-303.11**	• Applies FDA Food Code standards for fingernails and jewelry.
3.4	**K**	Recognize where eating, drinking, and tobacco use is allowed.	**2-401.11**	• Eats, drinks, and smokes only in designated areas.
3.5	**K**	Identify when to use hair restraints to avoid food contamination and which restrains are appropriate according to the FDA Food Code.	**2-402.11**	• Wears appropriate hair restraints when necessary.

3.6	**K** **S**	Describe how to correctly cover a bandage, finger cot, or finger stall located on the wrists, hands, or fingers. Distinguish when and how to use and replace single-use gloves according to the FDA Food Code.	**2-401.13** **3-304.15**	• Covers bandages, finger cots, or finger stalls according to the FDA Food Code. • Uses and replaces single-use gloves according to the FDA Food Code.
3.7	**K**	Describe how to correctly cover infected wound on the hands or forearms.	**2-201.13(I)** **2-401.13**	• Covers infected wounds according to the FDA Food Code.
3.8	**K**	Understands food workers may not care for or handle animals.	**2-403.11**	• Food employees do not handle or care for animals unless allowed by the Food Code.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 4: Preventing Cross-Contamination

Section 4: Preventing Cross-Contamination	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
4.1	**A**	Prevent contamination of all food, including ice, during preparation, storage, and display. Prevent contamination of in-use utensils.	**3-304.12** **3-307.11**	• Prepares, stores, and displays all food in a manner that prevents contamination. • Store in-use utensils in a manner that prevents contamination.
4.2	**A**	Identify potential for food contamination associated with consumer self-service areas.	**3-306.13(B)** **3-306.13(C)** **3-304.17**	• Monitors and notifies a person in charge when a self-service area has potentially become contaminated.
4.3	**A**	Determine when to replace equipment and utensils with clean and sanitized equipment and utensils.	**4-601.11**	• Replaces equipment and utensils with clean and sanitized utensils.
4.4	**K**	Identify how to correctly store cleaned and sanitized utensils and equipment.	**3-304.12**	• Stores cleaned and sanitized utensils in a manner that prevents contamination.
4.5	**S**	Prevent contamination of fruits and vegetables by avoiding bare hand contact after washing raw, uncut fruits and vegetables.	**3-302.15**	• Washes raw, uncut fruits and vegetables prior to preparation or service and avoids bare hand contact once washed.
4.6	**S**	Describe proper storage of food, food containers, single service, and single use articles to prevent contamination.	**3-305.11** **3-305.12** **4-401.11**	• Properly stores food, food containers, single service, and single use articles to prevent contamination.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 5: Allergen Control

Section 5: Allergen Control	KSA Type	Food Safety Employee Training Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
5.1	**K**	Identify the major food allergens as defined by the FDA Food Code 2017, which includes milk, egg, fish, crustacean shellfish, tree nuts, wheat, peanuts, soybeans, and sesame (upon inclusion in the Food Code).	**1-201.10** Definition: • Major Food Allergen	• Lists the major food allergens as defined by the FDA Food Code.
5.2	**K**	Describe how food employees should communicate with customers to prevent allergic reactions.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, effectively executes on the training to prevent customer exposure to food allergens.
5.3	**K**	Identify methods for preventing cross-contact when preparing food.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, effectively executes on the training to prevent customer exposure to food allergens.
5.4	**K**	Recognize the signs of an allergic reaction and respond accordingly.	**2-103-11(N)**	• Receives food allergen awareness training from person in charge, and effectively executes on the training by properly describing how to respond to an allergen emergency.
5.5	**K**	Identify major food allergens on labels; is knowledgeable of proper allergen labeling.	**3-602.11 (B)(5)**	• Receives food allergen awareness training from person in charge, and effectively executes on the training by adhering to proper food allergen labeling.

Employee Food Safety Training Guidance Document (2017 FDA Food Code)

Section 6: Time and Temperature Control for Safety (TCS)

Section 6 Time and Temperature Control for Safety	KSA Type	Objective	2017 FDA Food Code Reference	Example Measures *Possible ways to measure attainment of an objective*
6.1	**K**	Identify foods requiring time and temperature control to reduce the risk of foodborne illness.	**1-201.10** Definition • Time / Temperature Control for Safety Food	• Applies time/temperature controls to TCS foods such as but not limited to the following items: raw or heat-treated animal FOOD, plant FOOD that has been heat treated, raw seed sprouts, cut melons, cut leafy greens, cut tomatoes or mixtures of cut tomatoes that are not modified, or garlic in oil mixtures that are not modified.
6.2	**K**	Identify the requirements for noncontinuous cooking of TCS foods.	**3-401.14**	• Partially cooks TCS foods according to requirements.
6.3	**A**	Identify how to monitor TCS food temperatures using appropriate temperature measuring devices. Recognize that the temperature of TCS foods must be routinely monitored during cooking, holding, and cooling using a thermometer that meets requirements.	**1-201.10** Definition • Temperature measuring device **2-103.11(G)** **2-103.11(H)** **2-103.11(I)** **Annex 5:** The correct temperature measuring device and technique are essential in accurately determining the temperatures of TCS foods. The geometric center or thickest part of a product are the points of measurement of	• Use temperature measuring devices to monitor temperatures of TCS food. • Routinely monitors temperatures when cooking, holding, and cooling TCS food.

			product temperature particularly when measuring critical limits for cooking.	
6.4	**K**	Identify the appropriate cooking times and temperatures for TCS foods to reduce the risk of foodborne illness.	**3-401** (Raw animal FOOD) **3-401.13** (Plant FOOD for hot holding)	• Cooks TCS food to required minimum internal cooking times/ temperatures.
6.5	**S, A**	Identify the time/temperature requirements for cooling TCS food. Identify proper methods for cooling TCS food.	**3-501.14** **3-501.15**	• Cools TCS food according to time/temperature requirements. • Cools TCS food using a proper cooling method.
6.6	**A**	Apply corrective action to food that has fallen outside time/temperature control.	**3-501.18(A)(1)**	• Applies proper corrective action to food that has fallen outside time / temperature control.
6.7	**K**	Identify methods for safely thawing food according to the FDA Food Code.	**3-501.13**	• Thaws food safely following an approved method.
6.8	**K**	Identify time/temperature requirements for reheating TCS food for hot holding.	**3-403.11**	• Reheats TCS food for hot holding following time and temperature requirements.
6.9	**K**	Identify the time or temperature requirements for holding AND STORING hot and cold TCS food.	**3-501.16** **3-501.19**	• Holds and stores hot and cold TCS food according to time/temperature requirements.
6.10	**K**	Identify the requirements for date marking TCS food.	**3-501.17**	• Date marks TCS food according to requirements.

Committee Final Reports are considered DRAFT until acknowledged by Council or accepted by the Executive Board

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME Local Regulatory Representation

DATE OF FINAL REPORT: *11/09/22*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Chair Pieter A. Sheehan, Vice Chair, Jo DeFrancesco

COMMITTEE CHARGE(S):

Issue # 2020 II-10 To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:

- Examining the current Bylaws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
- Report back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
- Include representation from the Constitution and Bylaws Committee to assist in the development of recommendations and amendments from the findings determined in this charge.

COMMITTEE WORK PLAN AND TIMELINE:

1. Ongoing: Historical perspective review of CFP Constitution and Bylaws.
2. April 2022 :Organizational call
3. May 2022- July: Finalize survey and obtain recipient list. Survey current CFP local regulatory members to gather perspectives on the level to which CFP's organizational structure and biennial activities promote communication and collaboration among local regulators and between state and local regulators. Determine if there is outreach to locals from their elected representatives serving on the Executive Board; and is local regulatory participation extending beyond serving on the Board, Standing Committees, Council Committees, and Councils to voting representation on the Assembly of Delegates important to local regulators. Use survey results to inform committee's work to explore representation of local regulators on the Assembly of Delegates.
4. June 2022: Request assistance from Constitution & Bylaws/Procedures Committee for development of any recommendations to amend the Constitution & Bylaws or other governing documents based on outcome of work from charge #1.
5. July -August of 2022: review tentative survey data and determine further actions needed. Potentially survey other groups for information. Compile survey data and look for other ways to obtain local input on the issue.
6. September 2022: begin wrapping up survey activities and determine if enough data has been gathered to make a recommendation to change the Constitution and Bylaws. Begin work on any suggested changes.
7. October 2022: Committee met to discuss the final report to the board and any issues to be submitted.

8. November 2022: Prepare final report to the board and finalize issue from committee work.

, COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***

   04/26/22, 05/06/2022, 06/03/22, 07/15/22, 08/09/22, 09/05/22, 09/16/22, 10/07/22, 110/28/22, 11/4/2022

2. ***Charges COMPLETED and the rationale for each specific recommendation:***

   Charge 1: Examining the current Bylaws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates. This work resulted in recommendations to the Board to consider rewriting the responsibilities of Executive Board members.

   Charge 2: Report back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium. The committee did report back to the Executive Board during the October, 2022 Executive Board meeting as charged in Issue 2020-II-010. That meeting resulted in the Board accepting rewritten responsibilities of Executive Board members.

   Charge 3: Include representation from the Constitution and Bylaws Committee to assist in the development of recommendations and amendments from the findings determined in this charge.
   Member of Constitution and Bylaws Committee was present on all calls beginning 05/06/22 and provided clarification when necessary. Mr. Sean Dunleavy served as the representative of the Constitution and Bylaws Committee.

3. ***Charges INCOMPLETE and to be continued until the next biennium: n/a***

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

1. Local Regulatory Voting Representation

- Acknowledge the Committee report and thank the Committee members for their time.
- Acknowledge that the Committee did examine the current Bylaws, including a historical perspective and did explore methods to provide representation of local regulators on the Assembly of State Delegates, as charged in Issue 2020-II-010. This work resulted in recommendations to the Board to consider rewriting the responsibilities of Executive Board members.
- Acknowledge that the Committee did report back to the Executive Board during the October 2022 Executive Board meeting as charged in Issue 2020-II-010. That meeting resulted in the Board accepting rewritten responsibilities of Executive Board members.
- Acknowledge that the Committee did include representation from the Constitution and Bylaws Committee to assist in the development of recommendations and amendments from the findings determined as charged in Issue 2020-II-010. Mr. Sean Dunleavy served as the representative of the Constitution and Bylaws Committee.
- Disband the Committee as all charges from Issue 2020-II-010 have been completed.

a. ***Report – Committee Name:*** *Local Regulatory Representation Committee*

b. **List of content documents submitted with this Issue:** *Committee Member Roster*

☐ ***See attached revised roster PDF*** ☒ ***No changes to previously approved roster***

c. ***Other content documents:*** **List of supporting attachments:** ☐ ***Not applicable***

(c.i.1) **Survey Results II 22 10, PPT 22 11 10, Master Agenda and Minutes**

Note: *Minimum council committee size is 11 (as noted above): 1-Chair; 1-Vice Chair; 1-State; 1-Local; 2-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise; 6-Non-voting alternates. Maximum council committee size is 23 voting members: 1-Chair; 1-Vice Chair; 4-State; 4-Local; 8-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise; 18-Non-voting alternates.*
Membership on standing committees is defined by the Executive Board. On all CFP committees, the committee chair, co-chair(s), and vice chair(s) all count towards constituency balance.

Local Regulatory Representation Agenda and Minutes

10/28/22

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
    1. Examining the current by-laws to include a historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
    2. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
    3. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum – only 5 voting members present, Jo, Patrick Guzzle, Steve Carmody, Tim Westbrook, Herman Crawford

Reviewed Information on the Constitution and Bylaws pertaining to charges. Several Key items noted:

1) The Body of Delegates exists to ratify the votes that have already taken place in Council
2) Industry, Academia, and other constituencies also do have a vote on the Assembly of Delegates
3) The final guiding principle was the need to ensure that the Conference would provide a national and, to the extent possible, international dialogue on food safety on a regular, periodic basis, and that this dialogue would be among representatives of regulatory, industry, and other non-regulatory organizations.

Discussion on issues to submit to Council II.

1) Options were to reform the committee with better charges or dissolve the committee and make and respectfully make recommendations to the board in our final report. (Our final Report goes to the Board).

2) The consensus among the group on the call was to not reform the committee for the next biennium due to reasons listed below.

- Like Industry, Local Regulators can take part in the CFP process and have a voice by participating in committee work, and on councils.
- Local regulators can use the caucus process to aid in addressing concerns.
- We will ask the board to continue working towards increased communication with and to Local Regulators to promote greater involvement.
- Points 1 through 3 above
- This committee has been unable to obtain a quorum for the last several meetings thus making it harder to complete work or have in-depth discussion on issues. There has been minimal

committee participation throughout the last 6 months. It is hard to ask to extend the committee work with low attendance and participation.

Discussion for Call:

Reminder of information provided to Board at beginning of meetings on the Constitution and Bylaws

Constitution and Bylaws Discussion

- The rules for the Assembly of Delegates are spelled out in XIX (19) of the C&B
- All Delegates are required to list their alternate should they (Delegate) not be able to attend. The chosen alternate is at the discretion of the Delegate. There have been instances where the Delegate named a local regulatory representative to be the alternate Delegate and where a State Delegate named a neighboring State to be their alternate. (Side note: One possible consideration is to have the Local Regulatory Board members be Delegates. If this were decided, we would place that Local Regulatory Board member in a position where he/she is now responsible for representing hundreds of other local jurisdictions at the Delegates meeting. Additionally, let's suppose that Local Regulatory Board member is from Florida – we are now watering down Florida's vote to ¼ instead of the current 1/3 vote). It is possible that many members are not aware that all Delegates are required to list an alternate – and that the alternate is at the discretion of the Delegate.
- While the C&B is certainly open for revisions, the logistics of including local regulatory representatives in the Body of Delegates presents difficulty. Specifically, there are over 3300 local health departments in the United States and just over 50 state agencies. It should be recognized that trying to manage 50+ delegates is vastly easier than trying to account for the 3300+ local agencies.
- Page iii of the C&B describes the history in more detail – including the format and ratification process (which was modeled after the National Conference on Interstate Milk Shipments) that was decided in the 1980's. From page iii:
    - The final step in the decision to upgrade the Conference organization was taken at the 1986 Conference. The Program Committee reported that: "It was the unanimous view of the committee that the Conference should operate as an action organization, existing not merely to identify problems and formulate recommendations, but to resolve issues through the implementation of recommendations, much as the Weights and Measures Conference and the Interstate Milk Shippers do. Specific recommendations in this regard will be presented prior to the next Conference." (Page 410, Proceedings) To accomplish this, the 1986 Conference agreed: • To develop a state regulatory ratification mechanism whereby each of the 50 states will have one vote; and • To create a Constitution and Bylaws Committee to review the entire Constitution and Bylaws and to formulate recommendations for the Executive Committee to consider.
- Body of Delegates *ratifies* the vote that has already taken place in Council (where local regulatory representatives ARE involved in the vote)
- Pages iv and v of the C&B provide additional insight. From page iv:

    - The second principle that guided the review process was the need for the Conference to be more successful in promoting food safety, mutual respect, and uniformity. This was accomplished through the following changes: 1. The final actions taken by the Conference regarding such items as food safety controls, certification procedures, and Memoranda of Understanding, were to be adopted by the regulatory delegates of the Conference with the advice of industry and other non-regulatory members;
- Page v:
    - The final guiding principle was the need to ensure that the Conference would provide a national and, to the extent possible, international dialogue on food safety on a regular, periodic basis, and that this dialogue would be among representatives of regulatory, industry, and other non- regulatory organizations.

Discussion Points to turn into Potential Issues

The group produced several problems to be addressed when writing issues. They are placed into 3 categories

1) There is no Local Regulatory Representation voting during the Assembly of Delegates since only states are allowed to vote.
    - Many local jurisdictions are active in CFP and their state counterparts less so.
    - States and local jurisdictions may not use the same standards to protect food safety. (Local jurisdiction using the 2017 Food Code, the State still using 2005)
2) Communication to Local Regulators from States is usually top down and appears not to happen frequently, specifically on issues and voting.
    - States may not take into consideration the impacts of their votes on Local jurisdictions.
    - This could be potentially tasked to the Strategic Planning Committee on the board of Directors.

    Clarity is needed on the position description for members of the Assembly of Delegates (Is there one?) and a deep dive historical look at the Constitution and Bylaws and sates roles in the process. (This was addressed in first two meetings.)
    - Constitution and by-laws may be biased in favor of the states.
    - Constitution and by laws may make assumptions about the roles of both State and Local Jurisdictions in the CFP process as well as to what is occurring at the state level.

An additional idea, that had support is to ask the board if we can survey the members of CFP at the Biennium conference. The survey could be provided electronically or in paper form and, if approved the committee could man a table at the conference to gather as much input as possible.

Lastly a committee member reached out to Jo on bringing up the possibility of allowing the Regional Local representative to vote. Although this has been discussed I wanted to make sure all voices were heard

.

10/07/2022

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
    4. Examining the current by-laws to include a historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
    5. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
    6. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting Agenda

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum
- Sharon Wood and Patrick Guzzle proposed that the committee suggest a change in the language of the Executive Board Member job description.
- Old Language:
    - Communicates with and updates their respective constituencies on the progress of CFP.
- Suggested New Language:
    - Actively and regularly communicates and reports CFP business and updates to their associated constituency using appropriate venues to include, but not limited to, professional groups, institutions, associations, newsletters, social media groups, and / or presentations to maintain a high level of knowledge on the status of CFP activities and pending issues being addressed.
- The group agreed to suggestions on the language change and to ask the board to reform the committee to be able to expand the study of the issue. This committee did not have a great deal of time, and the last few meetings did not have a quorum when voting was necessary
- Jo will put the two items to an e-vote and amend the report to the executive board.
- E- Vote to accept previous meeting minutes from 08.05.2022 and from 09.02.22 minutes accepted with 7 yes votes.
- The executive board voted to pass the change to the position description and understands that additional work is needed on Local Representation. A big thank you to Sharon and Patrick for their work on this matter.
- Discussion now needed on issue submission to reform committee and drafting charges to further guide the process.

09/16/2022

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
    7. Examining the current by-laws to include a historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
    8. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
    9. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting Agenda

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum – Quorum not present
- Current survey results – Still at 25
- From 09/02 Need someone to sort through information that we do have to determine if anything can be inferred. Steve Carmody will evaluate data and the group will discuss it on 09/16. Steve was unable to fully evaluate due to promotion.
- The committee discussed the survey and implications of information flow to local regulators.
- Sharon Wood and Patrick Guzzle proposed that the committee suggest a change in the language of the Executive Board Member job description.
- Old Language:
    - Communicates with and updates their respective constituencies on the progress of CFP.
- Suggested New Language:
    - Actively and regularly communicates and reports CFP business and updates to their associated constituency using appropriate venues to include, but not limited to, professional groups, institutions, associations, newsletters, social media groups, and / or presentations to maintain a high level of knowledge on the status of CFP activities and pending issues being addressed.
- The group agreed to suggestions on the language change and to ask the board to reform the committee to be able to expand the study of the issue. This committee did not have a great deal of time, and the last few meetings did not have a quorum when voting was necessary.
- The group recognizes the implications of changing the Constitution and Bylaws and the amount of time and effort it could take to adopt and implement any changes to include local representation

- Jo will put the two items to an e-vote and amend the report to the executive board.
- E- Vote to accept previous meeting minutes from 08.05.2022 and from 09.02.22 minutes accepted with 7 yes votes.

Reminder, final report is to be submitted to the Executive Board.
Call ended at 1:00 pm EST

09/02/2022 Minutes

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
  10. Examining the current by-laws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
  11. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
  12. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting Agenda

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum – Quorum not present until end of meeting.
- Antitrust Statement reminder- Jo
- Vote to accept previous meeting minutes from 08.05.2022 and from 09.02.22, e-vote

Reminder, final report is to be submitted to the Executive Board.

Survey

Current Results – Still at 25

- How do we obtain additional information prior to final report?
- Need someone to sort through information that we do have to determine if anything can be inferred. Steve Carmody will evaluate data and group will discuss on 09/16

Other Items

- Discussion needed on the impact of changes to the Constitution and Bylaws.
- Discussion on issues facing Local regulators and the impacts on knowledge of and involvement in CFP

- Jo will schedule call for 09/16 for discussion on survey data and ideas that can be presented to Executive Board in Lieu of changes to Constitution and By Laws. Group agreed on date.

08.05.2022 Minutes

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
  13. Examining the current by-laws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
  14. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
  15. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting Agenda

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum- quorum was present
- Antitrust Statement reminder- Jo
- Vote to accept previous meeting minutes from 05.06.22 and 06.04.22 due to lack of quorum on previous call – unable to vote no quorum present
- Online vote for meeting minutes 9 yes votes. Motion to accept minutes from 05.06.22 and 06.04.22 passes.
- Vote to accept previous meeting minutes from 07.15.22

Survey

- Current Status
  - Pieter to send out survey next week to CFP Local members.
- Need to try to reach larger audience. To that end we are reaching out to other potential groups of locals for input.
- Deadline to send out survey to other organizations and obtain results- end of September.
- Remember issue submission is fast approaching. We will need recommendations for potential realistic wording for representation and placement in Constitution and Bylaws.
- Discussion on ways to potentially get more information to use in the final report.
- Meeting Adjourned

07.15.2022

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
  16. Examining the current by-laws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
  17. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
  18. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting called to order

- Welcome – Jo called meeting to order
- Attendance- 7 voting members needed for a quorum- no quorum present
- Antitrust Statement reminder- Jo
- Vote to accept previous meeting minutes from 05.06.22 and 06.04.22 due to lack of quorum on previous call – unable to vote no quorum present

Survey

- Current Status
  - Link and voting information emailed out on 05.03.22
  - Pieter sent out survey next week to CFP Local members.
- Sam Gaber- Member of Pieter Sheehan's staff- gave brief overview of survey results and a couple key comments.
- Group discussed next steps with Survey-
- Need to try to reach larger audience. To that end we are reaching out to other potential groups of locals for input
  Michelle DiMaggio will reach out to NEHA
  Deanna Copeland will reach out to AFDO
  Pieter Sheehan will reach out to NACCHO
- New Overview/Intro Paragraph to be drafted – Hunter McClellan has agreed to draft
- Deadline for outreach to other organizations and for intro to survey set as Friday July 22nd. Please, report back to committee with information on outreach.
- A big thank you to everyone that has agreed to step up and help out.
- Once results are back we will need to determine actions needed to address issue.
  Jo reminded everyone to become familiar with the Constitution and By-laws
- Jo will start email thread to vote on minutes as well as discuss any needed committee work.
- Next meeting August 5th at 12:00.

Meeting adjourned 12:23

- Group to work on data- July Call
- Next steps for use of information?? Discussion
- Discussion to determine where changes may be needed in Constitution and Bylaws when survey is complete (LINK)

Increasing Local Regulatory Involvement in CFP and committee work

- Comment from voting process – will add to agenda of next call
- Discuss with group

New Business

- **It was brought up that the next call was right before a holiday weekend. Call Changed to the 15th of July to avoid any issues for people traveling for the Holiday.**

Motion to adjourn: Second:

Local Regulatory Representation Agenda

Local Regulatory Representation Minutes

06.03.22

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
  19. Examining the current by-laws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
  20. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
  21. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Meeting called to order

- Welcome – Jo
- Attendance- 7 voting members needed for a quorum- no Quorum 4 Voting members
- Antitrust Statement reminder- Jo
- Vote to accept previous meeting minutes from 05.06.22: Unable to vote will vote on next call

Survey

- Current Status
  - Link and voting information emailed out on 05.03.22

- Motion made by Steven Carmody to accept the Survey as it was currently written, Seconded by Deana Copeland
- Vote passed on 05/16 with 8 voting members agreeing to send out survey with adjustments from last call to CFP local members
- Survey has not yet been sent out to Local Members
- Pieter will send out survey next week to CFP Local members. Jo will resend list of emails

- Group to work on data- July Call
- Next steps for use of information?? Discussion

- Jo requested everyone work to become familiar with Constitution and By Laws to help determine where changes may need to be requested when survey is complete

Increasing Local Regulatory Involvement in CFP and committee work

- Comment from voting process – will add to agenda of next call
- Discuss with group

New Business

- **It was brought up that the next call was right before a holiday weekend. Call Changed to the 15th of July to avoid any issues for people traveling for the Holiday.**

Motion to adjourn: Larry Second: Michelle

Local Regulatory Representation Agenda

05.06.22

Charges

- To evaluate local regulator voting representation on the Assembly of Delegates and report to the Executive Board for consideration of the following:
  22. Examining the current by-laws to include an historical perspective and exploring methods to provide representation of local regulators on the Assembly of State Delegates.
  23. Reporting back to the Executive Board before the next biennium to make a recommendation for consideration for issue submittal during the next biennium.
  24. Including representation from the Constitution and By-laws Committee to assist in the development of recommendations and amendments from the findings determined in charges.

Jo DeFrancesco called the meeting to order at 12:05

- Welcome
- Attendance- 7 voting members needed for a quorum, 9 voting members present
- Antitrust Statement- Jo reminded group of statement.
- Jo reminded group the meeting is being recorded.
- Group was reminded that Courtney Halbrook was the new Council II Chair, and that Wendy Bell has stepped up as Vice Chair of the Council.

- It was announced that Sean Dunleavy would be attending the meetings as a representative of the Constitution and By-Laws Committee. Sean was present on the call to add input as needed.
- Discuss Survey and Feedback from group
    - Discussion – Led by Pieter Sheehan
        - Sharon Wood agreed to draft introductory statement giving issue background information to survey respondents. This was felt to be necessary by the group to aid in educating respondents.
    - Several Questions need minor clarification to ensure respondents understand the intent of the question.
        - Questions #3 and #5: Wording needs adjustment to change the sord issues to "topics" or similar.
        - Question #4: Group felt it would be appropriate to place CFP in front of the word Issue and capitalize the word Issue.
        - Questions 11 and 13 were perceived to be leading questions.
            - Suggestion was made to remove the language, "..we understand that you rely on state delegates…" on question 11
            - Suggestion was made to remove language and have it state, "Please, indicate your reasons for participating in CFP."
    - Jo will follow up with appropriate board members for mailing list.
    - Pieter and Jo will send out revised survey to Committee with a tight turnaround for discussion and voting. This will occur once suggested revisions are completed.
    - After vote survey will go out immediately.
- Future Committee Work
    - Future steps potentially include a second survey, should data from the current survey provide sufficient evidence to warrant, to local jurisdictions outside of CFP.
    - Suggest recommendations to be put in place for Local Representation voting process.
    - Coordinate with Constitution and By Laws Committee where/how to place recommendations
    - Draft Issues
- Scheduling remaining calls
    - Group agreed that Fridays at 12:00 EST is an acceptable time for meetings
    - Additional meetings are anticipated once survey results are in.

- New Business
    - None

- Motion to Adjourn: Patrick Guzzle
- Second: Tim Westbrook

Next Meeting: June 3, 2022 12:00 EST – Jo will send invite

ID	Start time	Completion time	Email	Name	Is your local jurisdiction adequately* represented by your State Delegate (ST-D)? *Note: Adequately refers to how state delegation communicates and represents your jurisdiction's specific needs o...	If you selected "no", please explain.	Does your jurisdiction have the opportunity to discuss big-picture items that effect your local food safety program with the State Delegate or representatives of the Delegate's agency/office durin...	Please indicate how often you meet with your State Delegates or representatives to discuss CFP Issues that impact voting decisions in the Assembly.	Does your State Delegate initiate dialogue regarding unique local, developing, or historically problematic concerns that require a "birds eye" view to get a solution?	If you selected "yes" to the previous question, what are some examples of concerns being discussed?	Does your local food safety program have the opportunity to discuss the impact of CFP Issues on your jurisdiction with State Delegate(s) in a regularly scheduled manner?	How often does your State Delegate(s) consult with your local jurisdiction when voting on CFP Issues? Are you always clear on the CFP Issues being discussed and evaluated?	How would you classify the intra-communication between your state and local agencies that handle food safety?	If you selected "ad-hoc" or "limited" to the previous question, please explain.	As an active local regulator and participant in CFP, would additional local voting rights in the Assembly of Delegates cause you to get more involved in CFP?	Please explain your answer to the previous question.	The Assembly of Delegates is made up of states and territories who have complete voting rights. As a local regulator, please indicate your reasons for participating in CFP.	Have you previously attended the regulator's caucus meetings during the Biennial Meeting in which the CFP Issues are discussed among all regulators?	Are you going to participate in the 2023 Biennial Meeting of the Conference of Food Protection?
1	6/13/22 14:33:37	6/13/22 14:42:43	anonymous		Yes		Yes	3-4 times per year and as needed.	No		Yes	As needed	Open		No	I am already actively involved	To give a local voice on a national level	Yes	Yes
2	6/13/22 14:39:56	6/13/22 14:45:31	anonymous		No	State does not communicate with local health dept.'s.	No	N/A	No	N/A	No	N?A	Limited		Yes	State needs to discuss CFP with locals. Most do not even know it exists.	To be part of the process.	Yes	Yes
3	6/13/22 14:39:15	6/13/22 14:49:34	anonymous		Yes		No	We have a regularly monthly state conference call on local issues but not exclusively on big picture CFP issues. It would be nice to connect quarterly with our state to bring everyone up to speed on the various committee work within each Council that LHJs may be working on.	Yes		No	Not sure unless you're heavily involved with CFP issues within each Council or following CFP issues?	Open	Regular monthly state conference calls with LHJs is being held in WA State especially now we're adopting the 2017 FDA Food Code.	Yes	But not at the expense of aligning with the State on issues and voting - need to communicate closely. Voting rights does not necessarily mean getting more involved with CFP as time constraints and subject matter expertise of the individual factors in more.	Dual purposes of contributing to the CFP issues and ultimately current Model Food Code final drafts but also to understand the science/issues of food safety and regulator oversight that makes sense to LHJs jurisdiction frontline impacts.	Yes	Yes
4	6/13/22 14:50:27	6/13/22 14:59:04	anonymous		Yes		Yes	Sometimes right before CFP vote if delegate is available.	No		Yes	Historically, CFP issues haven't been discussed between local and State delegate prior to voting on CFP issues. Mostly clear on CFP issues being discussed & evaluated but think that it would be valuable for state and locals to visit prior to voting to be sure that all things are considered regarding voting outcomes.	Open		Yes	If local voting rights were provided, would speak to issues that affect jurisdiction	To hear about what's happening on a national level and work to build consistent approaches with states and territories that have similar demographics and food establishments.	Yes	Yes
5	6/13/22 14:54:36	6/13/22 15:06:16	anonymous		No	I believe they have requested feedback on topics to bring to CFP but never hear anything else from them. We are the largest jurisdiction (population and facility count) in our State and have never been asked questions related to topics or concerns at CFP.	No	We do not. We meet regularly with them but it is always around issues we see in our community, not related to CFP issues	No		No	They have never consulted with us being the largest in the State. No, unaware of the CFP issues being discussed.	Limited	The State is currently down multiple employees so they attend our statewide meeting every other month though seem to only be collecting information not providing responses. This makes things incredibly difficult to run a program at the County level when we have to ask the State for guidance as it is a State-wide program.	Yes	I think so, yes		No	No
6	6/13/22 14:59:21	6/13/22 15:08:13	anonymous		No	State delegate does not adequately represent our jurisdiction and does not request feedback based on our community's needs and goals for public heath and food safety	No	never	No		No	does not clearly solicit feedback on issues under discussion	Ad-hoc	State only reaches out when they see a need. They do not ask if we need items addressed and there is only a single meeting each year for general conversation, no specific to CFP issues.	No	Since we are already actively involved, this would not increase our involvement. I do feel that it would better represent the community in our jurisdiction since many CFP issues to directly impact the community.	Interest in issues and committee work for addressing those issues.	Yes	Yes
7	6/13/22 16:00:03	6/13/22 16:11:29	anonymous		No	This past year, there was no-one to represent my State. In my state, there are many different local authorities that cover Retail food while the State covers Manufactured foods.	No	We do not meet.	No		No	N/A	Open	There is open dialogue between us and the state, however it is very rare. We have our own code, with our own authority.	Yes	If we had a seat at the table when voting it would be nice. Since we are not represented at all currently.	I got involved, because I believe its a good cause. It's fascinating to see everyone come together.	Yes	Yes
8	6/13/22 16:43:56	6/13/22 16:53:01	anonymous		No	I think the answer to this is "unsure" - I don't know who at the state attends these meetings and we are not consulted on issues they are voting on. We are not asked for input on issues or what local needs might be.	No	Never.	No		No	Never consulted. Only clear if I do research through the CFP website on items that interest me, that is, if I know about them through another source.	Limited	Communication with the state on food safety issues is extremely limited. There are no regularly scheduled meetings for this. I came from out of state and was surprised to find no solid network of food safety programs/program managers or department directors in the state. They do reach out if the food code is being updated, but that is not very often.	Yes	Yes. What is the point of attendance/involvement if I really don't have a say/vote? I can follow what is happening online if I need to.	To keep up on what is happening from a big picture standpoint, which could lead to a more progressive local food safety program. Additionally, the locals are the boots on the ground and have first-hand knowledge of the practicalities of how retail food establishments operate which should be considered when voting is happening. This could be very helpful to the process.	No	Yes
9	6/13/22 23:50:50	6/14/22 0:02:16	anonymous		No	Infrequent contact from state delegation on local health needs. The state rarely reaches out for our input and does not communicate on their dealings with CFP.	No	Never. In the 15 yrs I have been in the field the state delegates have never reached out to individual jurisdictions for their input.	Yes	Sous vide process, ROP	No	Never, no	Limited	State delegation does not ask for local input.	Yes	Since local health is never consulted for input by the state delegates, this is a deterrent to getting more involved.	To gain more knowledge of the FDA food code as CT uses a state code. To keep abreast of current issues that CFP addresses. To meet industry and government regulators for all over.	Yes	Yes

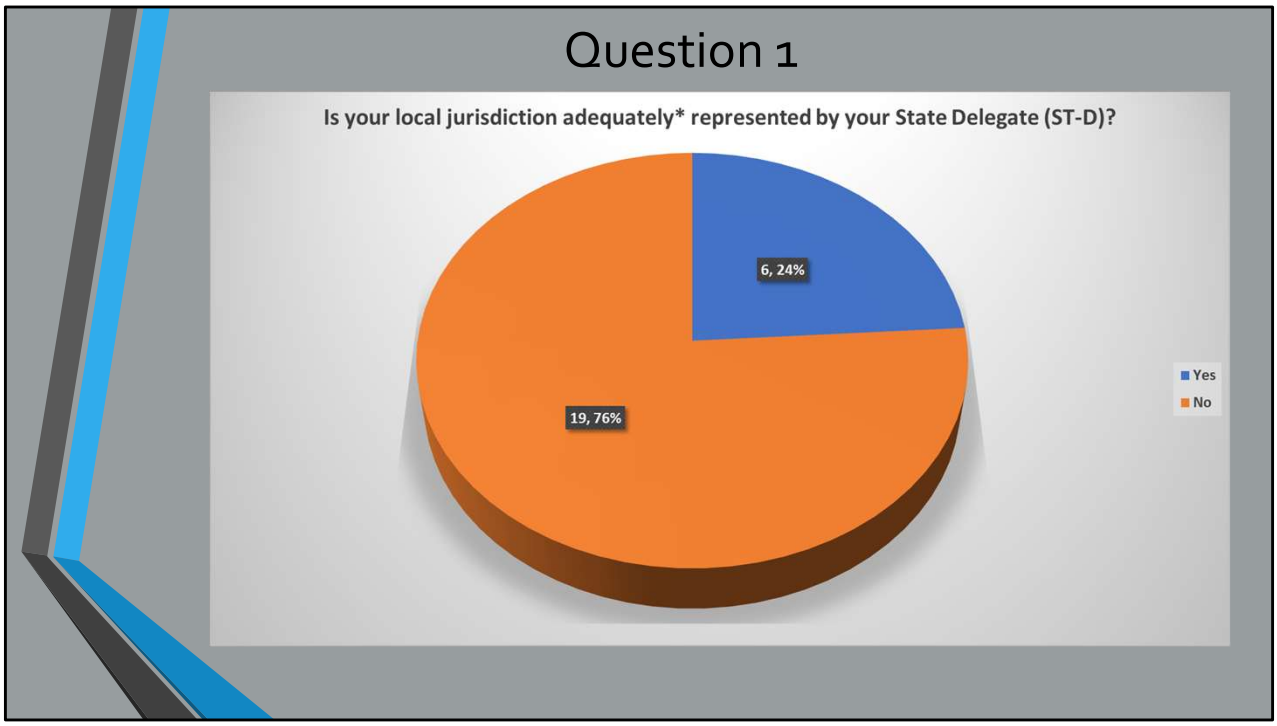
10	6/14/22 7:43:30	6/14/22 7:47:57	anonymous	Yes		No	never	No	No	Never, to my knowledge. No, not clear.	Ad-hoc	Communication as needed.	Yes	I'd try to understand the issues more than I do now, and that would cause me to be more involved in CFP.	Participation in the national organization that has direct impact on food safety regulations.	Yes	Yes
11	6/14/22 8:38:07	6/14/22 9:07:08	anonymous	No	The state does their thing and they vote with which I'm sure is their best choice. However, they did not reach out to us to hold a separate meeting to understand our viewpoints regarding each of the issues from those in our state. Historically, local regulators have only been allowed to attend the state caucus meetings so that a general understanding from all regulators regarding each of the issues could be discerned, especially amongst the state delegates who will be voting. The way it is currently set up, a local regulator has to do their own homework and lobby everyone to get their voice heard.	No	Whenever they decide that its a good time to conduct a training	No	No	I have not heard anyone from the state do so. I'm always clear on the issues because I do a lot of homework before hand and keep up with the actions taken by each of the councils	Ad-hoc	They provide presentation type of training when there is a code change. They are available by email if we have a question.	Yes	I have been involved with CFP for some time. I would love to have the opportunity to serve as a local regulator on the assembly of delegates.	To participate in the issue action discussion and voting process either as a council member or by working with those on the councils to ensure my viewpoints are expressed and provided.	Yes	Yes
12	6/14/22 8:58:05	6/14/22 9:11:55	anonymous	Yes		No	never	No	No	none that i know of	Limited	The state will have or set up meetings when the state wishes to communicate something down the line. Example, if the individuals at the state level thinks the local level may be communicating or doing something the state agency may not approve of, then the state will pass communication down the line letting the local agency know that they object to what is happening even when there was no guidance prior to the state reaching out to the local agency.	No	I do not think I have time to spend / work on issues at the CFP [illegible]	To read about issues other jurisdictions are having and what may be coming down the line.	No	No
13	6/14/22 9:34:17	6/14/22 10:00:54	anonymous	No	The Ohio Department of Health and the Ohio Department of Agriculture represent and advocate for their own best interests and have long been in a "them vs. us" relationship with local health departments. The delegates are their employees and are required to regard the desires of the agencies above all else, including the opinions of what local health departments think they need. This is unlikely to change.	No	Rarely - I can't recall any such meetings. Meetings with the state officials/ state delegates involve meetings where we *may* be permitted to observe - such as the Retail Food Safety Advisory Council (RFSAC) or where they are telling us what is going to happen during Food Safety Meetings. There are opportunities to ask questions, but these are by no means discussions. We are told what will happen and the questions are only in regard to clarification as to how they feel we should be interpreting or responding to situations. Our feedback as local health departments is deemed unnecessary. Feedback can be formally submitted during rule review, but that is only because it is required, not that it is seriously considered. The only way people know about CFP is if they engaged and found out about it on their own. It is not promoted or discussed by our state agencies. They don't want us involved at all.	No	There are none. They dc	No	Never. Have never been contacted or asked and I would be the person to ask at my department.	Limited	Non-existent needs to be an option. The state uses a top down management style. There is little involvement by the locals in what actually happens. There may be some "committees" to make it look like LHDs are involved, but there is little actually taken from them and put to use. They make all the decisions and we deal with them. They do not involve us in CFP related issues at all.	Yes	[illegible] to be more diversified so that more voices can be heard. If it truly is a unanimous decision, it would be the same result anyway wouldn't it? What would it hurt to have more voices? With the voting power only at the top state agencies and their delegates, currently, local health departments have no say, no power, and really no incentive to want to be involved in CFP. I think we need to get the word out that Locals CAN make a difference and CAN play a role in how our codes are made. The state likes to make people think otherwise. This can be a collaborative effort. The state agencies are	It is important to understand how everything fits into the big picture. Even though we are a small part of the puzzle, we each contribute to a greater whole and can influence what happens. If few people care enough to be involved, we all will suffer when decisions are made by limited perspectives. Additional perspectives, can provide insights that we may not have been aware of. That can help us make more informed decisions. What we do keeps our communities and families safe. That is important and a valuable use of time.	Yes	Yes
14	6/14/22 10:28:36	6/14/22 10:32:49	anonymous	No	Our State is not involved in CFP or the FDA Program Standards.	No	Our State is very hands off. Little to no communication about anything. We basically do what we want and govern ourselves.	No	No	State does not discuss.	Limited	State does not do anything to support local efforts.	Yes	We are already heavily involved in CFP through committees and council membership. We just do not get to vote or have any input after that.	To help develop Food Code policy, provide input from actual 'boots on the ground' individuals, and to learn more about food law.	Yes	Yes
15	6/14/22 10:48:25	6/14/22 10:56:25	anonymous	No	In Nevada, there are 4 jurisdictions, three local county health districts that cover environmental health for their respective counties and the State of Nevada that covers all other rural counties within in the state. Each jurisdiction is separate with their own regulations, etc. The state delegation committee does not communicate important retail food issues to our jurisdiction and does not have an understanding of our needs and issues at the local level.	No	Had one meeting prior to the last CFP meeting, but no other outreach from the State Delegates regarding CFP issues.	No	No	So far, just one meeting prior to the 2020/21 CFP.	Limited		No	We already have several staff on committees and have participated on council. We would continue to be involved with CFP regardless of having local voting rights.	Our agency has been active in CFP for several years as we want to be informed of immerging food safety issues that effect our local community.	Yes	Yes
16	6/14/22 12:56:40	6/14/22 13:10:03	anonymous	Yes		Yes	Upon request by either party	No	Yes	The local representation has dialogue and opportunity sharing to come to consensus prior to vote. Ultimately, as is known, the state votes accordingly to what they believe is accurate for the entire state.	Open		No	I'm already actively involved and our delegation of authority is granted by the state.	I agreed to represent the local regulators in the SE on the EB board. It is of service to the profession.	Yes	Yes
17	6/14/22 16:58:44	6/14/22 17:14:19	anonymous	No	In the past we would have meetings and work groups to talk about the issues submitted to the CFP. Last two CFP Annual meetings there was no coordinated meetings or work groups to discuss the presented issues prior the CFP annual meeting.	No	Have not meet for the last few years.	No	No	Only at the CFP regulatory meetings.	Limited	Haven't had meetings regards CFP Issues for a long time.	Yes	We are already pretty involved with CFP but would like to become more involved with local participation.	Being able to be involved on working committees, and councils. Being able to listen to the dialogue of issues being presented to the three councils.	Yes	Yes

18	6/14/22 17:52:38	6/14/22 18:02:35	anonymous	No	Locals represent themselves best and make decisions more efficiently. There is an association that brings all the locals together with the State agency but the State does not make the necessary decisions in a timely manner to allow locals to progress in their decision making.	Yes	These meetings are scheduled once a month. They are not exclusively for CFP related items but if there are any, they would be discussed at this meeting.	No		Yes	As stated above, if they do come up, it would be at the monthly meetings. Our local jurisdiction has multiple members of CFP so we are aware through direct participation.	Ad-hoc	Our State agency does not have the expertise nor the decision making processes in place to lead food safety topics and issues.	Yes	Understanding that our voice could directly be heard, would increase participation. Our large local agency is the most influential food safety agency within the State. The State relies on the locals a lot but does not provide the necessary leadership.	To be part of the discussion in how our industry approaches regulations and the direction food safety programs should be progressing in.	Yes	Yes
19	6/14/22 17:51:28	6/14/22 18:09:33	anonymous	No	There is little to no communication between our jurisdiction and the State Delegate regarding CFP issues.	No	We may run into them at the CFP Biennial Meeting. A "formal" meeting is not scheduled.	No		No	We usually aren't even informed of who the State Delegate is. The State does not reach out to us regarding CFP Issues. Any communication takes place at the Biennial Meeting if we run into each other, such as at the regulator caucus or in the halls at breaks.	Limited	We do not have regularly scheduled meetings or communication with our State.	No	I am sufficiently involve, additional voting rights would not cause me to get more involved.		Yes	Yes
20	6/14/22 15:42:53	6/15/22 14:34:46	anonymous	No	The state does not solicit information/feedback from the counties regularly and the counties often take topics to the state for discussion and receive no feedback or untimely feedback. When the state is engaged on a topic, they often defer to the counties so they are not involved. In addition, the state mostly regulates correctional institutions and behavioral health facilities. The local counties regulate more than 90% of retail food facilities and have the greatest experience.	No	The state attends a monthly meeting with all of the counties but CFP and how the State will vote on CFP items is not a routine agenda item. The state does not engage the counties in discussing issues or proposing issues in advance of the biannual meeting.	No	This dialogue is typically	No	This interaction is infrequent and we may discuss items that end up at CFP but the conversation is not typically geared towards preparing for CFP voting or discussions. The state also lacks in-house expertise of the regulations.	Limited	The counties often approach the state with food safety topics but the response is often to handle it on our own or the state says they will get back with us and it does not happen timely or at all	Yes	Local representation could speed things up for regulators and our stakeholders, but we risk diluting the importance of the states participating in the process.	We have participated in councils to discuss the issues. We have also provided comments on proposed issues.	Yes	Yes
21	6/15/22 14:58:16	6/15/22 15:12:31	anonymous	No	We are very seldom asked or given the opportunity to participate in any meetings determining regulatory activity.	No	Never	No		No	Never	Limited	We are contracted by the state and the state makes all of the decisions.	Yes	I would be able to provide insight to my staff and have a better understanding of how decisions are made regarding regulatory issues.	I wanted to get more involved and have more knowledge of how decisions are made.	No	Yes
22	6/16/22 8:16:09	6/16/22 8:33:03	anonymous	No	Our state delegates do not communicate with the local jurisdictions in our state regarding issues, needs, requests, or CFP involvement.	No	zero	No		No	zero	Ad-hoc	There are no regularly occurring meetings or communication. Conversations are initiated at the local level on an as needed basis. As a home rule state, our state department of health does not have oversight of our program.	Yes	As a local regulator, we are as active as can be in the current structure on councils and committees. We have not observed or participated in a closing session as we have no impact or input at that level.	Changes made to the Food Code and Program Standards have the greatest impact on local jurisdictions. I want to have a voice in the changes that are made that affect food safety. When change is made and passed down to locals, often locals do not embrace these changes and this contributes to the inconsistency of the food safety regulatory structure at all levels across the country.	Yes	Yes
23	6/16/22 12:34:12	6/16/22 12:42:43	anonymous	No	It appears that most of the items passed through the councils or recommendations by the council tend to pass in the assembly and the assembly of delegates is more of a formality but I also don't know who my state delegates are which kind of says to me that there is a barrier there if there is no opportunity to speak to them. I know this may be more possible in our "region" meetings that occur during CFP, but if these states delegates don't attend those meetings, how are we supposed to know who they are or network with them?	No	Leading back to the last question, our jurisdiction may just be getting more involved in these discussions and there are instances when our department works with the state but I'm not sure if there are instances where we meet with the state specifically for this purpose.	No	Not that I know of.	No	Not that I know of.	Limited	Again, I as a local member have not had any insights or guidance on even having a discussion with our state people so maybe I'm just super new but no idea.	Yes	I think people may be more inclined to be involved when they know they are contributing to the decision. Again, I think that being involved in the committees is good enough for me and I haven't seen anything shot down by what the committees are doing by the assembly so I think local regulators do have some power, it may just come down to how that is marketed. Also I get the sense that many local authorities see this as more of a hindrance rather than an opportunity to grow as an employee. My local gov employer has not decided if my involvement is really allowed based on my job title. I tend to clock out during the CFP	I like to give our perspective at the local level in the field to help make decisions on ways to standardize or simplify processes to make it easier for all of us. It's tough when local regulations tend to be different in regions and being able to have these discussions to talk them out may be helpful for everyone involved. I like to be involved in these as it helps me get a whole view sense of the process which I believe helps me become a better inspector.	Yes	Yes
24	6/18/22 10:17:50	6/18/22 10:32:22	anonymous	No	Attendance by my state at the Biennial Meeting has not been consistent over the last decade, and most local inspectors in my state do not understand the function of the CFP, the Biennial Meeting or the way that the Food Code is updated.	No	Rarely, if ever, mostly due to the lack of local involvement in the Biennial Meeting.	No		No	Never	Limited	In my state, experienced food safety employees are retiring and there is a lack of experienced inspectors at both the state and local level. Because my state does not use the Food Code, the mechanism to field train and certify inspectors is dissicult and there is a back-log of new inspectors needing certification.	No	Local inspectors in my state (CT) are responsible for all environmental oversight: wells, septic, salons, pools, housing, etc. and do not have time to get involved in CFP or focus with any debth on food safety.	I used to work for a Tribal Health Dept. and had time to devote to CFP. Since returning to local health during the pandemic, it is not possible do to the huge workload.	Yes	No

25	6/22/22 13:38:08	6/22/22 13:56:09	anonymous	No	As a local regulator in my state highly involved with CFP over the past years I have never had my ST-D reach out to my department and ask for requests to bring up to the CFP. We have also never had information or updates from the CFP in our state.	No	This has never occurred in my state.	No	Yes	There has been no consultation with local jurisdiction.	Ad-hoc	Local jurisdictions contact the state agency only when there is a question, scenario, or new procedure that requires state guidance on.	No	if we start to allow local regulators to have voting rights within CFP there may be the possibility of conflict of interests (many local regulators may be involved/married into families of large industry companies etc. and may start to push for their agendas), disagreements with local regulators and state agencies/delegates, and an opening to undermining future CFP work. I am a local regulator and against having voting rights traditionally held by our state delegates. I do ask for updates from our state delegates about work being done at the CFP	I like to know what is going on at a national level. I like to be involved with committee work and helping contribute to national changes. I enjoy policy-making work and ensure things are carried out with DEI work in mind also.	Yes	Yes

Local Regulatory Committee Survey

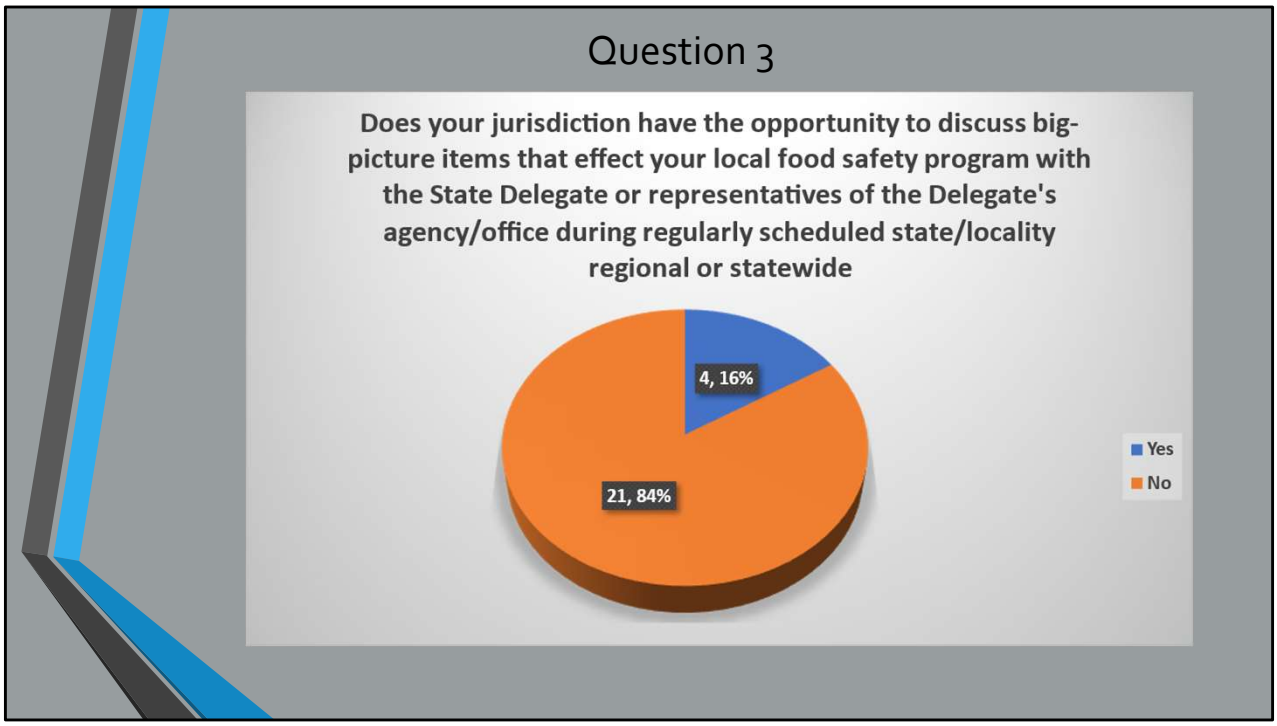
Prepared by Samuel Gaber



Observation: Little to no communication between the states and locals.

Example:

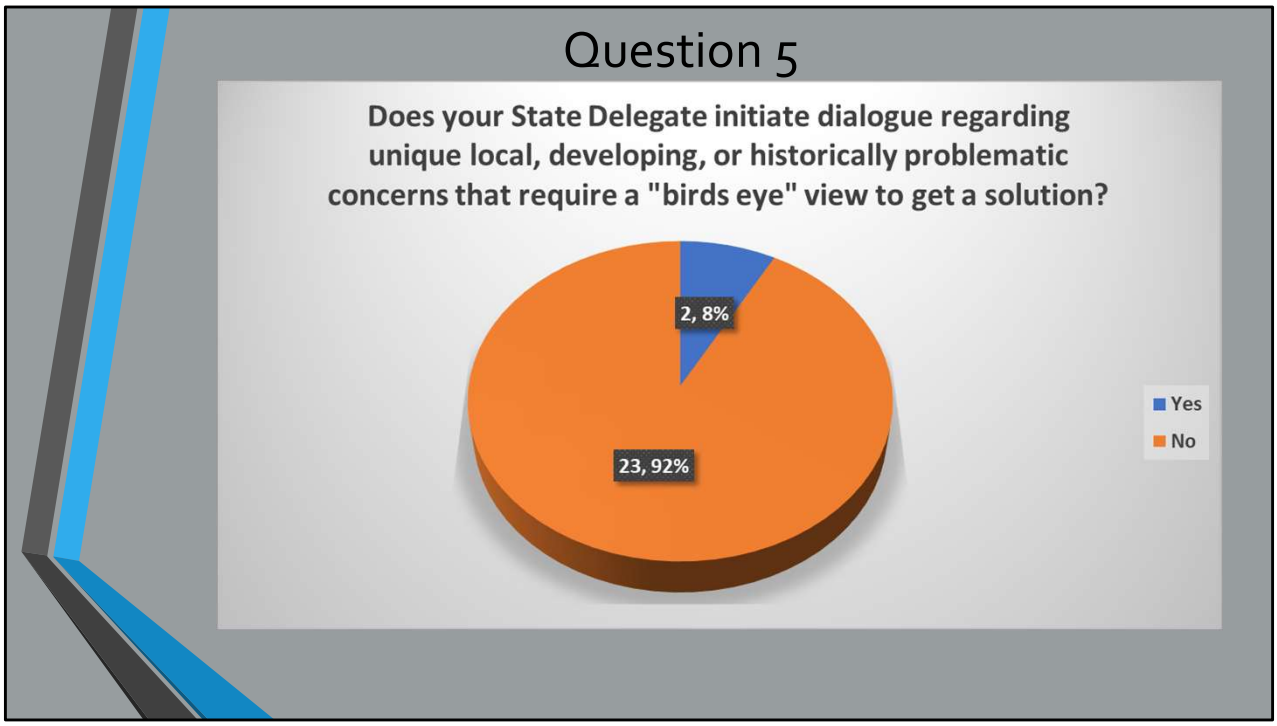
- State does not communicate with local health dept.'s.
- There is little to no communication between our jurisdiction and the State Delegate regarding CFP issues.
- There appears to be some confusion over **who** should be communicating information to the Local Regulators is it the state? The Delegate?



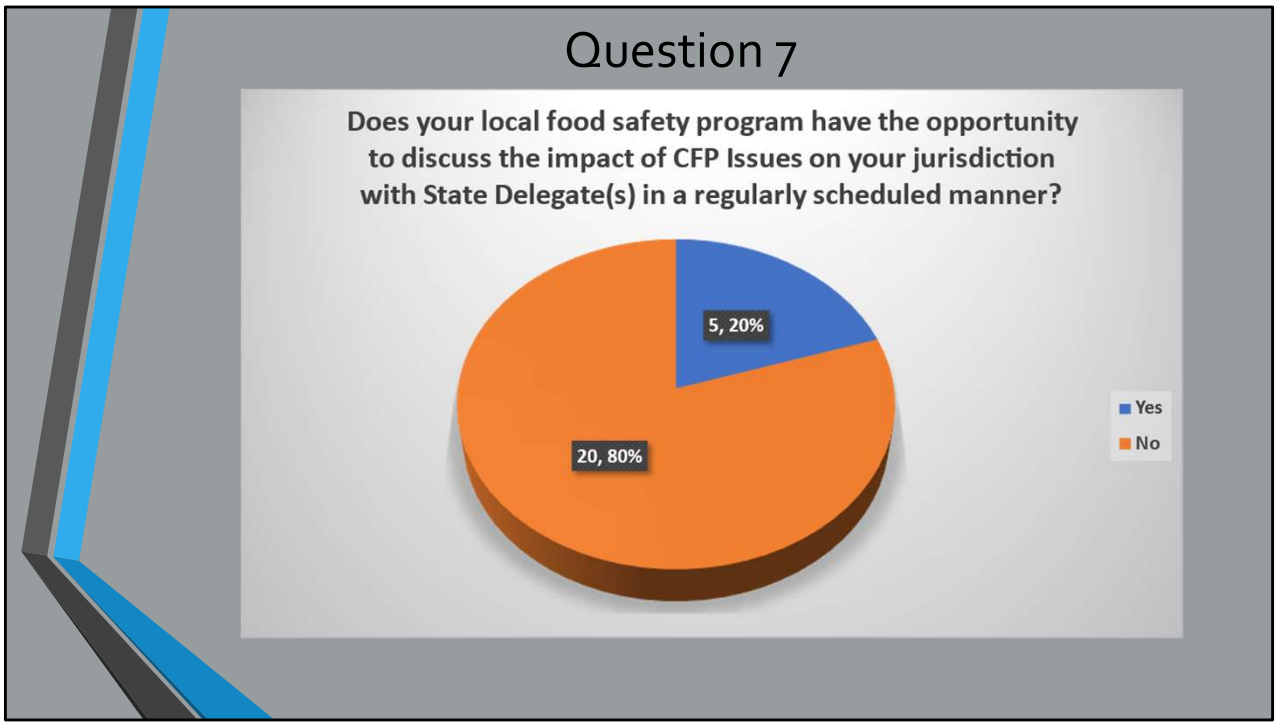
Observation: Official meets are not happening between states and locals.

Example:

- This has never occurred in my state
- We may run into them at the CFP Biennial Meeting. A "formal" meeting is not scheduled.
- We do not. We meet regularly with them but it is always around issues we see in our community, not related to CFP issues
- We have a regularly monthly state conference call on local issues but not exclusively on big picture CFP issues. It would be nice to connect quarterly with our state to bring everyone up to speed on the various committee work within each Council that LHJs may be working on.



Same two as previous question

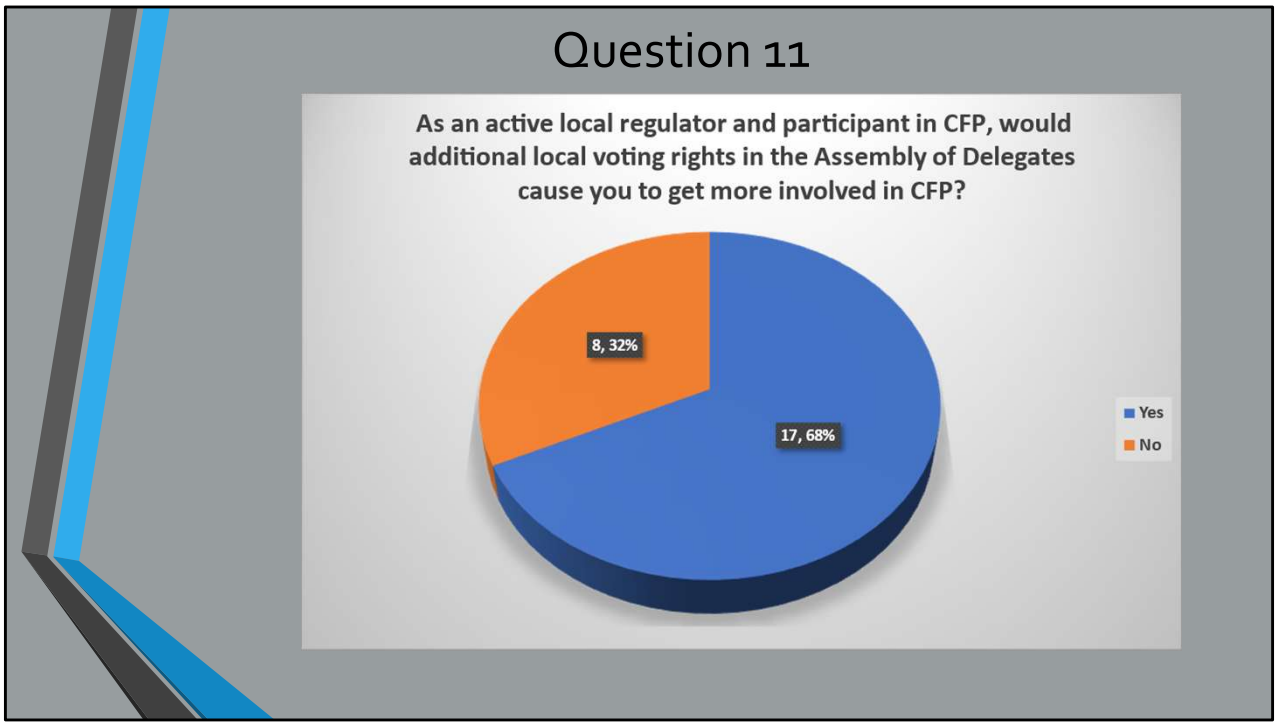


Observation: Little to no communication between the states and locals.

Example:

- There are none. They don't want our opinions or for us to be involved at all.
- Not sure unless you're heavily involved with CFP issues within each Council or following CFP issues?
- Historically, CFP issues haven't been discussed between local and State delegate prior to voting on CFP issues. Mostly clear on CFP issues being discussed & evaluated but think that it would be valuable for state and locals to visit prior to voting to be sure that all things are considered regarding voting outcomes.

General comments reflect a top down approach to any messaging between state and local.

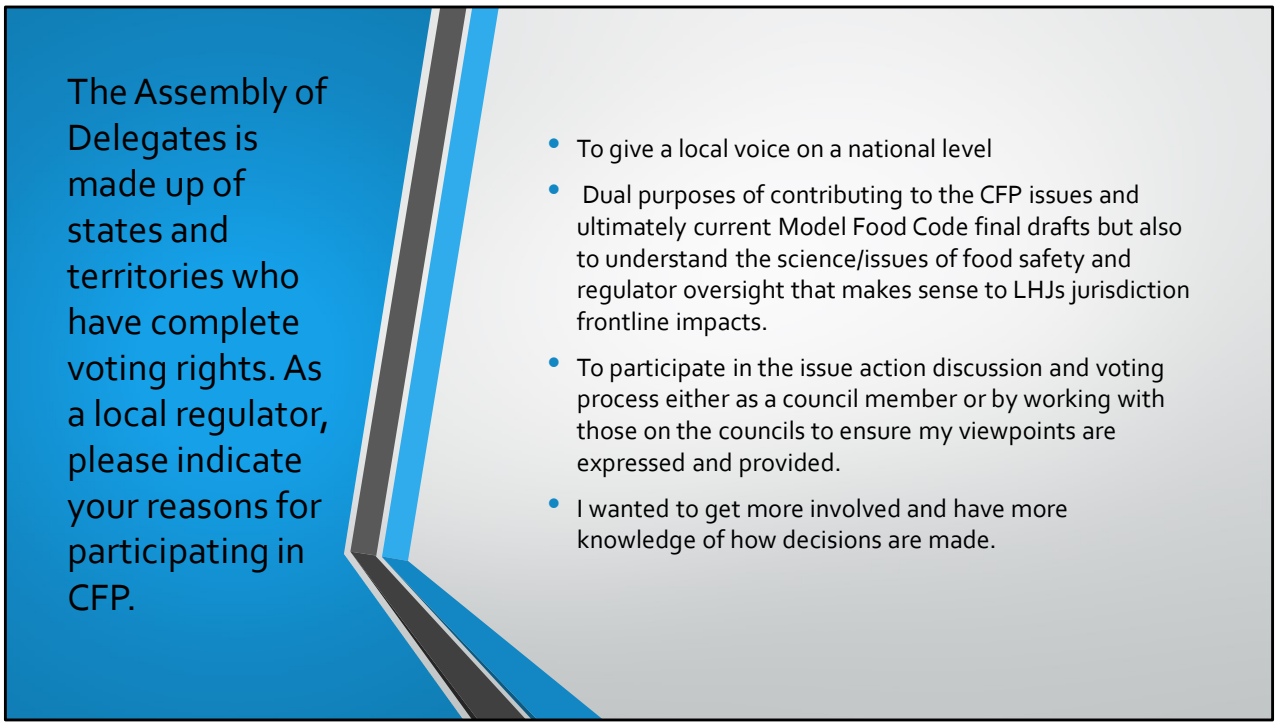


Observations: Locals want to participate
Of those that answered no 7 of them said they were already active and one said they didn't have time.

Example:

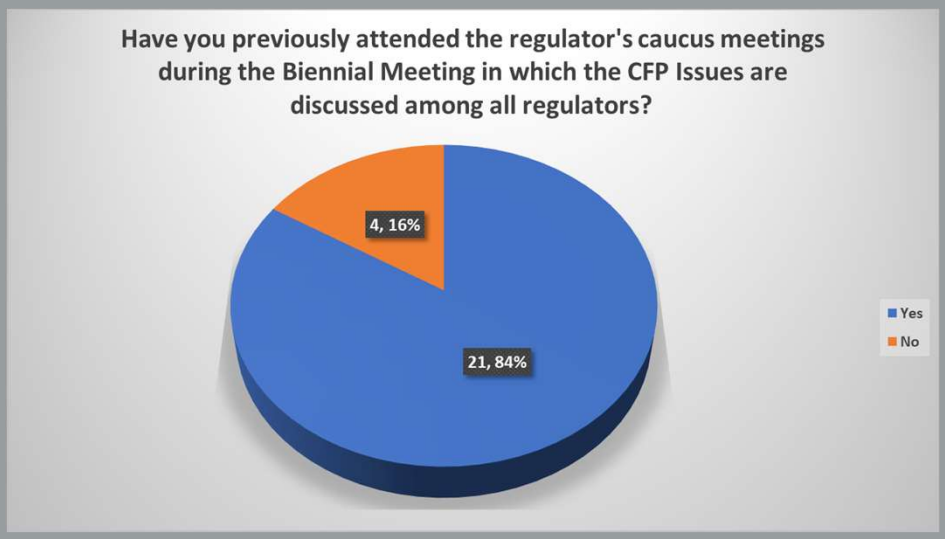
- To give a local voice on a national level
- To participate in the issue action discussion and voting process either as a council member or by working with those on the councils to ensure my viewpoints are expressed and provided.
- But not at the expense of aligning with the State on issues and voting - need to communicate closely. Voting rights does not necessarily mean getting more involved with CFP as time constraints and subject matter expertise of the individual factors in more.
- If we start to allow local regulators to have voting rights within CFP there may be the possibility of conflict of interests (many local regulators may be involved/married into families of large industry companies etc. and may start to push for their agendas), disagreements with local regulators and state agencies/delegates, and an opening to undermining future CFP work. I am a local regulator and against having voting rights traditionally held by our state delegates.

- I do ask for updates from our state delegates about work being done at the CFP level from time-to-time. This should be happening, but is not.



Observations:
The general vein of the answers to this were almost all along the same vein. To be part of the process, to have their voice heard and to have a say in the decisions being made

Question 14



Have you previously attended the regulator's caucus meetings during the Biennial Meeting in which the CFP Issues are discussed among all regulators?
4, 16%
21, 84%
Yes
No

Remarkably, even with communication issues noted the data shows the majority of participants will attend the next biennial conference.

Clearing House Question STND 6

State Enforcement Policy and Corrective Action

Keywords: STD-06, FDA

Issue Description

Background

As a result of 2019 legislation, our state implemented a new, progressive methodology for enforcement that became effective on January 1, 2020. This protocol takes into consideration not only the severity of the identified violation but also the prevalence of violations observed. The legislation provides for a uniform system to communicate inspection results which is based on an overall point system driven by assigned values of low, medium and high pervasiveness (identified in the attached document "19-09 Requirements for Communicating Inspection Ratings"). This point system establishes the criteria by which resources are to be directed for additional full re-inspections or enforcement activities.

Pervasiveness is the overall evaluation of specific issues observed to determine how prevalent the violation is. Using all available information such as active managerial control, previous inspection records, long term controls, and overall risk/severity of the specific situation, an inspector assigns a violation pervasiveness. This system then classifies routine and re-inspections into one of three ratings ("Pass," "Re-inspection," or "Closed") based on the total cumulative violations/ points. This rating is then used to determine the next required action: no required action (the next routine inspections is scheduled), a full facility re-inspection, or the immediate suspension of a license to operate. Facilities that score less than 50 points pass the inspection and do not have to demonstrate correction of risk factor or intervention violations through re-inspection or other follow-up.

Question/Problem

The current enforcement system in our state focuses on comprehensive compliance with the food code through a points-based rating system. Establishments that achieve a "Pass" rating during an inspection will not be required to show resolution for any out-of-compliance risk factor or intervention violations. Does this enforcement system meet the intent of Standard 6, Compliance and Enforcement?

Rationale

It is possible to have a risk factor violation that was unable to be corrected on-site at a facility that did not receive enough accumulated points to warrant a full re-inspection and actually achieved a "Pass" rating. At the time of the inspection, a "Pass" rating requires no further action by the operator to demonstrate correction of a violation and the next routine inspection will be scheduled. The "Pass" score during a full risk-based inspection has demonstrated that the operator had an overall effective control of the food safety risks. The system in Colorado was designed to allow regulatory resources to be focused on the operators that have significant food safety risks (resulting in a full "Re-inspection" or "Closure" of the facility) and not on those facilities that have their food safety risks under control (resulting in a "Pass" score) and have demonstrated active managerial controls are in place.

The desired outcome is to focus resources to effectively achieve compliance with regulatory requirements at facilities that have a significant lack of control over risk factors and interventions. Point values are reflective of risk factors and interventions and are given more emphasis based on prevalence.

Standard 6 – Criteria 1

1. Compliance and Enforcement Procedure

a) The jurisdiction has written step-by-step compliance and enforcement procedure that describes what actions and tools (i.e. forms, documents, interventions) are to be used to achieve compliance

<u>Clearinghouse Response</u> (11-30-2022)

No. The intent of Standard 6 is to evaluate the effectiveness of a jurisdiction's compliance and enforcement policy. Compliance and enforcement activities should result in follow up actions for out-of-control risk factors and timely correction of code violations. The program must demonstrate credible follow up for each violation noted during an inspection with particular emphasis placed on risk factors that most often contribute to foodborne illness.

Conference for Food Protection
2020 Issue Form

Issue: 2020 II-018

Council Recommendation:	Accepted as Submitted	_____	Accepted as Amended	_____	No Action	_____
Delegate Action:	Accepted	_____	Rejected	_____		

All information above the line is for conference use only.

Issue History:

This issue was submitted for consideration at a previous biennial meeting, see issue: 2016 II-020; new or additional information has been included or attached and the recommended solution has been revised.

Title:

PSC Issue #2 New assessment tool for Standard 8 Staffing Level Criteria

Issue you would like the Conference to consider:

The Program Standards Committee has addressed the charges outlined in Issue 2018 II-018: Continue Revision of Voluntary National Retail Food Regulatory Program Standards (VNRFRPS) Standard 8 Staffing Level Criteria. The Committee has proposed a recommendation that the FDA modify the Standard 8 "Staffing Level" criteria by including the proposed model assessment tool as a secondary option to assess compliance based on the findings of the 2018 - 2020 Program Standards Committee, Subcommittee #2.

Public Health Significance:

The VNRFRPS offer a systematic approach to, through a continuous improvement process, enhance retail food regulatory programs. The VNRFRPS define and provide a framework designed to accommodate both traditional and emerging approaches of regulatory programs operating within an integrated food safety system. The Program Standards Committee established a subcommittee to address the specific charges in Issue 2018 II-018. The subcommittee, with support from staff from Harris County Public Health, created a new proposed model assessment tool, ensured it to be statistically sound, and completed a pilot study among 19 jurisdictions to test the proposed model. The information collected provided the means to: (1) Improve the proposed model assessment tool that was initially created by the Standard 8 Subcommittee in Issue # 2016 II-020; (2) Validate the statistical soundness of the proposed model by confirming there was no relationship found between times and frequencies provided by "high" and "low" performing jurisdictions; (3)

Determine if the proposed model assessment tool could be used in the real world setting by conducting a Pilot Study to assess the functionality of the model among varying jurisdictions; and (4) Utilize data from the study to recommend the proposed model assessment tool be included in the Standard 8 "Staffing Level" criteria as an alternative way to determine compliance.

Recommended Solution: The Conference recommends...:

The Conference recommends that a letter be sent to FDA asking them to modify the "Description of Requirements" for "Staffing Level" in Standard 8 by including the proposed model assessment tool as an alternative option to assess compliance for the VNRFRPS.

3.

COMMITTEE WORK PLAN AND TIMELINE: CO-CHAIRS CONTINUED TO WORK THE PLAN AND TIMELINE IN ACCORDANCE WITH CHARGES SINCE OCTOBER 2021.

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***
   - Initial meeting in November 2021 after committee membership approval.
   - Routine meetings held on: 11/22/21, 12/06/21, 01/18/22, 1/31/22, 02/14/22, 02/28/22, 3/28/22, 4/11/22, 4/25/22, 5/23/22, 6/6/22, 7/18/22, 8/1/22, 8/15,22, 8/29/22, 9/12/22, 9/26/22, 10/10/22, and 10/24 via Teams.
   - Since January 2022 our committee completed two participant surveys. First survey obtained members Yes/No and comments on Charge 2 – whether an additional knowledge area under 2-102.11(C) relating to Food Establishments is appropriate. Second survey, more specific on participant recommended verbiage.
   - With 80% Yes on recommending additional knowledge area, specific to Food Defense and 100% Yes on proposing the FDA definition for Food Defense be added.
   - Charge 1 – FDA and USDA consultants provided their updated website links, participants reviewed and provided comments to update Annex 2, Section 4, will be submitted for Council consideration.
   - Our committee worked on an employee orientation checklist for Food Defense to completion. This document is to be submitted as an issue for Council consideration.
   - Charge 4 – We want to thank our FDA and USDA consultants for being on our virtual sessions, working closely with our committee. The FDA Food Defense and Emergency

Coordination staff, Julia Guenther and Jon Woody attended our meetings, providing input periodically and being available to assist with our drafted issues to be submitted.

Our Charge - that a FDC be reestablished to evaluate ways to improve Food Defense awareness for both operators and regulators in food establishments.

Charges for the committee are:

- Identify current food defense references to be included in Annex 2, Section 4.
- Recommend whether an additional knowledge area under 2-102.11(C) relating to Food Defense in food establishments is appropriate.
- Report the committee's findings and recommendations back to the Conference at the next Biennial Meeting.
- The Committee would work closely with the FDA Food Defense and Emergency Coordination staff in CFSAN.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***

a. Charge 1 - Identify current food defense references to be included in Annex 2, Section 4. This charge is completed with providing Annex 2, Section 4 updated information.

b. Charge 2 - Recommend whether an additional knowledge area under 2-102.11(C) relating to Food Defense in food establishments is appropriate. After discussion, two surveys and a final vote our committee completed this charge. Our participants are in favor of Food Defense awareness by employees be provided by the Person in Charge.
Approved language by vote on 7/18/2022:
ADD- FDA Food Code- 2-102.11 Demonstration (C) Responding correctly to the inspector's questions as they relate to the specific FOOD operation.

18) Explaining steps that are taken to prevent intentional ADULTERATION by CONSUMERS, FOOD EMPLOYEES, or other persons including monitoring operations, ingredients, supplies, and finished products for unusual or suspicious activities, and similar FOOD DEFENSE activities.

ADD- FDA Food Code – 2-103.11 Person in Charge the PERSON IN CHARGE shall ensure that: (Q) EMPLOYEES are aware of food defense, such as signs of intentional acts of ADULTERATION as it relates to their assigned duties and report suspicious activity to the PERSON IN CHARGE.

ADD- FOOD DEFENSE Definition: FOOD DEFENSE is the effort to protect food from acts of intentional ADULTERATION.

c. Charge 3 - Report the committee's findings and recommendations back to the Conference at the next Biennial Meeting.
Our committee co-chairs will submit our findings and approved recommendations as CFP 2023 issue(s), forwarding to our Council II Chair, Vice Chair for comment, then submit to our CFP issue receiver.

d. Charge 4 - The Committee would work closely with the FDA Food Defense and Emergency Coordination staff in CFSAN.

   Our committee wishes to thank our FDA Consultants, some of whom represent the FDA's Food Defense and Emergency Coordination staff in CFSAN. They actively participated in our committee meetings and discussion. USDA was also present for our meetings, provided Annex update and actively participated with input during discussion of our charges.

3. ***Charges INCOMPLETE and to be continued to next biennium:***

   There are no incomplete charges, our committee completed work on the four charges provided by Council II.

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.

2.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

a. ***Issue #1: Report – Committee Name:*** **List of content documents submitted with this Issue:**
Committee Member Roster:

☒ ***See attached revised roster PDF*** ☐ ***No changes to previously approved roster***

"Committee Members Template" (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

FDC Membership roster is updated to include alternate members requested by Co-Chairs to participate as voting members. Participants who have resigned from the committee are noted with a strikethrough.

(1) ***Other content documents:***

b. List of supporting attachments: ☒ ***Not applicable***

(b.i.1)

1. ***Committee Issue #2***: Amend Food Code – add Food Defense requirement under 2-102.11(C).
2. ***Committee Issue #3***: Amend FDA Model Food Code Annex 2, Section 4 Food Defense references.
3. ***Committee Issue #4:*** Approval and Posting of Food Defense Guidance Document

Food Defense

Employee Orientation

Establishment Name: _____ **Employee ID#:** _____

Food Employee Name: _____

Employee Awareness Checklist: The purpose of this checklist is to provide a guideline to help raise employee awareness pertaining to Food Defense. This can be used during employee orientation or during routine employee training to help document Food Defense discussions.	**Employee Initials**
Be a responsible employee. Communicate any potential food defense issues to your manager.	
Be aware of your surroundings and pay close attention to customers and employees who are acting suspiciously or are not where they belong	
Limit the number of personal items you bring into your work establishment and keep items secure in a designated area	
Be aware of who is working at a given time and where (in what area) they are supposed to be working.	
Periodically monitor the food display and food service areas (like salad bar, food displays, and other self-service foods.)	
Make sure chemicals are labeled an in their designated storage or sales area. Notify manager if large amounts of chemicals are missing.	
Know your company guidelines and follow them. If you have questions or believe company guidelines are not being followed, request assistance from your manager.	
Take all threats seriously, report any verbal or social media threats made by other employees or customers to your manager.	
If the back door is supposed to be locked and secure, **make sure it is!**	
If something doesn't look normal, **stop** using the product and **notify** your manager **immediately**. For example, if a food product or chemical you use looks different than it usually does	
If an ex-employee or non-employee enters an **"employees only"** area, let them know they have entered an "employee only" area, ask if they need help, escort them out of the employee area. Notify the person in charge or a manager.	
Cooperate in all investigations and notify management or corporate office. This could mean answering questions from the police or other government officials	
Do not talk to the media; refer all questions to your manager, person in charge, or corporate office.	
If you are aware of a hoax, prank, or social media challenge, notify your manager **immediately**.	
CUSTOMER AWARENESS SOP:	
Be aware of any unattended bags or briefcases customers bring into your operation, notify your manager **immediately**.	
If a customer walks into an **"employee only"** area of your operation, ask the customer politely if he or she needs help, then notify a member of management.	
VENDOR AWARENESS SOP:	
Check the identification of any vendor or service person that enters restricted areas of your operation and do not leave him or her unattended. Make sure management is aware of any after-hour vendor services or deliveries.	
Monitor all products received and look for any signs of tampering.	
When a vendor is making a delivery, never accept more items than what is listed on your invoice. If the vendor attempts to give you more items than listed, **notify your manager**.	
When receiving deliveries: **Step 1.** Always ask for identification. **Step 2.** Stay with the delivery person. **Step 3.** Do not allow the person to roam freely throughout your operation. **Step 4**. Delivery vehicle must always be attended or locked when the driver is away delivering products.	
FACILITY AWARENESS SOP:	
Report all equipment, maintenance, and security issues to your manager.	
Document any equipment, maintenance, and security issues.	
Be aware of the inside and outside of your facility, including the dumpster area, and report anything out of the ordinary.	
ESTABLISHMENT SPECIFIC FOOD DEFENSE (OPTIONAL):	

EMPLOYEE SIGNATURE DATE OWNER/MANAGER SIGNATURE DATE

Resourced by: SURE, Food Defense Manager Manual For food service and retail establishments

NEW EMPLOYEE ORIENTATION

1. It is the recommendation that food establishment employees complete this Food Defense Employee Orientation form within 30 days of hire. This includes anyone that serves or sells food, including volunteers, owners, and managers, regardless of whether they have been trained in food safety.

2. The Food Defense Employee Orientation should be completed in its entirety.

3. The food establishment employee should complete the top section which includes Establishment Name, Name of Employee, and the Employee ID Number (if applicable).

4. Food establishment employee should read and initial all the statements listed under each topic.

5. Please make sure that both the owner/manager and food employee sign and date the form.

6. Completed Food Defense Orientation forms should be maintained as part of the food establishment's operating records and kept for two years. You are encouraged to keep the original completed forms for the duration of the employee's employment.

7. This form should be completed only one time by each food establishment employee. If you wish to review this information again in the future with an employee who previously completed the form, follow these steps. Review the information and have the employee sign and date the back of the form.

Food Defense

Employee Orientation

Establishment Name: _____ **Employee ID#:** _____

Food Employee Name: _____

Employee Awareness Checklist: The purpose of this checklist is to provide a guideline to help raise employee awareness pertaining to Food Defense. This can be used during employee orientation or during routine employee training to help document Food Defense discussions.	**Employee Initials**
Be a responsible employee. Communicate any potential food defense issues to your manager.	
Be aware of your surroundings and pay close attention to customers and employees who are acting suspiciously or are not where they belong	
Limit the number of personal items you bring into your work establishment and keep items secure in a designated area	
Be aware of who is working at a given time and where (in what area) they are supposed to be working.	
Periodically monitor the food display and food service areas (like salad bar, food displays, and other self-service foods.)	
Make sure chemicals are labeled an in their designated storage or sales area. Notify manager if large amounts of chemicals are missing.	
Know your company guidelines and follow them. If you have questions or believe company guidelines are not being followed, request assistance from your manager.	
Take all threats seriously, report any verbal or social media threats made by other employees or customers to your manager.	
If the back door is supposed to be locked and secure, **make sure it is!**	
If something doesn't look normal, **stop** using the product and **notify** your manager **immediately**. For example, if a food product or chemical you use looks different than it usually does	
If an ex-employee or non-employee enters an **"employees only"** area, let them know they have entered an "employee only" area, ask if they need help, escort them out of the employee area. Notify the person in charge or a manager.	
Cooperate in all investigations and notify management or corporate office. This could mean answering questions from the police or other government officials	
Do not talk to the media; refer all questions to your manager, person in charge, or corporate office.	
If you are aware of a hoax, prank, or social media challenge, notify your manager **immediately**.	
CUSTOMER AWARENESS SOP:	
Be aware of any unattended bags or briefcases customers bring into your operation, notify your manager **immediately**.	
If a customer walks into an **"employee only"** area of your operation, ask the customer politely if he or she needs help, then notify a member of management.	
VENDOR AWARENESS SOP:	
Check the identification of any vendor or service person that enters restricted areas of your operation and do not leave him or her unattended. Make sure management is aware of any after-hour vendor services or deliveries.	
Monitor all products received and look for any signs of tampering.	
When a vendor is making a delivery, never accept more items than what is listed on your invoice. If the vendor attempts to give you more items than listed, **notify your manager**.	
When receiving deliveries: **Step 1.** Always ask for identification. **Step 2.** Stay with the delivery person. **Step 3.** Do not allow the person to roam freely throughout your operation. **Step 4**. Delivery vehicle must always be attended or locked when the driver is away delivering products.	
FACILITY AWARENESS SOP:	
Report all equipment, maintenance, and security issues to your manager.	
Document any equipment, maintenance, and security issues.	
Be aware of the inside and outside of your facility, including the dumpster area, and report anything out of the ordinary.	
ESTABLISHMENT SPECIFIC FOOD DEFENSE (OPTIONAL):	

EMPLOYEE SIGNATURE DATE OWNER/MANAGER SIGNATURE DATE

Resourced by: SURE, Food Defense Manager Manual For food service and retail establishments

NEW EMPLOYEE ORIENTATION

1. It is the recommendation that food establishment employees complete this Food Defense Employee Orientation form within 30 days of hire. This includes anyone that serves or sells food, including volunteers, owners, and managers, regardless of whether they have been trained in food safety.

2. The Food Defense Employee Orientation should be completed in its entirety.

3. The food establishment employee should complete the top section which includes Establishment Name, Name of Employee, and the Employee ID Number (if applicable).

4. Food establishment employee should read and initial all the statements listed under each topic.

5. Please make sure that both the owner/manager and food employee sign and date the form.

6. Completed Food Defense Orientation forms should be maintained as part of the food establishment's operating records and kept for two years. You are encouraged to keep the original completed forms for the duration of the employee's employment.

7. This form should be completed only one time by each food establishment employee. If you wish to review this information again in the future with an employee who previously completed the form, follow these steps. Review the information and have the employee sign and date the back of the form.

Note: *Minimum council committee size is 11 (as noted above): 1-Chair; 1-Vice Chair; 1-State; 1-Local; 2-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise; 6-Non-voting alternates.*
Maximum council committee size is 23 voting members: 1-Chair; 1-Vice Chair; 4-State; 4-Local; 8-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise; 18-Non-voting alternates.
Membership on standing committees is defined by the Executive Board. On all CFP committees, the committee chair, co-chair(s), and vice chair(s) all count towards constituency balance.

*added at the direction of Conference Chair and not eligible as a voting member until approved by the Executive Board

Committee Final Reports are considered DRAFT until acknowledged by Council or accepted by the Executive Board

The Conference Chair, Executive Director, Council Chair, or Issue Chair may return committee reports, Issues, or attached documents requesting edits to improve clarity or understanding, or to include missing information.

Committee-submitted documents may impact the image, credibility, and integrity of the Conference as an organization. With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME: Food Safety Management Systems (FSMS) Committee

DATE OF FINAL REPORT: December 2, 2022

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Mandy Sedlak, Committee Co-Chair Industry
Christine Sylvis, Committee Co-Chair Regulatory

COMMITTEE CHARGE(S):

Issue: 2020 II-030

1.Identifying barriers to the universal *voluntary* development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.

2.Identifying solutions for overcoming the identified barriers in #1 and provide recommendations for how to promote the solutions.

3.Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on:

a) the hurdles/challenges involved in such a requirement; and

b) recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries. The committee should also consider a gap analysis of § 2-103.11 as a starting point.

4.Developing recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4.

5.The committee should report its findings and recommendations at the next Biennial Meeting of the Conference for Food Protection. While FDA's efforts will be ongoing during this time, the findings and recommendations will continue to be useful to the agency as it continues to implement its blueprint on retail modernization.

COMMITTEE WORK PLAN AND TIMELINE:

The committee met monthly from November 2021 through November 2022. Workgroup documents were shared via FoodSHIELD, CFP Microsoft Teams/SharePoint, and attached to calendar invitations. Microsoft Teams was used for monthly meetings and for the working document. The following milestones were established: identifying barriers to the universal *voluntary* development and implementation of documented FSMSs consistent with Annex 4 of the Food Code by January 2022; identifying solutions for overcoming the identified barriers and provide recommendations for how to promote the solutions by August 2022; conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs in a future edition of the Food Code by September 2022; and developing recommendations on next steps to promote universal development and implementation of documented FSMSs by October 2022. Periodic reports were prepared and submitted in October 2021, March 2022, July 2022, and November 2022, in accordance with the CFP master calendar.

COMMITTEE ACTIVITIES:

1. Overview of committee activities:

Council II Vice Chair Drafted initial proposed membership roster which was approved by the Board.

Dates of committee meetings or conference calls: The committee has met on November 16, 2021, December 14, 2021, January 18, 2022, February 14, 2022, April 19, 2022, May 17, 2022, June 24, 2022, July 26, 2022, October 18, 2022, and November 15, 2022, November 18, 2022. A subcommittee was created to organize identified barriers into subcategories and consolidate and edit the barriers. Additional subcommittees were created to review the solutions submitted by barrier subcategory (economic, people, and training), and to identify pros and cons.

The initial meeting November 16, 2021, included committee member introductions, a review the committee charges, a timeline for addressing the charges was agreed upon, and it was decided that FoodSHIELD will be used for document sharing.

During the meeting December 14, 2022, work being conducted on FSMSs by other groups such as the food safety management survey that the Association of Food and Drug Officials (AFDO) in conjunction with the FDA Retail Food

Safety Regulatory Collaborative was discussed, an overview of FoodSHIELD and the working document was provided, and committee members were encouraged to submit new barriers and barriers submitted.

During the meeting January 18, 2022, the categories to organize barriers (economics, training, processes, accountability, people) were discussed and an overview of the AFDO food safety management industry survey was provided.

During the meeting February 14, 2022, the barriers listing, as organized by the subcommittee, were reviewed. The committee determined that the terms in Annex 4 of the Food Code (Food Safety Culture, Food Safety Management Systems (FSMS), and Active Managerial Control (AMC)) needed to be clarified and defined prior to moving forward with solutions.

During the meeting April 19, 2022, a definition for AMC was decided upon and work on a definition for FSMS was commenced.

During the meeting May 17, the format for the solutions listing was decided upon and three subcommittees, with leads for each of the related barrier categories were created (economic, people, training). Work on a definition for FSMS continued.

During the meeting June 24, 2022, the definition for FSMS was completed and an example of how to implement a FSMS was discussed. Review of solutions to economic and people barriers were complete. The co-chairs met with FDA Advisor, John Marcello, on June 24, 2022, to discuss the direction of the Committee and future actions/charges of the FSMS. The co-chairs met with Council II Chair and Vice-Chair, Courtney Halbrook, and Wendy Bell, on July 13, 2022, to discuss the progress of the Committee and recap the discussion with the FDA Advisor to ensure it aligned with the charges of the Committee.

During the meeting July 26, 2022, a quorum was not established so the definition of FSMS could not be voted upon. Options for the future direction of the Committee was discussed and work on Charge #3 commenced.

During the meeting September 20, 2022, the committee discussed and voted on changes to the roster. The roster changes were necessary to form a quorum to vote in future meetings as a result of non-attendance and individual requests. The roster update consisted of removing voting members Mark Speltz (Regulator – Sate) and Naomi Macias (Regulator – Local) who respectfully asked to be removed from the committee due to a new job responsibility. Moved voting members Sean Dunleavy (Regulator – State) and Shelly Wallingford (Industry- Food Service) to non-voting members due to missing at least three consecutive meetings and not responding to an email regarding future participation. Transferred Troy Huffman and Hsing Yi from non-voting members to voting members to replace those listed in 1 and 2 above. Transferred Evelyn Pollak to an alternative voting member. The committee also voted/approved the proposed FSMS definition. The committee also established a special meeting on September 29, 2022, to finalize pros and cons. A reminder was made that the committee would vote on accepting the proposed solutions and barriers on the October 18, 2022, meeting. There was also discussion around the future of the FSMS committee.

During the October 18, 2022, meeting, a quorum was established, and the committee voted and approved the proposed barriers and solutions. The committee discussed the development of prospective Committee Issues to present to Council II Chair and Vice Chair by November 18, 2022. The committee also discussed consideration for recreating the FSMS Committee with proposed committee charges and the idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, about submitting an Issue to establish a joint Standing Committee to encompass the work of the FSMS and DFSS Committees. Next steps, co-chairs met with stakeholders for considering recreating with the DFSS committee. Committee co-chairs Mandy Sedlak and Christine Sylvis will draft charges report and issues for review by the FSMS committee before the November 15, 2022, meeting.

During the November 15, 2022, meeting, the committee voted/approved to accept the Pros/Con report as written to be included in final report submission. The next discussion was around developing recommendations on how to promote universal development and implementation of documented FSMSs consistent with Annex 4. The committee started with 2 options. 1. Consider recreating FSMS Committee – creating committee charges using the Barrier's list as a starting point. 2. Consider idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, submitting an Issue to establish a Standing Committee to encompass the work of the FSMS and DFSS Committees. The will of the FSMS committee was to request a standing committee (w/o digital committee). A motion was made to recreate the committee as council committee w/chargers and to create a separate issue to change from a council committee to a standing committee w/duty as stated by constitution and bylaws. Motion passed. The final discussion of the meeting was around the charges for FSMS Committee during 2023-2025 biennium. The considerations for charges were:

- Risk Factor for PIC provision
- Cost benefit analysis (NACCHO/collaborative)
- Develop a toolbox, develop verbiage to outline prerequisites (SOPs) that are not covered. Review results of EHS-Net/CDC collaboration and incorporate into toolbox
    - Focus on Employee Health, Healthy people
    - Use the school USDA/HACCP SOPs as a possible guide/tool; consider reviewing #4 "Guidance for School Food Authorities, "Developing a Food Safety Program based on the process approach to

HACCP Principles" Consider having CDC provide an overview of project and what tools may come out of this down the road.
    - CONSIDER: Piloting a FSMS for Employee Health program to see how it might work. Find industry volunteer to develop FSMS; site visits to support and verify effectiveness. Industry/Regulatory Partner. Note this is something that CDC is already using this approach/project. Initialed via EHS-Net
    - Get understanding of EHS-Net project as how it relates to FSMS committee work and consider collaboration and providing guidance based on the results of the study.
    - The overarching thread of these suggestions is that we need to increase awareness, communication and idea sharing with initiatives already underway. A committee may not be well suited to do a pilot study themselves but give the results they could give guidance.
- Reviewing the previously identified pros and cons to barriers to the universal voluntary development and implementation of documented FSMS and provide additional remedies
- Items not covered in our current charges
- Complete gap analysis of PIC Provision
- Committee Charge to fill in the gaps between all areas working on aspects of employee health and all aspects of collaboration/projects currently being done.

During the November 18, 2022, meeting, the committee discussed how to and where to suggest the addition of the approved FSMS definition into the Food Code. After much discussion, the committee proposed that it be added in the public health significance section. (The Definition be incorporated into chapter 1, and that FSMS and its definition be incorporated into to AMC.) The committee voted to include FSMS, AMC into code w/voluntary use terminology, the motion passed. Mandy and Christine edited the draft issues to improve clarity and style as discussed and shared the issues with all members. The final report was submitted to Council II Chair and Vice Chair on November 18, 2022

In addition to monthly meetings additional Subgroup Meetings took place on the following dates:

- 01-11-2022
- 02-02-2022
- 02-08-2022
- 02-28-2022
- 03-22-2022
- 04-14-2022
- 05-13-2022
- 07-13-2022
- 08-25-2022
- 9-29-2022
- 10-31-2022
- 11-02-2022

Collaborative Meetings:

- 09-13-2022
- 11-04-2022

2. Charges <u>COMPLETED</u> and the rationale for each specific recommendation:

a. (Charge 1) Identifying barriers to the universal *voluntary* development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.
    i. The Committee met on several occasions including subcommittee work to identify barriers to the universal voluntary development and implementation of documented FSMSs. The barriers are documented in the Committee Findings Report.

b. (Charge 2) Identifying solutions for overcoming the identified barriers in #1 and provide recommendations for how to promote the solutions.
    i. The Committee met on several occasions including subcommittee work to identify solutions for

overcoming the identified barriers in #1 and provide recommendations for how to promote the solutions. The solutions are documented in the Committee Findings Report.

c. (Charge 3) Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on: a) the hurdles/challenges involved in such a requirement; and b) recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries. The committee should also consider a gap analysis of § 2-103.11 as a starting point.
    i. The Committee met on several occasions including subcommittee work to identify pros/cons assessment of including a requirement for the development and implementation of documented FSMSs in a future edition of the Food Code. The pros and cons are documented in the Committee Findings Report.

d. (Charge 4) Developing recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4.
    i. The Committee met on several occasions including subcommittee work to develop recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4. The Committee is submitting an Issue for the 2023 CFP Biennial Meeting to include the definitions of Active Managerial Control and Food Safety Management Systems into Chapter 1 of the Food Code and incorporate these systems into Chapter 2 of the Food Code in § 2-103.11. It is also being recommended that the future FSMS Committee continue to develop recommendations on additional steps to promote universal development and implementation of documented FSMSs.is

e. (Charge 5) The committee should report its findings and recommendations at the next Biennial Meeting of the Conference for Food Protection. While FDA's efforts will be ongoing during this time, the findings and recommendations will continue to be useful to the agency as it continues to implement its blueprint on retail modernization.
    i. The Committee is submitting an Issue for the 2023 CFP Biennial Meeting to acknowledge this final report with attachments containing meeting minutes and the Committee Findings Report which includes the findings and recommendations.

3. Charges <u>INCOMPLETE</u> and to be continued to next biennium:

All charges are complete, however continued work is needed to promote universal development and implementation of documented FSMSs.

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***
☐ ***Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.***

ISSUE 2020-II-030

Title: **Creation of a Food Safety Management System (FSMS) Committee**

Committee Recommended Solution: The Conference recommends...:

a Food Safety Management System (FSMS) Committee be created and work with stakeholders such as but not limited to the Retail Food Safety Regulatory Association Collaborative to identify recommendations for developing and implementing documented, HACCP principles-based Food Safety Management Systems (FSMSs) in all food establishments to support FDA's blueprint for a New Era of Smarter Food Safety. The FSMS Committee should consider:

1. Identifying barriers to the universal voluntary development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.
2. Identifying solutions for overcoming the identified barriers in #1 and provide recommendations for how to promote the solutions.
3. Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on:
   a) Hurdles/challenges involved in such a requirement; and
   b) Recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries. The committee should also consider a gap analysis of § 2-103.11 as a starting point.
4. Developing recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4.
5. The committee should report its findings and recommendations at the next Biennial Meeting of the Conference for Food Protection. While FDA's efforts will be ongoing during this time, the findings and recommendations will continue to be useful to the agency as it continues to implement its blueprint on retail modernization.

CHARGE 1: BARRIERS

Economic Barriers

Economic related barriers to the universal voluntary development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.

1. **Resource Barriers**
    a. Insufficient supervision/oversight of staff (such as a Certified Food Protection Manager (CFPM)) during all hours of operation.
    b. Lack of resources (time, personnel) to develop and implement SOPs and train on FSMSs.
    c. Implementing FSMSs is costly and difficult.
    d. Lack of expertise and direction by staff to create FSMSs.
    e. Costs associated with technology upgrades (electronic monitoring on refrigeration, electronic logs/recordkeeping, databases) to capture data and report findings.
2. **Time Barriers**
    a. Staff and management do not have enough time dedicated for monitoring and recordkeeping.
    b. Lack of time for development, implementation/training, maintenance, and continuous improvement.
    c. FSMSs are not addressed during the plan review process. Regulators place emphasis on physical facilities over operational elements (AMC and FSMS) during plan review
3. **Cost Barriers**
    a. Concern that FSMSs will increase costs due to an increase in corrective actions.
        i. Training costs associated/especially with high turnover and staff shortage.
        ii. Costs for development, implementation/training, maintenance, and continuous improvement (Labor, Materials, Support, Training).
        iii. Cost/benefit (return on investment) of FSMSs is hard to quantify.
    b. Cost of foundational prerequisite programs (i.e., facility, equipment, pest management, cleaning).

People Barriers

People related barriers to the universal voluntary development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.

1. **Buy-in Barriers**
    a. Resistance to change.
    b. Disconnect between food safety behaviors and the occurrence of foodborne illness.
    c. Lack of knowledge of the “why” for food safety related to business case.
    d. Food safety is behavioral so getting staff (leadership and front-line) to buy in to it is difficult.
    e. Lack of operator motivation to implement and maintain more processes. FSMSs are perceived as extra work.
    f. Voluntary FSMSs without tangible incentives will probably not be followed. Voluntary perceived as not important or necessary.

g. Development of a FSMS will vary for different types of food establishments (chain/independent, quick service/full service, process 1/2/3, etc.). Although the principles are the same, model templates may not apply to all types of food establishments.
h. Resistance of leadership to invest in FSMSs, people, and processes to help maintain food safety.

2. Leadership/Accountability Barriers

a. Lack of management commitment.
b. Competing priorities.
c. Lack of management setting expectations and holding people accountable.
d. Lack of a champion.

3. Values Barriers

a. Lack of trust and understanding between industry and regulatory folks.

4. Cultural/Ethnicity Barriers

a. Language and literacy barriers (spoken and written).
b. Lack of belief in the science and causes of foodborne illness.

Training Barriers

Training related barriers to the universal voluntary development and implementation of documented FSMSs consistent with Annex 4 of the Food Code

1. Training Barriers

a. Lack of training/time for regulatory time to coach, offer guidance to industry
b. Lack of dedicated time to develop procedures that are prerequisites of FSMSs, train food handlers on procedures, review their level of understanding, monitoring, and coaching to improve
c. Lack of training for industry on understanding, developing, and implementing a FSMS.
d. FSMS is not a defined or universally understood/consistent term. Inconsistent use of Food Safety Culture, Food Safety Management Systems, and Active Managerial Control.

2. Knowledge Barriers

a. Lack of knowledge of hazards, risk factors, interventions, and corrective actions.
b. Lack of understanding of the science and causes of foodborne illness.
c. Perception that they “have it covered”.
d. Lack of technical ability to create a FSMS.
e. Upper management may not be clear on the importance of food safety and current food safety conditions.

3. Processes Barriers

a. Some food establishments currently have an unstable foundation of prerequisites (pest control, sanitation, crisis management, etc.) and are not set up for success for developing and implementing FSMSs.
b. Businesses are different, significant process variability. Not a one-size fits all approach.
    i. Type of Operation (Retail food, Sit down Restaurants, Quick serve Restaurants, Convenience Stores)
    ii. Size of operation (# of locations, Franchise operation, Regional vs. national company)

c. Who oversees and manages food safety? Managed at Corporate level vs at the restaurant/store location

4. **System Development/SOPs Barriers**
    a. Lack of standardized processes (across multiple stores, regional, company locations (decentralized management)).
    b. Lack of resources (implementation guides, creation examples, messaging, templates, sample SOPs, guidance documents and tools) to get a FSMS program started.
    c. Annex 4 is not an 'easy-read.' Terminology needs to be defined and used consistently between courses (FD215, FD218), the Food Code, and other materials. There have been significant advancements in the availability of tools since it was drafted.
    d. Lack of capturing and monitoring key food safety data points then using the data to maintain and improve food safety and quality
5. **Code Differences Barriers**
    a. Inconsistent terminology used with industry vs. regulatory.
    b. Many states don't adopt Food Code Annexes.
    c. Alignment between Federal, State, and local authorities.

CHARGE 2: SOLUTIONS

Economic Solutions

1. **Lack of resources (e.g., time, personnel, expertise) to develop procedures, implement and train procedures, and monitor ongoing implementation of procedures.**
    a. Provide tools for regulators to educate and assist operators. Provide guidance to regulators on how an inspection might differ for locations that have implemented voluntary a FSMS. Encourage regulatory agencies to schedule visits with operators to promote the adoption of voluntary FSMSs.
    b. Update FDA Food Code Annex to clarify what a FSMS is, how operators can implement them effectively, and how regulators can support them during visits.
    c. Create a starter kit that regulators can provide to operators (such as at the time of initial permitting.) Where appropriate, leverage existing FDA materials, posters, and videos for educating frontline workers. Include:
        i. Education on the basic concepts of FSMSs.
        ii. Examples of procedures, training and monitoring specific to each industry segment (restaurant, grocery, convenience store, etc.)
        iii. Examples of signage and job aids
        iv. Templates for logs
    d. Information on types of technology that can support FSMSs (electronic monitoring for refrigeration, electronic logs/recordkeeping, digital task management, etc.)
    e. Develop an industry-focused marketing campaign to promote FSMSs. Leverage resources and communication channels through the Retail Food Safety Collaborative. Include:
        i. Purpose and value of FSMSs, including cost benefit analyses with case studies and examples.
    f. Available tools and templates for FSMS components.

g. Develop a regulatory-focused marketing campaign to promote FSMSs. Leverage resources and communication channels through the Retail Food Safety Collaborative. Include:
    i. How to communicate the purpose and value of FSMSs.
    ii. Available tools and templates for operators.
    iii. Guidance for how to encourage the voluntary adoption of a FSMS.

2. **Perception that implementing FSMSs is costly and difficult.**
    a. Update ANSI CFPM requirements to include training on FSMSs to promote a more universal understanding of basic FSMS processes and how voluntary adoption improves food safety.
3. **Facilities are not designed to support FSMSs.**
    a. Provide support and training for regulators conducting the plan review process so that they can guide operators toward plans and specifications support voluntary FSMSs now and in the future.
    b. Provide training and materials for regulators conducting the plan review process, such as charts that illustrate FSMSs and encourage forward thinking about how preparation procedures, facility layout, and equipment choices provide a foundation for voluntary FSMSs.
4. **It is difficult to quantify the return on investment for a FSMS and demonstrate that the cost justifies the benefit.**
    a. Create a guidance document that operators can use to design, implement, and evaluate a Case Study to justify the cost effectiveness of FSMSs. Create specific versions for industry segments where appropriate.
        i. How do you create an effective study design?
        ii. What are the costs?
        iii. How do you quantify the benefit for employees, customers, the company?
        iv. How can results from recent FDA Risk Factor Studies be leveraged, e.g., over 60% fewer high-risk issues when managers had strong knowledge of their FSMS?
    b. What is the value proposition in terms of risk mitigation? In terms of quality?
        i. The cost avoidance of prevented foodborne illness outbreaks due to implemented FSMSs.
    c. Create a cost benefit analysis example to educate operators on the benefits of implementing FSMSs. Leverage the Retail Food Safety Regulatory Association Collaborative's "Active Managerial Control Incentive Programs Assessment Report" as a model. (Possibly engage the Collaborative to conduct this work.)
    d. Fund pilot programs to study and quantify the impact of implementation of FSMSs in the real world. Then publish results as detailed cases studies with costs, benefits, and lessons learned.
    e. Leverage the cost benefit analysis to organize and sponsor a collaborative marketing campaign aimed at operators around the cost benefit analysis to encourage voluntary adoption. Publicize through Collaborative and Industry organizations to ensure broad communication across stakeholders.
    f. Provide tools to educate regulatory food inspectors on how to leverage the cost benefit analysis when working with operators to encourage voluntary adoption of FSMSs.

People Solutions

1. Buy-in Barriers

a. For regulatory agencies and industry trade organizations to conduct a general cost benefit analysis for Code Compliance inspections and inspections focused on Risk Based incorporating FSMSs. Identify the return on investment for each type of inspection:
    i. Include stories and case studies of actual foodborne illnesses.
    ii. Create a sample business case that includes benefits to employees, customers, organization, quality, risk mitigation and costs, etc.
    iii. Reframe the role of FSMSs as a good practice that supports other elements of an operation, such as employee retention, training, cost controls to support and market FSMSs.
    iv. To conduct a study of actual costs of implementing FSMSs by the industry with impact changes.
    v. To conduct a study of actual costs of implementing FSMSs training and policy by the regulatory agencies doing risk- based inspections with impact changes as compared to Code Compliance inspection costs.
    vi. Develop simple communication messages that can be used to influence upper leadership. Communicate previous situations where companies did not invest and the negative effects. Several well-known examples exist. The use of facts and statistics can support the messages and can be used as a persuasion tool to increase interest in and creation of a FSMS.
    vii. Use the cost benefit analysis to educate the operator on reasons why they can't afford not to implement a comprehensive FSMSs designed to control hazards associated with foodborne illness risk factors in their businesses.
    viii. For regulatory authorities and industry members to build relationships focused on risk factors and FSMSs via networking meetings, new business start-up kits, virtual meetings, advisory group meetings…coffee with your health department, etc.
b. Identify individuals or groups of individuals within a food facility of industry and/or regulatory community that are food safety ambassadors and advocate for safe food handling practices and procedures that support FSMSs across the industry.
c. Increase in industry member awareness and participation in food safety as it relates to their job.
d. Recommend industry training of front-line workers incorporate the "FDA Retail Food Protection Industry Education Materials -Posters and Videos" into their new hire training plan or use similar training material that illustrate the consequences of poor behavioral food safety practices along with traditional training that describes how to do the procedure correctly.
e. Encourage regulatory agencies to conduct risk factor studies that use Food Code critical limits as part of the study of regulated businesses on a routine basis in partnership with the industry. Identify risk factors in need of priority attention, develop intervention strategies designed to control those problematic risk factors and publicize the initiative and results within the community.
f. Encourage regulatory agencies to implement the criteria in the FDA Voluntary National Retail Food Program Standards for improving their food programs.

g. Regulatory partners should provide outstanding customer service by being helpful and providing appropriate resources to the industry that support the implementation of a FSMS as part of their permit in a consistent and dependable manner.
h. Food safety regulators should tell stories of actual foodborne illness cases studies during their inspections to encourage industry member buy-in of implementing FSMSs. Use social media and commercials to increase industry and consumer awareness about the correlation between FSMSs and compliance of risk factors and how implementation of FSMSs can make a difference. Get statistics to support this message from FDA, CDC, Olmstead County, MN, and other agencies.
i. Consider the use of incentive programs or other systems that motivate good food safety practices. These motivators could include, but may not be limited to: public recognition, certificates/awards for achievement, positive feedback on inspection reports, etc. Examples:
    i. Inspector following up every month or so for first 6 months to a year to support Risk Control Plan for FSMS implementation.
    ii. Incentive programs for AMC of risk factors that includes model templates and examples which are easily accessible by industry members and regulatory authorities. The Retail Food Safety Regulatory Association Collaborative has examples at these links:
    https://ActiveManagerialControlincentiveProgramsAssessmentReport-RetailFoodSafetyCollaborative
    https://www.retailfoodsafetycollaborative.org/tools/active-managerial-control-incentive-programs-examples-from-jurisdictions-leading-the-way
j. Regulatory agencies recognize industry efforts who implement FSMSs successfully in their businesses. For example, regulatory agency could develop web-based public recognition of the business so it pops up whenever someone electronically searches for that business which can be removed by the regulatory agency as necessary. Another example -industry who implements FSMSs and control all hazards associated with foodborne illness risk factors that are in compliance at the time of regulatory inspections might get a permit fee reduction or inspected less frequently if they are routinely in compliance.
    i. Identify incentives for regulatory agency using FSMSs. For example -Inspectors who routinely provide training on FSMSs during inspections might get recognition from their Agency, especially if they are making a difference in their district.
    ii. Include FSMSs component in the application for the Crumbine Award and other state/national awards to recognize regulatory agency efforts in promoting the implementation of FSMSs by the regulated industry and getting improved long-term compliance of risk factors

2. Leadership/Accountability Solutions

a. Provide free guidance and resources through multiple collaborations (FoodSHIELD, Retail Food Safety Collaborative, FMI, NRA, etc.)
b. Encourage both bottom-up and top-down approaches to training, education, and communication on the importance of FSMSs. Create accountability at all levels for well-developed and executed FSMSs.
c. Food service establishments may consider hiring a consultant with expertise in FSMSs to assist in the development, execution, and improvement of the facility FSMS.

d. Define routine corporate level food safety reporting to the Corporate Suite along with recommendations for improvement.
e. Regulatory inspections can support industry efforts in implementing their FSMS by assessing compliance of hazards associated with foodborne illness risk factors at the time of inspection as priority over good retail practices in their limited time

3. Values Solutions

a. Build relationships between regulatory authorities and industry members so they:
    i. Share a common goal to focus on AMC of risk factors and FSMSs.
    ii. Educate on what a FSMS is and how to build/apply/improve.
    iii. Work collaboratively on solving problems around the control of hazards.
b. Regulatory inspectors can support industry efforts in implementing their FSMS by assessing compliance of hazards associated with foodborne illness risk factors at the time of inspection as priority over good retail practices in their limited time.
c. During and after Plan Review:
    i. Recommend industry use preoperational plans and/or inspections as a time to discuss FSMSs with the regulatory authority. Include a review of facility construction and design; menu items and food preparation process based upon how many times a menu item moves through the temperature danger zone, which is between 41 F and 135 F; food handling practices and behavior that may affect equipment needs and facility layout; training and education provided by whom; and current SOPs to support a comprehensive FSMS.
    ii. Operators are encouraged to work with their inspector to identify alternative food safety practices and behaviors to control hazards associated with foodborne illness risk factors after opening day as necessary. Such as, changing from a complex food process that involves cooling and reheating to same day service process that shouldn't require as much refrigeration or facility space.
d. Encourage food safety regulators to engage with food handlers and managers during inspections to explain the importance of food safety concepts using relatable language and storytelling, to foster understanding and buy-in of FSMSs.
e. Recommend regulatory authorities provide classroom and/or field training during onsite inspections that includes education for the industry using the "FDA Retail Food Protection Industry Educational Materials -Posters and Videos" or similar training materials that illustrate the consequences of poor behavioral food safety practices along with traditional training that describes how to do the procedure correctly. Additional option is to conduct/offer virtual training sessions/solution meetings" (This would allow for individualized interaction/topic specific training tailored for the operators needs/deficiencies. While still building the positive relationship between regulatory and business) - may also be a helpful tool to accommodate businesses who operate on second and third shifts.
f. For regulatory agencies to update their inspection reports and standardization procedures to include the assessment of FSMSs. For example, Olmstead County, MN developed a PTV Package (Discussion and Observation Guide and information poster showcasing the results of two in-depth studies) that they use, make appointments with the manager to sit down and have a discussion about food safety during non-busy time. They first began developing

their program in the late 1990's. Another example is FDA FSMSs assessment of foodborne illness risk factor areas to identify correlations between PTM and compliance of risk factors during their most recent risk factor studies.

g. Regulatory to look at incorporating/developing a separate consultative service who work exclusively with industry to assess/develop FSMSs. This division would operate separate from enforcement. OSHA and State OSH programs utilize this concept very effectively for workplace safety -examples: https://www.osha.gov/consultation, http://169.62.82.230/documents/dleg/.wsh_cet0165_216929_7.pdf. MIOSHA for example also utilizes an Alliance program to partner with organizations/businesses to promote/reward safety practices. http://www.agcmichigan.org/uploads/.1/0/6/5/106585507/infosheet_onsite_consultation_services_guideline.pdf. For the alliance, Associations like ASSP (American Society of Safety Professionals) has local chapters that will partner/sign an alliance with MIOSHA to promote and provide community-based services to members/nonmembers and community. This concept could be used/developed to promote effective FSMSs.

4. Cultural/Ethnicity Barrier Solutions

a. Encourage the use of translation services and/or storyboards to effectively communicate messages in multiple languages. The storyboards should illustrate the consequences of the improper food safety practices behavior as well as the desired food safety practices behavior. As an example, the FDA worked collaboratively with many regulatory agencies and industry members to develop storyboards in multiple languages for foodborne illness risk factors.

b. Seek feedback for solutions from other industry peers, food associations, your HR department, Risk Management, and Insurance Providers (as both of these divisions have enormous amounts of data, statistics, program assessments, stories, etc.) etc.

Training Solutions

1. Training Solutions

a. Provide training materials
   i. Assess current FSMSs implementation and focus on vulnerabilities/gaps
   ii. Illustrate the consequences of poor behavioral food safety practices
   iii. Traditional training materials for front line employees based on their job responsibilities

b. Recommend regulatory agencies
   i. Be trained in FSMSs process to be a valuable resource and provide support to the industry for training, materials, consultations, etc.
   ii. Promote incentive programs to facilities with FSMSs leading to decreased inspection frequency
   iii. Evaluate FSMSs during the plan review process
   iv. Assess the uniformity of FSMSs based on the operations and food processes
   v. Include FSMSs in risk classification, potentially leading to less frequent inspections for well-managed locations.

c. Update FDA OTED courses (FD215, FD218, FD312) as necessary to include what a FSMS is, how to verify during routine inspections, and how retail food inspectors can provide guidance on FSMSs to the operator based on inspectional findings.

d. Update CFP Field Training Manual to include verifying knowledge of FSMSs on the Training Plan and evaluate understanding on the Training Worksheet.
e. Update FDA Standardization Procedures to include verification that the candidate has an understating of FSMSs as a performance area.
f. Request SME when reviewing the job task analysis for the CFPM exam to determine if knowledge development of FSMSs should be expected of every CFPM/PIC

2. Knowledge Solutions

a. Increase awareness of the need for FSMSs through a marketing campaign including:
    i. Major causes of foodborne illness in retail
    ii. Control of hazards associated with foodborne illness risk factors
    iii. Use of case studies
    iv. What success looks like in different types of businesses/sizes (risk factor PTM data)
    v. Promote continuous improvement of food safety programs

3. System Development/SOP Solutions

a. Develop an operational toolbox
    i. Create a FSMS Team and assign roles/establish ownership and accountability
    ii. Implementation guidance document (promote parallel development of FSMSs during startup of retail food businesses),
    iii. User friendly/easily implemented training aids,
    iv. Templates,
    v. Coaching and communication, accountability ideas, reinforcement approaches
    vi. Create a tiered system of tools based on establishment processes (considering independents/small chains to large corporate/franchisee)
b. Include ""Managing Food Safety -A Manual for the Voluntary use of HACCP Principles for Operators of Food Service and Retail Establishments"" as a resource
c. Use available resources such as: state/local regulatory authority websites, CFP, universities (i.e., NC State, University of FL, University of GA), professional organizations (IAFP, NEHA, AFDO, NACCHO), Key service providers, Business associations (FMI, NRA, etc.)
d. Review, update and streamline info in Annex 4.
    i. Focus on process with flexible approach rather than prescriptive
    ii. Define elements of FSMSs
    iii. Explain what is foundational vs. best practices
    iv. Explain how to apply principles
    v. Link FSMSs to Inspections

CHARGE 3: PROS/CONS ASSESSMENT SOLUTIONS

PROS of including a requirement for the development and implementation of documented FSMSs in a future edition of the Food Code.

1. FSMSs are very beneficial because research documenting a PIC's strong working knowledge of their FSMS correlates to fewer occurrences of foodborne illness risk factor violations during an inspection. These findings were highlighted in various studies including but not limited to FDA Risk Factor Studies.

2. Operators understand the food safety hazards in their processes and how to control them which would advance AMC and reduce risk factor violation occurrence and prevent foodborne illness.
3. Having all operators and regulatory agencies working toward this common goal of voluntary FSMS implementation could encourage collaboration across the industry and regulatory community. A minimum expectation of FSMSs that control risk factor occurrence can be identified with specific goals for respective partners.
4. Developed and implemented FSMSs have the potential to make onboarding and training new employees easier for industry and regulatory staff.
5. Requiring FSMSs would allow for review of operational components and evaluation during plan review providing regulators and operators with earlier intervention and educational opportunities.
6. Flexible FSMSs could foster an effective food safety culture.

CONS of including a requirement for the development and implementation of documented FSMSs in a future edition of the Food Code.

1. FSMSs are an emerging topic in retail food not widely understood. There is a need for training of regulators and industry on the concept of developing, evaluating, and assessing FSMSs with an emphasis on how FSMSs may differ to address the differences in corporate infrastructure and diversity within the retail and food service industries prior to including a requirement for the development and implementation of documented FSMSs in a future edition of the Food Code.
2. The requirement for the development and implementation of documented FSMSs in a future edition of the Food Code would be difficult for many. Some reasons include:
    a. Small businesses just starting out, or businesses with English as second language to may have limited resources to develop FSMSs.
    b. One size does not fit all types of operations that are regulated under the Food Code.
    c. Extra resources to ensure fairness and equity among types of food establishments would be needed.
    d. It will be a challenge to write the requirement in such a way that all types of operations (large national corporations, to non-English owner operator facilities) will be able to comply with the requirements.
    e. If implemented FSMSs are too simple, it may not achieve the outcome of a well written plan that results in active managerial control.
3. Regulators would need the training and experience and program infrastructure to evaluate/assess the customized and individual FSMSs. In addition, there would need to be an agreement/understanding that format and content is operationally specific and would not have to exactly match a model template or Annex 4.
4. Crafting the verbiage to allow enforceable language may be difficult.
5. This could add time or cost to health departments food programs, and create industry push back/variance requests, etc.
6. It is a large project for any company or location. Many people are likely unfamiliar with the term, so making it "required" will be a large step. This is especially true if the requirement includes that FSMSs be documented. Industry may view this as overregulation even though many are already doing it. If it starts as voluntary, large organizations might pave the way and

create example systems that smaller operators can use as templates. Perhaps industry groups could be leveraged to facilitate this process and openly share examples.

7. The cost to industry to develop FSMSs and the cost to regulators to review industry FSMSs for compliance.
8. Jurisdictions that adopt the food code could exclude or modify this provision, resulting in inconsistencies.
9. Brands may not want proprietary documents and components of their customized FSMS shared in a public document such as a plan review.

2021-2023 CFP
Food Safety Management System (FSMS) Committee

Meeting Number: 1
DATE: November 16, 2021
TIME: 3:00 EST

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisors: Jessica Otto and John Marcello
CDC Advisor: Beth Wittry and Mark Otto
Scribe: Christine Sylvis

Agenda

	AGENDA ITEM	PRESENTER	
1.	Welcome, Call to Order	Christine Sylvis and Mandy Sedlak	
2.	Rollcall	Christine Sylvis	
3.	Conference for Food Protection, Inc. Antitrust Statement	Mandy Sedlak	
4.	Food Safety Management Systems Definition	Christine Sylvis	
5.	Review of Committee Charges	Christine Sylvis	
6.	Review CFP Timeline for Committee Work:	Mandy Sedlak	
7.	Suggested Schedule	Mandy Sedlak	
8.	Overview of Committee Working Plan	Mandy Sedlak & Christine Sylvis	
9.	Action Items	Christine Sylvis	
10.	Next meeting date	December 14, 2021	

MEETING MINUTES:

1. **Meeting Called to Order:**
   - Sylvis FSMS Committee meeting called to order at (time),

2. **Roll Call FSMS Committee:**
   - Roll Call Conducted by Christine Sylvis
     - Co-chair introduction
     - Voting Member introduction
     - FDA Consultant and Alternate introduction
     - CDC Consultant and Alternate introduction
     - Non-Voting Member introduction
   - *See attendance spreadsheet*

3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Read by Mandy Sedlak
     - Moving forward, statement will just be referenced
     - PowerPoint will be kept so statement can be referenced at any time. A copy will also be placed in FoodShield.

4. ***Food Safety Management Systems***
   - Definition of FSMS along with resources
   - References to what committee will be discussing in the next year

5. **Review of Committee Charges:**
   - 5 charges

        - First charge tentatively due January 2022
    - First charge: Identifying barriers to the universal *voluntary* development and implementation of documented FSMSs consistent with Annex 4 of the Food Code.

6. **Review CFP Committee Work Timeline/Calendar:**
    - March 2022
        - Reports for Executive Board Meeting due to ED
    - July 2022
        - Reports for Executive Board Meeting due to ED
    - November 2022
        - Final Committee Reports and prospective Committee Issues due to Council Chairs for preliminary review
        - Revised Final Committee Reports and Issues submitted to Issue Chairs for preliminary review and comment
    - December 2022
        - Issue Submission for 2023 Biennial Meeting opens online for 30 days

7. **Suggested Schedule**
    - Deadline is November 2022 for 2023 Council Meeting
    - Exactly a year to get 5 charges completed
    - Tentative/Suggested Schedule
        - First Charge complete by January 2022
        - Second Charge Complete by April 2022
        - Third Charge Complete by July 2022
        - Fourth Charge Complete by October 2022
        - Final Committee Report Due November 2022

8. **Overview of Committee Working Plan/Administration/Meetings:**
    - Monthly Schedule; 2:00 pm CST every third Tuesday
    - Meeting Frequency?
        - starting out monthly and adjusting as needed
    - Each charge might have separate meeting
    - Meeting Platform?
        - Teams Meeting acceptable
    - Shared Documents?
        - Set up FoodSHIELD group and invite team members

9. **Action Items/Next Steps**:
    - Verify that FoodSHIELD works.
    - Send out Teams invitation for December 14, 2021 with a backup link
    - Identifying barriers – first committee charge before talking about hurdles to overcome them (second charge).
    - Put a live document on FoodSHIELD to add in barriers for first charge.
    - Feedback by December 13, 2021 for next meeting on December 14, 2021.

10. **Next Meeting Date**:
    - December 14, 2021

2021-2023 CFP
Food Safety Management System (FSMS) Committee

11. Identify a Scribe for 12/14/21 meeting:
- Todd Rossow

Meeting Number: 2
DATE: December 14, 2021
TIME: 3:00 – 4:00 pm EST

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisors: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Todd Rossow

Agenda

11. Welcome, Call to Order		
12. Rollcall,	Christine Sylvis	
13. Conference for Food Protection, Inc. Antitrust Statement	Mandy Sedlak	
14. Identify a Committee Scribe:	Todd Rossow	
15. Review CFP Timeline for Committee Work:	Mandy Sedlak	
16. Review of Committee Charges:	Mandy Sedlak	
17. Overview of Committee Plan of work:	Mandy Sedlak and Christine Sylvis	
18. Action Items:	Christine Sylvis	
19. Determine next meeting date:	January 18, 2023	

MEETING MINUTES:

1. **Meeting Called to Order:**
   a. Second FSMS Committee meeting called to order at (time),
      i. Motion accepted (identify members). Todd motioned to open the meeting with a Second by Mark
2. **Roll Call:**
   a. Roll Call Conducted by Christine - She has a maintained spreadsheet of the voting and (alternate) non-voting committee members
3. **Conference for Food Protection, Inc. Antitrust Statement**
   a. Mandy referred to this document and that it is posted to our FoodSHIELD site.
4. **Identify a Committee Scribe:**
   a. Todd was identified as the scribe for this call.
5. **Review CFP Committee Work Timeline:**
   a. Mandy reviewed the Suggested Schedule from the 20211116 presentation
   b. We are currently reviewing Charges 1 to the Barriers to the universal development and implementation of documented FSMSs consistent with Annex 4 of the Food Code. – January 2022
   c. We also reviewed the expected deliverables from the Charge on April 2022, and those due on July 2022, Oct 2022, and the final report due November 2022.
   d. Meeting invites are to be sent out to all with the defined schedules
   e. Meeting was requested to be recorded
6. **Review of Committee Charges:**
7. **Overview of Committee Working Plan:**

a. We will maintain the original direction to hold monthly calls and follow the Schedule to address the Charges.
b. We discussed the AFDO Food Safety Management Survey worked on in conjunction with the FDA Retail Food Safety Regulatory Collaborative
    i. Elisabeth Nutt and John Marcello shared some highlights of the survey.
    ii. The survey was constructed by an AFDO cross-functional working group.
    iii. It has 2 Parts – Part 1 (Food Safety Culture and Employee Health Policy) and Part 2 (Active Manager Control and Food Safety Management Systems).
    iv. The last part of the survey was sent out Dec 1 and will close out at the end of 2021.
    v. Survey was sent to industry and key associations (National Restaurant Assoc, National Association of Chain Restaurants, FMI, Grocers Assoc, etc.) These associations relayed the survey out to their member.
        1. Comment – AFDO should consider sending the survey to State associations too.
    vi. The survey was also sent to key food industries (grocery, C-stores, restaurants, etc., both large and small).
    vii. The survey results will be used to find best practices, what is the industry doing and what are they not doing around these four topics.
    viii. Data to be available at the end of March 2022.
    ix. The FDA Retail Food Safety Regulatory Collaborative objectives will be shared with the CFP FSMS committee. These results of the survey will help support the New Era of Smarter Food Safety as part of FDAs initiative.
    x. Part of the Retail Collaborative Grant is to pursue FSMS and AMC.
    xi. There are no direct connections of the survey questions to the CFP FSMS committee. The Committee can look at the questions and which may best serve the CFP FSMS committee. Elisabeth Nutt will share with the committee the survey questions.
    xii. Again, the results from the survey will be back in the spring of 2022 and will be shared with the CFP FSMS committee.
c. Submit the barrios and solutions, not all members submitted. The summitted comments shared so far were reviewed.
d. Food Shield Overview to see the submitted – Foodsheild.org
e. Go to Groups and see the groups you are part
f. Christine reviewed the committee's folder and where out documents are located
g. There are still some that can't gain access to FoodSHIELD. Email Christine if you are having issues gaining access.
h. John Marcello – He shared some about the AFDO survey on behave of the Retail Collaborative. The survey data collection will be completed by the end of Dec and will have some results to be shared at the January meeting, primarily about Best Practices.
i. The committee members were asked to review the barriers submitted.
j. We need to consider a White Board to collect some common ideas to Barriers.

8. Action Items:

a. Set up a small subgroup to review the Barriers and Solutions comments and help bucket for best organizations. The following volunteered to help. (Venessa B and Jeff J). Others interested should connect with Mandy and Christine. **Christine and Mandy** will set up a call to review these items for consolidation.
b. **Christine** will get the excel sheet with the committee members recorded Barriers and Solutions posted to FoodSHIELD. Each week she will update with additional feedback.

c. **All committee members** should review the Charges, go to FoodSHIELD and review the recorded Barriers and Solutions and be prepared to contribute to the conversation on the January call.
d. **Elisabeth Nutt** will share with the committee the AFDO survey questions.

9. **Motion to adjourn** – Troy H made a motion and second by Mark S.
10. **Next Meeting Date**:
    a. January 18, 2022.
    b. Linda Z will be the scribe for this coming meeting in January (Venessa B also stepped up to help, if needed (via Chat)

Meeting Number: 3
DATE: January 18, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisors: Jessica Otto
CDC Advisor: Beth Wittry (Jona Johnson filling in while Beth Wittry on leave)
Scribe: Linda Zaziski

Agenda

20. Welcome, Call to Order	Christine Sylvis	
21. Rollcall	Sylvis/Sedlak	
22. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis	
23. Review barriers identified	Mandy Sedlak	
24. AFDO Industry Survey Overview	Mandy Sedlak	
25. Action Items:	Mandy Sedlak and Christine Sylvis	
26. Next meeting date: February 15, 2021 3:00pm EST	Christine Sylvis	

MEETING MINUTES:

1. **Meeting Called to Order:**
    a. Third FSMS Committee meeting called to order at 3:01pm EST
2. **Roll Call:**
    a. Roll Call Conducted by Christine Sylvis, documented by Mandy Sedlak
3. **Conference for Food Protection, Inc. Antitrust Statement**
    a. Reminder by Christine Sylvis
4. **Review barriers to the universal voluntary development and implementation of documented FSMSs identified**
    a. Subgroup met to identify "categories" of barriers and are working on grouping
        i. 97 barriers have been initially identified
        ii. Categories for barriers identified: economics, training, processes, accountability, people
            1. Sub-committee Divided document into 3 main buckets to assist in consolidation/analyzing/organizing
                a. **Economics** (resources, cost, time, equipment)
                b. **People** (buy-in, staffing, cultural)

                Training (Knowledge of Regulators and Industry) System Development, SOPs Accountability (leadership)
    b. Next Steps:

i. Review barriers Get through barriers by end of January 2022
ii. Address Solutions component: Target Date: April 2022

5. **AFDO Industry Survey overview:**
   a. Presented by Elizabeth Nutt
      i. Background:
         1. Task for collaborative to look at food safety culture
         2. Help industry and regulatory what is active managerial control and what is needed for a good food safety system.
         3. Mick Micklos; NRA, FMI, NCS, NCRS. Industry input 4-part survey management systems, employee heath, food safety systems, food safety culture.
         4. Roll-out done in 2 installments. (Early Nov/2nd Part just closed 1/10)
         5. Iowa State validating survey, looking at how and which data can be used/comparisons
         6. Survey taken by – IAFP, Industry Trade Organizations, AFDO
      ii. Types of Questions
         1. Questions shared with the group
         2. Surveys to be posted to Food Shield. – for committee use.
      iii. TBD – how to use data: actionable, best practice
      iv. Looking to distribution to regional facilities or single operators. To get a good cross functional look to see where these groups are at.
      v. TBD: Findings Report-out. Collaborative wants to convene face-to-face meeting w/industry leaders to share findings/work groups, publication to follow.
      vi. Information may be useful for charges of this committee. – independent research and initiatives can add value to each other
6. **Action Items**:
   a. Subgroup to group barriers and review to consolidate
   b. Committee to review barriers and solutions by next meeting. Provide suggestion to edits/additions
   c. Entire Group - To review barriers before meeting
7. **Next Meeting Date**:
   a. February 15, 2021, 3:00pm EST
   b. Identify a Committee Scribe: Linda Zaziski
   c. Meeting ended 3:25pm; Subgroup stayed on to work on barrier consolidation

---

Meeting Number: 4
DATE: February 14, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak
FDA Advisors: Jessica Otto
CDC Advisor: Beth Wittry/Jen Otto
Scribe: Linda Zaziski

Agenda

27. Welcome, Call to Order	Mandy Sedlak	
28. Rollcall	Mandy Sedlak	
29. Conference for Food Protection, Inc. Antitrust Statement	Mandy Sedlak	
30. Review CFP FSMS Solutions Pro/Cons Next Steps 20220209	Mandy Sedlak	

31. Comments/Discussion/Formatting; Solution Considerations Next Steps	Mandy Sedlak	
32. Action Items: See minutes	Mandy Sedlak	
33. Next meeting date: March 15, 2021 3:00pm EST	Mandy Sedlak	

MEETING MINUTES:

1. **Meeting Called to Order:**
    a. Forth FSMS Committee meeting called to order at 3:04pm EST
2. **Roll Call:**
    a. Roll Call Conducted/Documented by Mandy Sedlak
    b. Christine is on vacation
3. **Conference for Food Protection, Inc. Antitrust Statement**
    a. Reminder by Mandy Sedlak
4. **Review Committee prepared excel: CFP FSMS Solutions Pros/Cons Next Steps 20220209**
    a. Woot! Woot! Shoutout to the participants of the subcommittee
        i. **Feedback regarding the solutions pro/con next step document**
            1. Concern: Under training barriers: FSMS is currently not clearly defined as a universal term consider prioritizing as most important
                a. Jessica Otto to provide terminology used in the recent surveys.
                b. Elizabeth – Risk factor 'pillars of risk factors" Policy/Procedures in writing, training and Follow-up Accountability
                c. Important not to confuse performance systems reactive control/active managerial control. Active managerial definition is laid out in Annex 4.
                d. Some confusion has been noted regarding Annex 4; culture, food safety management systems and active managerial control
                e. **ACTION: First Priority of Next Working Group**- Better define/Clarify definitions in Annex 4 (Food Safety Culture, Food Safety Management Systems and Active Managerial Control)
                    i. Question are we taking a regulatory approach or an industry approach. Looking at 2 different approaches to the same thing. Voluntary vs Regulatory how is supporting industries efforts to develop a food safety management system.
                    ii. Picture may become clearer once definitions are clarified – differences and similarities between food safety culture, management systems and active managerial control.
                    iii. What are action items that industry can do? What can regulatory do to support? Within the Deli Study as an example: There were 2 steps that were leaned in on: one for industry and one to regulators.
                    iv. Elizabeth Nutt – Update: Industry survey has been closed, sent to Iowa University for assessment. Information to be shared with group as it becomes available.
                    v. Focus on how industry defines
                    vi. Volunteers sought for working group. Suggested meeting date March 1 3:00pm EST
        ii. **Formatting**
            1. Some struggles: Some of the items crossed over to multiple buckets (People, Training, Economics)
            2. Still open for formatting comments, suggestions

iii. **Solutions**
1. **ACTION** – send solution suggestions over to Mandy and Christine to capture in master document.
   a. Review barriers and how they are classified
   b. Can put solution suggestions next to the barrier or in format that is easiest for you.

b. **Next Steps:**
i. **Sub Committee to work on/develop definitions from Annex 4 – Mandy to set up meeting**
ii. Review barriers submit solutions for capturing in the master documents.
iii. Continue to Address Solutions component: Target Date: April 2022

5. **Action Items**:
   a. **Definition Subgroup–** Mandy to set up; March 1, 2022, at 3pm EST
   b. **Entire Group** to review barriers document. Submit solutions to Mandy/Christine by next meeting

6. **Next Meeting Date**:
   a. March 15, 2021, 3:00pm EST
   b. Identify a Committee Scribe: Linda Zaziski
   c. Meeting ended 3:40pm

Meeting Number: 5
DATE: April 19, 2022
TIME: 3:00pm EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisors: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

1. Welcome, Call to Order	Christine Sylvis	
2. Rollcall,	Christine Sylvis	
3. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis	
4. CFPM and AMC Definitions	Christine Sylvis	
5. Action Items:	Christine Sylvis	
6. Next meeting date: May 17, 2022, 3:00pm EST	Christine Sylvis	

MEETING MINUTES:

1. **Meeting to Order:**
   - Sixth FSMS Committee meeting called to order at (3:02pm),

2. **Roll Call:**
   - Roll Call Conducted by Christine Sylvis
   - Mandy Sedlak not able to attend. Kudos given to Alternates for participating/attending 😊
   - 8 voting members present. No Votes anticipated

3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Reminder by Christine Sylvis

4. FSMS and AMC Definitions

- Review FSMS and AMC Definitions from workgroup 4/14/21
  - Definition documents sent to group. Document is available on the CFP team site for FSMS
  - Committee agreed the CFP AMC definition was a good definition.
  - Some additional sources with additional information – subcommittee, comments, FDA and some references to risk factor studies in delis and other references w/links that have other documents that have similar information in them. Marking instruction on procedures training and monitoring.
  - Definition of FSMS and Procedure (oral/written) w/ examples, Training/Monitoring to follow same example. Notes/Thoughts can be found on document – not full sentences, just thoughts/work in process (so concepts and ideas did not get lost.
  - Consider have one-line definitions with examples listed below and have an example that would show steps from procedure to monitoring/training.
  - Floor opened for discussion:
    - Question asked: Written/verbal – do we need to include these for monitoring
    - Group left off - with training.
    - Monitoring was next bucket to be looked at. Definition was taken from the risk factor study. Has not been word-smithed yet.
    - Suggestion: Use similar language under procedures for monitoring (for consistency purposes) Example could be digital thermometers to tie monitoring piece into paragraph.
    - Monitoring may be more visual then oral.
    - Monitoring – assess knowledge of person; are they following the concept. Can we incorporate 'assessing knowledge'
    - All for ease of system, monitoring just an oral/visual process or is it recorded to ensure that it is being completed. Or are we placing that at the AMC level?
    - FSMS – continuously improved, wrapped up to include continuous improvement process.
    - Monitor and verify. If do not record will be difficult to get to improvement part. Feel recording should be included. Hard to prove or demonstrate corrective action effectiveness w/o proof.
    - Go back to written procedure that monitoring would meet the intent. What's going to differentiate accidental vs purposeful. Procedures like training could be stepped not necessary as an essay in paragraphs.
    - Wall charts and job aids can be part of training
    - Looking at definition – training procedures and monitoring. Putting it into a procedure basics then put into next steps of training, monitoring and improvement. Current definition is a bit confusing.
    - Can have written procedure or can have an oral procedure - i.e. this is how you wash your hands (opposed to written) but would have either demo by PIC or posted job aides/posters. Training how you give information to food employees.
    - Group thinks that oral should be taken out… not sure how to monitor oral
    - Would be challenging for manager to document handwashing; so visual would be a good way to assess/monitor. Lends flexibility
    - Perhaps general statement conducted visually; records of monitoring are the best way to verify completion/compliance.
    - Couldn't record be just a yes or no; wouldn't that be an acceptable record?
      - Depends on how specific the group wants to get
      - Applicable as we can get to put into action in establishment
    - Example from Mark (from chat box) was dropped into Christine's working documents.

- Question: Are we trying to move beyond oral procedures? Ideal or goal would be to have written but oral procedures would be acceptable – this would impact all food establishments, not just restaurants.
- Really looking at how process would be applied.
- Suggestion: Monitoring example for digital temperature where logs, review process by PIC during their shift may be a good place to include these concepts.
- Caution: The more we include - written records, may lose those who truly work in an oral culture. Documented is stronger, but oral is a FSMS. Does not seem like the message we want to say. A well-developed written FSMS is one thing; but oral culture can be a FSMS
- Isn't this in fact one of the barriers that we need to overcome and work through
- For FDA to develop a system that can be used by everybody. Maybe we need to encourage that next level of FSMS.
    - Some mom/pop shops struggle. The monitoring piece is crucial and makes a difference. Know what they are supposed to be doing, but monitoring is not happen. Agree with some of written, some of monitoring should be written. Not necessarily one size fits all. Some may allow documenting others may not (i.e., air monitoring). Is there a way to say that? Written procedure on how something is monitored.
    - Would have something to verify against.
- Is next level having a written process? Is that our charge? Yes, charge does say written FSMS.
- May be conducted visually, monitored with a goal of having a well-documented FSMS program. (i.e., tying in hand washing poster with steps as an example)
- Combination of things – regulatory remember history. Elements of good FSMS and HACCP, inroads of concepts to incorporate. All or nothing. Developing the tools to do root cause analysis. Businesses along process – where are they will be based on how you ask the questions. I.e. some may have written/training may need emphasis on monitoring. Elements can assist in incrementally improving FSMS
- Visual and recording. Procedures and Training then implement more visually. Routine/process then institutionalize and introduce charts/systems that work for the operation. Validation doing process reaches the validated method to ensure the process works and works for the operation.
- Consider using terminology "move towards' opposed to 'have'
- Incorporate the goal, complete and consistent primarily written.
- Examples provided – do we like list? edits, removal, additions?

5. **Overview of Committee Working Plan:**
    - Button up definitions, send out to group for review
    - Christine/Mandy to send out email requesting participation/meeting dates to continue work on solutions to barriers.

6. **Action Items**:
    - Next Steps:
        - Christine to massage examples make sure everything matches; will send updated document out to group.
        - Heads up – We are coming up to our deadline to review 'solutions' for FSMS
        - Completed first set of barriers, next step to work on solutions then move on to pros/cons;

- Additional dates/sub-committee meetings may be established/sent out to begin this work prior to the next formal meeting. All are welcomed to join/participate.

7. **Next Meeting Date**:
   - May 17, 2022, 3:00pm EST
8. **Adjourned at 4:02pm EST**

Meeting Number: 6
DATE: May 17, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

1. Welcome, Call to Order	Mandy Sedlak and Christine Sylvis	
2. Rollcall	Mandy Sedlak and Christine Sylvis	
3. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis	
4. Review work completed by working group on Solutions/Next Steps	Mandy Sedlak	
5. Review Final Definition of Food Safety Management System	Mandy Sedlak	
6. Review of Committee Charges	Mandy/Christine	
7. Overview of Committee Plan of work	Mandy	
8. Action Items	Mandy	
9. Next meeting date:	Christine/Mandy	

MEETING MINUTES:

1. **Meeting Called to Order:**
   - 7th FSMS Committee meeting called to order at 3:02pm
2. **Roll Call:**
   - Roll Call Conducted by Christine Sylvis, documented by Mandy Sedlak
3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Reminder by Christine Sylvis
4. **Review work completed by working group on Solutions:**
   - Meeting 5/13/22
   - New sheet “Solutions full list” on working Excel document. Updated version in Food Shield 2022-0516.
   - Decided on format of “Solutions” - Assign solutions into 3 barriers “buckets” (color coded)
     - Economic (blue)
     - People (yellow)
     - Training (green)
   - Visual representation shared with attendees on meeting. Various workbooks on workbook.
     - Created new page. Decide How to propose the solutions
     - Using the 3 lists Barriers, People and Training have one list for each set of solutions for these barriers

Solutions next steps:

- Divide into 3 groups to work on solutions, one group per bucket. To locate document: Working, Barriers, Solutions Workbook – go to versions and download. 2.0 version; most current version will have all columns filled out.
- Group Leads: Chris Boyles – Economic; Lisa Whitlock – People; Mandy – Training
- Working groups for each bucket – attached below.

Economic		Training		People	
Chris	Boyles	Elizabeth	Nutt	Mark	Speltz
Sean	Dunleavy	Dan	Okenu, Ph.D.	Dan	Tew
Jeffrey	Edelen	Susan	Quam	Shelly	Wallingford
Jeff	Jackson	Todd	Rossow	Lisa	Whitlock
Naomi	Macias	Heather	Sanders	Yolanda	Woods
Monique	Crawford	Colleen	Smith	Linda	Zaziski
Vanessa	Bussiere	Martin	Flusberg	Melissa	Smith
Herman	Crawford, Ed.D.	Hsing-Yi	Hsieh	Laura	Temke
Theodore	Dohnal	Troy	Huffman	Laura	Wildey
Ashley	Eisenbeiser	Evelin	Pollock	David	Wilson
		Mario	Seminara	JEREMY	ZENLEA

- Review Solutions, decide if appropriate, combine like Solutions, wordsmith as needed
- Original milestone to have Solutions completed: April 2022 (Note: We are a bit behind to work on definition of food safety management systems)
- Goal: Complete Solutions lists by May 31, 2022 and return to Mandy Sedlak and Christine Sylvis.
    - An updated version will be sent to the full committee for review.
    - Mandy Sedlak and Christine Sylvis are available to schedule and join meetings.

5. Review the Definition of Food Safety Management System

- References for definition development
- April 14th version – Almost complete w/FDA feedback
- Documented 4/20 – Review
    - Procedures for Procedures, Training and Monitoring.
    - Final Version reviewed as group
        - Change maintain to ‘follow’
        - Under monitoring, include technology (monitoring/automatic) systems.
        - A written FSMS indicated better compliance. Under procedures, “oral’ can you document. Concern the word oral waters down the intent
            - Careful not to get bogged down, some of industry may not be able to do everything, may have procedures of culture, even though the system is primarily oral. Group goal is to help move bar. Delicate balance to consider diversity, and open to other approaches that are out there.
            - Something written does not need to be complicated reference to manual of dishwasher, fact sheet from local HD/written. Something written not huge/beautiful but right direction.
            - If we want to make progress take into account, there are several ways to do things. Which would include oral. Not everything written down; less prescriptive.

- Have had extensive conversations lending to the definition listings allowing oral, written, job aids, posters w/steps, SOP etc… last sentence – Ultimate goal is – while not discounting the other types of methods/modalities.

- Training – discussion on verbiage; add goal is to…
  - Add specific/assigned to the employee's job duty (what they do).
  - Consider not singling out.
  - Add including allergen and awareness
  - Shouldn't this be more general then specific?
  - PIC needs to know all so they can monitor and ensure that all employees are doing what they need to. But specific employees only need to know what their specific job duties would require. (ie dishwasher would not necessarily know temperature to cook food)
  - Concern raised regarding others doing multiple jobs
  - Broader the more encompassing. Broad brush approach allows industry operator to put together a system to effectively train their employees.
  - Job duties is broad, that employee needs to be trained in all duties they are responsible for.
  - Consider using Jessica's verbiage; consider including the word document/documenting. (being the ultimate goal)
  - Refresher and frequency important to include.
  - Straw poll – 'All' was the most preferred verbiage

6. **Review Committee Charges**
7. **Overview of Committee Working Plan:**
   - Next milestone, July 2022: Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on:
     a) the hurdles/challenges involved in such a requirement; and
     b) recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries.
     The committee should also consider a gap analysis of § 2-103.11 as a starting point.
8. **Action Items:**
   - Subgroups meet and complete Solutions Lists, return to Mandy Sedlak and Christine Sylvis by May 31, 2022.
   - Review updated Solutions List for the three buckets of Barriers sent out after June 1, 2022 to discuss at the June 21, 2022 meeting.
   - ACTION For all Members– Review definition and review the barrier buckets/solutions
9. **Next Meeting Date: June 21, 2022, 3:00 EST**
10. **Meeting Adjourned 4:00pm EST**

Meeting Number: 7
DATE: June 23, 2022
TIME: 10:00AM EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

1. Welcome, Call to Order	Mandy Sedlak and Christine Sylvis	

2. Roll Call	Mandy Sedlak and Christine Sylvis	
3. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis	
4. Review work completed by working groups on Solutions/Next Steps	Mandy Sedlak	
5. Review of Committee Work Plan	Mandy Sedlak	
6. Action Items	Mandy Sedlak	
7. Next meeting date: July 19, 2022	Christine/Mandy	

MEETING MINUTES:

1. **Meeting Called to Order:**
   - 7th FSMS Committee meeting called to order at 10:04am
2. **Roll Call:**
   - Roll Call Conducted by Christine Sylvis, documented by Mandy Sedlak
3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Reminder by Christine Sylvis
4. **Review work completed by working group on Solutions:**
   - Main committee divided into 3 working groups (leads in Red)

Economic		Training		People	
Chris	Boyles	Elizabeth	Nutt	Mark	Speltz
Sean	Dunleavy	Dan	Okenu, Ph.D.	Dan	Tew
Jeffrey	Edelen	Susan	Quam	Shelly	Wallingford
Jeff	Jackson	Todd	Rossow	Lisa	Whitlock
Naomi	Macias	Heather	Sanders	Yolanda	Woods
Monique	Crawford	Colleen	Smith	Linda	Zaziski
Vanessa	Bussiere	Martin	Flusberg	Melissa	Smith
Herman	Crawford, Ed.D.	Hsing-Yi	Hsieh	Laura	Temke
Theodore	Dohnal	Troy	Huffman	Laura	Wildey
Ashley	Eisenbeiser	Evelin	Pollock	David	Wilson
		Mario	Seminara	JEREMY	ZENLEA
		Christine	Sylvis		
		Mandy	Sedlak		

   - Economic and People working groups each met and submitted consolidated solutions.
   - Kudos to Economic and People group for work done!
   - **ACTION:** Training group needs to meet.
   - **ACTION for all members:** Review people and economic solutions consolidated list for discussion at next meeting

5. **Review Committee Work Plan**

Definition of Food Safety Management System; Most Current Version

- Goal: Feedback/Incorporation and Agreement/Vote on definition moving forward
- Discussion on where this definition came from
  - Definition for the National Retail Study
  - FSMS can be in any form; more documented more sustainable. But documentation is not required.

- Most were happy with procedures, still working through the training portions
- **Procedure's component**… Positive reaction from group
- **Training Component:**
    - Do we need to mention risk factor interventions in this section?
    - Might be narrowing things by too much
    - Focus on critical limits.
    - There are some hazards not included that would be related that would be controls (ie Covid). Can FDA comment
    - Add in beginning over food safety risk factors.
    - Are we getting in the weeds? Conceptualize the groups work to work on barriers/solutions.
    - Pre requisition programs, GMP, other areas are important as well.
    - Continue to keep interpretations broad. Allow for maximum flexibility. Group Agreed
- **Monitoring Component**
    - Adequately and consistently – is it too definitive?
    - Change verbiage "Conveys adequate amount of knowledge to …
    - Original Charge – asking us to make recommendations to creating documented HACCP Based Food Safety Management System. Are we meeting intent of our charge?
        - Clarification on issue itself; right above numerical listing.
        - **ACTION**: Add full listing of charges on spread sheet
        - Beginning paragraph is the crem dela crème – slow process that would begin to facilitate a forward movement towards a food safety management system. Baby steps not all or nothing… Be wary of approach.
        - 30,000 not narrowing change down any further. May later be parched out into smaller sections.
        - Group in agreement; that tier approach as first step; going in right direction.
        - Starting a food safety management system is better than having nothing at all.
    - Add Jessica language
    - Group agreed with verbiage changes as presented.
- **Examples Section**
    - Examples provide ideas on how to incorporate. To have procedure, a diagram could contain steps.
    - Really not writing a procedure here. Well-developed procedure would be to have the diagram above the 3-compartment sink
    - Point of Clarification: Where diagram is, procedures should include recontamination; is why that was added in might need some word smithing. Having a nice diagram can be your written procedure (do not need written SSOP)
    - Is the example helpful? Or does it need to be more streamlined.
    - Example - Way to detailed. (not have as specific SOP)
    - Take off prewash to air dry
    - Trepidation – those written procedures too much; making simplest solution ie poster could serve as procedures. Does not need to be difficult.
    - Simplistic – Beneficial pointing back to the food code. Food code will answer all of the questions. Use that as a resource/reference.
    - In the procedure – procedures can be as simple as posted visual reminders?
    - Evolution of definition – did have within definition; getting too long – hence example was created to demonstrate how all those steps could be incorporated. Goal to control length and complexity of the definition.

- Example – too prescriptive (small retailer and regulatory) getting pretty prescriptive. Way too much work – I am not doing this. Having an example this detailed setting the bar too high/expectation of regulatory. Is biggest concern. Might be doing the opposite of what we are trying to achieve.
- Conceptually agree on FSMS
- Example may be better suited for barrier or solution section.
- Q&A section better way to use example piece.
- Examples sometimes thought as a benchmark (one size does not fit all)
- Biggest challenge to try and break this down in bite size pieces. IE Employee Health as one section. How to package this back to the conference.

- **NEXT STEPS**: Christine will send out final version w/o examples, group review; Will Vote on definition next meeting. Continued incorporation and discussion of examples

6. **Overview of Committee Working Plan:**
    a. Next milestone, July 2022: Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on:
    a) the hurdles/challenges involved in such a requirement; and
    b) recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries.
    The committee should also consider a gap analysis of § 2-103.11 as a starting point.
7. **Action Items:**
    a. **ACTION: Training Subgroup** needs to meet to complete Solutions Lists, (ASAP)
    b. **ACTION For all Members** – Continue to review consolidated People and Economic Solutions Lists for discussion next meeting
    c. **ACTION For all Members** – Review definition of FSMS – Vote Next Meeting

8. **Next Meeting Date: July 19, 2022, 3:00 EST**

Meeting Adjourned 11:03pm

Meeting Number: 8
DATE: July 26, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Mandy Sedlak/Linda Zaziski

Agenda

1. Welcome, Call to Order	Christine Sylvis	
2. Rollcall	Christine Sylvis	
3. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis	
4. Charge #3	Christine Sylvis	
5. Review of Committee Work Plan	Christine Sylvis	
6. Action Items	Christine Sylvis	
7. Next meeting date: July 19, 2022	Christine/Mandy	

2021-2023 CFP
Food Safety Management System (FSMS) Committee

MEETING MINUTES:

1. Meeting Called to Order:

- 8th FSMS Committee meeting called to order at 3:10pm

2. Roll Call:

- Roll Call Conducted by Christine Sylvis, documented by Christine Sylvis
- Quorum not established – all votes put on hold (only 6 voting members present); Voting via email discussed; to be coordinated by Sylvis/Sedlak

3. Conference for Food Protection, Inc. Antitrust Statement

- Reminder by Christine Sylvis

4. Commence work on Charge #3:

Conducting a pros/cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code. In the assessment, the committee should consider providing feedback on:

a) the hurdles/challenges involved in such a requirement; and
b) recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries. The committee should also consider a gap analysis of § 2-103.11 as a starting point.

Plan to complete Charge #3:

- Mandy Sedlak and Christine Sylvis met with Courtney Halbrook, Council II Chair, and Wendy Bell, Council II Vice Chair and John Marcello regarding the progress of the committee and the charges. They were very impressed with the amount of work already completed by the committee! They agreed with assessing Charge #3 at an overview level. They acknowledge that this committee will likely be reformed (or a similar one formed) and encourage for us to think about those next steps and suggest charges.
    - Suggested that Charge 3 as an overall broad umbrella. Suggested Pro/Cons be developed/looked with an overall perspective Overview
    - List of barriers, pros, cons with really nothing coming out of it. To help expediate. Looking at pro/cons at an overview level
    - Coming up with a project of sorts that would show FSMS as it is being implemented
    - Liked example for manual ware washing on how easy it is to initiate a FSMS with more details in documentation/SOPs
    - The committee could do the committee a great favor of coming up with more then just a list.
    - FDA developed an employee health policies w/tool kit tying it in w/Norovirus. Perhaps that type of recommendations that an association or entity develop a project with learnings be rolled into a national strategy.
    - Take a microcosm on what we learn with would have a drastic impact on public health.
    - Tool out of this group from industry on how they need to work/manage a toolkit or step by step process on how to roll out/develop in business-based concept. Industry can provide helpful insight into development – voluntary approaches.

- Consider/suggest charges for a newly formed committee resulting from 2023 CFP
- Assess lessons learned on pros/cons and barriers/solutions before making suggestions on how to proceed. How can we incorporate our experiencing into context?
- Annex 4 of the food code. Incorporate Pros/Cons having FSMS as a requirement in the food code. Once barriers are solved items/topics FSMS incorporated into the Food Code.
- Provision – FSMS; responsibilities on the PIC have various controls and KSA of employees. High Level approach. If group took a look at that provision discussed strength and weakness of how it exists in the Food Code. Are jurisdictions using this provision if so, how, if not why-not? How is industry seeing use of this component? This be the starting point as it is already in the food code. (2-103.11)
- Not about putting more content in the code. How does the PIC – support or positively impact retail.
- How is regulatory authority applying this provision when inspecting the food code. For example: temperature violation is observed, mark cooking violations. If PIC portion on FSMS is marked, is there a double violating. How is this assessed?
- Suggestion: Helpful if Food Code had defined term for FSMS. Definition will provide a criterion on how to evaluate PIC. Annex 4 written more in industry vernacular then regularity speak.
- FSMS mentioned 54 times, all in Annex 4.
- What is experience with PIC provision? Challenges/How applied. Make sure all members have read PIC provision.
- Hesitancy to double dip citations. Identify a problem not driving to the underlying problem. Consultative way but not as a citation/regularity enforcement mode. Never found a way to address w/o alienating industry. The way it is written there are things intertangled not just concise or aligning well with Annex 4. Not a connective method to jive with other documents.
- Jurisdiction – the only time double debited. If failed, then PIC would be marked. Not for temperature violation only if they failed the inspection.
- Underutilized marking due to double dipping.
- One agency developed a flow chart on when to use PIC violation. Did use a lot more; had framework for not double dipping and not beating up on industry. Not written in code or pushed to regularity/industry. Can this template be shared?
- Data from AFDO on how often PIC demonstrates knowledge is marked. One of top 5 violations cited. Counts really climbed. Considerations and causes of this. Demonstration and Duties (Mandy has data via a presentation)
- There is some guidance for using 2-103.11 in marking instructions of Annex 7, but it is worded broadly. (Con) The section, does discuss PIC citations as being a judgement call.
- Send pros/cons in broad fashion. Something to meet changes then individual project for Charge 5. Include some experiences of what we learned
- Food code already requires a FSMS by practice does not explicitly state. Does ask that management make sure employees are following a program.

5. **Status of Committee Charges**
   - **a.** Definition of Food Safety Management System – vote next meeting
   - **b.** Work on “Training solutions” continues
6. **Action Items:**

a. Training Subgroup needs to meet to complete Solutions Lists, (ASAP)
b. **ACTION – All Members Send to Mandy:**
   - A listing of the hurdles/challenges (pros/cons) of Including FSMS into the food code specifically hurdles and challenges of the requirement and recommendations on how to best incorporate into the food code.
   - Also include Recommendations on how a requirement might best be incorporated to proactively control foodborne illness risk factor occurrence while recognizing the diversity within the retail and food service industries. Use § 2-103.11 as a starting point. Include: Suggestions on how this provision can be used. What and how it is currently being used or not being used. Provide any info sheets/guidance documents/flow charts that may exist.
c. **ACTION For all Members** – Continue to review consolidated People and Economic Solutions Lists.
d. **ACTION For all Members – Review definition of FSMS**
e. This is the last week to submit applications for Council membership at the 2023 Biennial Meeting: deadline 11:30 p.m. EST on Wednesday August 3, 2022. A final message will be sent out next week to let people know the application deadline has been moved to Friday, August 5.

7. **Next Meeting Date: August 16, 2022, 3:00 EST**

Meeting Adjourned: 3:59pm

Meeting Number: 9
DATE: September 20, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Mandy Sedlak/Linda Zaziski

Agenda

7. Welcome, Call to Order	Christine Sylvis
8. Rollcall	Christine Sylvis and Mandy Sedlak
9. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis
10. Committee Roster Update	Christine Sylvis and Mandy Sedlak
11. Vote on FSMS Definition	Christine Sylvis and Mandy Sedlak
12. Completed Charges Format	All
13. Status of Committee Charges	Christine Sylvis and Mandy Sedlak
14. Future of FSMS Committee	Christine Sylvis and Mandy Sedlak
15. Action Items	Christine Sylvis and Mandy Sedlak
16. Next meeting date: October 18, 2022	Christine Sylvis and Mandy Sedlak

MEETING MINUTES:

1. **Meeting Called to Order: 3:02pm**
   - 9th FSMS Committee meeting called to order at 3:00 EST
2. **Roll Call:**
   - Roll Call Conducted: Quorum Established
3. **Conference for Food Protection, Inc. Antitrust Statement**

- Reminder by Christine Sylvis

4. **Roster Update**
   - Remove voting members Mark Speltz (Regulator – Sate) and Naomi Macias (Regulator – Local) who respectfully asked to be removed from the committee due to a new job responsibilities.
     i. Elizabeth Nutt - **MOTION** made to remove Speltz/Macias at their request: Seconded: Dan Okenu. Vote: No opposition: **MOTION APPROVED**
   - Remove voting members Sean Dunleavy (Regulator – State) and Shelly Wallingford (Industry- Food Service) due to missing at least 3 consecutive meetings and not responding to an email inquiring about future participation.
     i. Elizabeth Nutt made friendly amendment - **MOTION** to move Dunleavy/Wallingford to alternate/non-voting; Seconded Dan Okenu. Vote: No opposition: **MOTION APPROVED**
     ii. Discussion regarding how both were contacted; to verify non-interest, if not needed for full vote. Suggested to move forward then make contact; then work on reinstating/bringing back to group. Perhaps move to non-voting roll by committee then reach out. Move members around to have voting structure.
   - Transfer Troy Huffman and Evelin Pollock from alternate members to voting members to replace those Speltz/Macias.
     i. **MOTION** by Dan Okenu to move Troy Huffman (regulatory) from non-voting representative to voting representative. Seconded by Elizabeth Nutt. Vote: No opposition: **MOTION APPROVED**
     ii. **MOTION** by Elizabeth Nutt to move Evelyn Pollak from an alternate to a voting member (regulatory) Pending Pollak acceptance. Seconded by Jeff Edelen. Vote: No opposition: **MOTION APPROVED**
     iii. Possible industry representatives to voting position: Hsing Yi, Laura Tempke, Laura Wilding
     iv. **MOTION** by Jeff Edelen to move Hsing Yi from alternate to voting member Troy Huffman seconded Voting: No opposition: **MOTION APPROVED**

5. **Vote on FSMS Definition:**

FSMS refers to a specific set of actions (e.g., procedures, training, and monitoring) to help achieve active managerial control.

Procedures (P): A defined set of actions adopted by food service management for accomplishing a task in a way that minimizes food safety risks. Procedures may be oral or written and include who, what, where, when, and how a task should be performed. The goal is to move toward complete, consistent, and primarily written procedures and may include topics such as when to wash your hands, how to set up a 3-compartment sink, how food temperatures are achieved and maintained/monitoring food temperatures.

Training (T): The process of management's informing employees of the food safety procedures within the food service establishment and teaching employees how to carry them out. Information may be presented in formats such as a set of instructions/illustrations, recipe cards with process instructions, wall charts, wallet cards, or live demonstration. The goal is to provide and document training for all food safety tasks in a format and frequency adequate to ensure employees have the knowledge to carry out the procedures consistently and effectively.

Monitoring (M): Routine observations and measurements conducted to determine if food

safety procedures are being followed. Monitoring systems should include who, what, where, when, and how monitoring is to be performed and may be conducted visually or documented in writing. The goal is to move toward a well-documented system that can be verified and may include use of automated systems, digital thermometers, logs, charts, checklists, and other job aids and tools

- Elizabeth Nutt made **MOTION** to accept the definitions as presented. Motion Seconded by Hsing Yi. Motion amended to add verbiage under "training": Information may be presented "in formats such" as a set of instructions/illustrations…" for Voting: No opposition: **MOTION APPROVED**
    - Excellent start to begin our discussion on FSMS. May have some wordsmithing but great start.
    - Consider adding on-line/virtual verbiage. Consider not putting in these words to keep broad. Consider adding word "such as"

6. **Completed Charges Format:**
    - Changed format of barriers and solutions
    - Currently in list format included all buckets and sub buckets (took everything we had and put it in one listing)
    - Suggestions on other method to format? Consider a table or chart with each bullet being a table. Same format in table opposed to bullet. Group agrees that bullets are good for formatting.
    - Recommendation to use numbers instead of bullets to be able to identify topics as individual discussion points.
7. **Status of Committee Charges:**
    - Review pros and cons submitted.
        i. Special Meeting: September 29, 2022, at 8:00 Pacific/11:00 Eastern
    - Vote next meeting: Charge 1 (Barriers), Charge 2 (Solutions) and Charge 3 (Pros/Cons)
    - Discuss Charge 4 (recommendations on next steps) next meeting.
    - Develop prospective Committee Issues to present to Council II Chair and Vice Chair by November 2022.
    - Revised Final Committee Reports and Issues submitted to Issue Chairs for preliminary review and comment by November 2022.
    - Issue Submission December 2022.
8. **Future of FSMS Committee**
    - Summary of Retail Food Safety Regulatory Association Collaborative project and possible resource/assistance by David Lawrence.
        i. David Lawrence and Brenda Bacon; Introduction and high-level overview of Collaborative.
        ii. Collaborative working with NACCHO for project funding; CFP Board currently in discussion to accept funded program.
        iii. Brenda and David asked to attend future FSMS meetings so that they can be in know of committee activity/recommendations so that through the Collaborative's partnership with NACCHO - documents/information developed by the committee can be made publish-ready. Allows them to get a pulse for what is going on and how their partnerships can get ahead of the curve to make the process more streamlined while tying in possible resources.

iv. Objectives of this committee and the Collaborative dovetail very well together.
v. FDA request to truly involve the Collaborative.

- Consider recreating FSMS Committee – Committee Charges will need to be developed. Barrier's list can be used as a starting point
- Consider idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, about submitting an Issue to establish a Standing Committee to encompass the work of the FSMS and DFSS Committees.
    i. Any movement forward on this initiative will be taken up by the FSMS in collaboration with the DFSS Co-Chairs and in consultation with Council II Chairs.

9. **Action Items:**
    - **ACTION For all Members –** Conduct a final review on consolidated pros/cons list. Send any recommended changes to Many and Christine. Plan to vote on final list at next meeting.
    - **ACTION For all Members** – Conduct a final review of consolidated People, Economic, and training Solutions and Barriers Lists. Send any recommended changes to Many and Christine. Plan to vote on final list at next meeting.
    - **ACTION For all Members** – Think about Issues regarding FSMS that may be submitted for the 2023 CFP. Possibly Recreate committee
    - NEHA AEC abstract submission contact Laura Widley
10. **Next Meeting Date:** October 18, 2022, 3:00 EST

Meeting Adjourned: 4:00pm

Meeting Number: 10
DATE: October 18, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

17. Welcome, Call to Order	Christine Sylvis
18. Rollcall	Christine Sylvis and Mandy Sedlak
19. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis
20. Changes Document	Christine Sylvis and Mandy Sedlak
21. Charge 4	Christine Sylvis and Mandy Sedlak
22. Status of Committee Charges	Christine Sylvis and Mandy Sedlak
23. Future of FSMS Committee	Christine Sylvis and Mandy Sedlak
24. Action Items	Christine Sylvis and Mandy Sedlak
25. Next meeting date: October 18, 2022	Christine Sylvis and Mandy Sedlak

MEETING MINUTES:

1. **Meeting Called to Order: 3:01pm**
    - 10th FSMS Committee meeting called to order at 3:01pm EST
2. **Roll Call:**

- Roll Call Conducted; Quorum Established

3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Reminder by Christine Sylvis
4. **Completed Charges Document:**
   - Changed format of Barriers and Solutions to use numbers instead of bullets to be able to identify topics as individual discussion points.
   - No comments received on Barriers and Solutions.
   - Vote: Charge 1 (Barriers), Charge 2 (Solutions)
     i. Items still in red:
        1. (2) Comment/discussion questioned group to put under equipment or cost barriers. Put under cost barrier subset vs a standalone. Suggestion made to Bucket out. Group good with leaving as a standalone
        2. Process Solution Bucket for sub processes – number 3 was removed
        3. Idea for additional cost: unacknowledged cost if a foodborne illness incident occurs. People do not recognize a cost if something does not occur … more of a solution piece (4a iii, or add as a subset under bullet 4 under b). Group agreed/added in.
   - Christine will ensure that all formatting is consistent
   - **Vote**: Lisa made motion to approve solutions and barriers (Charges 1 and 2) accept the documents; Troy Seconded. Discussion: non. Vote; no objections or abstentions. **Charges 1 and 2; Motion Passed**

5. **Charge 4:**
   - Charge 4: Developing recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4.
     i. Retail Food Safety Regulatory Association Collaborative/NACCHO project resources. Also: AFDO/NEHA (Active Managerial Control), Plan Review Committee
        1. Cost/benefit analysis of implemented FSMSs
        2. Toolbox resources (draft SOPs, job aids, case studies, etc.)
           Note: David Lawrence mentioned the year one goals of collaborative. Document to be shared with group on current status and support for present and forward movement. Added to teams site and Food Shield.

     ii. CDC EHS-Net project on Employee Health Policy
     iii. Retail Food Safety Specialists – Train the Trainer type program
   - Develop prospective Committee Issues to present to Council II Chair and Vice Chair by November 2022.
     i. **Consider recreating FSMS Committee –** Committee Charges will need to be developed. Barrier's list can be used as a starting point
     ii. Consider idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, about **submitting an Issue to establish a Standing Committee to encompass the work of the FSMS and DFSS Committees.**

1. Do not need to recreate committee every year. Charges would be included in the bylaws.
2. Standing committee
    - Can be explored as an option if we can pin-point criteria. The other committees usually have some oversight of standards with ANSI/reviewed yearly. Lots of overlap.
    - More research may be necessary regarding standing committees or when a committee moves into a standing option.
    - Big thing outside of FSMS – regulated to conference administration vs standard maintained as long as CFP has that standard. may be new territory to create a new standing committee that would not have a sunset every two years.
    - Executive committee will need to have a discussion on. Standing committee reports to executive committee. Board tracking constitutionals charges, plus charges from board meeting or from conference. Constant maintenance and other charges, benefit rational two council committees doing similar to bring both committees together. Argument in background. Constitutional bylaws outlined. Procedures document to the board. Rational is there.
    - Putting into the issue along with the background. Retail foods is also a standing committee. Constantly maintaining program as well. Huge amount of work.
    - Large committee with multiple subcommittees to support to spread out work.
    - Prepare a case and get some feedback from others with experience to see if we are on the right track with fall back in council. Committee were to propose, would this be an issue or would it go through the executive board. Not pan out then there would be some charges to move forward. Issues submitted for acknowledgement in November. This would be seen by board to garner support. Would be an issue by one of two committees Christine/Mandy and Ben/ co-submitting. Get all players with co-chair of to committees. Publication committee was the last standing committee that was formed. (in Richmond).

6. **Status of Committee Charges:**
    - Special Meeting: September 29, 2022, at 8:00 Pacific/11:00 Eastern reviewed Pros
    - Complete review of Cons assessment of including a requirement for the development and implementation of documented FSMSs, consistent with Annex 4, in a future edition of the Food Code October 21, 2022 at 8:00 Pacific/11:00 Eastern.
    - Vote next meeting: Charge 3 (Pros/Cons)
    - Revised Final Committee Reports and Issues submitted to Issue Chairs for preliminary review and comment by November 2022.
    - Issue Submission December 2022.

7. **Future of FSMS Committee**
    - Summary of Retail Food Safety Regulatory Association Collaborative project and possible resource/assistance by David Lawrence.
        i. David Lawrence and Brenda Bacon; Introduction and high-level overview of Collaborative.
        ii. Collaborative working with NACCHO for project funding; CFP Board currently in discussion to accept funded program.
        iii. Brenda and David asked to attend future FSMS meetings so that they can be in know of committee activity/recommendations so that through the Collaborative's partnership with NACCHO - documents/information developed by the committee can be made publish-ready. Allows them to get a pulse for what is going on and how their partnerships can get ahead of the curve to make the process more streamlined while tying in possible resources.
        iv. Objectives of this committee and the Collaborative dovetail very well together.
        v. FDA request to truly involve the Collaborative.
    - Consider recreating FSMS Committee – Committee Charges will need to be developed. Barrier's list can be used as a starting point
    - Consider idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, about submitting an Issue to establish a Standing Committee to encompass the work of the FSMS and DFSS Committees.
        i. Any movement forward on this initiative will be taken up by the FSMS in collaboration with the DFSS Co-Chairs and in consultation with Council II Chairs.
8. **Action Items:**
    - **ACTION For all Members** – Think about Issues regarding FSMS that may be submitted for the 2023 CFP. Possibly Recreate committee or standing committee
    - **ACTION For all Members – Special meeting on Oct 31 review cons and complete**
    - **ACTION: Smaller/Identified members/guests** to discuss standing committee option prior to the 31st. (Becky, Todd, Mandy, Christine, David, Devine)
    - **ACTION For all interested Members: Meeting prior to the 15th to create the issue submission for vote on the 15th.**
    - **ACTION for Voting Members/Others:** Meeting scheduled for November 15th – Vote on Charge 3 Pros/Cons and Charge 4 Next Steps.
9. **Next Critical Voting Meeting Date:** November 15, 2022, 3:00 EST

Meeting Adjourned: 3:55pm EST

Meeting Number: 11
DATE: November 15, 2022
TIME: 3:00 EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

26. Welcome, Call to Order	Christine Sylvis
27. Rollcall	Christine Sylvis and Mandy Sedlak
28. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis
29. Changes Document – Pros and Cons vote	Christine Sylvis and Mandy Sedlak
30. Charge 4 – Future of the Committee	Christine Sylvis and Mandy Sedlak
31. Charge 4 - Issues for next Committee	Christine Sylvis and Mandy Sedlak
32. Issue – Final Report	Christine Sylvis and Mandy Sedlak
33. Issue – FSMS Definition	Christine Sylvis and Mandy Sedlak
34. Status of Committee Charges	Christine Sylvis and Mandy Sedlak
35. Action Items	Christine Sylvis and Mandy Sedlak
36. Adjourn	

MEETING MINUTES:

1. **Meeting Called to Order: 3:02 pm**
    - 10th FSMS Committee meeting called to order at 3:02pm EST
2. **Roll Call:**
    - Roll Call Conducted; **Quorum Established**
3. **Conference for Food Protection, Inc. Antitrust Statement**
    - Reminder by Christine Sylvis
4. **Completed Charges Document:**
    - Thank you to those who attended the Special Meeting on September 29, 2022. Pros and Cons were completed!
    - Edited Barriers and Solutions to use FSMS/FSMSs correctly and consistently
        i. Unbolded items and single/plural consistency
        ii. Con #2; wordsmithing to address all the bullets/flow
    - Added Pros and Cons to the document.
    - No comments have previously received regarding Pros and Cons.
        i. Discussion by Group
            1. No Discussion
        ii. Other Comments:
            1. Clarification regarding revisiting some charging for this group to look at charges not directly dealt with due to time constraints Yes, future of committee and/or standing committee can address open ended items/unaddressed items
    - **VOTE:** Elizabeth Nutt; **Motion to Accept Pros/Con report as written to be included in final report submission.** Second Yolanda Woods. No Discussion; Vote: No Dissentions, No abstentions. **MOTION PASSED**
5. **Charge 4 Future of the Committee:**
    - Charge 4: Developing recommendations on next steps to promote universal development and implementation of documented FSMSs consistent with Annex 4
    - 2 Options:
        i. Consider **recreating FSMS Committee** – Committee Charges will need to be developed. Barrier's list can be used as a starting point
        ii. Consider idea presented by Eric Moore and Ben Chapman, Digital Food Safety Systems (DFSS) Committee Co-Chairs, about submitting an Issue to establish a **Standing Committee to encompass the work of the FSMS and DFSS**

Committees. Meetings have been held with Council II Chair (Courtney Williams) and Vice Chair (Wendy Bell) and with CFP Constitution and Bylaws Committee Chair (Daveen Sarrocco-Smith), Issue 2020-II-030 submitter (John Marcello), and DFSS Committee Co-Chairs (Eric Moore and Ben Chapman). A Standing Committee is a practical option.

iii. Discussion:

1. Standing Committee well received by members
2. Are we already incorporating the merging of all of those groups?
3. Standing committee would incorporate FSMS and Digital Committee The new committee would have charges in both.
4. It is very difficult for committees to deal with charges when merging groups. Concern what is being suggested is bandwidth of committee to deliver and move bar forward.
5. Sustainably of Food Safety Management Systems, if it did get put into the food code.
    - Envision 4 years down the road.
    - Aspects of FSMS in pieces into the food code.
    - The thought was that incremental editions will be made into the food code over a longer period of time.
    - On-going changes as time goes along.
    - Not as big as programs standard committee but would have charges to committee.
    - Sustainability was discussed based on interest for committees. Would 2-4 committee formed be enough interest to join committees
6. Question: Would considerations be made for standing committee w/o combining with the Digital Food Safety System Committee work
    a. What is the vision for synergize of both committees combining?
        i. Component of FSMS, having digital portion incorporated into it
        ii. Christine shared charges of collaborative on how digital would fit into FSMS
7. Suggestion was to have standing committee for FSMS as standalone standing committee w/o having them work as one
8. The 4 deliverables of the collaborative are tied to new era for food safety. Listed separately for scope under broad idea of FSMA. Standing committee would need sub committees and workgroups. Complexed need lots of work but need lots of symmetry.
9. 2 thoughts standing committee for FSMA. Digital as standalone or combining with separate charges/combining them perhaps at a later time.
10. If they go separate; not likely to get 2 standing committees; be sure to give that some consideration. 2 is very unlikely.
11. Not sure that that would matter. We can request, if not standing, then request to be a continued committee. To be prepared for that; Standing Committee let digital address their own perspective. To be proactive, our

committee should be proactive if we are not looking to be a standing committee then look at a recommendation for reforming/extending

12. If both ask to be a standing committee; then executive committee could recommend to combine.
13. **Will of Committee:** Request standing committee (w/o digital committee) if that does not look favorable then default fall back to council committee. Council members for council 2 would need to recommend be recreated as a council committee
14. Council 2 FSMS Members; (Courtney WIlliams, Chair) Christine and Ashley Eisenbeiser

iv. Recommended solution language/other thoughts:

1. Add Active Managerial Control of Risk Factors
2. Charges in the Public Health significance need to be in Solution. What is the committee going to work on. Charges and recommended are in the solutions point.
3. Advise from Daveen, one issue to create committee to change bylaws then a separate issue to recreate w/charges of committee.
4. Consider recreation of committee then based on public health significance to standing committee. Council Chairs determine what order issues are addressed in. They determine order the CFP ordering system. Once council beings they can change order w/recommendation and vote.
5. Some of the charges for this new committee next biennium will be solution on other charge/issue on charges would be incorporated into next biennium and explaining on why this needs to be a standing committee. Council chair confers with council members on order. Has been standard, not impossibility to this order.
    a. Good idea; insure committee gets created. If becomes standing committee that is another issue, but at least the committee will continue.
6. Recreate committee w/ charges. Separate issue submitted to create as standing committee. (Might be more straight forward to do it this way)
7. Charges on public health significance – carry over some of the items on initial FDA and CDC studies FSMA have strongest statistical correlation to reduction of FBIs
8. Health People; Norovirus reduction. Developing health policies program. Better focus on one specific area. Number one case of FBI at retail level with focus of employee health

- **VOTE** Lisa Whitlock made motion to recreate the committee as council committee w/chargers with separate issue to change from council committee to a standing committee w/duty as stated by constitution and bylaws. Jeff Jackson seconded. No objections, no abstentions **MOTION PASSED**

6. Charge 4: Charges for FSMS Committee during 2023-2025 biennium

- Considerations for Charges:
    i. Risk Factor for PIC provision

ii. Cost benefit analysis (NACCHO/collaborative)
iii. Develop a toolbox, develop verbiage to outline prerequisites (SOPs) that are not covered. Review results of EHS-Net/CDC collaboration and incorporate into toolbox
    1. Focus on Employee Health, Healthy people
    2. Use the school USDA/HACCP SOPs as a possible guide/tool; consider reviewing #4 "Guidance for School Food Authorities, "Developing a Food Safety Program based on the process approach to HACCP Principles" Consider having CDC provide an overview of project and what tools may come out of this down the road.
    3. CONSIDER: Pilot a FSMS for Employee Health program to see how it might work. Find industry volunteer to develop FSMS; site visits to support and verify effectiveness. Industry/Regulatory Partner. Note this is something that CDC is already using this approach/project. Initialed via EHS-Net
    4. Get understanding of EHS-Net project as how it relates to FSMS committee work. Consider collaboration
    5. The overarching thread of these suggestion is that we need to increase awareness, communication and idea sharing with initiatives area underway. A committee may not be well suited to do a pilot study themselves but give the results they could give guidance.
iv. Reviewing a charge for Barriers, Pros/Cons provide solutions/remedies
v. Items not covered in our current charges
vi. Complete gap analysis of PIC Provision
vii. Committee Charge to fil in the gaps between all areas working on aspects of employee health and all aspects of collaboration/projects currently being done.
viii. NOTE: Christine typed up charges and read as written
ix. Items to be word smithed; Charges Can Vote to have 4 items incorporated into the charges submitted for the reformation/standing committee

7. **Review Issue to submit committee final report**
8. **Review Issue to include where FSMS definition fits into Food Code**
    - Where does definition of FSMS belong in the Food Code discussion
    - Annex 4, under active managerial control
    - Place after AMC, put in FSMS definition
    - Soft roll-out in code: Put somewhere under the radar; time to include into definition Chapter One for the Food Code. PIC duties, que Employees begin using FSMS to begin voluntary implementation of systems to reduce FBI.
9. **Status of Committee Charges:**
    - Final Committee Report to be submitted to Council II Chair and Vice Chair by November 18, 2022.
        i. Thank you, Linda Zaziski, for reviewing!!
    - Revised Final Committee Issues submitted to Council II Chair and Vice Chair and Issue Chairs for preliminary review and comment by November 2022.
    - Issue Submission December 2022.
        i. Summary of Issues to be submitted

1. 1. Accept FSMS Committee Final Report
2. 2. Recreate FSMS Committee
3. 3. Create FSMS as a Standing Committee
4. 4. Charges for FSMS Committee during 2023-2025 biennium.

10. Action Items:

- **ACTION For Christine and Mandy** – Finalize final report and issues and submit to Council II Chair and Vice Chair within deadlines
- **ACTION For all Members –** Thank you for your outstanding work and dedication to this committee and your dedication to food safety every day and adjourn.
- **ACTION– For All Voting Members: Need to determine where definition falls into Food Code. (Vote needed)**
  - **i. Next meeting November 18, 2022 at 10:00 EST**

11. Meeting Adjourned 5:03pm

Meeting Number: 12
DATE: November 18, 2022
TIME: 10:00am EST
Conference Call: via Teams

Co-Chairs: Mandy Sedlak and Christine Sylvis
FDA Advisor: Jessica Otto
CDC Advisor: Beth Wittry
Scribe: Linda Zaziski

Agenda

37. Welcome, Call to Order	Christine Sylvis
38. Rollcall	Christine Sylvis and Mandy Sedlak
39. Conference for Food Protection, Inc. Antitrust Statement	Christine Sylvis
40. Location of FSMS in the Food Code	Christine Sylvis and Mandy Sedlak
41. Charge 4 - Issues for next Committee	Christine Sylvis and Mandy Sedlak
42. Issue – Final Report	Christine Sylvis and Mandy Sedlak
43. Action Items	Christine Sylvis and Mandy Sedlak
44. Adjourn	

MEETING MINUTES:

1. **Meeting Called to Order: 10:03am**
   - 10th FSMS Committee meeting called to order at 3:02pm EST
   - Quorum Established
2. **Roll Call:**
   - Roll Call Conducted; Quorum **Established**
3. **Conference for Food Protection, Inc. Antitrust Statement**
   - Reminder by Christine Sylvis
4. **Location of FSMS Definition in Food Code**
   - Term Active Managerial Control around for 20 plus years. Not made its way into definition of food code. Think time to put on radar going hand in hand with FSMS. Employees begin using AMC by using FSMS. Deal with compliance. Allows for a soft roll-out. No specification gives wiggle room but gets the ball rolling. Time to be in codified portion in the food code.

- If definition in food code, if in annex can it be in the definition. Terms defined n codified section. If you want it in Chapter 1. Language needs to be in codified section so it can appear in purpose and definition. Excellent definition and concept. Do not need to be prescriptive in definition. FDA please incorporate as appropriate.
- Council will need vision to move forward
- If in multiple sections Chapter 1, 2 and annex; Council chairs recommended do multiple issues. Don't include too many in a single issue. Multiples allow options. Annex a no-brainer. If we want to get it in the food code – optional at this stage. Making it an "and: (hard call) Making it an "or" – more receptive
- FSMS are actual things… tend to lead to AMC; makes it difficult/tricky
- Proposed mechanism/intent; less on where it is placed. Angle of intended outcome. Want it to be codified. opposed to danker with language.
- Active managerial control in definition. PIC use FSMS as an example fo what they can do to achieve AMC
- PIC responsible for developing the FSMS. PIC would be the executer of the system. In the italicized section is more of explanation; call out permit holder implement some type of FSMS. Interesting angle –
- Agree on FSMS definition. Grappling with where does it go? Struggle; what does this look like. Duties of AMC is FSMS, how do we rationalize the PIC provision. Struggle may be related to the work that is still needed.
- 2-101.11 best place to include. Section P, written plans where specified required (health policy/vomit clean-up) FSMS is not always written… goal for written. Permit holder would develop.
- FSMS members in committee support concept and code concept/definition inclusion. May get pushback from industry.
    i. Teaching concept in food safety classes to include small industry
    ii. Many SOPs for larger organizations already refer to PIC/systems
- 2-101.11 Duties, Assignment, AMC in 2-111.2
- If several avenues, list several for consideration; in code somewhere not sure where in code. Not sure where it would fit just that you want it in there. Options to consider.
- there are concurrent Issues to be submitted by the Program Standards Committee to add plan review with a FSMS perspective to Standard 3 and to re-create the CFP Plan Review Committee to update the Food Establishment Plan Review Guidance Document to be inclusive of FSMS
- It would be a big challenge during plan review to have a full menu developed to drive a complete FSMS but I could see some components being available then.
- could go under responsibilities of the permit holder in Chapter 8
    i. Some agencies do not adopt Chapter 8. But then again everyone can pick and choose any code provision.
    ii. Need to find out why regulatory agencies are not using Chapter 8 – need deeper dive
    iii. Many not using Annex's

- Appears that we are moving too quickly. AMC must go hand in hand with FSMS. FSMS used widely. Is there a way we can move AMC into definitions then our task will be to develop a more clear perspective on what a FSMS. AMC in codified section.
- FSMS is a tool to achieve AMC
- Want to have in the code, but more to be done on development and interpretation of getting FSMS in code.
- Options: 2-103.11 incorporate FSMS AMC into duties but not be prescriptive or 2-101.11, chapter 8 incorporating AMC this go around.
- Under 2-103.11: **The Person In Charge shall maintain Active Managerial Control by ensuring:....** Will also allow for definition of AMC in codified.
- FSMS tool – massage them to work together. FSMS to become mandatory . Tool of choice to obtain AMC. Consider a FSMS to achieve AMC
- Could you add FSMS into 2-103.11 (P) Written procedures and plans, where specified by this Code and as developed by the FOOD ESTABLISHMENT or those created as part of a FOOD SAFETY MANAGEMENT SYSTEM, are maintained and implemented as required.
- VOTE Motion – would require specificity, perhaps later in the future.
- Let FDA find location.
- Submit issue provides AMC and FSMS in the code by ensuring really conveys the concept. Not worry about where it goes, probably the best use of groups time.
- Incorporate AMC into 2-201.11 and 2 other asks - define AMC and include FSMS defined in the code.
- Motion/friendly amendment to recommend verbiage presented on Charge 4 Incorporating **"voluntary use"**
- AMC is already in code that 'shall ensure' by including the AMC; already in code – hence reason why deep dive is needed and addressed as group.
    i. A through P is this in a nutshell.
    ii. FSMS is not well defined, required. AMC is getting a title and a definition
    iii. New names to old interventions.
- How to get the definition into the code.
    i. Into Annex 4, right after AMC
- Have defined FSMS; not have to decide exactly where it goes. Perhaps in public health significance section. Definition be incorporated into chapter 1 and that FSMS and definition incorporated into to AMC
- **VOTE: Motion to include FSMS, AMC into code w/voluntary use terminology** made by Jeff and seconded by Lisa. Discussion, no objections, no abstains **MOTION PASSED.**
- Vote was on inclusion to the food code; actual verbiage does not require vote.

5. **Charge 4; Issues for next committee**
    - Draft issues shared on screen - verbiage as currently written.
    - Based on conversations today, these items will be wordsmithed and then shared with all members.
6. **Final Committee Report – Submission Due November 18**
7. **Action Items:**
    - **ACTION For Christine and Mandy** – Finalize final report and issues and submit to Council II Chair and Vice Chair within deadlines (Deadline Nov 18)
    - **ACTION – For Christine/Mandy and All Voting Members: Christine will wordsmith and send final issue verbiage to committee members. Please review ASAP.**

- **ACTION For all Members –** Thank you for your outstanding work and dedication to this committee.
- **ACTION For all Members – Need new Co-Chair Committee for next biennium all members encouraged to consider this opportunity.**

8. **Meeting Adjourned: 11:06am**

COMMITTEE NAME *Digital Food Safety Management Systems*

DATE OF FINAL REPORT: *11/10/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: ERIC MOORE AND BEN CHAPMAN

COMMITTEE CHARGE(S):

1. Identifying best practices, existing guidance documents, and research that relate to the use of digital food safety management systems including digital temperature monitoring equipment.
2. Developing a guidance document for food establishments and regulatory authorities that establishes General Best Practice Guidelines for Digital Food Safety Management Systems (DFSMS) including digital temperature monitoring equipment.
3. Determining appropriate methods of sharing the committee's work, including but not limited to a recommendation that a letter be sent to FDA requesting that the Food Code, Annex 4 (Management of Food Safety Practices - Achieving Active Managerial Control of Foodborne Illness Risk Factors), Annex 2 (References, Part 3-Supporting Documents) be amended by adding references to the new guidance document as well as any existing guidance documents that the committee recommends, and the posting of information on the CFP website.
4. Reporting the committee's findings and recommendations to the next Biennial Meeting of the Conference for Food Protection.

COMMITTEE WORK PLAN AND TIMELINE:

Workplan:

- *Monthly full committee meetings (Started in Nov. 22)*
- *Collect existing literature, guidance, and research documents related to Digital Food Safety Management System (DFSMS)*
- *Create basic best practice guidance document from document research findings for use as a working outline*
- *Create two working subcommittees to edit working outline*
- *Sub-Committee meetings started 06/01/2022*
- *Meetings scheduled to occur by-weekly*
- *Committee review and approval of best practice guidance document*
- *Create sharing plan*
- *Report findings and recommendations*

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***

- *Committee determined that monthly full committee calls (when feasible) were appropriate.*
- *Created file and document sharing process for committee members access and use for research documents and working group documents.*
- *Committee identified several existing documents (research, industry articles, regulatory guidance) during the research discovery.*
    - *Received and reviewed over 30 documents and publication*
- *Committee determined the need to develop alignment around terminology of what a Digital Food Safety Management Systems (DFSMS) and Digital Temperature Monitoring Equipment (DTME) is and is not. This was accomplished by creating definitions that the committee came to consensus on.*
- *Committee agreed that a good starting point for a Best Practice Guidance document would be to use an existing regulatory guidance document as a starting point (FDA-Guide to Inspections of Computerized Systems in the Food Processing Industry) for the committees work on developing a best practice document to simplify format and approach with an existing regulatory best practice document.*
- *Committee determined the need to establish two working subcommittees to revise/edit the existing guidance document with the goal of developing an appropriate retail focused best practice guidance document.*
    - *Two subcommittees were created; one to focus on DFSMS, and the other to focus on DTME*
    - *Subcommittees determined that bi-weekly meetings (when possible) would be needed to complete necessary edits/revisions.*

Subcommittees also agreed to providing progress reports on monthly full committee calls.

- *Subcommittee outputs were combined into a single document: General Best Practice Guidance for Food Establishments and Regulatory Authorities for Digital Food Safety Management Systems.*

- *Chairs of this committee have been in communication with the CFP liaisons for the Retail Food Regulatory Association Collaborative on future steps (such as FDA grant funded industry research) and deliverables of this* committee's *work. These efforts focus on a grant objective to encourage the application of digital tools and incentives that prompt desired behaviors (e.g., handwashing) in collaboration with retail food and foodservice industry trade organizations.*

- *On 12/12/2022 a 2-day voting member electronic vote to Approve the final version of the DFSMS Best Practice document was initiated for all 19 voting members.*
  - *Voting closed on 12/14/2022.*
  - *Voting member quorum was obtained (18 yes, 1 no),*

COMMITTEE AND SUBCOMMITTEES MET ON THE FOLLOWING DATES: *NOVEMBER 16, 2021 – FEBRUARY 8, 2022 - MARCH 18, 2022 - APRIL 29, 2022 - MAY 23, 2022 - JUNE 17, 2022 - JULY 1, 2022 - JULY 15, 2022 - AUGUST 12, 2022 - SEPTEMBER 7, 2022 - SEPTEMBER 9, 2022 - SEPTEMBER 23, 2022 - OCTOBER 7, 2022 - NOVEMBER 2, 2022 - NOVEMBER 4, 2022 - NOVEMBER 7, 2022* - DECEMBER 8, 2022

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a. All charges completed
3. ***Charges INCOMPLETE and to be continued to next biennium:***
   a. None

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***
☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**
1.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

1. ***Committee Issue #1: Report – Digital Food Safety Systems Committee***

   List of content documents submitted with this Issue: ***Committee Member Roster:***

   ☐ ***See attached revised roster PDF*** ☒ ***No changes to previously approved roster***
   "Committee Members Template" (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

   (1) ***Digital Food Safety System Committee Final Report***
   (2) ***Digital Food Safety Management Committee Member Roster***
   (3) ***Draft General Best Practice Guidelines for DFSMS***

   a. **List of supporting attachments:** ☐ ***Not applicable***

   (1) ***Attachment 1_Original CFP ISSUE)2020_II_021***
   (2) ***Attachment 2_DFSSC Meeting Minutes***
   (3) ***Attachment 3_DFSSC Definitions Accepted***
   (4) ***Attachment 4_Computerized Systems in Food Processing FDA***
   (5) ***Attachment 5_SubCommittee DRAFT DFSMS Best Practices Doc***

2. ***Committee Issue #2: Approve/Post General Best Practice Guidelines for Digital Food Safety Management Systems***
3. ***Committee Issue #3: Amend Food Code Annex to Include Reference to General Best Practice Guidelines for Digital Food Safety Management Systems***

Committee Name: Digital Food Safety

A. Introduction and Scope

The use of Digital Food Safety Management Systems (DFSMS) within the retail food industry, regulated by the Food and Drug Administration (FDA), continues to gain widespread interest, acceptance, and use. The use of DFSMS is expected to continue to grow in the retail food industry as technology improves and components become more readily available. As technology advances the retail food industry continues to replace paper-based records associated with traditional food safety management systems with digital documentation. Recent FDA Risk Factor study results have shown that utilizing a robust management system leads to a reduction in food safety risk factors.

An oft-used component of a DFSMS, Digital Temperature Monitoring Equipment (DTME) can improve awareness, response, and documentation of temperature conditions. This technology allows more accurate, reliable, and efficient food and equipment temperature control impacting safety and quality improvements. As DFSMS and DTME become more common in the retail food industry, the visibility, awareness, and availability of information that these systems and technology can provide should support improvements in controlling food safety risk factors in food retail.

This guidance will outline food safety management approaches specific to the implementation and use of technology in food retail. Best practices provided in this document serve as a foundational guide for the collection of accurate, consistent, and reliable data that can be used to make risk-reduction decisions. This document has been written with the assumption that a food retail establishment has a food safety management system and that they have identified and addressed HACCP Principles 1, 2 and 3 as referenced in Annex 4 of the most recent version of the U.S. FDA Model Food Code.

B. Definitions

Digital Food Safety Management System (DFSMS)

An interactive, digital, or electronic archive intended to collect, store, and analyze data that supports a food safety management system as defined in Annex 4 of the most recent version of the U.S. FDA Model Food Code. DFSMS specifically supports ongoing quality control and assurance, monitoring and recordkeeping of specific food safety goal-oriented plans, like Risk Control Plans (RCPs), that outline procedures for controlling foodborne illness risk factors. A DFSMS is intended to enable a proactive approach to support the consistent safe production, transport, preparation, storage, and service of safe wholesome food as defined in the most recent version of the FDA model Food Code. A DFSMS employs active user-based workflows that support decision making, that can be reviewed and acted upon, and may be housed locally (on-premises) or be accessed remotely using off-site servers or cloud storage.

DFSMS may include but are not limited to functionality that allows a user to:

- capture, record, and store multiple types of data
- provide real-time feedback to users
- generate record keeping reports (i.e., Trends over time)

Other components, tools, and records within a DFSMS may include:

- specific policies, procedures, recipe cards, and critical limit monitoring actions and corrective actions including training tools
- risk control plans
- product storage/movement information and inventory supporting recalls and market withdrawals
- equipment maintenance documentation
- active alerting
- networked and/or IOT devices

Digital Temperature Monitoring Equipment (DTME)

Automated purpose-built temperature measuring device(s) that often includes sensors capable of generating and capturing temperature data for analytical use. This equipment may include the functionality of automatically measuring, monitoring, storing, transmitting, documenting, and sharing the temperature of food, air, or water. Monitoring equipment that captures and stores temperature data over a period of time that may connect to a system that may be capable of delivering alerts and exception reports.

Software

Software is the term used to describe the total set of programs, procedures, rules, and any associated documentation pertaining to the operation of a technology-based system that

includes, but is not limited to application, operating system, and utility applications used by the computerized system.

C. Prerequisites

Best practice for a DFSMS is to employ purpose-built hardware and software when designing and implementing an approach. The appropriateness of hardware and software should meet the goals of any RCP. Maintenance of the system and the proper replacement of system hardware is critical for it to function as designed. Design specifications of the hardware and software should be determined and periodically reviewed to ensure the system and its functional components do what is intended to support food safety.

This document recognizes that DFSMS are built and utilized to support the most recent version of U.S. FDA Model Food Code, Annex 4, HACCP Principles specifically:

Principle #4: Establish Monitoring Procedures
Principle #5: Establish Corrective Actions - implementation of the corrective action specifically
Principle #6: Verification/Sharing for equivalency for regulatory checks
Principle #7: Record keeping procedures and documentation

Personnel operating, maintaining, and programming DFSMS should have adequate training to complete their assigned duties. Determine the extent of operator, system managers, and software system technical personnel training in the functions, requirements and operation of the computerized system.

Examples of training may include but are not limited to:

- system operation
- malfunctions
- regulatory requirements
- system changes
- security procedures
- manual operation of the system
- documentation of system errors

D. DFSS Inputs

Digital Food Safety System Equipment (DFSSE)

DFSSE typically include various purpose-built and designed stationary and handheld measurement instruments, tools, and sensors capable of the collection, storage, and

transmission of data into software. The food contact surface of DFSSE must meet the design and placement characteristics in Chapter 4 of the most recent version of the U.S. FDA Model Food Code and must be designed to meet or exceed NSF Standard 2 - Food Equipment or equivalent. Examples may include but are not limited to mobile device(s), sensors, thermometers, RFID/QR Code scanner/receiver, etc.

Stationary Monitoring Devices

Purpose build devices which are permanently or semi-permanently affixed, mounted, installed, attached to equipment or surface using food grade mounting/installing materials, maintained free of accumulated soil, and cleaned per manufacturer instructions. When devices do not include an external measurement display, access to the measurement data should be easily accessible and viewable. These devices when appropriate should meet the design and placement characteristics in Chapter 4 of the most recent version of the U.S. FDA Model Food Code and must be designed to meet or exceed NSF Standard 2 - Food Equipment or equivalent.

> *Note: DFSS Stationary temperature monitoring devices must meet the requirements outlined in the most recent version of the U.S. FDA Model Food Code 4-204.112 Temperature Measuring Devices*.

Device examples may include but are not limited to equipment or wall mounted data loggers, humidity sensors, door open/close sensors, camera's, etc.

Data access examples may include but are not limited to: Software report on mobile, desktop, tv monitor/screen, etc.

DFSSE Accuracy

Handheld and stationary temperature measurement instruments must meet the most recent version of the U.S. FDA Model Food Code 4-203.11 & 4-203.12. In the event that a handheld or stationary temperature device does not have a display; the operator should be able to easily demonstrate/record the reading/actual monitored temperature (value) for review and record. Follow OEM recommendations & guidelines and follow their procedures.

DFSSE Functionality

Regular and ongoing equipment and system operation functionality are recommended to be conducted (refer to manufacturer for frequency) to verify that DFSMS, DFSSE and DTME in use are operating as intended, if/when issue(s) are identified appropriate action is taken to correct issue(s).

Examples of device functionality issues are but are not limited to:

- Power loss
- Improper device installation
- Device damage/defective

- Software communication/connectivity
- Device communication/connectivity

It is recommended that records of software and equipment functionality verification be maintained and readily available.

Examples of functionality verification may include but are limited to:

- Handheld measurement device accuracy & functionality
- Stationary measurement device accuracy & functionality
- Software and device connectivity/communication

E. Data and System Infrastructure

DFSMS data are the measurement values and user inputs captured by DFSSE, DTME and DFSMS users that are then stored in DFSMS software. Data storage may be stored locally (on-site) or virtually (cloud storage) but access to this data must be readily available for use and display on-site. This makes it possible to retrace which value occurred at which time.

Examples of, but not limited to, measurement values that may be recorded and stored as data in a DFSMS:

- Time points and Account IDs which are assigned to certain quality checks
- Description of the area
- Description of the equipment
- Description of the products/product categories
- Description of the measurement locations of the equipment
- Description of suppliers
- Check lists/Quality handbook
- Tasks (Daily, Shift, On-Demand)
- Reports (Daily, Shift, On-Demand)
- Product specific quality and safety measurement data points (Temperature, pH, TPM, PPM, humidity, time)
- Alerts (alerts are notifications to users)
- Alarms (is the result of an unacceptable software or hardware reading)
- Alert recipients
- Corrective actions associated with checklists and measurement points
- Manual data entry (for immutability and data integrity)

When DFSSE, DTME or a DFSMS user completes a measurement this value is stored in DFSMS software. Each measurement value represents a unique permanent data point represented in the DFSMS software, additional or new data (including that which is associated with an existing or old data point) are then stored in a sequential manner allowing for the original data point to remain. This can be described as a time-based progression of record keeping. The DFSMS software should also be capable of recording all previously recorded data should be readily accessible and documented when changed and available for reporting.

Digital Temperature Monitoring Equipment (DTME) Data

There are three broad ways of capturing temperature and humidity data; they are commonly identified as hand-held, stationary, or Integrated temperature measuring devices. An important consideration for DTME is that devices have the ability to cache/store data locally when connectivity is interrupted, if/when data connectivity is interrupted a DTME device should have the ability to push/send cached/stored data to the DFSMS system when connectivity is restored.

Verification / Immutability

A retail food business may have measures in place to ensure that data captured by the computerized system cannot be altered without a digital signature record or other means of tracking history of inputs. If provisions are made to allow correction of data entries, the entry may identify the person making the changes, the reason for the change and reference to the originally captured data.

Data and System Integrity and Access

Data Integrity and Access are both important aspects of a DFSMS that should be considered to ensure that quality of the information collected by the system is accurate and reliable. To support the integrity of a DFSMS it is recommended that reasonable controls are in place to ensure that stored and/or in-process data is not able to be altered in an unauthorized manner, and that any changes to the DFSMS and/or the stored/in-process data is captured.

Data access is also a way to support effective data integrity. Access to a DFSMS should be controlled and limited only to those persons to whom permission is granted. All data and information should be protected through reasonable use of encryption protocols.

Examples of encryption may include, but are not limited to:

- Utilizing passwords,
- User management and,
- User rights.

Examples of information and/or data for encryption include but are not limited to:

- Passwords
- Proprietary business information
- Data transferred between the input devices and local/cloud-based reporting and storage programs/locations.
- Login occurrences
- Access to information within the DFSMS should also be tailored according to a user's role and responsibilities, writing, or reading rights.

Manual Data Entry

Determine if and how manual interventions are documented; a separate log may be kept of such interventions. The computerized system may be such that it detects, reacts to, and automatically records manual interventions. It is important that system operators are trained in manual backup systems as a best practice this should be documented and conducted prior to DFSMS usage. To ensure business continuity, it is recommended that users have their own SOP for review (redundancy) to ensure practices are being enacted.

Manual Back-Up

A manual back-up system is frequently utilized as a function of business continuity in the event of a computerized system (e.g., hardware or software) failure. Functions controlled by computerized systems may sometimes also be controlled by parallel manual backup systems. As a best practice, functions that are manually controlled and/or manually backed up should be identified and noted re: the firm’s protocols or the system’s protocol. Critical process controls are particularly important. Determine the interaction of manual and computerized controls and the degree to which manual intervention can override or defeat the computerized function. The firm's operating instructions should describe what manual overrides are allowed, who may execute them, how and under what circumstances.

F. DFSMS Outputs

System Outputs and Notification(s)

Typical DFSMS and DTMS include the capability to include user level notification(s) tailored around programmable components of an organization's Standard Operating Procedures (SOP), see What Data is Stored section above for measurement examples that may be involved.

Examples of user level system notification(s) may include but are not limited to the following:

- Reports
- Trends
- Automated emails
- SMS or text message
- Phone calls
- Visual indicators (lights)
- Audible indicators (sounds)

A best practice is to associate one or more corrective actions with an alert. To assure corrective actions are completed in a timely fashion, alerts can be escalated when corrective actions are not completed within a set timeframe.

Conference for Food Protection
2020 Issue Form

Issue: 2020 II-021

Council Recommendation:	Accepted as Submitted		Accepted as Amended	**x**	No Action		
Delegate Action:	Accepted		Rejected				

All information above the line is for conference use only.

Title:

Creation of a Digital Food Safety System Committee

Recommended Solution: The Conference recommends...:

the creation of a Digital Food Safety System Committee to complete the following charges and report its findings at the next CFP Meeting.

The Committee will be charged with:

1. Identifying best practices, existing guidance documents, and research that relate to the use of digital food safety management systems including digital temperature monitoring equipment.
2. Developing a guidance document for food establishments and regulatory authorities that establishes General Best Practice Guidelines for Digital Food Safety Management Systems including digital temperature monitoring equipment.
3. Determining appropriate methods of sharing the committee's work, including but not limited to a recommendation that a letter be sent to FDA requesting that the Food Code, Annex 4 (Management of Food Safety Practices - Achieving Active Managerial Control of Foodborne Illness Risk Factors), Annex 2 (References, Part 3-Supporting Documents) be amended by adding references to the new guidance document as well as any existing guidance documents that the committee recommends, and the posting of information on the CFP website.
4. Reporting the committee's findings and recommendations to the next Biennial Meeting of the Conference for Food Protection.

It is the policy of the Conference for Food Protection to not accept Issues that would endorse a brand name or a commercial proprietary process.

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 1
DATE: 11/16/21
TIME:11am – 12:30pm (Est)

Co-Chairs: Eric Moore & Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Eric Moore

Agenda

1. Welcome, Call to Order
2. Rollcall,
3. Conference for Food Protection, Inc. Antitrust Statement
4. Identify a Committee Scribe:
5. Review CFP Timeline for Committee Work:
6. Review of Committee Charges:
7. Overview of Committee Plan of work:
8. Action Items:
9. Determine next meeting date:

MEETING MINUTES:

1. **Meeting Called to Order:**
    - First D0K Committee meeting called to order at 11:10am,
        - Motion to begin meeting: Eric Moore
        - Motion accepted 1st Matt Brandt, 2nd Tom Woodbury
    - Committee chairs thanked all members for interest and agreement in being part of this working committee
    - Active participation in committee work was stressed given the condensed work timelines
    - Councill II Chair (Joetta Defrancesco) will be speaking to CFP leadership to get a clear understanding around the level of access for committee members to use Teams as a preferred file sharing platform. More details to be provided during the next meeting.
2. **Roll Call:**
    - Roll Call Conducted by Eric Moore
    - Roll call will be completed using Teams participant list to check for voting member quorum
    - Current voting member quorum requirement is 11 voting members
    - Attendance record captured on committee attendance log
3. **Conference for Food Protection, Inc. Antitrust Statement**
    - Full CFP Antitrust read by Ben Chapman
    - Complete antitrust statement review will be suspended for future meeting
    - Brief review of CFP-Antitrust will be completed for all future full & sub-committee meetings
4. **Identify a Committee Scribe:**
    - Lily Yang agreed to be committee scribe
    - Julian Graham agreed to be stand-by scribe to ensure continuity
5. **Review CFP Committee Work Timeline:**
    - Meeting was not recorded due to committee chairs not having Teams recording access
    - Current plan is to have full committee calls completed monthly, beginning in December

        - A straw poll about full committee monthly calls was with unanimous support.
    - Review of CFP Master Calendar identified the following key dates:
        - October 2021 – 1st Periodic report sent to Council Chair (PDF copy provided to committee)
        - March 2022 – 2nd Periodic report due to Council Chair
        - July 2022 – 3rd Periodic report due to Council Chair
        - November 2022 – Final report due to Council Chair
6. **Review of Committee Charges:**
    - Committee charges review completed
    - Committee was reminded that the charges are not able to be changed
    - Chairs provided a note of caution related to “Scope Creep” away from the charges
7. **Overview of Committee Working Plan:**
    - Full committee call all frequency to be monthly
    - 7 full committee meeting meets are going to be planned over the next 12 months
    - These meetings will act as a review/report out of sub-committee actives
        - Sub-committee meetings will occur in between these meetings
    - Meeting 0: Introductions
    - Meeting 1: Define committee focus, identify sub-committee needs, members, etc.
    - Meeting 2 & 3: Focus on work completed around charges 1 & 2
    - Meeting 4: Determine structure of documents identified in Charge 3
    - Meeting 5 & 6: Review of documents
    - Meeting 7: Review of Final Report
        - Slide deck was used to provide work plan details
        - Deck was provided to all committee members for reference
8. **Action Items**:
    - Charis to provide a voting member meeting poll to be sent out to determine most appropriate reoccurring monthly meeting dates & time
    - Committee members we requested to notify chairs of any committee conflicts that a member may have that will limit a member's active engagement.
    - Committee members were requested to:
        - Further review the committee charges
        - Think about how to define:
            - Digital Food Safety System
            - Digital Temperature Monitoring System
9. Questions – The following questions were asked by committee members:
    - Q1: How will meeting frequency be determined?
        - A1: Through voting member feedback
    - Q2: Will the use of organizational “Use-Case” documents be appropriate for use by committee?
        - A2: All documents are welcome for review and use by the committee
    - Q3: To reduce the potential for committee member work duplication around document research, will it be possible to have industry members and regulatory members focus on documents and information specific to constituency?
        - This is a great idea and will be part of further committee conversations
    - Q4: Is there a project management tool (ex-Smart Sheets) that could be used by the committee to support better transparency of work progress
        - A4: Great idea, committee chairs will look into if this is possible

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

-

10. Next Meeting Date:

- TBD after voting member poll is completed

Meeting Number: 2
DATE: February 8, 2022 **TEAMS and phone in options in calendar invite**
TIME: 10am ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Julian Graham (on behalf of Lily Yang)

Agenda

1.	Welcome, Call to Order
2.	Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
3.	Discuss Definitions
4.	Discuss documents collected by committee members (is anything missing? Next steps)
5.	Review FDA computerized document as a model for our committee guidance?
6.	Refine/add to/further outline what else would be captured
7.	Wrap-up

Link to definitions document:

Next Meeting Date: March 18, 2022 1pm ET

I. Welcome, Call to Order

Eric called meeting to order
Michael Robison call
Tom Woodburry second

II. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

Eric did roll call
Eric reviewed antitrust statement & shared link in the chat

III. Discuss Definitions

Eric shared screen
Ben lead discuss
1st charge

Digital food safety management system: A digital or electronic collection of policies, procedures, data, monitoring actions, cloud-based functionality including real-time alerting, automated reporting, and supporting documentation to support the consistent safe production, transport, preparation, storage, and service of safe wholesome food and food products intended for human consumption. .,

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Digital temperature monitoring equipment: Electronic sensors/devices capable of automatically measuring, monitoring, storing, transmitting, documenting and sharing the temperature (and potentially other characteristics) of food, air, or water. Monitoring equipment allows for the capture and storage of temperature data over a period of time and connects to a system capable of delivering alerts and exception reports.

Highlighted cloud-based functionality including real-time alerting not all system need to be cloud based some organization do not house data in the cloud.

Open Committee Discussion on Definitions:

Michael Roberson - I recommend striking "cloud based." Not all digital systems will be cloud based, especially when companies work to address data security concerns. Larger companies have their own servers and will not place all data into the cloud due to these data concerns.
Woodbury, Thomas - As a "Teams" novice... if you need to zoom in on the text displayed, hold down control/command and use your mouse wheel to scroll to zoom in/out
Rebecca Wynne - Added visibility
Angela (Guest) - Added capture/recording
Michael Roberson - I agree with Ben, as the Food Safety Management System is inclusive of all parts - policies, procedures, records, and monitoring actions. YES to recalls.
Adam Kramer - What should be the minimum requirements be.
Michael Roberson -Policies on a company intranet is one component. It may be helpful to have separate core components. Policies alone would not necessarily constitute having a digital food safety management system. Likewise, having an electronic recall system, without any policies and procedures, would not constitute having a digital food safety management system. Think "Active Managerial Control" components that are actively engaged on a regular basis.

Justin Asberry: Wanted to drop in the definition from the Food code for a FSMS:

Elements of an effective food safety management system may include the following:
• Certified food protection managers who have shown a proficiency in required information by passing a test that is part of an accredited program
• Standard operating procedures (SOPs) for performing critical operational steps in a food preparation process, such as cooling
• Recipe cards that contain the specific steps for preparing a food item and the food safety critical limits, such as final cooking temperatures, that need to be monitored and verified
• Purchase specifications
• Equipment and facility design and maintenance
• Monitoring procedures
• Record keeping
• Employee health policy for restricting or excluding ill employees
• Manager and employee training
• On-going quality control and assurance
• Specific goal-oriented plans, like Risk Control Plans (RCPs), that outline procedures for controlling foodborne illness risk factors.

Conesus on removing Animal Foods

Angela - Is “auditable” a sufficient replacement for “legally defensible”

Edsall, Jean V - There are existing legal precedents regarding recordkeeping systems. This may already expand to digital recordkeeping systems.

Travis Splawn - Agree with others. Not sure if "Legally defensible" is the best language, or used elsewhere.

Asberry, Justin - Let me ponder on that legally defensible question.

Travis Splawn - Perhap use something like "has an audit tracking feature"?

Asberry, Justin (Guest) - I will consult with FDA-CFSAN as well to give a Food Code Interpretation on the legal defensible conversation.

Moved on to 2nd Definition:

Digital temperature monitoring equipment: Electronic sensors/devices capable of automatically measuring, monitoring, storing, transmitting, documenting and sharing the temperature (and potentially other characteristics) of food, air, or water. Monitoring equipment allows for the capture and storage of temperature data over a period of time and connects to a system capable of delivering alerts and exception reports.

Engaging conversation on both definitions. Ben & Eric will share final definition to all members for Reminder to review documents between meetings.
Motion to adjourn

Thomas Woodbury - Strike other characteristics

Comments collected by committee members (is anything missing? Next steps)

IV. Review FDA computerized document as a model for our committee guidance?

V. Refine/add to/further outline what else would be captured

VI. Wrap-up

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 3
DATE: March 18, 2022 **TEAMS and phone in options in calendar invite**
TIME: 1pm ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Lily Yang

Agenda

8.	Welcome, Call to Order
9.	Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
10.	Past meeting minutes
11.	Voting member Definitions Poll Results Review
12.	Discuss FDA computerized document as a model for our committee guidance?
13.	Wrap-up

Link to definitions document:
https://docs.google.com/document/d/1uUsCjqeYG65sSG3oTYy738I7QG9JJhpSq70KY_kR3Wk/edit
Link to Google Drive for resources
https://drive.google.com/drive/u/0/folders/1jcAkf4fypF1pxEsiOUwYcW3FgV0sdIZg
Next Meeting Date: April 29, 2022 1pm ET

VII. Welcome, Roll Call

- Eric conducted roll call!

VIII. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

- Ascertained that all individuals are comfortable of Antitrust. If anyone is uncomfortable with it, please do let Eric Moore know.

IX. Welcome, Call to Order

- Amanda Douglass approved meeting to be in order
- Julian Graham seconds
- Chirag – we may not need to do this next time as other CFP committees are *not* doing this.
- Eric – this meeting is being recorded; if anyone has questions around this, can discuss OFFLINE
    - Ben is currently unable to join today and sends his regards

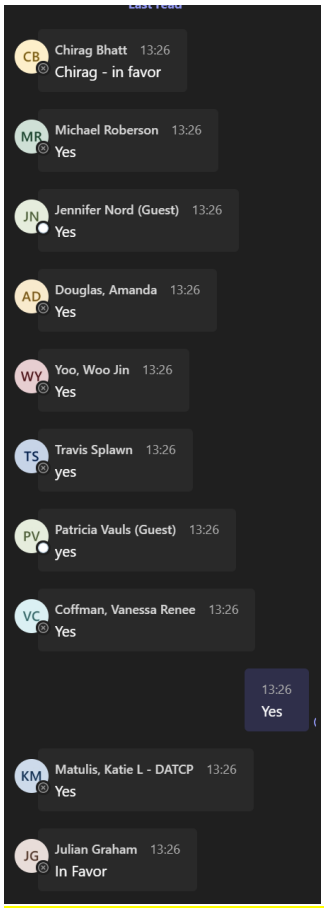
X. Last Meeting Recap

- Good discussion around the definitions that were shared with everyone for feedback. There was a lot of good discussion and Julian captured the comments accordingly.
- In the last meeting, committee discussed both definitions that were identified that were part of Charge 1
- First Definition for Digital Food Safety Management System
- Second Definition for Digital Temperature Monitoring Equipment
- With some post-editing per discussion with Eric/Ben, definitions were put into a place that everyone could be comfortable with. Yesterday, voting members completed a poll (agreement/disagreement) with the definitions that were made.
    - Consensus of vote:

    - Yes: Voting members of the committee agree with the definitions.
- (see “Discuss Definitions”)

XI. Discuss Definitions

- Eric – extends appreciation for Michael Roberson (email to Ben and Eric) stating that in a few areas, the definition used the word “must” as opposed to using another type of word. The intent, originally, was not to make rigid definitions
    - Perhaps the reason why one member voted “NO” may be due to the word “must”
    - Question for Voting Members: Do voting members feel that it would appropriate for an additional revision to the two definitions to edit the words that are very constrictive (i.e. ‘must’) and replacing with lighter words (i.e. ‘shall’) OR are voting members in agreement (now) with minor editorial revisions?
    - Michael Roberson –
        - “words matter” especially once issues and recommendations get to the Council.
        - For Council – often comes down to the wording
        - Is good with the content but did want to bring to the Committee’s attention of “the use of extremes; when we can provide flexibility, it helps”.
    - Eric – agrees with Michael – there shouldn’t be an issue with removing “most” and replacing with “shall”
- Michael Roberson, brings motion to floor: “To allow Chair and Vice-Chair Editorial Positions to address some of the words like “must” to make amendments to provide flexibility” for the two definitions.
    - Jennifer Nord seconds that motion
    - Jean (in comments)
    - Chirag: I agree with what Michael says. In order to avoid the lengthy discussion and Council discussion, it is probably in our best interest to change that word. And as we al know, Michael has been in CFP for a long time”
    - Robert Sudler: “To add to what Chirag and Michael have said. As I look at the definition themselves, the word ‘shall’ does really make a difference. We don’t want to regulate through definition”.
- Eric: “Let’s call the vote for the motion that has been provided” – votes are done via “text” in text window (see figure below).



- **Conclusion of Vote: There is voting member quorum to allow Chair and Vice-Chair editorial lee-way to replace terms like "must" with terms like "shall"**

XII. Review FDA computerized document as a model for our committee guidance?

- Is any of what is currently there usable? Any section? Content? Let's have a discussion around "that" [usability] and begin to identify – as in Charge 2 of Committee Charges – create guidance document around best practices specific to:
  - Use of Systems,
  - What these systems are (or aren't), and
  - How Regulatory Bodies can Assess Validity (including: if current system in place is viable or not)
- We all agree that a digital FSMS is *not* a PDF on a mobile device; it's more than that. Hence why we created the aforementioned two definitions.
- FDA's "Computers Systems in the Food Processing Industry" (link)
  - One of the questions – was anybody aware of the existence of this document?
    - Is it appropriate for the Committee to recommend, back to FDA, to make revisions to the existing document in relation to what our goals are OR

        - Is it better for the Committee to use it as a starting point for what we've been charged w/ creating and submitting *the created* at Biennium.
    - Michael Roberson – I don't recommend editing existing regulatory documents. Better to stick to what Council charge is. Use doc as a starting point.
    - Robert Sudler – agrees with Michael. He recently reviewed the article and noted it was updated last in 2014. Although it was created by ORA but also CFSAN. Justin (ORA) and him (CFSAN) will do their due diligence to identify if there is an update flying around.
        - This should be used as a starting point – needs to be tailored to what *we* want to focus on. There's a lot, he believes, of work that needs to be done.
    - Eric – Just to be clear, if Committee identifies portions/components of this document, are we (we are) allowed to choose portions of the verbiage, right? Since this is public domain documentation; want to ensure there is no potential issues with.
        - Robert Sudler – "It's a public facing document that's out there for people to use. Certainly nothing wrong with what you've described. No, no problem"

XIII. Discussion Time re: above

- Eric – for those that were able to go through this (he read it 4X):
    - What did you like?
    - What did you *not* like?
    - Is the format of this, appropriate? Format being – how the TOC is laid out ← is this format what we, as a committee, think will be appropriate for us to develop for the two documents to be created as part of the Charge? OR do we need to blow the format up and think of something new and different?
- LY: Wanted to better understand, are you referring to Chapter?
    - Eric: Right, this is the question – do we want it to mirror like that? "This has a very federal feel to it. Is that format appropriate for what we want to produce? OR does anybody have any suggestions for a different format that would be user-friendly for industry and/or regulatory individuals"
    - Robert Sudler - "is your attempt to modify or create a similar document that's geared towards the retail sector? Is that the eventual goal –that is able to cite Food Code provisions?"
        - Eric: In essence, yes. To replace wording. But we all know that isn't a possibility Leading to the next question – what portions of this document do Committee members are appropriate for Use or Adaptation for what *we* want to create?
            - Ask the latter question first.
            - Response for above re: formatting (LY) – it needs to be revised b/c it's not really useable
- Eric – Table formatting, let's focus on CONTENT
- Current Document - https://www.fda.gov/inspections-compliance-enforcement-and-criminal-investigations/inspection-guides/computerized-systems-food-processing-industry
    - Provided segregation of topics based on HARDWARE, SOFTWARE, PROCESS, PERSONNEL
        - Do we want to copy these topics over? Or do we want to reorganize parts of it?
        - Does there need to be sections of "Technology Overview" and such sections?
    - Julian – does not believe that this is the best approach to reading the document.
        - Explore from the Different Buckets. Thinking about a "DFSMS", there's some autonomous measurements that happen (e.g. IoT systems, people-driven

systems wherein handheld BT probes may be used, to digital version of checklists) – Using those three buckets

- Eric: What do people feel like? Hypothetically (below list) are the core sections of the document that we will create which mirror **Chapter 2** of document.
    - Overview
    - Hardware/peripherals
    - Software
    - Data storage and access/sharing
    - Maintenance and calibration
    - User/training/knowledge
- Chapter 2 seemed to have the most useful information to both BC & EM to move the project forward
    - Are there any buckets missing, from above? Or are any of them subsets of one/other?
- Jean Edsall
    - Has paged through document and while it has good definitions and descriptions of hardware and software and with rapid changing of technology (and the out-dated ness of this – what we write must be more generic and not as specific).
    - On proposed topic – there needs to be a MANAGER's piece of it for discussion management systems.
        - What's the manager's role and responsibilities
        - Who is responsible for it?
    - Eric: So looking at "User/training/knowledge" ← let's consider revising *this* title to have discussion
        - Adding "manager role and responsibilities" underneath
    - Jean: What are acceptable substitutions? How do you prove to regulatory? And how does regulatory utilize this document to assess that things are done right
        - What is industry moving towards?
        - What is regulatory going to use to assess the systems.
    - Eric – do you think that the above are subsets or a new section?
        - Jean – we need more feedback
- Eric:
    - While this document is outdated, a lot of the information within the current FDA document is not applicable to what is being created.
    - Example: should we include "inspection concepts" as part of that list?
    - Robert Sudler: Something to consider – if you're making a guidance document, one thing to focus on should be…if someone was reading the Food Code, what is missing and what doesn't currently fall in the Food Code.
        - When it comes to the Food Code, what is currently falling short & it should be addressed in the guidance document.
        - Ultimately this document should be able to assist with what may be missing and address potential gaps.
- Jin Woo Yoo –
    - It wouldn't hurt to add regulatory compliance section. Under the regulatory compliance section, we can add the details of the regulation that we can provide to regulator. It can act as a good chain-of-custody & be able to provide guidance for what to provide to regulators.

    - Jennifer Nord: To add to that, we not only need to think about regulators, but also how industry will be using/doing with this guidance.
- *Current updated List* @ 13:54 ET
    - Overview
    - Hardware/peripherals
    - Software
    - Data storage and access/sharing
    - Maintenance and calibration
    - User/training/knowledge
        - Manager role and responsibilities (person in charge – FC)
    - Regulatory Compliance
        - From Katie Matlulis - we could make a regulatory compliance checklist with the main points from the guidance document (more of a cheat sheet)
        -
- Justin Asberry (w/ FDA)
    - "How would the two definitions from last call fit into this document? In the beginning? In the definition?"
    - Eric: Yes. Ben and I chat that while we were creating the list above, we do all need to ensure that these definitions also cover the overlapping document itself
        - Yes, a definition aspect needs to be included for sure
- Katie Matulis DATCP (in chat):
    - A suggestion, we could make a regulatory compliance checklist with the main points from the guidance document (more of a cheat sheet)
    - Eric: great idea!
- Looking at the other sections of *List* – any opinions, perspective, recommendations for what would fall within each of the *Sections* – portions of this existing FDA document could begin to incorporated if Committee would like to do that!
    - Eric: We need to conceptually and mentally aware that we will be creating two different documents. The definition exercise was the generator for the document(s) that we would need to create. Each of the lists – one for DFSMS & another for Best Practice for digital temperature monitoring equipment – would be addressed.
        - Moving into a final place (from editing & finalizing perspective), can probably blend the two; however, for right now's ease of workstream, if Committee agrees that it may make the most sense to split into two subgroups to focus on each of the areas separately with the intent that it'll become a whole overarching document.
    - Amanda Douglas – Agrees, there should be two
    - Eric: While there may be some redundancy, needs to be considered separately.
        - We need to be aware of the usability & real-world application that companies are in.
        - Not everyone is going to need to use both at the same time.
        - Sounds like two working committees will be what makes sense!
        - Should we make motions to start the two subcommittees?
- Amanda brings a motion that we start the process to split into two subcommittees to work within the second Charge
    - Julian Graham – seconds.
    - Voting members vote through chat window

    -
    - Matt Brandt = Yes
    - Travis Splawn = Yes
  - **Voting members have approved the creation of two subcommittees to begin to work on addressing Charge #2**
- Establishing Members of Those Committees:
  - Option 1 – Provide polls to
    - 1) voting members – needs continuity between both subcommittees & voting member quorum – once established
    - 2) At-Large Members – poll will also be out there to identify which workstream to be involved with
  - Does anyone have other suggestions?
    - “Silence means acceptance” - Eric
    - Julian & Amanda & Lily think above option are great!

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

XIV. Refine/add to/further outline what else would be captured

- Committee meeting got through what Eric & Ben wanted to discuss
- OR do we want to discuss FDA documents that the Committee agrees for what the two subcommittees will be allowed to moving in it.
- We will need to start working on this expeditiously! – "Thanks, COVID"
- Julian – can we discuss the Timeline for the Subcommittees? What's our expectation for time, etc.?
    - Eric: Hope to get the poll out early next week (Week of March 21) for Voting Members – complete this ASAP – executed by end of next week (Week of March 21).
        - Secondary poll can be finalized by end of March 2022.
    - On next call, can identify:
        - Subcommittee completion times
        - Subcommittee reporting to the larger Committee
    - Subcommittees:
        - Will need to work independently of each other
        - However, must provide monthly progress updates.
- Which voting members would like to be Chairs of Subcommittees?
- Courtney (on phone) –
    - When you send out the poll, also let people vote who wants to self-nominate
    - Also believes it's a good idea for people to read the FDA document to figure out pieces.
    - With poll, remind people on what the Charge is and what needs to happen (since this is both for industry & regulatory – needs to be general so it's not just "old technology")
        - Will be useful to have experts lean on the sections
        - For those not as focused in this, let them ask the questions
    - Email from Joetta – deadline reminder progress report by 25th of March
        - Please be comfortable with where things are before sending in.
        - Eric – will have this part completed before next Wednesday (3/23)
- Katie Matulis (in chat) –
    - It may be useful to open up the FDA document for comments on the shared teams page/google documents/
        - Julian will convert the PDF doc to a Google Doc to allow for comments!
- Eric:
    - If you don't get the FDA podcast alerts that are coming out, there is going to be a new podcast that the FDA is pushing out that has absolute relevance to what we listen to.
    - Podcast Link (release on March 21): https://www.fda.gov/food/cfsan-constituent-updates/fdas-third-techtalk-podcast-will-be-artificial-intelligence

XV. Wrap-up

- Able to get 12 minutes back! 😊
- We will talk in a few weeks – keep an eye out for the polls!
- **Next meeting – April 29, 2022 from 1PM – 2:30PM ET**

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 4
DATE: April 29, 2022 **TEAMS and phone in options in calendar invite**
TIME: 1pm ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Lily Yang

Agenda

14. Welcome, Call to Order
15. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
16. Past meeting minutes review
17. Sign-Up Reminders: a. Sub-Groups b. Future meeting dates/times
18. CFP Executive Meeting Overview
19. CFP Support of Future (2025) Committee Activities
20. Wrap-up

Link to definitions document:
https://docs.google.com/document/d/1uUsCjqeYG65sSG3oTYy738I7QG9JJhpSq70KY_kR3Wk/edit
Link to Google Drive for resources
https://drive.google.com/drive/u/0/folders/1jcAkf4fypF1pxEsiOUwYcW3FgV0sdIZg
Next Meeting Date: TBD

XVI. Welcome, Roll Call

- Justin Asberry does not always receive the things they are hoping to receive (from either Ben or Eric) – Ben uses the Calendar invite for meetings (that might be the meeting and not having that).
- Completed w/ Quoroum

XVII. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

XVIII. Welcome, Call to Order

- Don't need to be following protocols for Robert's Rules
- Antitrust statement by Eric

XIX. Last Meeting Recap

- If anyone has specific questions as it relates to the last meeting, raise them NOW or email Ben and/or Eric

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

- Access last meeting notes here: https://drive.google.com/drive/u/0/folders/1F7XyuNLXR5s8AepF7BjgQvQkaYblPGuz Committee documents - Google Drive

XX. Sign-up Reminders

XXI. Sub-Committee

- **Please complete by next Tuesday**
- Question: Can you see on the back end which committee we picked?
    - YES. Your email is logged
- Link: https://docs.google.com/forms/d/e/1FAIpQLSdgA5Qssxbwd0a9lCKRxs6Rx8JCfQWSvZCvz08lalAxm2utYw/viewform?usp=sf_link

XXII. Future Meetings

- **Please complete ASAP.**
- Want to get a few more, in the books
- Meeting 4 (May) - http://whenisgood.net/89m3de8
- Meeting 5 (June) - http://whenisgood.net/hrff9hx

XXIII. CFP Executive Meeting Overview

XXIV. Wendy Bell (Council 2)–

- The former Council II chair is no longer in the regulatory role.
- Courtney Halbrook (vice-chair) has stepped into Council 2 chair position
- Wendy Bell has been brought on as the new Vice-Chair for Council 2

XXV. Overview of Executive Board Meeting

- Our committee came up in a number of discussions – focusing around publications, sharing, what to do with "best practices" guides going forward
- There is a plan to release the next iteration of the Food Code in 2022
    - As we think about our recs for the 2023 bi-annual, there is a goal by FDA (supplements, not full updates) – so if there are things we'd like to recommend Food Code related, there is a potential that is on a quick turn-around
- There is a Publications Commtitee for CFP looking at the best way to distribute information to stakeholders from what comes out of conference
- Potential that CFP website will be updated

XXVI. CFP Support of Future (2025) Committee Activities

- CFP is currently in the process of applying to different funding sources to supprot a vaariety of activities
- Group who was responsible for this had reached out to inquire if there were any potential needs for funds
- We can decide/discuss what the system/interface should be for (a) temperature recording; (b) digital management systems

  - We won't be able to get to: Implementation & Barriers around these systems
    - As there is exploration for grants – do we want to get public health grants or interns that could do some exploration/research into what is available for mid- and small businesses
    - Explore barriers to implementation?
- Put together some proposals that when/if this committee is reofrmed, we can put those into the charges
  - There is a high likelihood that this committee will be reformed
- CFP has been working with NEHA and others to bolster the ability to do inside-the-organization-help-for-resaerch-committees
- Julian: How would the money be used? What are some of the ideas, when we are out there, to do X? What is X?
  - Ben: When supporting a change in implementation – what are some problems people may have achieving best practices? Is it time, resources, lack of understanding and knowledge? Funds can provide starting point to fill gaps. As we're writing the best practices documents, we are making a bunch of assumptions.
  - This might allow us to park some of the assumptions and learn, somehow – through interviews or focus groups or visits or surveys – what the reality is across the industry (as opposed to speculation).
  - Likewise, could be working across the regulatory world about implementation.
  - Or utilization of resources (either Intern, or Consultant, or Contract) who can answer the questions about the implementation of the best practices
  - Often there are gaps that are filled by people outside of this process that committees use to move forward; but, maybe there are ways for CFP to support next steps for this committee
  - Eric – right out of the gate for this undertaking, it's working with FDA to CFP – we are the "guinnea pigs"
- Once we get an adequate number of voting members divided between the two subgroups, Ben and Eric will start the process by providing each committee with a general template that will be loosely framed and based to incorporate some components of the FDA document that was previously discussed to place comments within (via G-Drive)
  - **Please provide comments on the Google Document – re: Guide to Inspections of Computerized Systems**
  - **https://docs.google.com/document/d/1OlanY6xpA1WzLEo0eNsNR5hmQByuiaIN/edit**

XXVII. Wrap-up

- **Next meeting – TBD**

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 5
DATE: May 23, 2022 **TEAMS and phone in options in calendar invite**
TIME: 2pm ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Julian Graham

Agenda

1.	Welcome, Call to Order
2.	Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
3.	Past meeting minutes review
4.	Review of revised definitions
5.	Introduce sub-committee leads
6.	Sub-Group: a. Introduce leads b. Review charges c. Discuss meeting frequency
7.	Wrap-up

Link to definitions document:
https://docs.google.com/document/d/1uUsCjqeYG65sSG3oTYy738I7QG9JJhpSq70KY_kR3Wk/edit

Next Meeting Date: TBD

XXVIII. Welcome, Roll Call

- Some Members At Large & Voting are traveling
- Completed w/ Quoroum

XXIX. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

XXX. Welcome, Call to Order

- Don't need to be following protocols for Robert's Rules
- Antitrust statement by Ben

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

XXXI. Last Meeting Recap

- If anyone has specific questions as it relates to the last meeting, raise them NOW or email Ben and/or Eric
- Access last meeting notes here: https://drive.google.com/drive/u/0/folders/1F7XyuNLXR5s8AepF7BjgQvQkaYblPGuz Committee documents - Google Drive

XXXII. Review of revised definitions

No Comments on latest revision
https://docs.google.com/document/d/1uUsCjqeYG65sSG3oTYy738I7QG9JJhpSq70KY_kR3Wk/edit

Digital food safety management system (DFSMS): An interactive, digital or electronic archive intended to collect, store, and analyze data that supports a food safety management system. A DFSMS is intended to enable a proactive approach to support the consistent safe production, transport, preparation, storage, and service of safe wholesome food as defined in the FDA model food code. A DFSMS employs active user-based work-flows that support decision making, report generation (including trends over time) that can be reviewed and acted upon, and may be housed locally (on-premise) or be accessed remotely.

DFSMS should include but not limited to may havemust have functionality that allows a user to:

- capture, record, and store multiple types of data
- provide real-time feedback to users
- generate record keeping reports, for exampleand trends over times

Other components, tools, and records within a DFSMS may include:

- specific policies, procedures, recipe cards, and critical limit monitoring actions and corrective actions including training tools
- risk control plans
- product storage/movement information and inventory supporting recalls and market withdrawals
- equipment maintenance documentation
- active alerting
- networked and/or IOT devices

Digital temperature monitoring equipment: Automated temperature measuring device(s) that shouldmust include electronic sensors capable of generating and capturing temperature data for analytical use. This equipment may include the functionality of automatically measuring, monitoring, storing, transmitting, documenting, and sharing the temperature of food, air, or water. Monitoring equipment that captures and stores temperature data over a period of time may connect to a system that may be capable of delivering alerts and exception reports.

michael.roberson@publix.com
RWynne@darden.com

XXXV.

XXXVI. Charge

Developing a guidance document for food establishments and regulatory authorities that establishes General Best Practice Guidelines for systems based on our consensus definitions.

XXXVII. Equipment

Julian.Graham@sodexo.com (co-lead)
jaime.estes@albertsons.com (co-lead)
wmelichar@feedingamerica.org
Amanda.douglas@wawa.com
traviss@health.ok.gov
matthew.brandt@state.co.us
ECiarimboli@hy-vee.com

XXXVIII. Charge

Developing a guidance document for food establishments and regulatory authorities that establishes General Best Practice Guidelines for digital temperature monitoring equipment on our consensus definitions.

XXXIX. Format

Using existing FDA Document as scaffolding and bullet points/outline of best/good practices.

XL. General Discussion

- Ben and Eric will lead expectation meeting with Co Leads
- Co Leads will identify scheduling with the group
- Ben and Eric will share meeting invites with the entire committee, everyone is welcome to drop in.
- Edsall, Jean V

  how would you like non-voting members to join the sub-committees?

You may join either group as a non-voting member. Please email Ben if you have strong preference on subcommittee.

XLI. Wrap-up

- **Next meeting – TBD**

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 6
DATE: September 7, 2022 **TEAMS and phone in options in calendar invite**
TIME: 2PM ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Lily Yang

Agenda

UPDATED Agenda:

8. Welcome, Call to Order
9. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
10. Past meeting minutes review
11. CFP Reporting Deadline Review
12. Sub-Committee Progress Report Out: a. Digital Food Safety Management System i. Q&A b. Digital Temperature Monitoring Systems i. Q& A
13. General Q&A
14. CFP & NACCHO Research Grant Overview
15. Wrap-up

Link to definitions document:
https://docs.google.com/document/d/1uUsCjqeYG65sSG3oTYy738I7QG9JJhpSq70KY_kR3Wk/edit
Link to Google Drive for resources
https://drive.google.com/drive/u/0/folders/1jcAkf4fypF1pxEsiOUwYcW3FgV0sdIZg
Next Meeting Date: TBD

XLII. Welcome, Roll Call

- Do not have Voting Member Quorum
- Will continue to have the meeting
- Eric will run through Voting Member Names quickly that isn't marked off.
- Agenda
- Need to change certain individuals for names and positions (USDA v CDC)

XLIII. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

- Operating under CFP Anti-Trust operations – no talk about pricing & customers and all that goodness.

XLIV. Past Meeting Minutes Review

- Reviewed. Need to change a date

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

XLV. CFP Reporting Deadline Review

- Periodic review for Fall Meeting must happen by end of tomorrow (9/8/2022) because that document is due to CFP Executive Director by October 13, 2022 in preparation for OCT 5 & 6th Grand Rapids MI Board Meeting
- Coming up on due-dates very very quickly!
- Issues open December 19, 2022 (for 30 days)
- April 23 – 28 – Biannual Meeting

XLVI. Subcommittee Progress Report Out

- Digital Temperature Monitoring
    - They have mostly completed
    - They will have a cleaner version of the document by next week for everyone to review
    - Do you feel that subcommittee member engagement is adequately supporting the process as things are progressing?
        - Yes.
    - Do you think things are achievable within 4 – 5 weeks.
        - Yes. Taking a "simple" approach. Should get a version of that quickly
- Digital Food Safety Management
    - Taking each section and wordsmithing and eliminating verbiage and writing comments. As a group we have regular communication between the two sub-committee chairs and within group for providing comments
    - More than halfway through the document and at a good pace to complete in 5 weeks.
    - Handheld and stationary device*

XLVII. General Q&A

- Question from David & Brenda Bacon – to clarify – DFSM is editing the FDA Guidance Document that the edits are being made to?
    - Yes. Both Committees are using the original document from FDA 2001
- David Lawrence: for follow up to Eric – this subcommittee work will be two separate documents?
    - Yes. At this time, we don't have a voting member quorum, but we could have asked the committee (today) to vote whether or not there would be value in two independent documents (one on software component and other on hardware technology component) OR if it would be better to bring them back together into one final product. But since we can't vote today; we are mentioning this as something for Committee to think on and consider.
- Doing a Straw-Poll or Any Comments on the above?
    - Thomas Woodbury – generally deployment should be together for both aspects, he would vote to do a combined document
- 09/09/22 AMMENDED NOTES:

- During the call I mentioned that a vote may need to be conducted to determine if the documents our 2 subcommittees are working on should be combined into a single document or left as two standalone documents. I apologize but was not correct and a vote will not be required to combine the two documents into a single document. According to our second committee charge (see below or attached) our committee is charged with creating a single document, not multiple. Sorry for any confusion this may have created.
  - *DFSMS Charge 2) Developing a guidance document for food establishments and regulatory authorities that establishes General Best Practice Guidelines for Digital Food Safety Management Systems including digital temperature monitoring equipment.*

XLVIII. CFP & NACCHO RESEARCH GRANT REVIEW

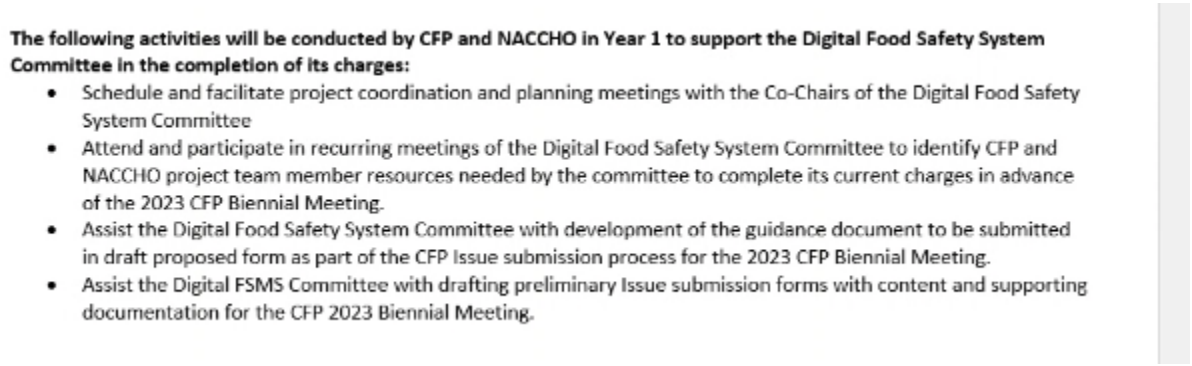
New Update: Retail Food Regulatory Association Collaborative (www.retailfoodsafetycollaborative.org) -- discussion the CFP & NACCHO research grant that has been awarded related to research incorporating what is being done in this Committee work (2 parts)

- Brenda and David want to thank everyone (including Ben & Eric) for being on this call.

- Regarding this Collaborative – long term objectives and priorities for the collaborative (multiple partners). There are ways to create grant funding.

  - If you don't know about the Collaborative already, there are many resources from Cycle 1, etc. FDA/CDC/etc that is maintained by NEHA) in the website.
  - Love the opportunity to market the Collaborative and what it's doing
  - The FDA funding has provided much needed support to complete Objectives
- There are two grant cycles for funding.
- Year 1 of Grant Cycle 2 = started August 1st – Year 1 is guaranteed funding for research funding strategy.
  - Works supporting Specific Aim #5 – 4 Objectives
    - Brenda & David working on this work
    - Angie Wheeler & Dr. McSwaine work together in a research team
- Provide assistance for grant funding and ability to leverage resources beyond CFP (like from NACCHO) to support charges of committees – including this one!
- As we are forming issues, if we want to continue this committee, what additional continuation would we have? What would we add to these charges?

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets



The following activities will be conducted by CFP and NACCHO in Year 1 to support the Digital Food Safety System Committee in the completion of its charges:

- Schedule and facilitate project coordination and planning meetings with the Co-Chairs of the Digital Food Safety System Committee
- Attend and participate in recurring meetings of the Digital Food Safety System Committee to identify CFP and NACCHO project team member resources needed by the committee to complete its current charges in advance of the 2023 CFP Biennial Meeting.
- Assist the Digital Food Safety System Committee with development of the guidance document to be submitted in draft proposed form as part of the CFP Issue submission process for the 2023 CFP Biennial Meeting.
- Assist the Digital FSMS Committee with drafting preliminary Issue submission forms with content and supporting documentation for the CFP 2023 Biennial Meeting.

-
    - The first bullet is already being worked on
    - The second bullet is happening today.
- There are changes that might happen to this guidance document but timeframe that occurs after the Biannual meeting to get ready for publication/posting, that's what we've asked NACCHO help us with to help achieve final publication standpoint.
- Brenda:
    - David and her are not part of the committee; they are here to help support the committee as it runs parallel to our committee. Don't want to be disruptive to our committee work – want to be supportive and assist as much as we'd like in being prepared for the biannual in 2023.
- Eric – Due to this condensed timeline, your support will be invaluable. Supportive of all the cooks in the kitchen.

Get on track for where things are going with the workstreams. Get on the subcommittee documents and provide documents.

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 7
DATE: October 07, 2022 **TEAMS and phone in options in calendar invite**
TIME: 4 PM ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Lily Yang

Agenda

Agenda:

16. Welcome, Call to Order
17. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
18. Past meeting minutes review
19. CFP Reporting Deadline Review
20. Sub-Committee Progress Report Out: a. Digital Food Safety Management System i. Q&A b. Digital Temperature Monitoring Systems i. Q& A
21. General Q&A
22. Wrap-up

XLIX. Welcome, Roll Call

- Do not have Voting Member Quorum
- Status update

L. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

- http://www.foodprotect.org/administration/policies/antitrust-policy/

LI. Past Meeting Minutes Review

- Reviewed. Need to change a date

LII. CFP Reporting Deadline Review

- Moving things forward on the Best Practices Update
- Committee Update for Timeline (Now and when Report is Due on November 18)
- Engagement from the Entire Committee

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

LIII. Subcommittee Progress Report Out

- Current Version of Combined Best Practices Document Link: https://docs.google.com/document/d/1ICYp069DJSqQOJKezzlbjfp2gmBj7zDLLpiu8Qc00wM/edit
- Opening up **TWO WEEK REVIEW TIME (October 21st) FOR ADDITIONAL COMMENTS/SUGGESTIONS/EDITS** to Best Practices Document Draft (above)
    - Document is ~8 pages of content – digital food safety systems & digital monitoring equipment
    - Identifying best practices per charge
    - Ben and Eric feel that this is practical; however, utilize next two weeks for feedback and discussion on holes/gaps in document that need to be included (or cut)
- After October 21st, David Lawrence and Brenda will work as part of the Retail Food Safety Collaborative to support with writing
- **By October 31st, want it to be ready for voting by the entire committee.**
- **Proposition for vote on November 2nd (as next planned meeting)**

- Review by David Lawrence – to review content as the whole committee has done and to provide editorial revisions – no intent to change content/information included

- Ben: Is two weeks enough time to review and provide additional feedback?
    - Jenn Nord – two weeks is perfect. Anymore time, it'll slip away from people
- David Lawrence – End of Business (Oct 21) is end of the review/comment period. Afterwards, is that when things will be cleaned up and ready for vote?
- Lily:
    - Shout-out to DFSM Sub-committee, you know who you are
    - If you, as a reader, are confused by any of the "techy" terms, please let us know. Part of the document is supposed to allow for tech people to ultimately understand the food safety of things. If things aren't understandable (especially as it comes to the food safety management system aspect), please comment and we'll address
- Julian:
    - Shout-out to Temperature Sub-Committee, you know you are
    - The section on "Guidance to Inspector" – decided that this part shouldn't be in this document and/or that it is necessary to complete this document.
        - Bringing up to the group at large to have this discussion.
- Ben: next agenda item was to tackle the "Do we need guidance for inspector"? – is this what we should talk about now or discuss in G-Document?
    - This document is an adaptation of existing FDA document on Digital Systems (aimed at processors – and in that document, there was a section on what inspector should know).
    - Need consensus on this

  - David Lawrence (CFRP): I am aware that the Program Standards Committee is looking at adding a food safety management system perspective to the plan review process conducted by regulators
    - Has been brought to the Program Standards Committee and sees that there is in-tandem as collaborative focus
- Any specific thoughts for the regulators? >> No response
- Does anyone feel strongly that it should (or shouldn't) be included in best practices document?
  - Julian: Subcommittee looked at hardware components of the digital food safety management system, and decided that it would be very hard to evaluate a data logger that didn't have a screen (and the efficacy of it working) other than "looking" at it. The hardware components that make up the food system are so different
    - Also included OEM as a means of capturing that data? Because some municipalities would find it different or difficult.
      If we do it, would be hard.
  - David: I'm thinking for the regulatory assessment of digital systems that might be used for specialized food processes like ROP
- Ben/Eric – Feel we are in a good spot to meet our charge and meet the charge on-time.

LIV. General Q&A

- Question from David Lawrence (CFP) on chat:

[16:09] David Lawrence, CFP (Guest)

- Ben & Eric, I would like to have the CFP Collaborative grant team take a look at this for feedback and comment if that is okay with the committee.
- Courtney Halbrook – did you propose of where the document will be posted?
  - Will be part of the November 2nd meeting
- David Lawrence: Are we trying to ensure that tech people can understand food safety?
  - Lily: Yes, because ultimately those will be the people to "put those things into place" and still have the food safety people (validation, verification, etc.) understand as a mainstay.
  - Ben: Yes, we are trying to bridge the gap of the people who are managing the DFSMS & those that'll be doing the IT behind that. That pathway between those two – so it's not just about, "this is what's important from food safety" but also incorporating the knowledge for the people who will be incorporating the systems from behind-the-scenes.
  - David – Definitely want to know that there is someone in the background who is managing the system/IT. Don't have to go looking for it.
- Courtney Halbrook - how do you want to collect that feedback in the document?
  - Ben: Yes. Everything that goes into the document, at this time, will be "comments and suggestions" – however you feel comfortable.
- Eric – if any individual will suggest a deletion or removal of sentences/sections; instead of just suggesting "Delete", please provide some comments/perspectives as to "why you don't feel this is appropriate and/or could be placed somewhere else"

- Chirag – The document is very comprehensive. Do you want everyone to do grammatical suggestions?
- Very close to being done! Just a little bit more work and we'll seal the deal – there have been no big Kerfuffle!!!

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 8
DATE: November 2, 2022 **TEAMS and phone in options in calendar invite**
TIME: 2 PM ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler
USDA Advisor: N/A
CDC Advisor: Adam Kramer
Scribe: Eric Moore

Agenda

Agenda:

23. Welcome, Call to Order
24. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
25. Past meeting minutes review
26. Review & Discuss Outstanding Document Questions
27. Issues Overview: a. Issues to submit i. Final report, supporting docs and member recognition ii. Approval and posting of draft guidance on CFP website iii. TBD – committee reformation as a sub-committee of the larger FSMS standing committee b. Proposed Issue(s) i. Combine DFSMS Committee with FSMS Committee ii. Create new FSMS Standing Committee
28. Next Steps: a. Volunteers for writing Issues b. E-vote on final document c. Create Final Report
29. Key Dates: a. 11/18/22 – Draft Final reports due to Council Chair b. 12/2/22 – Revised Final Reports due to Council Chairs c. 12/19/22 – 01/22/23 Issue Submission

LV. Welcome, Roll Call

- Do not have Voting Member Quorum

LVI. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

- http://www.foodprotect.org/administration/policies/antitrust-policy/

LVII. Past Meeting Minutes Review

- Reviewed, no changes

Review & Discuss Outstanding Document Questions

- Process started to review the editorial revisions completed by Committee Chairs (Eric & Ben), each paragraph was provided to members to view on screen for comment.

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

- Introduction & Scope comment(S):
    - Robert Sudler - Hyper link to FDA Retail Risk Factor Study Homepage provided in chat
    - David Lawrence – Does the most recent risk factor study highlight Digital FSMS?
        - Robert Sudler – It does not mention Digital no edits required
    - Adam Kramer – Would the Annex 4 number change with a new version of the food code?
        - Robert Sudler – Annex number would not change with a new food code version of the food code
- Definitions Comment(s):
    - David Lawrence – It's likely that FDA will release 2022 FDA Food Code by years end and suggested removing 2017 Food Code reference in DFSMS definition and replacing with "most recent version of the FDA Model Food Code"
- Best Practices Comments(s)
    - Eric raised question around the need for the mention of ieee & siia in the DTME paragraph.
        - Suggested change provided by Brenda Bacon. to remove the term back-end to eliminate confusion
- Handheld Devices Intended for Direct Food Contact Comment(s):
    - Eric updated the food code reference to include "most recent version of the FDA Model Food Code"
    - Robert Sudler – If this section is intended to focus only on food thermometers the specific section of the code should be reference
        - Ben & Eric – Intent of the section is to focus on more than just food thermometers, pH meters and humidity for example.
        - Robert – It is ok as stated if intended to be inclusive of other devices
- Integrated Temperature Measuring Devices Comments(s):
    - There was much discussion on the intent of this paragraph and the inclusion of OEM devices, the need for redundant thermometers in the food code
        - Robert Sudler & Adam Kramer – No specific requirements in the food code for 2nd thermometers
        - Katie Matulis - A secondary thermometer is not required with an OEM thermometer, but an OEM thermometer/digital readout is still required with a DFSMS (sensors, etc.).
    - Ben and Eric plan to make revisions based on the discussion and bring back to whole committee for further discussion.
    - **This is where discussion stop due to time**
        - **Follow Meeting to be scheduled to occur as soon as possible to review additional changes and the remaining sections of the document.**

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

LVIII. Issues Overview:

1. Issues to submit
    I. Final report, supporting docs and member recognition
    II. Approval and posting of draft guidance on CFP website
    III. TBD – committee reformation as a sub-committee of the larger FSMS standing committee
2. Proposed Issue(s)
    I. Combine DFSMS Committee with FSMS Committee
    II. Create new FSMS Standing Committee

LIX. Next Steps:

I. Volunteers for writing Issues
II. E-vote on final document
III. Create Final Report General Q&A

Key Dates:

a. 11/18/22 – Draft Final reports due to Council Chair
b. 12/2/22 – Revised Final Reports due to Council Chairs
c. 12/19/22 – 01/22/23 Issue Submission

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

Meeting Number: 9
DATE: November 07, 2022 **TEAMS and phone in options in calendar invite**
TIME: 3 PM ET
Co-Chairs: Eric Moore and Ben Chapman
FDA Advisors: Robert Sudler & Justin Asberry
USDA Advisor: Beth Wittry
CDC Advisor: Adam Kramer
Scribe: Lily Yang

Agenda

This meeting is being scheduled to pick-up where Call 7 (11/2/22) left off:

- Revised document will be sent out before end of day tomorrow for full committee review and comment on Monday
- We realize that this date/time may be a challenge but please do your best to attend if your schedule permits

Agenda:

1. Welcome, Call to Order
2. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement
3. Past meeting minutes review
4. Review & Discuss Outstanding Document Questions
5. Issues Overview: a. Issues to submit i. Final report, supporting docs and member recognition ii. Approval and posting of draft guidance on CFP website iii. TBD – committee reformation as a sub-committee of the larger FSMS standing committee b. Proposed Issue(s) i. Combine DFSMS Committee with FSMS Committee ii. Create new FSMS Standing Committee
6. Next Steps: a. E-vote on final document b. Create Final Report
7. Key Dates: a. 11/18/22 – Draft Final reports due to Council Chair b. 12/2/22 – Revised Final Reports due to Council Chairs c. 12/19/22 – 01/22/23 Issue Submission

2021-2023 CFP
Digital Food Safety System Committee
Meeting Minuets

LX. Welcome, Roll Call

- Do not have Quorum – only 8 voting members (Quorum is for 11 voting members)
- Will be conducting voting member polls to move the document into its finished stage for "time being"

LXI. Rollcall/ Conference for Food Protection, Inc. Antitrust Statement

- Operating under CFP Anti-Trust Rules
- http://www.foodprotect.org/administration/policies/antitrust-policy/

LXII. Past Meeting Minutes Review

- Finished to General Usage Section

LXIII. Review of Document

- Changing "system faults (bugs)" to "system malfunctions"
- Include Food Code #s – there may be changes in the future; unlikely that these will be changed. But doc should be reviewed every 4 years (Robert Sudler) – then these numbers will need to be updated; and any cross-references that mention the Code, if they change, also will be noted. Not something tht needs to be updated or worried about now; but definitely long-term, needs to be kept on the radar to review (don't wait 10 years). Need to include that these documents will be updated and reviewed periodically
- Data Storage – that system has some type of programming that is not acceptable despite what it is that it doesn't overwrite what was originally recorded (need to make sure)
- Finished review of document
- Review last week's edits from inputs:
    - Edited "Inputs – Digitl Food Safety Management System Equipment"

LXIV. Issues Overview

- Straw Poll of voting members? Will they accept as it is right now? – 8 of 8 YES (in agreement)
    - Non-voting members – are you also comfortable with the document? YES – 6 of 7 non-voting are in agreement
    - Total: 15 members

LXV. Issues to Submit

LXVI. Proposed Issues

- Request that *this* specific committee be reformed to further explore and work on identifying research information (work with Collaborative) to do a funded research study for the next biannual.
- In parallel, Ben & Eric – along with food safety Council 2 chair/vice-chair & David Lawrence & David McSwane have discussed the possibility of Food Safety Management Committee transitioning to a standing committee to identify specific charges to discuss formation of Standing Committee to begin during the next biennium.
    - Standing FSM Committee
    - Sub-committee standing - for digital food safety

    - To ensure alignment in wording and approaches moving forward
- Does anyone see any issues with this committee falling under a Food Safety Management Systems Committee (not yet proposed) – currently no one on the team feels negatively about this

LXVII. Next Steps:

- Co-Chairs to make minor document changes determined during today's meeting
    - Revisions completed 11/8/22
- Draft Final reports due to Council Chair
    - To be sent to Council Chair tomorrow 11/9/22
- Voting Member e-vote on Final Report
    - TBD based on Council Chair feedback
- Final Reports due to Council Chairs (12/2/22)
- Biennial Issue Submission (12/19/22 – 01/22/23)

Digital Food Safety System Committee Definitions

Digital Food Safety Management System (DFSMS): An interactive, digital, or electronic archive intended to collect, store, and analyze data that supports a food safety management system. A DFSMS is intended to enable a proactive approach to support the consistent safe production, transport, preparation, storage, and service of safe wholesome food as defined in the FDA model food code. A DFSMS employs active user-based work-flows that support decision making that can be reviewed and acted upon, and may be housed locally (on-premise) or be accessed remotely.

DFSMS should include but not limited to functionality that allows a user to:

- capture, record, and store multiple types of data
- provide real-time feedback to users
- generate record keeping reports, for example trends over time

Other components, tools, and records within a DFSMS may include:

- specific policies, procedures, recipe cards, and critical limit monitoring actions and corrective actions including training tools
- risk control plans
- product storage/movement information and inventory supporting recalls and market withdrawals
- equipment maintenance documentation
- active alerting
- networked and/or IOT devices

Digital temperature monitoring equipment: Automated temperature measuring device(s) that should include electronic sensors capable of generating and capturing temperature data for analytical use. This equipment may include the functionality of automatically measuring, monitoring, storing, transmitting, documenting, and sharing the temperature of food, air, or water. Monitoring equipment that captures and stores temperature data over a period of time may connect to a system that may be capable of delivering alerts and exception reports.

INTRODUCTION

One of the computerized systems within the food processing industry regulated by the Food and Drug Administration (FDA) continues to increase. The use of computerized control system technology is expected to continue to grow in the food industry as the cost of components decrease, as companies are continually improved to withstand the rigors of the food processing environment, and as computerized systems are used to replace facilities equipment and manufacturing processes in an attempt to produce high quality, high value products. Now process design will strive to achieve safe quality products, while at the same time minimizing production costs. The use of computerized control systems in the production of food products will be vital to fulfilling these goals.

As computer systems become instrumental in providing for the safety of FDA regulated products, the FDA will need to develop expertise to evaluate computerized systems, to examine, comment and validate records on computerized systems, and to conduct on-site storage inspections.

The purpose of this course is to examine the FDA investigation into conducted inspection of regulated food firms that use computers and computer software to control manufacturing processes. Chapter 1 will review the FDA regulations. Chapter 2 will look into reviews by the Office of Regulation Affairs (ORA), Division of Emergency and Investigational Operations (DEIO) and the Center for Food Safety and Applied Nutrition (CFSAN) of computerized systems in food processing establishments. Chapter 3 will examine the criteria for good processing manufacturing quality and conformance, plus communication your written comments or suggestions to DHEO, ORC (or send an e-mail to Internal Bureau address to). DEIO/ORA/FDA/5600 Fishers Lane/HFC-132

CHAPTER 1: REGULATIONS OF COMPUTERIZED SYSTEMS

A. FOOD, DRUG AND COSMETIC ACT

FDA's authority to regulate the use of computers in food plants is derived from the Food Drug and Cosmetic Act (FD&C Act). Section 402 (a) (3) of the Act states: "A food shall be deemed to be adulterated if it has been prepared, packed, or held under insanitary conditions whereby it may have become contaminated with filth, or whereby it may have become injurious to health." Section 402 (a) (4) states: "A food shall be deemed to be adulterated if the methods, facilities, or controls used for its manufacture, packing, or holding do not conform to or are not operated or administered in conformity with current good manufacturing practice to assure that such food is not unsafe or lacks sufficient quality and is not properly labeled under section 403 (a) (1) and food shall be deemed to be adulterated if it has been prepared, packed or held under insanitary conditions whereby it may have become contaminated with filth, or whereby it may have become injurious to health." Section 701 (a) authorizes the issuance of regulations for the efficient enforcement of the Act. Section 520 (f) (1) (B) authorizes the issuance of regulations for the control of methods used in, and the facilities and controls used for, the manufacture, processing, and packing of human food.

Before discussing the use of computerized systems under the FD&C Act, it is useful to review the related sections of the Act.

Section 201 (g) (1) defines the term drug to include articles "(B) intended for use in the diagnosis, cure, mitigation, treatment, or prevention of disease, in man or other animals; and (C) intended to affect the structure or any function of the body of man or other animals."

Section 201 (h) defines the term device to include articles "(3) intended to affect the structure or any function of the body of man or other animals, and which does not achieve its primary intended purposes through chemical action within or on the body of man or other animals and which is not dependent upon being metabolized for the achievement of its primary intended purposes."

Section 201 (s) defines the term "new drug" as any drug "the drugs, constituents, and conditions of use prescribed, recommended, or suggested in the labeling thereof, as are not held, by such experts, to be established safe, or any other contaminants."

Section 201 (ff) defines the term "**Subpart F Supplement, sun-gel** which is "any food which contributes consumption from any source." It continues to **sub-Pa (3) (A) (i)** to "any food manufacturing ... shall be conducted under such conditions and controls as are necessary to minimize the potential for growth of microorganisms, or for the contamination of food."

Implied and explicit references for the need to have computerized controls for accurate and reliable may be found in other Sections of the FD&C Act. For example, see the function of the computerized system in the food process.

PART 113 SUBPART A: THERMALLY PROCESSED FOOD AS ASSORTED LOW-ACID CANNED FOODS

FDA's General Food Safety and Regulation Division (GFSRD) has determined that the use of computerized systems to control processing operations is necessary to assure the safe production of low-acid canned foods. **Low-acid canned foods (LACF) are foods packaged in hermetically sealed containers, such as CYN Part 113, Thermally Processed Low-Acid Canned Foods in Hermetically Sealed Containers** except for: sealed, aseptic processing systems, and containers that are processed before they are sealed.

Computer equipment makes this task to control computer systems to help control food record keeping functions and to perform real time process deviation corrections, have been used in the food processing industry for many years. Examples of these uses have been:

- a. to aid in FDA by the systems vendor or user to explain the operation of the computer system,
- b. to aid by FDA in the vendor to examine the hardware and software development, validation and documentation procedures, and
- c. to aid by FDA in production to evaluate the computerized record maintenance and change control procedures.

To ensure vendors who submitted their computer systems to FDA for review and were found to be satisfactory, received a letter stating that FDA found the computerized system, as evaluated, to meet the intent of the regulations. Use of this voluntary submission of computerized systems to FDA for evaluation subjected the vendor to FDA's policy and procedures for the review of these systems. Upon receipt of a vendor's system, a requirement that FDA investigators would be provided on site access to the vendor's computer equipment software operating instructions, and a requirement that the vendor would maintain confidentiality of any trade secrets revealed by FDA's computer software and equipment.

Food manufacturers that used CYN Part 113LF computer controlled recording and real time process deviation corrections, have been used in the food industry for many years. The use of computerized systems to control processing operations is necessary to assure the safe production of low-acid canned foods. Low-acid canned foods (LACF) are foods packaged in hermetically sealed containers, such as cans, flexible pouches, and aseptic processing systems, except for: containers that are processed before they are sealed.

The function of the system as it operates can be used to determine if critical factors such as retortchon per minute (rpm), vent time, initial temperature, process, thermal process deviations, and documentation are being controlled by the computerized system. Operation of the FDA's computer equipment software operating instructions, and a requirement that the vendor would maintain confidentiality of any trade secrets revealed by FDA's computer software and equipment. As food product deviations will not have to be reported to FDA, as long as the computer system is functioning properly and properly documented, it will not record the systems functions. This is the automatic food or food process of performance. The only way to develop confidence that the computer system is going to perform correctly is to have a validation program as part of the design, check, or test. The validation program should encompass the entire computer system, including:

The investigator must keep in mind the limitations of specific regulations regarding the use of computers in food processing plants. Most of the current FDA food regulations in the FD&C Act of specific authority to examine computer software and computer hardware records. Section 704 authorizes FDA to conduct factory inspections to determine if a food manufacturer or the activities of a manufacturing process, the manufacturer is operating in establishing that the computerized system functions as it was intended to function. The investigator is not authorized to examine computer software. The investigator is entitled to be provided with the computer software that was intended to be used by the computer system as designed. It is important to remember that computerized systems are used to control the food manufacturing process, quality and consumer controls.

The investigator should evaluate the operations of computerized systems during the inspection to determine if the use of the computer software may lead to adulteration of the finished food product. Many companies used in the food industry may not have the in-house capability to write computer software programs. For example, if there was a misunderstanding on a bill of lading between a purchaser and a seller, the criticality of the inspectional control function may be a matter of reading in a batch of ingredients. Another example of a critical control function would be the temperature maintenance of a lot of process. A review of the computerized formulas provides consistent and reliable performance. HACCP (Hazard Analysis Critical Control Point) computer software programs are used to control critical control points in food processes. Documentation steps established by a computerized system.

This is an important to find out if the operator or management can override any of the computer control functions. If operators/management can override control functions, what are possible details on how this is done, what overrides are possible, and how overrides appear in the processing record should be determined.

The investigator should find out how the system handles deviations from an or expected operations. Does the computer automatically shut down the process, automatically generate parameters, calculate new manufacturing instructions or choose alternate programmed procedures the investigator must determine the parameters for computing or selecting the alternate procedures.

During inspection of food firms using computerized systems to control and monitor critical control points, investigators should review the computer software and hardware documentation to record other factors related to the food process. Examples of these factors are:

- a. The equipment specifications for software and hardware.
- b. The critical factors controlled by the system.
- c. Does the critical factors are controlled?
- d. How does the firm ensure that the microprocessor or computer is indicating the correct information (validation)?
- e. How and how often is the equipment calibrated and/or checked for accuracy?

Investigators should review the computer software documentation to determine responses to the authorization of a food product will take, and whether it fits in the documentation. Development of evidence of food adulteration caused by the operations of a computerized system is also discussed in Chapter 4 of the Compliance Program Guidance Manual.

During the inspection of food processing facilities the responsibility of the food manufacturer to establish that the computerized system functions as it was intended and the critical audit aspects of food manufacturing should be discussed with the facilities management. The FDA investigator should make the firm's management aware that a computerized system is subject to FDA inspection and that the firm must have the procedures required to operate the system. Management of the firm should be made aware that the computerized systems should be validated to place under actual operating conditions by the firm **Close Surface on Computerized System Validation.**

The applicable sections of the listed references should be used, in addition to this guide when inspecting firms using complex computerized systems.

CHAPTER 2: COMPUTER SYSTEM TECHNOLOGY

A. TECHNOLOGY OVERVIEW

In recent years digital electronic controllers have replaced the relays and analog switches that were used to control processing operations. Digital controllers are electronic devices that receive data input from the single loop controller to complex high-end computer systems.

If the function is for controlled consists of numerous sequential (logical) steps, the controlling device can be a fixed-level computer that is often called a logic controller. The logic controller may be set up as a single loop controller.

A single loop controller could be responsible for controlling one function, such as temperature, pressure, or flow. Single loop controllers could be programmable, and could be built-in temperature within set temperature parameters. The loop would consist of the temperature controller, a temperature sensor, a power source for the steam valve that controls the steam flow.

Digital single loop controllers contain Read Only Memory (ROM) which is manufactured into the controller or programmed into the controller by the manufacturer. Random Access Memory (RAM), Erasable Programmable Read Only Memory (EPROM) or Electronically Erasable Programmable Read Only Memory (EEPROM).

PROMs is field programmable by the manufacturer or customer once only by burning out the internal fuses. EPROMs and EEPROMs are erased by exposing the chip to ultraviolet light. EEPROMs are erased by electrical means. EEPROMs are programmed by exposing the chip to ultraviolet light sources that erase the original chip configuration. EEPROM memory is programmed by applying a voltage to the chip. Programmable logic chips (PLC) chip. RAM is normally used to control functions, the values of the parameters of an operator do not need to be changed. Random Access Memory (RAM) using battery backed memory to maintain the values of the parameters during power outages. This requires a power supply for both RAM and its replacement.

Superimposing, Advanced microprocessor or computer systems would normally use a combination of ROM and RAM to program control processing functions.

A more advanced system would use a programmable logic controller (PLC) which could allow the operator or firm to alter the control functions to meet the particular **close Approach** The type of controller would use algorithms in programmed procedures for solving a control problem. Algorithms are a set of logical steps that are performed in order to solve a logical sequence of events for solving a problem **Appendix 3A**

Control of multiple parameters such as temperature, pressure, pumping rate, rotation, etc. would require the application of several logic controllers connected to a PLC or microprocessor or computer.

Companies are different from hardwired controls to three major categories. To provide for adequate control of critical control points in food processing and/or documentation. The design of the computerized controls must address these three major areas:

- a. Proper, conventional hardwired systems, which provide for full-time monitoring of critical functions, the computer performs its task sequentially, and the computer monitors the critical functions on a time-shared basis. Should the system fail, it can malfunction(s) or become long before the computer to carry out these through its task), the critical sensor is not monitored. Normally this is not a problem, because the computer scans the critical sensors at a rate that is sufficient for the control. The problem occurs when the processing computer is directed from its task by another computer, or the computer software program is changed, or a defect occurs in the software. Should this occur, the food processing control computer may stray from its control or monitoring functions.
- b. In a computerized system the control logic may be easily changed if the computer software can be easily changed. Some security measures are needed to limit that the changes.
- c. Some computer experts have stated unequivocally that in computer software can be written error-free. While this may be true for very large software routines with thousands of lines of code, most of the software routines used for control and monitoring functions are relatively short and relatively simple. Because of this, these routines become critical to food safety and should be kept error-free.

B. COMPUTERIZED SYSTEM HARDWARE

Input Devices. Equipment that translates external information into electrical pulses that the computer can understand. Examples are thermocouples, RTDs (thermistor resistance temperature devices), pressure, flow, and conductivity transmitters, pH probes, and switches, such as limit switches, flow rate/y touch screens and operator keyboards.

Examples of hardware are:

- a. Thermocouple/RTD provides temperature input for operation of a retort.
- b. Pressure transmitter provides pressure input for operation of a retort.
- c. Operator keyboard used to input batch, menu number and other processing information.

Output Devices. Equipment that receives electrical pulses from the computer and either causes an action to occur, generally by controlling the manufacturing process functions, or displays data. Examples are chart recorders, valves, motors, printers, CRTs, video (CPU), printers, and alarms. Examples of hardware are:

- a. Solenoid activates the impeller of a mixer.
- b. Valve controls the amount of steam delivered to a thermal process.
- c. Printer records significant events during a sterilization process.
- d. Alarm (buzzer, bell, light, etc.) sounds when operator intervention is or lacking is/ds drops below the desired temperature.

Most output devices will be governed by a low food processing equipment under control, but not necessarily. Due to the CPU. Some output devices such as printers may be located remotely from the computer equipment.

Signal Conversion. Many input and output devices operate by transmitting or receiving electrical signals that are in analog form. These analog signals must be converted to digital form (A/D) before the computer can use them. Similarly, digital signals must be converted into analog signals for use by analog devices (D/A). Examples of hardware are:

- a. Thermocouple/RTD provides temperature input for operation of a retort.
- b. Pressure transmitter provides pressure input for operation of a retort.
- c. Operator keyboard used to input batch, menu number and other processing information.

**Computer Hardware

connection between complex computer systems that are geographically distant or they may consist of computer systems which are even several KILOMETRES apart.

If the firm is on a computer network it is important to know:

1. What types, such as batch production records, is sent to other parts of the network;
2. what kinds of input (instructions, software programs) are received;
3. the identity and location of establishments that interact with the firm;
4. the extent and nature of monitoring and controlling activities exercised by remote on-line computer systems;
5. what security measures are used to prevent unauthorized entry into the network and possible unsuccessful/real process alteration, or obliteration of local process controls and records.

Peripheral Devices: All computer associated devices external to the CPU (or the mainframe computer) are referred to as peripherals. Some peripherals are used for input devices. Input peripherals include devices which can be located at the site of operation such as CCD device. These include CRTs, printers, keyboards, disk, modems and tape drives.

C. ENVIRONMENTAL CONTROLS

Location: Potential problems have been identified with location of CPUs signal transmission lines and peripheral devices. Those include:

Humble Environment: Recommended extremes of temperature, humidity, static, dust, and electrical noise should be specified by the computer system manufacturer. Where such conditions may be common in certain computer and the investigator should be alert to locating sensitive hardware in such areas. Environmental safeguards may be necessary to ensure proper operation.

Electromagnetic Interference (EMI): Low voltage electrical lines from input devices to the CPU can be susceptible to electrical noise (EMI). EMI can cause data transmission distorted input data to the computer. Therefore, peripheral devices should be made immune to electromagnetic interference (EMI) such as electrical power lines, motors, radio and TV transmitters, and other devices that may cause EMI in the surrounding area. Peripheral devices and signal transmission lines should be located at least 30 meters (100 feet) away from sources of EMI. Shielding of signal transmission lines, grounding, and filtering of power lines to the computer and installation or housing are acceptable methods to prevent EMI.

Distance Between CPU and Peripheral Devices: Devices proximity to the CPU/computer may be important concerning loss of signal due to electrical resistance of the signal transmission lines. To correct this problem the device may be located near the CPU or signal boosters may be installed. Signal boosters are installed whenever G.A. 1 000 ft/305 m can be used.

Proximity of Input Devices to Food Processing.

Input devices such as employee timeclocks should be located as close as possible to the operation being controlled.

D. MAINTENANCE/CALIBRATION

Computer systems normally require a minimum of complex maintenance. Electronic components rarely fail. Mechanical devices, such as printers, are subject to frequent failure. Frequently software is available which enables them the routine to check computer performance and isolate defective integrated circuits. Maintenance procedures should be included in the firm's standard operating procedures. The availability of spare parts and access to qualified service personnel are important to the operation of the maintenance program.

The firm should use replacement parts which meet specifications of the original equipment system design or the system should be revalidated to document that the replacement parts perform as per the original specifications of the computer system.

Sensors such as part of the computerized system, monitoring or controlling process operations, should be calibrated routinely. Frequency of calibration will depend on the sensor's sensitivity to potential operations that the sensor is designed to detect. Records of calibration should be maintained.

Terms:

Input: Input refers to any entries or input or other certain input or output information that is received by the computer for processing. Input may be in human readable or machine readable forms. This is an old staff in use in the area of producing process. In the example, if a certain piece of input data does not consist of a four character number, software edits can be used to test common errors or omissions in input data. Input may be entered manually or scanned from a coded item in the facility. Security should also be used to limit access to certain users, such as input data. Determine if accountability is maintained for those devices and access is being limited.

An important part of software security is change control. The firm should have in place a system for controlling changes to software programs. Changes may be made to correct errors in a software system, how it was executed, or to accommodate the customer. All changes to software are other portions of the software program, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

E. PERSONNEL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

G. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be documented. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

H. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

I. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

J. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

K. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

L. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

M. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

N. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

O. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

P. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

Q. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

R. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

S. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

T. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

U. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

V. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

W. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

X. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

Y. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

Z. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AA. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AB. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AC. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AD. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AE. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AF. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AG. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AH. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AI. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AJ. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AK. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AL. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AM. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AN. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AO. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AP. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AQ. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AR. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AS. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AT. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AU. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AV. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AW. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AX. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

AY. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

AZ. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

BA. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

BB. PURPOSEFUL QUALIFICATIONS

Personnel operating, maintaining and programming computerized control systems should have adequate training and experience for performance of their assigned duties. Determine the extent of operator, system managers, and computer system technical personnel training. Training should be documented. Training should be conducted by trained personnel. Training should include on-site training, specialized training, seminars, system changes, security procedures, and software changes. Training should be documented. Personnel working with computerized system processes should be documented by the manufacturer/user.

The investigator should determine the key computerized systems personnel during the inspection. This may include not only the firm's employees but also contractors or consultants. For each of the key employees, determine to the extent possible, that adequate training and experience has been documented. Ascertain that adequate written procedural are available or can be reached during computerized system failures.

BC. PROCESS DOCUMENTATION

Most computerized systems are capable of generating accurate and detailed documentation of the food process under computer control. What is important is that the firm has documentation sufficient to assure that the computer is controlling the food process. For example, if production records are generated by computer, determine if they contain all of the information required to be in such records.

The firm should have security measures in place to assure that data captured by the computerized system cannot be altered. If provisions are made to allow correction of data entered into the computer system, the basis for such changes should be identified. For example, if the computer system records a temperature which is important for the safety of the food, the computer system does allow for the correction of data entered into the computer, were the changes validated (tested) to ensure that they were correct and that they did not cause other problems? Have the changes been documented? Software has been available that will maintain a detailed maintenance procedure to followed (See Computerized System Validation).

BD. PURPOSEFUL QUALIFICATIONS

Personnel operating, maint

Central Processing Unit

Distribution system

Peripheral devices

Alarms:

Types (visual, audible etc)

Functions

Records

Software:

Documentation:

Manuals

Operating procedures

Personnel:

Type

Training

4.) For computer hardware determine the manufacturer, make and model number.

5.) Obtain or make a simplified drawing of the computerized system control loop including:

Sensors

CPU

Signal converters

Actuators

Peripheral devices

6.) Software:

a. For all critical software determine:

Name

Function

Inputs

Outputs

Set-points

Edits

Input Manipulation of Data

Program Over-rides

b. Who developed software.

c. Software security to prevent unauthorized changes.

d. Firms checks on computerized systems inputs/outputs.

7.) Observe the system as it operates to determine if:

Critical processing limits are met

Records are accurate

Sensor input is accurate

Time keeping is accurate

Personnel are trained in systems operations and functions

8.) Determine if the operator or management can override computerfunctions. Explain.

9.) Explain how the system handles deviations from set or expected results.

10.) Determine the validation steps used to insure that the computerized system is functioning as designed.

a. Was the computerized system validated upon installation?

Under worst case conditions?

Minimum of 3 test runs?

b. Are there procedures for routine maintenance and revalidation?

Does the equipment in-place meet the original specifications?

c. Is validation of the computerized system documented?

d. How often is system:

maintenance performed

revalidated

calibrated

11.) Are system components located in a hostile environment which may effect their operation?

12.) Determine if the computerized system can be operated manually. Explain.

13.) Automated CIP (cleaning in place).

How does firm ensure that cleaning is adequate.

Documentation of CIP steps.

14.) Shutdown Procedures

Does firm use battery backup system?

Is computer program retained in control system?

What is firms procedure in event power is lost to computer control system?

15.) Does the firm have a documented system for making changes to the computerized system which explains:

The reason for the change

The date of the change

The changes made to the system

Who made the changes

16.) Document computer functions which are causing or may cause food products to be adulterated or misbranded.

G. Committee Members 8

A. Introduction and Scope

The use of digital food safety management systems (DFSMS) within the retail food industry, regulated by the Food and Drug Administration (FDA), continues to gain widespread interest, acceptance and use. The use of DFSMS is expected to continue to grow in the retail food industry as technology improves and components become more readily available. As technology advances the retail food industry continues to replace paper-based records associated with traditional food safety management systems with digital documentation. Recent FDA Risk Factor study results have shown that utilizing a robust management system leads to a reduction in food safety risk factors.

An oft-used component of a DFSMS, Digital Temperature Monitoring Equipment (DTME) can improve awareness, response and documentation of temperature conditions. This technology allows more accurate, reliable and efficient food and equipment temperature control impacting safety and quality improvements. As DFSMS and DTME become more common in the retail food industry, the visibility, awareness and availability of information that these systems and technology can provide should support improvements in controlling food safety risk factors in food retail.

This guidance will outline food safety management approaches specific to the implementation and use of technology in food retail. Best practices provided in this document serve as a foundational guide for the collection of accurate, consistent and reliable data that can be used to make risk-reduction decisions. This document has been written with the assumption that a food retail establishment has a food safety management system an that they have identified and addressed HACCP Principles 1, 2 and 3 as referenced in Annex 4 of the U.S. FDA Model Food Code (2017)

B. Definitions

Digital food safety management system (DFSMS)

An interactive, digital or electronic archive intended to collect, store, and analyze data that supports a food safety management system as defined in Annex 4 of the most recent version of the U.S. FDA Model Food Code . DFSMS specifically supports ongoing quality control and assurance, monitoring and recordkeeping of specific food safety goal-oriented plans, like Risk Control Plans (RCPs), that outline procedures for controlling foodborne illness risk factors. A DFSMS is intended to enable a proactive approach to support the consistent safe production, transport, preparation, storage, and service of safe wholesome food as defined in the most recent version of the FDA model Food Code. A DFSMS employs active user-based work-flows that support decision making, that can be reviewed and acted upon, and may be housed locally (on-premise) or be accessed remotely using off-site servers or cloud storage.

DFSMS may include but are not limited to functionality that allows a user to:

- capture, record, and store multiple types of data
- provide real-time feedback to users
- generate record keeping reports (i.e.trends over time)

Other components, tools, and records within a DFSMS may include:

- specific policies, procedures, recipe cards, and critical limit monitoring actions and corrective actions including training tools
- risk control plans
- product storage/movement information and inventory supporting recalls and market withdrawals
- equipment maintenance documentation
- active alerting
- networked and/or IOT devices

Digital Temperature Monitoring Equipment (DTME)

Automated purpose-built temperature measuring device(s) that often includes sensors capable of generating and capturing temperature data for analytical use. This equipment may include the

functionality of automatically measuring, monitoring, storing, transmitting, documenting, and sharing the temperature of food, air, or water. Monitoring equipment that captures and stores temperature data over a period of time may connect to a system that may be capable of delivering alerts and exception reports.

Software

Software is the term used to describe the total set of programs, procedures, rules, and any associated documentation pertaining to the operation of a technology based system that includes, but is not limited to: application, operating system, and utility applications used by the computerized system.

C. Prerequisites

Best practice for a DFSMS is to employ purpose-built hardware and software when designing and implementing an approach. The appropriateness of hardware and software should meet the goals of any RCP. Maintenance of the system and the proper replacement of system hardware is critical for it to function as designed. Design specifications of the hardware and software should be determined and periodically reviewed to ensure the system and its functional components do what is intended to support food safety.

This document recognizes the that DFSMS are built and utilized to support the current version of U.S. FDA Model Food Code, Annex 4, HACCP Principles
Specifically:
Principle #4: Establish Monitoring Procedures
Principle #5: Establish Corrective Actions - implementation of the corrective action specifically
Principle #6: Verification/Sharing for equivalency for regulatory checks
Principle #7: Record keeping procedures and documentation

Personnel operating, maintaining, and programming DFSMS should have adequate training to complete their assigned duties. Determine the extent of operator, system managers, and software system technical personnel training in the functions, requirements and operation of the computerized system.
Training may include but are not limited to:

- system operation
- malfunctions
- regulatory requirements
- system changes
- security procedures
- manual operation of the system
- documentation of system errors

D. DFSMS Inputs

Digital Food Safety Management System Equipment (DFSMSE)

DFSMS Equipment typically include various purpose-built and designed stationary and handheld measurement instruments, tools and sensors capable of the collection, storage, and transmission of data into software. The food contact surface of DFSMS Equipment must meet the design and placement characteristics in Chapter 4 of the most recent version of the U.S. FDA Model Food Code and must be designed to meet or exceed NSF Standard 2 - Food Equipment or equivalent. Examples may include but are not limited to: mobile device(s), sensors, thermometers, RFID/QR Code scanner/receiver, etc.

Stationary Monitoring Devices

Purpose build devices which are permanently or semi-permanently affixed, mounted, installed, attached to equipment or surface using food grade mounting/installing materials, maintained free of accumulated soil, and cleaned per manufacturer instructions. When devices do not include an external measurement display, access to the measurement data should be easily accessible and viewable. These devices when appropriate should meet the design and placement characteristics in Chapter 4 of the most recent version of the U.S. FDA Model Food Code and must be designed to meet or exceed NSF Standard 2 - Food Equipment or equivalent.

Note: DFSMS Stationary temperature monitoring devices must meet the requirements outlined in the most recent version of the U.S. FDA Model Food Code 4-204.112 Temperature Measuring Devices.

Device examples may include but are not limited to: equipment or wall mounted data loggers, humidity sensors, door open/close sensors, camera’s, etc.
Data access examples may include but are not limited to: Software report on mobile, desktop, tv monitor/screen, etc.

DFSMSE Accuracy

Handheld and stationary temperature measurement instruments must meet the most recent version of the U.S. FDA Model Food Code 4-203.11 & 4-203.12. In the event that a handheld or stationary temperature device does not have a display; the operator should be able to easily demonstrate/record the reading/actual monitored temperature (value) for review and record. Follow OEM recommendations & guidelines and follow their procedures.

DFSMSE Functionality

Regular and ongoing equipment and system operation functionality are recommended to be conducted (refer to manufacturer for frequency) to verify that a DFSMS, DFSMSE and DTME in

use is operating as intended, if/when issue(s) are identified appropriate action is taken to correct issue(s). Examples of device functionality issues are but are not limited to:

- Power loss
- Improper device installation
- Device damage/defective
- Software communication/connectivity
- Device communication/connectivity

It is recommended that records of software and equipment functionality verification be maintained and readily available. Examples of functionality verification may include but are limited to:

- Handheld measurement device accuracy & functionality
- Stationary measurement device accuracy & functionality
- Software and device connectivity/communication

E. Data and System Infrastructure

DFSMS data are the measurement values and user inputs captured by DFSMSE and DFSMS users that are then stored in DSFMS software. Data storage may be stored locally (on-site) or virtually (cloud storage) but access to this data must be readily available for use and display on-site. This makes it possible to retrace which value occurred at which time. The following are examples of, but not limited to, measurement values that may be recorded and stored as data in a DFSMS:

- Time points and Account IDs which are assigned to certain quality checks
- Description of the area
- Description of the equipment
- Description of the products/product categories
- Description of the measurement locations of the equipment
- Description of suppliers
- Check lists/Quality handbook
- Tasks (Daily, Shift, On-Demand)
- Reports (Daily, Shift, On-Demand)
- Product specific quality and safety measurement data points (Temperature, pH, TPM, PPM, humidity, time)
- Alerts (alerts are notifications to users)
- Alarms (is the result of an unacceptable software or hardware reading)
- Alert recipients
- Corrective actions associated with checklists and measurement points
- Manual data entry (for immutability and data integrity)

Combined DFSSC Sub Committee DFSMS Best Practice Guidelines

When DFSMSE or a DFSMS user completes a measurement value this value is stored in DFSMS software. Each measurement value represents a unique permanent data point represented in the DFSMS software, additional or new data (including that which is associated with an existing or old data point) are then stored in a sequential manner allowing for the original data point to remain. This can be described as a time-based progression of record keeping. The DFSMS software should also be capable of recording All previously recorded data should be readily accessible, and documented when changed and available for reporting.

Digital Temperature Monitoring Equipment (DTME) Data

There are three broad ways of capturing temperature and humidity data; they are commonly identified as held, stationary, or Integrated temperature measuring devices. An important consideration for DTME is that the devices often have the ability to cache/store data locally when connectivity is interrupted, if/when data connectivity is interrupted a DTME device should have the ability to push/send when connectivity is restored. The infrastructure shall refer to information technology industry cache/storage best practices at the time (such as ieee.org).

Verification / Immutability

A retail food business may have measures in place to ensure that data captured by the computerized system cannot be altered without a digital signature record or other means of tracking history of inputs. If provisions are made to allow correction of data entries, the entry may identify the person making the changes and the reason for the change and what previous data was.

Data and System Integrity and Access

Data Integrity and Access are both important aspects of a DFSM that should be considered to ensure that quality of the information collected by the system is accurate and reliable. To support the integrity of a DFSM it is recommended that controls are in place to ensure that stored and/or in process data is not able to be altered data in an unauthorized manner, and that any changes are captured. Data access is also a way to support effective data integrity. Access to a DFSMS should be controlled and limited only to those persons to whom permission is granted. All data and information should be protected through the use of encryption protocols. Examples of encryption could include, but are not limited to, utilizing passwords,user management and user rights. While examples of things needing encryption include but are not limited to:

- Passwords
- Proprietary business information
- Data transferred between the input devices and local/cloud-based reporting and storage programs/locations.
- Login occurrences
- Access to information within the DFSMS should also be tailored according to a user's role and responsibilities, writing or reading rights.

Manual Data Entry

Determine if and how manual interventions are documented; a separate log may be kept of such interventions. The computerized system may be such that it detects, reacts to, and automatically records manual interventions. It is important that system operators are trained in manual backup systems; as a best-practice this should be documented and conducted prior to DFSMS usage. To ensure business continuity, it is recommended that users have their own SOP for review (redundancy) to ensure practices are being enacted.

Manual Back-Up

A manual back-up system is frequently utilized as a function of business continuity in the event of a computerized system (e.g. hardware or software) failure. Functions controlled by computerized systems may sometimes also be controlled by parallel manual backup systems. As a best practice, functions that are manually controlled and/or manually backed up should be identified and noted re: the firm's protocols or the system's protocol. Critical process controls are particularly important. Determine the interaction of manual and computerized controls and the degree to which manual intervention can override or defeat the computerized function. The firm's operating instructions should describe what manual overrides are allowed, who may execute them, how and under what circumstances.

F. DFSMS Outputs

System Outputs and Notification(s)

Typical DFSMS and DTMS include the capability to include user level notification(s) tailored around programmable components of an organization's Standard Operating Procedures (SOP), see What Data is Stored section above for measurement examples that may be involved. Examples of user level system notification(s) may include but are not limited to the following:

- Reports
- Trends
- Automated emails
- SMS or text message
- Phone calls
- Visual indicators (lights)
- Audible indicators (sounds)

A best practice is to associate one or more corrective actions with an alert. To assure corrective actions are completed in a timely fashion, alerts can be escalated when corrective actions are not completed within a set timeframe.

DRAFT

Template approved: 7/13/2021

Committee Final Reports are considered DRAFT until acknowledged by Council or accepted by the Executive Board

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME: Council II Allergen Committee

DATE OF FINAL REPORT: *12/5/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☒ ***Council II*** ☐ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Co-Chairs: Dr. Amani Babekir and Michelle Hill CP-FS

COMMITTEE CHARGE(S):

Issue # _2020-II-011__

1. Develop an operational framework for food allergy prevention and control using existing research and other evidence-based materials (for example: CDC guidance in schools and guidance developed by retail food industry) in retail food establishments including:

- **a.** A written template retail food establishments can use to reduce the risk of food allergy reactions and respond to any reactions that do occur. The template can incorporate findings, lessons, materials, etc. from items b-f.
- **b.** Steps to take during a food allergy emergency and identify key components of food allergy emergency plans.
- **c.** Food allergy training for food workers and identify educational content and training needs based on employees' assigned duties.
- **d.** Findings, recommendations, and materials from the 2018 Allergen Committee to ensure retail food establishments have tools to notify customers when menu items contain major food allergens.
- **e.** Food-handling practices, policies, and procedures to prevent food allergens from unintentionally contacting another food.
- **f.** Equal considerations for alternate food sources, such as food pantries and food banks, to ensure equity and access.

2. Recommend changes to the Food Code that support retail food establishments to operationalize framework to prevent and control food allergic reactions.

3. Report back findings and recommendations to the next Biennial Meeting of the Conference for Food Protection.

COMMITTEE WORK PLAN AND TIMELINE: The committee charges are completed; the committee will meet as needed to finalize the documents after the Council II Co-Chair review process.

COMMITTEE ACTIVITIES: *Dates of committee meetings or conference calls:*

A) Allergen Committee: 3/31, 4/14, 4/28, 5/12, 6/9, 6/23, 7/7, 8/4, 8/18, 9/1, 9/15, 9/29, 10/13, 10/27, 11/10, 12/5

B) Sub-group meetings, week of: 3/20, 3/27, 4/3, 4/10, 4/17, 5/8, 5/15, 5/22, 5/29, 7/10, 8/14, 8/21, 8/28, 9/4, 9/8

1. *Overview of committee activities:*

Completed the Framework after addressing the Federal Partners comments.

Finalized the Issue language recommending changes to the Food Code.

Completed the Issues to submit to Council II.

2. *Charges <u>COMPLETED</u> and the rationale for each specific recommendation:*

All charges are completed and the guidance documents, “Major Food Allergen Framework” and “Summary – Major Food Allergen Framework” were produced through the Committee’s hard work.

3. ***Charges INCOMPLETE and to be continued to next biennium:***

   All charges have been completed.

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

Issue #1: Allergen Committee (AC) Final Report

List of content documents submitted with this Issue: Committee Member Roster:

☐ ***See attached revised roster PDF*** ☒ ***No changes to previously approved roster***

“Committee Members Template” (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

(1) *Other content documents:*

a. List of supporting attachments: ☐ ***Not applicable***

(a.i.1) “Major Food Allergen Framework” document

(a.i.2) “Summary – Major Food Allergen Framework” document

(a.i.3) Meeting Minutes

(a.i.4) Meeting Attendance Records

1. ***Committee Issue #2***: Publish “Major Food Allergen Framework” and “SUMMARY – Major Food Allergen Framework” to CFPs website.
2. ***Committee Issue #3***: Amend the Food Code.
3. ***Committee Issue #4***: Re-create the Allergen Committee

Committee Name: Allergen Committee

w

Note: *Minimum council committee size is 11 (as noted above): 1-Chair; 1-Vice Chair; 1-State; 1-Local; 2-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise;*
Maximum council committee size is 23 voting members: 1-Chair; 1-Vice Chair; 4-State; 4-Local; 8-Industry; 1-Academia; 1-Consumer; 3-Any constituency with emphasis on expertise; 36 -Non-voting alternates.
Membership on standing committees is defined by the Executive Board. On all CFP committees, the committee chair, co-chair(s), and vice chair(s) all count towards constituency balance.

Major Food Allergen Framework

Conference for Food Protection
2023 Biennium
Council II: Allergen Committee
Publication Date: _____

[This page is intentionally blank.]

Contents

Introduction

PURPOSE This document is to serve as a voluntary operational framework for FOOD ALLERGY[1] prevention and control of the MAJOR FOOD ALLERGENS[2] (as defined below) using existing research and other evidence-based materials for FOOD ESTABLISHMENTS[3] and OTHER COMMUNITY FOOD SOURCES[4]. Readers should be aware, however, that people may have other allergies beyond the major food allergens, and food establishments may employ the same practices outlined in this document to assist CONSUMERS[5] with allergies, FOOD INTOLERANCE/SENSITIVITY[6] beyond those listed herein.

Readers should be aware that consumers may have other food allergies, intolerances, or sensitivities (such as celiac disease, Crohn's disease, IBS/IBD, and others) which, although not technically allergies, are triggered by ingestion of particular foods.

SCOPE This document covers food allergy training of FOOD HANDLERS[7]; food handling policies and practices; consumer notification tools for food allergens; a food allergy reaction and emergency response guide; and equal consideration for other community food sources.

BACKGROUND A food allergy happens when a person's immune system overreacts to a food protein. Approximately thirty million people in the U.S. have food allergies, leading to 200,000 emergency department visits per year. FOOD ALLERGIC REACTIONS[8] vary in severity, from mildly itchy skin and lip swelling to severe, life-threatening symptoms (ANAPHYLAXIS[9]) and death. In the United States, 51% of adults and 42% of children with food allergies have experienced a severe reaction.

1 "Food allergy" means the reaction of the body's immune system to certain proteins in food. Reactions can vary in severity from mild symptoms involving hives and lip swelling to severe, life-threatening symptoms, called anaphylaxis, which may involve shock and fatal respiratory problems.

2 "Major Food Allergen" mean the allergens in foods that cause over 90% of allergic reactions: milk, egg, fish (such as bass, flounder, or cod), crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, soybeans, and sesame.

3 "Food establishment" means an operation that (a) stores, prepares, packages, serves, vends food directly to the consumer, or otherwise provides food for human consumption such as a restaurant; satellite or catered feeding location; catering operation if the operation provides food directly to a consumer or to a conveyance used to transport people; market; vending location; institution; or food bank; and (b) relinquishes possession of food to a consumer directly, or indirectly through a delivery service such as home delivery of grocery orders or restaurant takeout orders, or delivery service that is provided by common carriers.

4 "Other community food sources" means food sources that are made available to the public on a need basis, e.g., food bank, food shelf, food pantry.

5 "Consumer" means a person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale

6 An adverse reaction to a substance in food that does not involve the immune system, e.g., the inability to process or breakdown a certain food such as the milk sugar lactose which can lead to discomfort or have ill effects.

7 "Food handler" means a person who handles food utensils or who prepares, processes, or serves food or beverages for people other than members of their immediate household.

8 "Food allergic reaction" means an adverse health effect arising from a specific immune response that occurs reproducibly on exposure to a given food. The immune response can be severe and life-threatening.

9 "Anaphylaxis" means a life-threatening allergic reaction due to over-release of certain chemicals in the body resulting in shock when a person with an allergy is exposed to an allergen. Allergies to food, insect stings, medications, and latex, are most frequently associated with this type of severe response, and may include skin symptoms or swollen lips, difficulty breathing, reduced blood pressure, and gastrointestinal symptoms.

The **Major Food Allergens** that cause over 90% of all allergic reactions in people are these types of food:

- Milk
- Eggs
- Fish (such as bass, flounder, or cod)
- Crustacean shellfish (such as crab, lobster, or shrimp)
- Tree nuts (such as almonds, pecans, or walnuts)
- Wheat
- Peanuts
- Soybeans
- Sesame[10]

This guide includes example procedures, considerations, and resources that a food establishment can use to respond when someone notifies the food establishment about a food allergy or reports an allergic reaction. It also provides a framework for providing consumers accurate information about food ingredients so they can make informed decisions when ordering.

Although comprehensive, this guide might not provide everything that needs to be considered for a food allergy reaction and emergency response plan. It might also contain materials that are not relevant to every food establishment, so please consider internal procedures or standard operating procedures when using this material.

10 Sesame has been added to the list of Major Food Allergens via the FASTER Act of 2021, effective January 1, 2023.

A. Training

PURPOSE This is a framework to educate food handlers about (1) the Major Food Allergens – milk, egg, fish (such as bass, flounder, or cod), crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, soybeans, and sesame; and (2) other allergy and intolerance issues they may encounter.

Duties in food establishment (intensity of training increases with responsibility)

1. PIC - Person in Charge (PIC)[11]

Training should include

a) Definitions for food allergy, food intolerance/sensitivity, and CROSS-CONTACT[12].
b) List of the symptoms of a food allergic reaction, including anaphylaxis.
c) List of the Major Food Allergens in FDA's Food Code.
d) Dangers of food allergens and how to prevent cross-contact.
e) Using proper cleaning methods, such as wash, rinse, and sanitize, to prevent cross-contact.
f) How and when to communicate with consumers and staff about food allergens.
g) Special considerations related to food allergens for workstations and SELF-SERVICE[13] areas.
h) How to handle food allergy requests.
i) How to deal with food allergy emergencies.
j) Proper food preparation for guests with food allergies.
k) How to read a food LABEL[14] and understand the importance of food labels.
l) Personal hygiene practices to prevent cross-contact.
m) How to receive and store foods that contain Major Food Allergens to prevent cross-contact.

2. Front of house; wait staff, hostess/host, to-go personnel

Training should include

a) Definitions for food allergy, food intolerance/sensitivity, and cross-contact.
b) List of the symptoms of a food allergic reaction, including anaphylaxis.
c) List of the Major Food Allergens in FDA's Food Code.
d) How to handle food allergy requests.
e) How to deal with food allergy emergencies.

3. Back of house; Food handler *(as defined in FDA's Food Code)*

Training should include

a) List of the Major Food Allergens in FDA's Food Code.
b) Dangers of food allergens and how to prevent cross-contact.
c) Cleaning and personal hygiene practices to prevent cross-contact.
d) In-depth knowledge of MENU[15] items and preparation as it relates to assigned duties.
e) Proper food preparation for consumers with food allergies.
f) How to read a food label and understand the importance of food labels.

11 "Person in Charge (PIC)" means the person present at a food establishment who is responsible for the operation at the time of inspection.

12 "Cross-contact" means the unintentional transfer of an allergen from a food or food-contact surface containing an allergen to a food or food-contact surface that does not contain the allergen.

13 "Self-service" means areas where a food handler is not present to serve a consumer and the consumer is responsible for serving themselves. Examples: buffets, salad bars, sushi bars, or display cases.

14 "Label" means a display of written, printed, or graphic matter upon the immediate container of any article; and any word, statement, or other information that appears on the outside container or wrapper of the retail package.

15 "Menu" means all written and verbal lists of foods prepared and offered in a food establishment.

4. Understanding Labels

a) Manufacturers of PACKAGED FOOD[16] products that contain a Major Food Allergen are required by law to list that allergen on the product label – including if they are, or are a component of, a flavor, color, incidental additive, or spice (i.e., sesame paste).
b) There are several ways the allergen can be listed, so CONSUMERS[17] must read product labels carefully.
   i. The allergen may be listed in a 'Contains' statement.
   ii. If the product does not have a 'Contains' statement, consumers should review the entire ingredient list.
   iii. A 'may contain' or 'produced in a facility' marking is a voluntary, separate allergen advisory statement when there is a chance that a food allergen could be present. Anything labeled in this manner should be considered to have an allergen present.
c) Common allergens can have other names. For example, caseinates (in all forms), and whey (in all forms) are all milk proteins.
d) Although the same allergen can be present in multiple ingredients, its "food source name" (for example, milk), or common or usual name, must appear in the ingredient list just once to comply with LABELING[18] requirements.

SUPPLY CHAIN CONSIDERATIONS Manufacturers change their ingredients and production methods continually and without warning; it is especially important to read the ingredient label, and ingredient statement, for the presence of major food allergens with each shipment. Contact the manufacturer in advance if you have questions about food allergens that may be in a product.

e) Major food allergen labeling information can be found within:
   - FDA's "21 CFR 101", https://www.ecfr.gov/current/title-21/chapter-I/subchapter-B/part-101
   - USDA's "Allergens – Voluntary Labeling Statements," https://www.fsis.usda.gov/guidelines/2013-0010
   - USDA's **"**FSIS Compliance Guidelines: Allergens and Ingredients of Public Health Concern: Identification, Prevention and Control, and Declaration through Labeling," https://www.fsis.usda.gov/sites/default/files/import/Allergens-Ingredients.pdf

16 "Packaged" means bottled, canned, cartoned, bagged, or wrapped, whether packaged in a food establishment or a food processing plant. "Packaged" does not include wrapped or placed in a carry-out container to protect the food during service or delivery to the consumer, by a food handler, upon consumer request.

17 "Consumer" means a person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale.

18 "Labeling" means all labels and other written, printed, or graphic matter upon any article or any of its containers or wrappers or accompanying such article.

B. Food-Handling Policies & Practices to Help Consumers with Food Allergies

PURPOSE Example policies and practices are provided here that will reduce the risk of a consumer being exposed to a food allergen.

With food allergens, it is **very important** to avoid having **even small amounts** of an ingredient to which a consumer is allergic come into contact with their food, utensils, tableware, and packaging. The unintentional transfer of an allergen from a food or food-contact surface containing an allergen to a food or food-contact surface that does not contain the allergen is called **cross-contact**. Sometimes it is obvious when an allergy-causing ingredient has gotten into a food through cross-contact because the ingredient can be easily seen, but other times it is not obvious, and great care should be taken to avoid these situations.

Following these guidelines, which apply to **all food handlers** who come into contact with food, beverages, and any food preparation surface, can help consumers with allergies avoid potentially life-threatening allergic reactions.

Train relevant staff in the following procedures

1. Food & Ingredient Storage

a) **Label** and segregate unpackaged foods containing one or more of the Major Food Allergens away from each other, and store separately from other foods and ingredients. *Make sure to read ingredient labels to check for the presence of allergens before labeling and segregating.
b) Spills of any of the Major Food Allergens should be cleaned up immediately, following the usual cleaning procedures used in the food establishment. If any Major Food Allergen accidentally comes into contact with other food ingredients that do not contain that allergen, these ingredients should be excluded from use.

2. Self-Service Items

a) For food items that were made on site, **label** the food items, or place **signs** next to the food items, that clearly identify the presence of one or more of the Major Food Allergens, or keep ingredient lists on site that identify the presence of one or more of the Major Food Allergens.
b) Labels and signage should be in both English and Spanish, and/or other languages appropriate to either the establishment, or the geographic area.

3. Taking a Food Order

a) When a consumer informs staff they have a food allergy, intolerance, or sensitivity, immediately **notify** the Person in Charge (PIC) or designated person (manager, chef, or key employees).
b) Help the consumer **identify** menu items that contain ingredients to which they are allergic and offer suggestions for alternative menu items.
c) If no alternative menu options are available, politely **inform** the consumer.
d) If it is possible to **modify** a menu item so that it does not include ingredients the consumer must avoid, inform the consumer, and ask if the modification would suit their needs.
e) **Verify** with the food handler that the proposed menu item modification is possible, feasible, and can be done safely for the consumer.
f) Make a **note** on the consumer's order that they have a food allergy/intolerance/sensitivity and which ingredients they must avoid so that other food handlers are aware.

4. Preparing a Food Order

a) Thoroughly clean all areas and equipment that will be used for preparing the allergic consumer's meal, even if those areas had already been cleaned for normal use.
b) Wash hands thoroughly before preparing the allergic consumer's meal. In some situations it may be necessary to change apron/chef coat, if previously soiled with potential allergens.
c) Use dedicated equipment or physically separate products to prevent cross-contact.

i. Use color-coded or specially marked supplies, uniforms, equipment, and utensils designated for preparing allergen-free meals.
ii. Avoid using the same cooking medium (e.g., oil or water) and surface (e.g., grill, prep table) when handling ingredients with and without allergens.

d) Use ingredients that do not contain the allergen(s) to which the consumer is allergic. Check ingredient labels for packaged foods.
e) Prepare food in a manner that eliminates cross-contact. All preparation, including garnishes, should be done by only one food handler who is dedicated to ensuring the meal is allergen-free, and who is not preparing other consumers' meals at the same time.

i. **If a mistake is made**, and an ingredient to which the consumer is allergic is accidentally included in the meal, it is **not sufficient** to simply remove the offending ingredient, because cross-contact will have occurred. In case this happens, **re-make** the consumer's meal.
ii. Wash your hands with soap and water before continuing preparation to avoid potential, or additional, cross-contact.

f) Cover the meal with a clean lid to prevent cross-contact and mark the meal as "allergy" so other staff are aware.
g) Notify the PIC, or designated food handler once the allergen-free meal is prepared and ready for service.
h) Wash, rinse, and store special equipment for allergen-free meals to be ready for next use.
i) Wash your hands with soap and water before touching anything else if you have handled a food allergen.

5. Delivering a Food Order

a) Verify with the food handler who prepared the meal that it does not contain the allergen specified by the consumer.
b) Ensure no cross-contact with other meals occurs during transport of the meal to the consumer.
c) Use a separate meal tray to deliver the meal.
d) VERIFY with the consumer that the meal meets their needs.
e) Discard the meal and offer to re-make it for the consumer if the meal contains ingredients to which the consumer is allergic. **Notify** the PIC. **Review** procedures and **retrain** the food handler(s) who prepared and handled the meal on these procedures **before** allowing them to re-make the consumer's meal.

C. Tools to Notify Consumers about Major Food Allergens

PURPOSE The purpose of this guidance is to provide examples of how to give consumers accurate information about food ingredients that are, or that contain, Major Food Allergens so they can make informed decisions when ordering. Giving incorrect or incomplete information can put consumers at risk for allergic reactions.

Consumers with food allergies depend on accurate allergen information when deciding what to eat. It is most effective to tell the consumer both verbally and in writing (e.g., on labels and menus) about the presence of food allergens and the risks of cross-contact.

1. Food Allergens in Menu Items & Self-Served Food[19] Items

a) Review your menu and source ingredients.
b) Use a table (see "Figure 1: Example Food Allergen Matrix" below), listing each menu item and noting the presence of major food allergens including all ingredients such as egg washes, sauces, garnishes, etc. Remember, a food might have more than one allergen.
c) Print "Figure 2. Allergen Matrix – Major Food Allergens Present in Menu Items" (following page) and use it for staff and consumers.
d) Assign a person in charge to regularly, at least once a year, review the food allergen table and update it as needed to verify the ingredients have not changed. Review and update when ingredients, suppliers or processes have changed, and/or a new item has been added to the menu. Consider off-menu items, seasonal and specialty items.
e) Have accessible the full list of ingredients for menu items for consumers with allergies or intolerances beyond the top nine. Consumers may be allergic to ingredients beyond the Major Food Allergens, like gluten. Understanding the full list of ingredients may help you better assist these consumers.

2. Create a Food Allergen Matrix *(based upon your current menu items)*

Figure 1. Example Food Allergen Matrix

Food Items*		Major Food Allergens								
		Egg	Fish	Milk	Peanut	Sesame	Shellfish	Soybean	Tree Nut	Wheat
Breads or Breaded	Bagels	X		X		m		m		
	Gluten Free biscuit	X		X				m	m	
	Sourdough bread									
	Croutons	X		m		m			m	
	Onion rings	X		X						
	Chicken nuggets	X						m		
	Mac and cheese	X		X						
Cheese	American			X						
	Provolone			X						
	Cheddar			X						
	Peanut oil in fryer				X			X		
Lettuce Salad	no Dressing									
	with Dressing	X		X				X		

"X" Contains this allergen.

"m" May contain this allergen or is processed in a facility with this allergen.

19 "Self-served food" means Restaurant-type food that is available at a salad bar, hot food bar, buffet line, cafeteria line, or similar self-service facility, and is served by the consumers themselves. Self-service food also includes self-service beverages, such as drinks dispensed from a soda fountain and coffee available on a self-service basis

Figure 2. Allergen Matrix[20]

Major Food Allergens Present in Menu Items

Food Items *	Major Food Allergens									Other Components			
	Egg	Fish	Milk	Peanut	Sesame	Shellfish	Soybean	TreeNut	Wheat				

"X" Contains this allergen.
"m" May contain this allergen or is processed in a facility with this allergen.
** Include off-menu items, seasonal and specialty items.*

Created on:_____ Reviewed on:_____ Next review:_____

20 A table such as this could be customized for gluten-free and other food intolerances and sensitivities by utilizing the “Other Components” column.

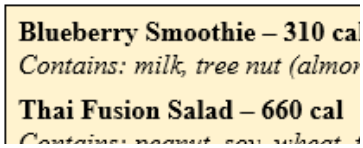
3. Menus & Signage

Design and update existing menus (including those for online ordering, catering, specials, and take-out) to ensure names and descriptions of **all** food items include Major Food Allergens present in each food. For example:

a) Have signage to notify consumers and food handlers an allergen menu exists.
b) Next to each menu item, include text to specify allergens (e.g., *Contains egg, milk*).
c) Use images (or "icons") of food allergens next to menu items where they are present. Include a key so consumers know what the icons represent. Links to websites with pre-made icons are included below.

Figure 3. Examples of notifications

Example 1: In-menu allergen notification.



Example 2: Allergen icons.

4. Talk with Consumers

a) Encourage staff to **ask consumers** about any food allergies they might have.
b) **Provide a list** of menu items and their ingredients for food handlers and consumers as a reference.
c) **Appoint at least one trained food handler per shift** to respond to consumer requests and questions about food allergens.

5. Other Ways to Inform Consumers

a) **Static clings** on display cases provide Major Food Allergen information in consumer view. **Tags or tents** next to food items also work well.
b) **Counter cards, table-talkers, or signs** at the point-of-sale or pick-up to inform consumers.
c) Consider **placing a sign in a prominent location**, when contact with a Major Food Allergen is possible or unavoidable (e.g., French fries prepared in the same fryer as breaded [wheat-containing] items).
d) **Websites** where you can find graphics and other icons for food allergens include:

i. International Association for Food Protection (IAFP) Food Allergen Icons
https://www.foodprotection.org/resources/food-allergen-icons/
ii. StateFoodSafety Allergen Icons

iii. Erudus Food Allergy Icons
https://erudus.com/standardised-food-allergy-icons/

D. Food Allergy Reaction & Emergency Response Guide

PURPOSE This section is to serve as a resource for food establishments when writing a food allergy reaction and emergency response plan. This guide includes example procedures, considerations, and resources that a food establishment can use to respond when someone reports an allergic reaction. Although this section was written specifically for food allergies, some parts are applicable to reactions caused by other exposures, such as bee stings. Example informational posters are included for you to use within your food establishment.

1. What an allergic reaction may look like

Allergies are complex and allergic reactions can vary from person to person.

Allergic reactions can present in many ways. Food allergic reactions vary in severity, from mildly itchy skin and lip swelling to severe, life-threatening symptoms (anaphylaxis) and death. Some signs and symptoms only affect one part of the body (for example, hives around the mouth). Some signs and symptoms mean that multiple areas of the body are affected (for example, dizziness).

Even within the same person, reactions can differ from food-to-food and day-to-day. For example, a person might experience itching around the mouth after eating an almond, but they could have difficulty breathing and require emergency care after eating a peanut. Even reactions to the same food on different eating occasions can cause different symptoms in the same person.

Different people, including children, experience different symptoms too. For example, not everyone experiences nausea or diarrhea during a reaction. Likewise, it is possible to have a severe life-threatening reaction (anaphylaxis) without any skin symptoms, such as a rash or hives.

2. Allergic reactions in children and adolescents

Children can experience serious food allergic reactions, with an alarming number of fatal anaphylactic reactions occurring during adolescence. Milk, egg, wheat, and soy allergies are more common in childhood than adulthood.

Children can have difficulty communicating what they are experiencing during a reaction. Some children put their hands in their mouths or scratch at their tongues. Their voices may change (for example, becoming hoarse or squeaky), and they might slur their words.

3. If someone reports an allergic reaction

These are **examples** of potential actions to take when a person reports an allergic reaction. Procedures may differ depending on the severity of the reaction. Food establishments should evaluate their need for internal procedures or additional steps. based on corporate policies or other circumstances.

*** When in doubt, call 911 ***

a) Clearly direct one person to dial 911 and report an allergic reaction.
b) Follow the directions of emergency services personnel and the food establishment's food allergy emergency response plan.

4. Epinephrine auto-injectors

a) What is an auto-injector?
EPINEPHRINE AUTO-INJECTORS[21] are medical devices for injecting a measured dose of epinephrine directly into a person experiencing an allergic reaction. The devices are designed to be given through clothing. Multiple brands of auto-injectors are available in the United States, and other countries, and may look slightly different. In the U.S., you cannot buy an epinephrine auto-injector unless you have a prescription from a health care provider. Food establishments will not be able to stock an auto-injector for general use.
Epinephrine auto-injectors have specific directions for use printed directly on the device. **Always follow the instructions printed on the auto-injector**. Always call emergency services when an auto-injector needs to be administered, as a relapse is possible.

b) Here are some example images of what an epinephrine auto-injector might look like; not all auto-injectors will look like these.

Figure 4. Examples of Epinephrine auto-injectors (EAIs)

5. Additional considerations for the food establishment

The following questions and scenarios may be used to develop a detailed food allergy reaction and emergency response plan and/or can be used as a practice drill. Not all questions and scenarios will apply to a food establishment and some food establishments might have additional questions to consider.

a) What ingredient information will be provided to a consumer if they ask? Will this information be written or verbal?

i. If a person experiences a reaction, their first question will be if the allergen was present in any of the food(s) they ate.

b) The exact numbers to dial to reach emergency services should be clearly posted by all telephones.

i. Is there an additional number to dial or extra step to get an outside line?

c) Each person should be aware of any role they play during an emergency. You may consider who will:

i. Be the primary person in charge and ensure each person is performing their duties.

21 A device for injecting oneself with a single, preloaded dose of a drug. The device typically consists of a spring-loaded syringe activated when the device is pushed firmly against the body.

ii. Call emergency services and relay information.
iii. Direct and meet emergency medical services? Are there clear instructions available on how to find the food establishment?
iv. Interact with and physically assist the consumer, if necessary.
v. Keep the area around the person experiencing the reaction clear.

d) Will the food establishment keep any allergy-specific supplies (for example, antihistamines or itch creams) on hand? If yes, when will they be used?

REMINDER Epinephrine is the only medication that can treat a severe allergic reaction and must be prescribed by a health care provider.

e) Will staff have permission to search a person's belongings for an epinephrine auto-injector if they are unable to assist?
f) Can staff administer epinephrine auto-injectors? If yes, which people have permission?
g) Is there an automated external defibrillator ("AED") available? If yes, are staff trained to use it?
h) What are the procedures if the person experiencing a reaction does not want to call an ambulance? If the person leaves before the ambulance arrives, who will pay for any charges incurred?
i) Is there a debriefing and/or reporting requirement after the incident? If yes, include those steps in the allergic reaction response plan.
j) Modify the response plan, as necessary, to better prepare for future incidents.

6. Examples of Posters *(that can be placed within your food establishment to support food allergy preparedness and emergencies)*

E. Equal Consideration for Other Community Food Sources

Other community food sources provide healthy, nutritious food to those in need. For individuals with food allergies, it can be difficult to find safe foods. People with food allergies may need additional support and it is important to consider the food sources' ability to do the following:

- Have at least one well-trained person that is available to speak with those who have allergy concerns. It is important to identify foods that do not contain *at least* the Major Food Allergens so appropriate suggestions can be made.
- Allow consumers the opportunity to review original food packaging so they can read the labels. Know the importance of reading every label, every time, as ingredients can change without warning.
- Make sure staff understand the dangers of cross-contact and how to avoid it. Find out what procedures are in place to avoid cross-contact in the storage and/or preparation of food, if it is being prepared on site, so it can be shared readily.
- If food is cooked and/or served on the premises, be sure workers knows how to recognize the signs and symptoms of anaphylaxis and what the protocols are for a food-allergic emergency.

When offering foods/meals to large groups, encourage preparation of meals that are free of the Major Food Allergens.

- If foods or meals with food allergens are served, provide materials (e.g., signage, labels, tags, tents) in prominent and visible locations to inform consumers.
- While most sections of this document are applicable to both food service venues as well as other community food sources, special attention should be paid to the understanding of how allergens are listed on food labels and the availability of food label information.

Food Sources During an Emergency and Disaster Preparedness

Whether an earthquake, hurricane or wildfire, natural disasters, in addition to man-made ones, can happen at any time, often with little notice. Establish procedures for accessing allergen-friendly foods during an emergency. A crisis is never a time to experiment with a new food or product.

Fig

Food Allergy Reactions

Nine Major Food Allergens

- Milk
- Eggs
- Fish
- Shellfish
- Tree nuts
- Peanuts
- Wheat
- Soybeans
- Sesame

Symptoms of a Severe Allergic Reaction

LUNG
Short of breath, wheezing, repetitive cough

HEART
Pale, blue, faint, weak pulse, dizzy

THROAT
Tight, hoarse, trouble breathing/ swallowing

MOUTH
Significant swelling of the tongue and/or lips

SKIN
Many hives over body, widespread redness

GUT
Repetitive vomiting, severe diarrhea

OTHER
Feeling something bad is about to happen, anxiety, confusion

OR A COMBINATION
of symptoms from different body areas.

FOR **MILD SYMPTOMS** FROM **MORE THAN ONE** SYSTEM AREA, GIVE EPINEPHRINE.

If someone is having a SEVERE ALLERGIC REACTION…

INJECT EPINEPHRINE IMMEDIATELY

Follow the instructions on the device.

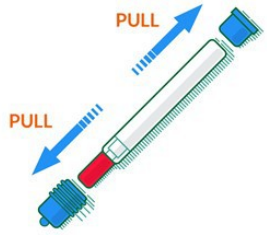
CALL 911

Tell them the individual is having an allergic reaction.

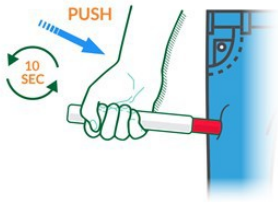
LAY them down.

If breathing is difficult or they are vomiting, let them sit up or lie on their side.

STEP 1. Prepare the epinephrine auto injector for injection by following the instructions on the device.



STEP 2. Administer the injection by firmly push the needle into the leg until a click is heard or felt. Hold the device there.



Written allergic reaction response plan is can be found here: _____

Adapted from Michigan Department of Agriculture and Rural Development, Michigan Restaurant Association, https://www.foodallergy.org/living-food-allergies/food-allergy-essentials/food-allergy-anaphylaxis-emergency-care-plan, and https://www.fda.gov/food/food-labeling-nutrition/food-allergies

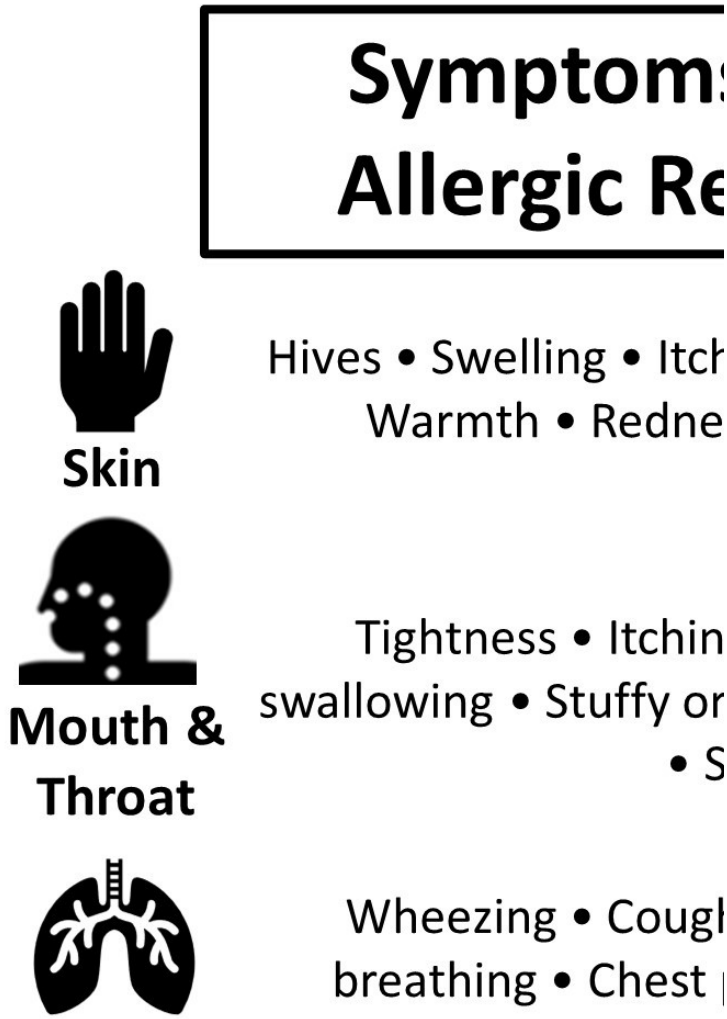


Figure 6. Symptoms of an Allergic Reaction

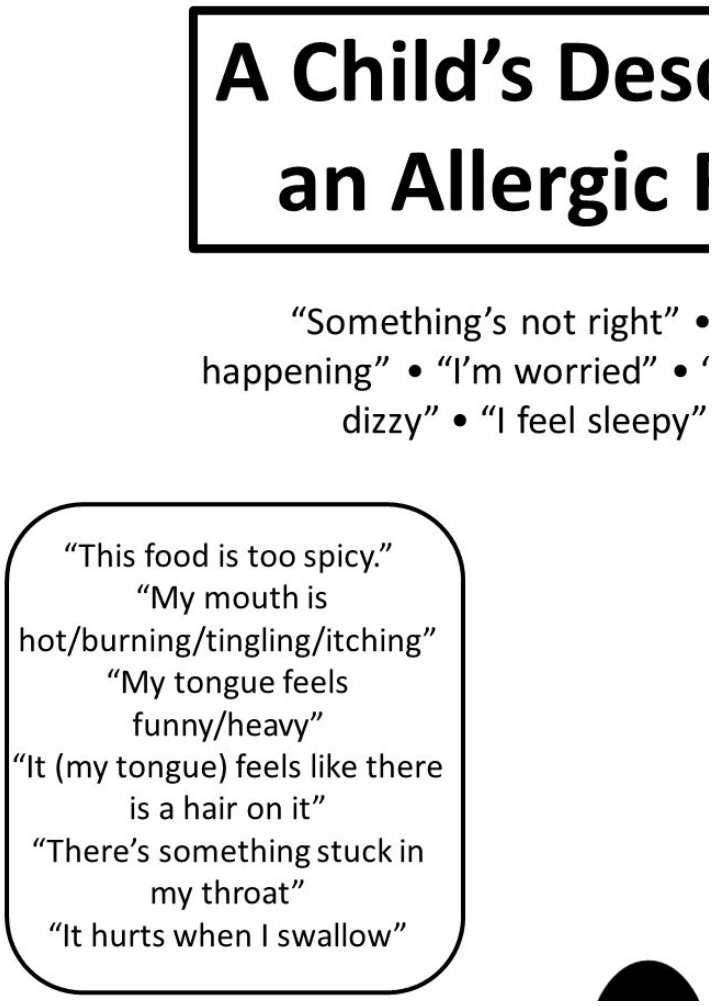

Figure 7. A Child's Description of an Allergic Reaction

Figure 8. Food Allergy Aware - Six that save lives

FOOD ALLERGY AWARE

SIX THAT SAVE LIVES

1

The Symptoms

Signs of a serious food allergy reaction – known as anaphylaxis – are 2 or more of the following after eating a suspect food:

- Hives, itching and/or skin redness
- Swelling of the tongue, lips or throat
- Breathing difficulty, wheezing or coughing
- Stomach cramps or vomiting or diarrhea
- Feeling faint / drop in blood pressure (If only this 1 symptom, it is still anaphylaxis.)

2

In Anaphylaxis: Use the auto-injector right away. Call 911 and report a food allergy emergency.

Epinephrine shots are given via the auto-injector to the outer thigh muscle. This is considered a very safe drug. Antihistamines are acceptable as secondary medication only. They won't halt anaphylaxis. Allergists say: err on the side of using the auto-injector.

3

Time is of the Essence

In studies of those who have died of anaphylaxis, they did not receive an epinephrine injection, or they got it too late, after a reaction had progressed. In anaphylaxis, prompt use of the shot is always essential.

4

Go to the Hospita

A person who had an eme epinephrine shot must be to hospital for observation. transport, IF symptoms ha improved within 10 to 15 n a second auto-injection s be given.

5

Reclining is Best

During the ambulance r the person having the se reaction should be lying d with the legs raised (this im blood flow). NIAID guidel recommend the patient re oxygen and IV fluid.

6

Don't Go It Alone

No person should be exp to be fully responsible fo administration of an epine auto-injector. Assistance anaphylaxis is crucia

From allergicliving.com. Based on guidelines from NIAID and the Canadian Society of Allergy and Clinical Immunology.

Definitions

Anaphylaxis
A life-threatening allergic reaction due to over-release of certain chemicals in the body resulting in shock when a person with an allergy is exposed to an allergen. Allergies to food, insect stings, medications, and latex, are most frequently associated with this type of severe response, and may include skin symptoms or swollen lips, difficulty breathing, reduced blood pressure, and gastrointestinal symptoms.

Consumer
A person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale.

Cross-contact
The unintentional transfer of an allergen from a food or food-contact surface to a food or food-contact surface that does not contain the allergen.

Epinephrine auto-injector
A device for injecting oneself with a single, preloaded dose of a drug. The device typically consists of a spring-loaded syringe activated when the device is pushed firmly against the body.

Food allergic reaction
An adverse health effect arising from a specific immune response that occurs reproducibly on exposure to a given food. The immune response can be severe and life-threatening.

Food allergy
The reaction of the body's immune system to certain proteins in food. Reactions can vary in severity from mild symptoms involving hives and lip swelling to severe, life-threatening symptoms, called anaphylaxis, which may involve shock and fatal respiratory problems.

Food establishment
An operation that (a) stores, prepares, packages, serves, vends food directly to the consumer, or otherwise provides food for human consumption such as a restaurant; satellite or catered feeding location; catering operation if the operation provides food directly to a consumer or to a conveyance used to transport people; market; vending location; institution; or food bank; and (b) relinquishes possession of food to a consumer directly, or indirectly through a delivery service such as home delivery of grocery orders or restaurant takeout orders, or delivery service that is provided by common carriers.

Food handler
A person who handles food utensils or who prepares, processes, or serves food or beverages for people other than members of his or her immediate household.

Food intolerance/sensitivity
An adverse reaction to a substance in food that does not involve the immune system, e.g., the inability to process or breakdown a certain food such as the milk sugar lactose which can lead to discomfort or have ill effects.

Label
A display of written, printed, or graphic matter upon the immediate container of any article; and any word, statement, or other information that appears on the outside container or wrapper of the retail package.

Labeling
All labels and other written, printed, or graphic matter upon any article or any of its containers or wrappers or accompanying such article.

Major Food Allergen
The allergens in foods that cause over 90% of allergic reactions: milk, egg, fish (such as bass, flounder, or cod), Crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, sesame, and soybeans.

Menu
All written and verbal lists of foods prepared and offered to consumers.

Other community food sources
Food sources that are made available to the public on a need basis, e.g., food bank, food shelf, food pantry.

Packaged food
"Packaged" means bottled, canned, cartoned, bagged, or wrapped, whether packaged in a food establishment or a food processing plant. (2) "Packaged" does not include wrapped or placed in a carry-out container to protect the food during service or delivery to the consumer, by a food handler, upon consumer request.

Person in Charge (PIC)
The person present at a food establishment who is responsible for the operation at the time of inspection.

Self-served food
Restaurant-type food that is available at a salad bar, hot food bar, buffet line, cafeteria line, or similar self-service facility, and is served by the consumers themselves. Self-service food also includes self-service beverages, such as drinks dispensed from a soda fountain and coffee available on a self-service basis.

Self-service
Areas where a food handler is not present to serve a consumer and the consumer is responsible for serving themselves, such as at a buffet, salad bar, sushi bar, or display case.

Train relevant staff in the following procedures:

1. Food & Ingredient Storage

a) Label and segregate unpackaged foods containing one or more of the Major Food Allergens away from each other, and store separately from other foods and ingredients. *Make sure to read ingredient labels to check for the presence of allergens before labeling and segregating.

b) Spills of any of the Major Food Allergens should be cleaned up immediately, following the usual cleaning procedures used in the food establishment. If any Major Food Allergen accidentally comes into contact with other food ingredients that do not contain that allergen, these ingredients should be excluded from use.

2. Self-Service Items

a) For food items that were made on site, label the food items, or place signs next to the food items, that clearly identify the presence of one or more of the Major Food Allergens, or keep ingredient lists on site that identify the presence of one or more of the Major Food Allergens.

b) Labels and signage should be in both English and Spanish, and/or other languages appropriate to either the establishment, or the geographic area.

3. Taking a Food Order

a) Encourage staff to ask consumers about any food allergies they might have.

b) When a consumer informs staff they have a food allergy, intolerance, or sensitivity, immediately notify the Person in Charge (PIC) or designated person (manager, chef, or key employees).

c) Provide a list of menu items and their ingredients for food handlers and consumers as a reference.

d) Help the consumer identify menu items that contain ingredients to which they are allergic and offer suggestions for alternative menu items.

e) If no alternative menu options are available, politely inform the consumer.

f) If it is possible to modify a menu item so that it does not include ingredients the consumer must avoid, inform the consumer, and ask if the modification would suit their needs.

g) Verify with the food handler that the proposed menu item modification is possible, feasible, and can be done safely for the consumer.

h) Make a note on the consumer's order that they have a food allergy/intolerance/sensitivity and which ingredients they must avoid so that other food handlers are aware.

4. Preparing a Food Order

a) Thoroughly clean all areas and equipment that will be used for preparing the allergic consumer's meal, even if those areas had already been cleaned for normal use.

b) Wash hands thoroughly before preparing the allergic consumer's meal. It is necessary to change apron/chef coat, if previously soiled with potential allergens.

c) Use dedicated equipment or physically separate products to prevent cross-contact.

   i. Use color-coded or specially marked supplies, uniforms, equipment, and utensils designated for preparing allergen-free meals.

   ii. Avoid using the same cooking medium (e.g., oil or water) and surface (e.g., grill, prep table) when handling ingredients with and without allergens.

d) Use ingredients that do not contain the allergen(s) to which the consumer is allergic. Check ingredient labels for packaged foods.

e) Prepare food in a manner that eliminates cross-contact. All preparation, including garnishes, should be done by only one food handler who is dedicated to ensuring the meal is allergen-free, and who is not preparing other consumers' meals at the same time.

   i. If a mistake is made, and an ingredient to which the consumer is allergic is accidentally included in the meal, it is not sufficient to simply remove the offending ingredient, because cross-contact will have occurred. In case this happens, re-make the consumer's meal.

   ii. Wash your hands with soap and water before continuing preparation to avoid potential, or additional, cross-contact.

f) Cover the meal with a clean lid to prevent cross-contact and mark the meal as "allergy" so other staff are aware.

g) Notify the PIC, or designated food handler once the allergen-free meal is prepared and ready for service.

h) Wash, rinse, and store special equipment for allergen-free meals to be ready for next use.

i) Wash your hands with soap and water before touching anything else if you have handled a food allergen.

5. Delivering a Food Order

a) Verify with the food handler who prepared the meal that it does not contain the allergen specified by the consumer.

b) Ensure no cross-contact with other meals occurs during transport of the meal to the consumer.

c) Use a separate meal tray to deliver the meal.

d) VERIFY with the consumer that the meal meets their needs.

e) Discard the meal and offer to re-make it for the consumer if the meal contains ingredients to which the consumer is allergic. Notify the PIC. Review procedures and retrain the food handler(s) who prepared and handled the meal on these procedures before allowing them to re-make the consumer's meal.

6. If someone reports an allergic reaction

*** When in doubt, call 911 ***

a) Clearly direct one person to dial 911 and report an allergic reaction.

b) Follow the directions of emergency services personnel and the food establishment's food allergy emergency response plan.

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Rollcall	Michelle Hill
iii.	CFP Antitrust Statement	Amani Babekir
iv.	Identify a Committee Scribe	Michelle Hill (via Teams transcription service)
v.	Review CFP Timeline for Committee Work	Michelle Hill
vi.	Review of Committee Charges	Michelle Hill
vii.	Overview of Committee Plan of work	Amani Babekir
viii.	Action Items	Amani Babekir and Michelle Hill
ix.	Determine next meeting date	Tuesday, Nov 23, 2021, 2 pm EST
x.	Adjournment	Amani Babekir
xi.	Attachments to Minutes	Yes

MEETING MINUTES

i. Call to Order – Amani Babekir

This first meeting of the CFPs Council II Allergen Committee will now come to order at 11 am EST on November 12, 2021 … As this is our first meeting there are no minutes to approve.

ii. ROLLCALL – Michelle Hill - 15/19 Voting Members present [*9 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – Read out by Amani Babekir

This Antitrust Statement is to inform the Conference for Food Protection (CFP) Executive Board members and the general membership of CFP that whenever competitors within an industry gather together, appropriate care must be taken to ensure that violations of antitrust laws do not take place.

CFP functions, be they conferences, board or committee meetings, by their very nature, bring competitors together. To avoid antitrust allegations it is necessary to avoid discussions of sensitive topics. Agreements to engage in product boycotts, restrictive market allocations, refusal to deal with third parties and price-restraining activities are automatically illegal under antitrust laws.

An antitrust violation does not require proof of a formal agreement. There need not be written or verbal agreement to collude. Also, conversations regarding any of these sensitive areas may be construed as implicit violations. As a result, those attending CFP-sponsored functions should remember the importance of avoiding not only unlawful activities but even the appearance of unlawful activity.

The antitrust laws – the Sherman Act, Clayton Act, and the Federal Trade Commission Act – are intended to ensure free and open competition. Violations of these laws can have serious consequences for CFP and its members. Violations are felonies that can result in severe penalties and significant litigation expenses for CFP and its members. Even if a government or private suit is successfully defended, the cost and disruption of the litigation can be overwhelming. Taking antitrust precautions, therefore, is not only advisable but imperative.

For your protection, the Conference for Food Protection recommends that, should one of these subjects be brought up, it would be in your best interest to voice your objection and disassociate yourself from the discussion if it continues.

iv. Committee Scribe

Michelle Hill will vet meeting minutes and curate the file moving forward. Meeting minutes to be approved at the start of the next meeting.

v. Review CFP Timeline for Committee Work – Michelle Hill

This timeline was produced by the 2023 Biennium Executive Board. As we all are aware, we are operating on a condensed timeline for this biennium. We have just over 12-months to address and complete the charges assigned to this committee.

The EB has yet to publish a more specific timeline. As more information is made available, we will be sharing exact dates.

As you can see from this list, we have deadlines dictating the completion and submission of our work to our Council II Chairs, Co-Chairs, and EB.

Committee reports are due in March, July, September, and November.

2022	March	**Due: Committee Reports submitted to Council (14-days prior to EB-mtg)**
	April	EB Meeting – Westin Galleria - Houston TX
	May/June	Opens: 30-day period to apply online for Councils for 2023 Biennium
	July	**Due: Committee Reports submitted to Council** Review: Council Chairs review 2023 Council Applicants Due: Recommendations for Council - 30-days prior to EB Meeting
	August	EB Meeting: TBD EB Approve: Council Members for 2023 Biennium Due: 2023 *draft* Registration Packet for EB review Finalized: Registration Fees for 2023 Biennium Sponsorship categories, benefits, fees Consider: Workshop topics for 2023 Biennium
	September	Send: Notification to Council Applicants **Conference Call: Issue Chair hosts call with Council and Standing Committee Chairs and Co-Chairs** Site Visits: for future Biennial Meeting 2025/2026 Midwest Region TBD Due: Meeting venue contract negotiations for EB approval.
	October	Released: 2023 Issue Pre-submission form; Issue submission guidelines Distribute: Registration Packets
	November	Send: Delegate Letters – 150-days prior to Biennial Meeting (mandated) **Due to Council Chairs for Review: Final Committee Reports; Prospective Committee Issues** Send to EB for Review: Standing Committees Documents Due: Feedback to Committee Chairs from Conference Chair/EB/Council Chairs Submit: Revised Final Reports submitted to Issue Chairs for review and comment Submit: Revised Issues submitted to Issue Chairs for review and comment
	December	Opens online: 30-day submission period for 2023 Biennium
2023	January	Close: Issue submission mandated to close not less than 90-days prior to Biennial Meeting
	February	Deadline: Submit Official State Delegate Voting Form Finalize and Assign: Issue Committee completes review and assigns each to a Council for deliberation
	March	Available: Director produces Issue Packets, mandated at least 40-days prior to Biennial Meeting Due: Reports for EB due to Director
	April	21st -28th Biennial Meeting – Westin Galleria -Houston TX

vi. Review of Committee Charges – read out by Michelle Hill

1. Develop an operational framework for food allergy prevention and control using existing research and other evidence-based materials (for example: CDC guidance in schools and guidance developed by retail food industry) in retail food establishments including:
   a. A written template retail food establishments can use to reduce the risk of food allergy reactions and respond to any reactions that do occur. The template can incorporate findings, lessons, materials, etc. from items 2-6.
   b. Steps to take during a food allergy emergency and identify key components of food allergy emergency plans.
   c. Food allergy training for food workers and identify educational content and training needs based on employees' assigned duties.
   d. Findings, recommendations, and materials from the 2018 Allergen Committee to ensure retail food establishments have tools to notify customers when menu items contain major food allergens.
   e. Food-handling practices, policies, and procedures to prevent food allergens from unintentionally contacting another food.
   f. Equal considerations for alternate food sources, such as food pantries and food banks, to ensure equity and access.
2. Recommend changes to the Food Code that support retail food establishments to operationalize framework to prevent and control food allergic reactions.
3. Report back findings and recommendations to the next Biennial Meeting of the Conference for Food Protection.

vii. Overview of Committee Work Plan/Timeline – Amani Babekir

a) collect materials and resources … complete by the end of November.

b) sorting of collected materials

c) categorize it into categories and then we assign workgroups to these categories.

d) workgroups will evaluate resources and determine the materials … to construct framework.

e) Collection and analysis completed by end of March

f) April - write template to be used by … retail food … to manage the risk of allergy … template is also going to be part of the framework.

g) Framework to complete by … July the 30th.

h) Identify possible change to the food code by the end of October – clear Framework written and reviewed.

i) Finalize Committee work – by end of December 2022.

Steps to Completion	Completion Date
Collect materials/resources	November 30
Assign work groups	December 30
Evaluate materials/resources	March 30
Write a template	April 30
Written framework	July 30
Changes to the Food Code	October 30
Final Report	December 30

Amani Babekir: I'm opening the floor for discussion from all of you. So, if you have a point or suggestion or comments, please raise your hand.

Michelle Hill: Madam Chair, I don't see any hands raised.

Amani Babekir: I would like to have a motion to accept or decline the workplan. Can I get first and a second on this motion please?

Michelle Hill: I move to accept this workplan.

Vinson, Scott: Second … the motion.

Babekir, Amani: And let us proceed with the vote on the motion … To make it simple … voting YES for **non-acceptance**. …if anyone opposed to the motion please say no or raise your hand … Do we have any abstain … motion pass to accept the committee work plan. Thank you.

viii. Action Items – Amani Babekir

Amani Babekir: Per our work plan we need to complete the collection of the material and resources … by the end of this month. THANK YOU FOR CONTRIBUTING: James Baldwin, Jennifer Green, Ben Wagner. From the beginning of this committee work we are looking to add extra resources and materials to the research FDA and CDC, USDA … local regulatory … if you are aware of any resources, please send it to us. You could send the link or the PDF file.

Cartagena, Mary: clarification …. Is it any resource on allergens or is there something specific that you're looking for?

Amani Babekir: Yes … it's more about controlling allergy in education about allergen and managing allergy in public setting or in food service areas.

Michelle Hill: We have not yet been able to set up a collection point on … Teams … as soon as we're able … start pulling all those resources in one - we'll send out an email when completed - you can go and check it out and we don't repeat effort.

Resource	Completed

ix. Meetings Schedule for 2022 / 2023

- Bi-weekly meeting
- Thursday's
- 2 - 3 pm EST, 1 - 2 pm CST, 12 - 1 pm MST, 11 am – 12 pm PST
- Teams – configure access and data storage

Amani Babekir: [Opens Discussion around the proposed Committee Meeting Schedule]

Mortiz, Erin – makes suggestion regarding meeting times, alternating days of week so if you cannot attend one you may be able to attend another.

Amani Babekir: set up recurring meeting every Thursday … will monitor your emails and responses to every meeting and invitation as it approaches … those who cannot attend … could suggest a better time or day …. to move it. [Request for questions / discussion]

Thoma, Libby – Yes, I was wondering if it's possible to have a proxy attend in our place if we have a desk, one dedicated person to fill in as our backup. If we're not able to attend.

Courtney Halbrook – I serve as vice chair of Council 2 and … The correct answer is I'm not 100% certain … so we'll get back to you. But it's a great question. Will find an answer.

Babekir, Amani – That sounds good. Thank you, Courtney … we will send out an email once Courtney clarifies. Any further suggestions or a question? [silence] I would like to have a motion to accept or decline the timeline proposed here. Can I get first and second on this motion?

Vinson, Scott – I move to accept this schedule.

Baldwin, James – … I … second.

Babekir, Amani - Thank you, so let's proceed with the vote on this motion. Is there anyone opposed to the motion? Please say no or raise your hand? [silence] Do we have any abstaining? [silence] Thank you so Motion passes … we will accept this schedule and adjust it as it needed. Thank you. I would like have a motion … to accept or decline the next meeting Tuesday, November 23rd from 2:00 to 3:00. … Can I get a first and second on this motion?

Vinson, Scott – Moves the motion

Ben Wagner – Seconds the motion.

Babekir, Amani - Thank you, let's just proceed with the vote on the motion … anyone opposed motion, please say no. [silence] Do we have any abstaining? [silence] The motion passes - we will have our next meeting Tuesday, November 23rd from 2:00 to 3:00 Eastern Time. **ACTION** – Co-Chairs will send out email invites for meetings.

FSIS Compliance Guidelines Allergens and Ingredients of Public Health Concern: Identification, Prevention and Control, and Declaration through Labeling

Food Allergies Webpage

Ongoing Verification of Product Formulation and Labeling Targeting the Eight Most Common (BIG 8) Food Allergens - Revision 2

Allergens- Voluntary Labeling Statements

Availability of FSIS Compliance Guidelines for Allergens and Ingredients of Public Health Concern: Identification, Prevention and Control, and Declaration Through Labeling (79 FR 22083)

Meeting Number 02	Meeting Date **11/23/21**	Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair; Meeting Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour	Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Rollcall	Michelle Hill
iii.	CFP Antitrust Statement	Included via attachment to Meeting Invitation email.
iv.	Identify a Committee Scribe	Michelle Hill (via Teams transcription service)
v.	Meeting Minutes	Michelle Hill
vi.	Accessing Teams	Amani Babekir
vii.	Collect Resources	Michelle Hill
viii.	Action Items	Verify access to Teams and the Resources folder
ix.	Adjournment	Amani Babekir

MEETING MINUTES

i. Call to Order

ii. ROLLCALL - 16/19 Voting Members present {*9 required for quorum}*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Committee Scribe

Michelle Hill will vet meeting minutes and curate the file moving forward. Meeting minutes to be approved at the start of the next meeting.

v. Approve previous Meeting Minutes (11/12/21)

Motion passed via voice vote.

vi. Accessing the folder of Resources for evaluation – Amani Babekir

Showed the committee members how to access the Resource folder within Teams.

The FDA members are not able to access the Teams folders so have requested another method of distribution. We agreed to send documents, when needed, via email attachment, and also recommended that members access document via the SharePoint interface of Teams.

Two additional document repository services were recommended to try – Dropbox and Adobe Cloud.

vii. Overview of Collected Resources – Michelle Hill

Showed the committee members the folder of Resources that need to be reviewed. We opened the floor for discussion, and it was suggested that we choose an evaluation method to screen documents for further evaluation. Additional resources were shared by committee members via the Chat in Teams.

viii. Action Item

Co-chairs agreed to send out two options to access documents: Teams and SharePoint; requested members email the Co-Chairs with access issues so they can be addressed before the next meeting.

xi. Meeting Adjourned – Amani Babekir

Meeting Number 03	Meeting Date **12/09/21**	Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair; Meeting Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour	Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Rollcall	Michelle Hill
iii.	CFP Antitrust Statement	Included via attachment to Meeting Invitation email.
iv.	Meeting Minutes	Michelle Hill (via Teams transcription service)
v.	Review Committee Work Plan	Amani Babekir
vi.	Access to Resources	Michelle Hill
vii.	Evaluate Collected Resources	Amani Babekir
viii.	Assign Documents for Evaluation	Michelle + Amani
ix.	Adjournment	Amani Babekir

MEETING MINUTES

i. Call to Order

ii. ROLLCALL

18/19 Voting Members present {*10 required for quorum}*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Meeting Minutes

Michelle Hill will vet meeting minutes and curate the file moving forward. Meeting minutes to be approved at the start of the next meeting.

Motion to approve Meeting Minutes made by NAME, seconded by NAME, approved via voice vote.

v. Review of Committee Work Plan

Steps to Completion	Completion Date
Collect materials/resources	November 30
Assign work	December 30
Evaluate materials/resources	March 30
Write a template	April 30
Written framework	July 30
Changes to the Food Code	October 30
Final Report	December 30

vi. Access to Resources

Three Ways to Access Documents

- CFP Teams > Files > Council II > Allergen Committee > Members > Collected Resources

- CFP SharePoint via Teams
- Email attachments

vii. Evaluate Collected Resources

Collected Resources

Folder Name	#
CDC related	2
CFP related	6
FDA related	20
International	39
Regulations	18
Regulatory – State and Local	21
Research 1. Allergen control 2. Allergen Labeling 3. Allergens educating about 4. Allergens general info	 28 14 20 133
USDA related	9

1. Co-chairs evaluate documents using the "Evaluating Information Source" form
2. Files that meet criteria will be assigned to reviewers

Deadline 12/30/21

Evaluation Form

Evaluating Information Sources

Criteria	(Yes/No)
Document Purpose	
Provide information, persuade or advocate	Yes
Intended audience	
Food retail, food service, food industry, public, researchers	Yes
Authority and credibility	
the resource has authority/credibility	Yes
Accuracy and reliability	
The information well researched?	Yes
Currency and timeliness	
The information is not outdated or updated/revised in another version?	Yes

If you answer "Yes" to all of the criteria items, please proceed to the information collection step using the "**Information Collection Form**"

Information Collection Form

Allergen Committee –Information Collection Form

Name: Amani Babekir	
Document Title/Date: Food Allergen Notifications: A Guidance for Industry / 2020	
Document Source: CFP 2020 – Allergen Committee	
Document Pass Information Criteria (Yes/No): Yes	
Allergy emergency	
Steps during allergy emergency	
Components of food allergy emergency plans	
Employee Training	
Education content	
Training per assigned duties	
Food-handling practices to prevent cross-contact	
Policy	
procedures	
Equity access	
Alternative food sources	
Tools for retails to notify customers about item containing allergen (CFP previous committee)	
• A combination of verbal and written allergen notifications. • Notifications should be specific to menu items and the major food allergens they contain, rather than generic warnings that may apply to the entire menu or food preparation environment. • Food allergen notifications should address all ingredients containing major food allergens, including "hidden ingredients," such as egg washes, sauces, garnishes, etc. • If food operation is not able to accommodate an allergen-free order. Be open and honest with the consumer about the limitations of the establishment in controlling food allergens. **More illustration/details in the documents**	

viii. Assign Documents for Evaluation

- Members will be notified by email of the documents to evaluate.
- The assigned document will be sent by email to each reviewer.
- Forms will be sent to each reviewer by email
- Forms and documents will be available in Teams
- Objections and Discussions – Darby's statement and request to just begin by writing a draft framework ….

ix. Meeting Adjourned

Next meeting: December 23, 2021 - 2:00 EST

Meeting Number 04	Meeting Date **12/23/21**	Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair; Meeting Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Rollcall	Michelle Hill
iii.	Meeting Scribe	Amber Potts
iv.	CFP Antitrust Statement	Amani Babekir
v.	Previous Meeting Minutes	Amani Babekir
vi.	Reconsider Work Plan	Amani Babekir and Michelle Hill
vii.	Adjournment	Amani Babekir

MEETING MINUTES

i. Call to Order

ii. ROLLCALL - 15/17 Voting Members present {*10 required for quorum}*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

There were no meeting minutes for call held 12/23/2021 as there was not a quorum. Meeting minutes for 12/09/2021 were voted on. Motion to approve Meeting Minutes 12/09/2021 as is made by Scott Vinson, seconded by Ben Wagner, approved via voice vote. Today's meeting minutes scribed by Amber Potts.

v. Reconsider Work Plan

The original process was to use the form created to evaluate the documents and a form to collect information needed. The resources would be split into sections and assigned out.

Madam Chair *entertained a motion* regarding reviewing only the shared resources, attached to the email meeting invitation. The shared resources are those added by the committee only.

No motion to proceed. Motion dies.

Several committee members expressed issues with accessing the resource link on the shared resource document stating there are issues with security risks on the document, unable to open the link, some links were not working. Vy Goddard suggested all members to list the resources by charges and see if everyone's match.

Madam chair *entertained a motion* to proceed as Vy suggested.

Steven von Bodungen motioned to proceed. Amanda Garvin seconded.

Discussion opens. Michelle Hill asks Vy to repeat the suggestion. Vy clarifies that we would all review the shared resource document and assign links to specific charges, the groups would be assigned charges. This would negate the need for any collection forms Vote on motion: 0 opposed, 0 abstain. *Motion passes.*

Vy screen shared to show example. Groups would compile everything then vet resources at the next meeting. Vy would begin working on this.

Scott Vinson raises a question: For charges 1a, it states relating to items 2-6. There are no items 2-6.

Michelle Hill clarifies it means b-f, all items below 1a or the remaining part of the list. Charge 1 refers to SOPs and 1b are the steps to take. Looking at the Australia and New Zealand resources, they have implemented allergen training modules at the Federal level for specific retail establishments: hospitals, restaurants, schools, etc. They have methods and modules we can use to build our framework.

Amani mentions that we are vetting the resources because they are going to be the components of the framework.

Scott Vinson comments: Allergy training is one of *many* trainings for employees. Due to the high turnover and limited period for training Scott suggests that what ever materials we prepare should be concise and conveyed quickly.

Steven von Bodungen backs up the comment and agrees materials should be concise and to the point.

Amber Potts also agrees, and the materials should be in plain language. Vy suggests making flyers, stickers, and magnets. Cassandra Mitchell agrees with Vy, there are many languages spoken so pictures would be great.

Libby Thoma mentions to look in the ServSafe exam. There is limited information on allergens and ServSafe is not focused much on food production. ServSafe should be added to the resource page. ServSafe has an online allergen module.

Crystal Eisner says she would look into Responsible Training, link already on the shared resource page.

Scott Vinson suggests that the workers in food service ask if the consumer has any food allergies or to post a sign to encourage customers to let the server know of the allergy. For customers to take more responsibility. Several members agree and it is suggested that conversation happen with the PIC or the manager, not necessarily the server.

Amani Babekir asks if we should begin preparing the framework at the next meeting to add in these points made. Several members agree.

David Read raises a question if we should not just limit the allergen training and this framework to focus on worker but also for managers and even up to the corporate level?

> Scott suggests not bringing it to the corporate level and to focus on the workers. He recommends listing the most common allergens with graphics so they can quickly see them.
>
> Christine Sylvis says there are a lot of resources from SNHS we can use. She shares her screen so we can view the Big-8 infographic. The smaller 'Just Ask' infographic was not successful in their local campaign.

Amanda Garvin likes SNHD and states we should base our material on their resources; Suggests the dairy allergen graphic be something other than a glass of milk.

Scott Vinson also likes SNHD and proposes *to move a motion.*

Madam chair *entertains a motion* that on the next call we will review all the SNHD resources and decide which to incorporate into the work project.

> Michelle Hill motions to proceed. Amanda Garvin seconds.

Motion opens for discussion. Christine Sylvis is happy to share all the information in a format that we can utilize, Word document etc. Amber Potts mentions that NEHA has a Canva account and can make infographics.

Vote on motion: 0 opposed, 0 abstain. *Motion passes.*

vi. Next call

- We will look into SNHD resources. Christine to send resources in an email.
- Armani and Michelle will begin building out the framework.
- Vy clarifies that we will no longer be reviewing the shared resource document.

Amanda Garvin raises a question: Is our work directed toward industry and not inspectors and only to change the food code?

Greg Able answers yes. Reminds us that this is for all institution types in the retail setting: grocery, deli, restaurants, schools, food trucks etc.

Libby Thoma asks if we can see the work completed from the 2018 committee?

Amani answers work can be viewed from CFP website, ask for all issues and attachments.

vii. Meeting Adjourned - Next meeting January 20th 2022. .

Meeting Number	Meeting Date		Meeting Time
06	**01/20/2022**		2:00 pm EST

AGENDA

i. Rollcall – Michelle Hill

ii. Scribe (Volunteer) – Amber Potts

iii. CFP Antitrust Statement – Amani Babekir

iv. Meeting Minutes Approval – Michelle Hill

v. Review SNHD Resources - Committee

vi. Framework Points - Committee

vii. Adjournment – Amani Babekir

MEETING MINUTES

i. Call to Order – Amani Babekir

ii. ROLLCALL – 13/17 Voting Members present [*10 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

Madam Chair *entertained a motion* to approve previous meeting minutes from 1/6/2022 meeting.

Scott Vinson moved to approve minutes.

Jim Baldwin seconded the motion.

Madam Chair opened the floor for discussion. Michelle Hill recognized Amber Potts for a god job on previous meeting minutes.

Vote on motion: 0 opposed, 0 abstained. *Motion passed* to accept previous meeting minutes as they were submitted.

Christine Sylvis asked about icons from the 2018 Allergen Committee. She is unable to find the icons and would like for us to see them

Madam Chair said she will look into finding the icons.

Amber Potts scribed today's meeting minutes.

v. Review SNHD Resources

Madam Chair screen shared SNHD resource page we received by email. We began reviewing links in resource page one at time. Question raised by Scott Vinson; should we click on the links in the documents? Madam chair answered yes.

Allergy Aware Poster:

Michelle Hill- the poster is an excellent resource and categorized correctly and associated with charges.

Michelle Hill – will SNHD be updating for sesame? Christine Sylvis answered, yes SNHD can update to include sesame.

Amber Potts – maybe we should change photos? Is this intended for food handlers? Answers is yes, it's for food handler. So, we could put in more specific photos to show the kinds of food these allergens are present in.

Jennifer Green – seconds changing photos to things we eat that have the allergen in them.

Michelle Hill – thirds. To look for alternative graphics.

James Baldwin – Recommends storing the poster with food as reminder and to create awareness and be used as a training tool [by inspectors] when on site to explain major allergens and what a food handler's role is. Will illicit awareness and quick reference and what to do, how to recognize a reaction.

Scott Vinson – Pictures aren't going to be the way those appear in a restaurant. Some are additives to food items that aren't able to be seen. We may have a hard time finding pictures to represent this.

Erin Moritz – agree with Scott. Unless we want an exhaustive list we may want to stick with them [current graphics]. If we make food specific photo it may be seen to the food worker as the only thing to worry about, example being bread.

Amanda Garvin– Answer will lie somewhere in the middle. Agree about changing milk picture as dairy, but maybe have a few more things. This will not work without some sort of training – combined with training. Answer of including (example dairy) has three main ingredients casein, whey, and lactose as proteins people are allergic to. List proteins people are allergic to.

Scott Vinson– Wheat is its own challenge. When customers say they have a wheat allergy they probably mean they have celiac disease, which is not the same as an allergen. Whey, barley, oats etc. Not sure how to visually depict wheat. What is our committee charge on gluten or related celiac disease, not an allergy?

Erin Moritz– agree simpler is better. End result is to not expose customers to what they can't eat. In training, it would be worth to introduce, at a very high level, that celiac is a different outcome than with someone with a food allergy. Allergy vs sensitivity vs celiac.

Vy Truong – keep things simple. Resources specific to PIC can be more thorough than with food worker. The PIC can narrow it down to what they have in their facility.

Amanda Garvin – We do need something simple, quick but where do we draw the line of simple? We need to take things forward before we know the line. Agree that we should define a few things to eliminate confusion. So we can help break myth that people who aren't allergic will not die if they are exposed.

Jenna Seymore – The problem is that within the restaurant world a lot of restaurant tell the customer to say you have an allergy so it alerts people and increases seriousness even if it's not an allergy.

James Baldwin – Referring back to a comment in last meeting by Scott regarding practicality and simplicity and competing training. Most food establishments don't have labs or scientist – recommend we be simplistic about 8 major allergens. Can't make it too complex or it will not work well.

Cassandra Mitchell – concur with Vy to keep it simple and training will be essential. Ask Cristine – how has this been received at SNHD establishments?

Christine Sylvis– Received really well. Did this as intervention strategy, the risk factor survey identified we weren't doing a good job about educating on allergens. Did include industry in creating strategy. Response always poster is a good idea. SOP good idea. Having a logo or something to say we are educated on allergens was not received well, thought there was liability on their part. Inspections talked about allergens and importance and things food hander could do. Promotional to handout purple marker to hand write allergen orders. Discussion about allergens – sees posters up, helps with PIC knowledge. Statistics show a significant improvement on allergy awareness on follow up study.

Madam Chair asked if we can more forward with using the poster as a resource. Several members said yes we want to use poster.

Allergy Awareness Video

Amber Potts – There may be an issue with using video for training due to language barrier.

Scott Vinson in chat: I think it's a great video and I watched nearly the whole thing, but I think it might be a bit long for our purposes.

James Baldwin – Is the intent to use the video as part of the process -or use ideas from the video in the frame work (recommend second)? There are states that require managers allergen cert requires food handlers to view video and take a test and completed annually.

Madam Chair proceeded to next resource.

Allergen Guide

Scott Vinson in comments: I think it's a useful resource and we should include it

Crystal Eisner agrees and says it's a good tool.

James Baldwin – Provides an allergen guides helps them make an informed decision on what to eat. Customer informs server and lets the cooks know to prepare item to spec using clean utensils. This is a good part of training. Not so much all on restaurant but gives guest a chance to talk – partnership.

Madam Chair proceeded to next resource.

Food Allergen Warning Sign

Amber Potts – This seems like a liability statement on restaurants, I don't think it would be helpful.

Scott Vinson agrees – not helpful and doesn't provide training. But we can use it if our charges require this kind of resource.

Christine Sylvis – agrees with Scott – not favorite thing but industry asked for it.

Crystal Eisner – Can be a tool in toolbox that most rest require them to post that. Can still be part of the tool box.

Vy Truong – good start to bring awareness to consumers – could reword it. Include cross contact to be aware that the other foods are in the establishment.

Madam Chair proceeded to next resource.

Logo for Allergy Awareness

Amber Potts- similar to previous and not sure how well it would be received. And to be used when the facility is certified in allergen training.

Scott Vinson in chat: I think it's fine. It's an efficient way of getting 8 words into a square shape.

Madam Chair proceeded to next resource.

SOP – Allery Free Meal Prep

Amber Potts and Vy Truong agree to use

Madam Chair proceeded to next two resources.

[Via Chat]

Vy Truong - I think this resource will be helpful. I think all three SOPs are great

Scott Vinson - Allergy is spelled incorrectly at top

Amber Potts - I love SOPs but I am not sure how useful they are in a restaurant setting.

Scott Vinson- I agree -- I frankly don't think the typical restaurant will use these last three documents

Cassandra Mitchell - I think the SOP are great. I like the break down of the instructions in different segments

Committee did not have time to discuss the Framework Points.

Madam chair asked for any final comments before we adjourn.

Libby Thoma asked if we can get access to SafeFood program's training on allergens to review.

Madam Chair said she would check to see if we have access to the resources, which should be listed on the resources page.

vi. Next call

We will discuss framework points and working groups and brainstorm to see how we can cover all the charges.

vii. Meeting Adjourned. - Next meeting February 3, 2022.

AGENDA

i. Call to Order – Amani Babekir
ii. Rollcall – Michelle Hill
iii. Scribe – Amber Potts
iv. CFP Antitrust Statement – Amani Babekir
v. Meeting Minutes Approval – Michelle Hill
vi. Framework Points – Committee
vii. Next call
viii. Adjournment – Amani Babekir

MEETING MINUTES

i. Call to Order – Amani Babekir

ii. ROLLCALL 11/17 Voting Members present [*10 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

Madam Chair *entertained a motion* to approve previous meeting minutes from 1/20/2022 meeting.

Cassandra Mitchell moved to approve minutes; Scott Vinson seconded the motion; Madam Chair opened the floor for discussion.

Vote on motion: 0 opposed, 0 abstained. *Motion passed* to accept previous meeting minutes as they were submitted. No other discussion ensued.

v. Framework Points

Madam Chair screen-shared the framework point document. At the requests of members, Amani emailed the document so we could follow along.

Amani gave a summary of this framework document:

Noted that the targeted timeline is July 2022.

She divided up the section into 6 workgroups to present draft work to the committee to frame out the final framework. These workgroups would meet separately then come together at the committee meetings to discuss progress. Workgroups will have leaders who decide on work and when to meet.

Ben Wagner asked to clarify the sequential due dates, does that mean workgroups cannot get started at the same time? Amani answered that it depends on the workgroup and suggested all workgroups begin work at once.

Erin Moritz commented that some workgroups will have more work than others and we may want to keep that in mind when we decide how many are in each group.

Emergency Plans Group:

Volunteers = Erin Moritz, Mary Cartagena, Libby Thoma, Crystal Eisner

Lead = Erin Moritz

Training:

Volunteers = Vy Goddard, Dave Reed, Nicole Lepore, Amber Potts, Jennifer Seymour, James Baldwin, Greg Abel

Lead = Amber Potts

Notification Tools:

Volunteers = Cristine Sylvis, Cassandra Mitchell, Erin Moritz, Mary Cartagena, Christina Meinhardt

Lead = No one volunteered so Amani will request more members through email and then we will come back to decide a leader.

Practices:

Volunteers = Ben Wagner, Scott Vinson, James O'Neil, Aubrey Noller, Greg Abel, Amani Babekir

Lead = Scott Vinson

Equal Consideration:

Unidentified member asked what this workgroup is. Amani explained that it is finding an alternative food source and to include this in your (the food establishment's) operational plan.

Discussion Ensued:

Scott Vinson and Erin Moritz disagreed with Amani and interpreted 'equal consideration' to mean we need to come up with allergen resources for entities that are not typical food establishments (not restaurants). Scott thought the charge should have read 'alternative' not 'alternate.' Food source means other food establishments such pantries and banks. So, our charge is to come up with allergy awareness resources used in food settings other than retail foods.

Mary Cartagena asked are food banks/pantries not considered retail food establishments? Scott Vinson answered that retail means they sell food. Amber Potts clarified that the Food Code says 'convey' and has nothing to do with if they charge or not.

Erin Moritz commented that whatever resources we develop can be adapted for locations other than restaurants and grocery stores. Scott Vinson agreed. Scott suggested eliminating this as a workgroup suggested the CFP included it to cover equity considerations. Jennifer Green (?) disagreed with the CFP equity statement and added that people who work in these alternate establishments are often volunteers, older and less aware of allergen issues. There is a difference so we should include different resources for them, it's important to think about this sector – donated food. Vy Truong agreed with Jennifer adding that workers are not trained and it is a good idea to have a few things on hand for them for the volunteers (basic allergen training).

Cassandra Mitchell suggested we come back to this workgroup. Erin agreed and added that we could consider developing other materials and come back. Or instead of forming a formal workgroup we designate individuals to keep this consideration in mind as work through our charges. Vy Truong and Jennifer Green volunteered as well. Amani agreed and asked the group if we can appoint them for this position. Group agrees.

Template (must include all sections we develop and to be used by the establishments):

Volunteers = Erin Moritz, Ben Wagner

Lead = Ben Wagner

No additional thought or comments were made about the workgroups or framework document.

Amani reminded everyone that we do have resources already approved in the Teams folders.

- SNHD resources
- Shared resources
- Collected resources

Amani asked about the ServSafe resources and if we are allowed to use them. There is a charge to access the platform. Jo DeFrancesco said she would meet with Amani separately about this.

Amani asked about the Responsible Training resources (generic allergen awareness training). There is also a charge. Crystal Eisner answered that she has emailed the owner and is awaiting an answer. But she would pay the cost to access the training.

Amani will send out email and contact list so workgroup members can start their work and begin scheduling meetings.

No final comments were made.

vi. Next call

Framework.

vii. Meeting Adjourned. - Next meeting February 17, 2022.

Meeting Number 08	Meeting Date **02/17/2022**	Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair and Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour	

AGENDA

i. Call to Order – Amani Babekir

ii. Rollcall – Michelle Hill

iii. Scribe – Michelle Hill

iv. CFP Antitrust Statement – Amani Babekir

v. Meeting Minutes Approval – Amani Babekir

vi. Sub-committees – Progress Reports for groups b, c, d, e

vii. Adjournment – Amani Babekir

MEETING MINUTES

i. Call to Order – Amani Babekir

ii. ROLLCALL 13/17 Voting Members present [*10 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

Madam Chair *entertained a motion* to approve previous meeting minutes from 2/03/2022 meeting.

Crystal Eisner moved to approve minutes; David Read seconded the motion; Madam Chair opened the floor for discussion.

Vote on motion: 0 opposed, 0 abstained. *Motion passed* to accept previous meeting minutes as they were submitted.

No other discussion ensued.

v. Sub-Committees – Progress Reports

- During our previous meeting, we voted to:
- divide into 6 workgroups to present draft work to the committee to frame out the final framework. These workgroups would meet separately then come together at the committee meetings to discuss progress. Workgroups will have leaders who decide on work and when to meet.
- Madam Chair requested the leader of each sub-committee report on their progress.

Emergency Plans (Due date Feb 16, 2022):

- Members Erin Moritz, Mary Cartagena/Devin Dutilly, Libby Thoma, Crystal Eisner
- Lead Erin Moritz

Status report given by E. Mortiz – held 1st meeting last week, will meet again tomorrow.

- Currently group is tasked with gathering already-published Allergy - Emergency Control Plans.
- Will gather the documents, review, and use them to inform our plan creation.

b. Training (Due date March 2, 2022):

- Members Amber Potts, Vy Truong, David Read, Nicole Lapore, Amanda Garvin, Greg Abel, Jennifer Seymour, James Baldwin

- Lead Amber Potts

Status report given by V. Truong – held two meetings this week.

Defined 3 categories of training, organized as a tier system for amount and type of training for each tier.

1. PIC – most training. Will create/acquire Allergen awareness materials based on allergens on site; will train others on how allergens appear in the food being offered. Can use posters, printed materials, and video-learning for training. (Southern Nevada Allergy Materials; FAAN videos)
2. Food Handler/Prep – Must be able to name all major allergens and how they appear in the food being served; will learn safe-handling practices for allergens. Can use posters, printed materials, and video-learning for training. (Southern Nevada Allergy Materials; FAAN videos)
3. Wait Staff – Must know what allergens are present for menu items and if and how they can be excluded or replaced. Will use primarily video-based training (FAAN videos, etc.)

Vy Truong asked what the expectations are for sub-committees for work completion. Madam Chair declared that the sub-committees are expected to produce DRAFT framework around their charges.

c. Notification Tools (Due date March 16, 2022):

- Members Cristine Sylvis, Cassandra Mitchell, Erin Moritz, Mary Cartagena/Devin Dutilly, Christina Meinhardt, Michelle Hill, Scott Vinson, Amani Babekir
- Lead Amani Babekir

Status report – given by A. Babekir – held 1st meeting this week. The group acknowledges the hard work of previous Allergen Committees within the CFP. Selected the 2020 Allergen guidance as published on the CFP website as a base starting point to develop this part of the framework.

It was determined that the document has been well-prepared and will allow us to make informed decisions moving forward. The idea is to reduce words when able and move towards a shorter, more visual presentation for this information.

The use of ICONS to visually represent allergens was discussed. It was agreed that the ICONS included in the previous CFP work were acceptable to use and to encourage others to use.

Anne D – speaking as a Consumer, finds the ICONS very helpful in making decisions.

V. Truong – Agreed with Anne. Prefers visual over written words as it can reach all people. Visual ICONS are easily recalled later.

E. Moritz – Suggested the committee provide the ICONS as part of the Framework so that entities can choose to use those they find to be appropriate.

d. Practices (Due March 30, 2022):

- Members B Scott Vinson, Ben Wagner, James Baldwin, Aubrey Noller, Greg Abel, Amani Babekir, James O'Neal
- Lead Scott Vinson

Status report – given by A. Babekir – held 1st meeting yesterday. Group agreed to combine 2 SOPs from Southern NV Health District for clarity sake. Considering ICONS.

e. Template Group (Due date April 27, 2022):

- Members Ben Wagner, Michelle Hill, Erin Mortiz
- Lead Ben Wagner

Status report – given by A. Babekir – Has not met yet – will wait until work has been submitted by the other sub-groups and then begin the process of porting it all into the Framework.

vi. Next call - Subcommittee Status Reports - March 3, 2022.

vii. Meeting Adjourned. - Next meeting.

Meeting Number 09	Meeting Date **03/03/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Scribe Susan Algeo	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Devin Dutilly Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour		

AGENDA

i. Call to Order – Amani Babekir

ii. Rollcall – Amani Babekir

iii. Scribe – Susan Algeo

iv. CFP Antitrust Statement – Amani Babekir

v. Meeting Minutes Approval – Amani Babekir

vi. Committee charges review - Amani Babekir

vii. Working group update – group leaders

viii. Adjournment – Amani Babekir

MEETING MINUTES

i. Call to Order – Amani Babekir

ii. ROLLCALL 9/16 Voting Members present [*9 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

David Read- Motion to accept previous meeting minutes, second James O'Neal, no discussion. Motion passed to accept last meeting minutes.

v. Discussion regarding questions that came up during sub-committee meetings

Questions about charge #2: Will the framework we create be referenced in the food code or will it act as guide for retail food establishments?

[Opens the floor for discussion]

James Baldwin- are we trying to determine the charge? Recommendation is guidance.

Amber Potts- agree they are very different things and if it was for the food code, we would need specific language. Recommend it is referenced as a guide but that the food code require sometime of framework.

Jo DeFrancesco- we can make a recommendation that the FDA includes it and offer language that can be modified.

Scott Vinson – are we supposed to recommend specific language?

David Read – recommend what we do could be included as guidance in the Food Code Annex, which does not change the codified Food Code language. The Annex is guidance

Greg Abel- support not recommended for food code and do it as a framework and/or annex. This is because it's about bringing awareness for allergens. Because if it's in the food code, can it/will it be enforced?

Scott Vinson- given what we heard about enforcement; are the guidance documents enforceable provisions?

Jo- talked about different ways to submit the documents (whitepapers, annexes, CFP website) without it being codified

James Baldwin- recommend whitepapers to be posted on CFP website.

- Subgroups
- Emergency Plans

Devin Dutilly- Continue to work, meeting every Friday. Things are going well and should meet the deadline.

Training

Amber Potts- shared document they are working with. They need an extension for deadline. They started questioning if we want an SOP for an allergen free meal based on the document they had started with.

Question for larger group: how in depth should we be going?

Scott Vinson suggested condensing the document (their group had used the same document) into one or two pages. To make it as simple as possible for food workers to understand and food managers to be able to train.

They will go back and make it a more generalized document about major allergens and symptoms.

James Baldwin cautioned the group on whatever is put together here applies to the retail industry across the board (supermarket vs. restaurant). Be careful to not make it very specific to table service.

Amanda Garvin- is there a different term for food handlers in grocery stores??

Greg Able- FDA refers to retail as anywhere the consumer gets their hands on the food. Recommended Food Employee (which would be consistent with the food code).

Discussion about definition of food employee and who will be trained on allergens.

Amber asked if the training group is supposed to recommending increased allergen training??

Erin Moritz- in general we want to provide as much as we can. Seems there are not a lot of training that are available.

C. Notification Tools

Amani Babekir- Making good progress. Prepared documents on previous committees work and added extra materials about how to check food allergens in menu items

They would like to add Spanish language icons/posters to the materials.

Practices

Scott Vinson- they are making good progress for the March 30th deadline

First draft is put together. They want the document to be readable and something that can be copied and displayed in food establishments. They have written about storage, taking the order, preparing, and serving the food. They are still working on pairing it down so it can be concise and fit on one page.

Greg Abel asked about how useful documents posted on the wall will work for visual learners? And mentioned many employees won't read something posted. Scott mentioned there are icons that IAFP had created that may be useful; they do plan on having graphics in addition to verbiage.

Question for the group: Should they be developing only visual?? And let the training group deal with the verbiage?

Scott made the point we need to make the documents understandable for everyday people, by using plain language and simplified documents.

Devin Dutilly suggested looking up plain language there are resources that can assist.

Templates

If other groups come across forms or tools that could be useful for the templates group, please send to the group. At the end of the month the Templates group should be able to start their work.

NRA/ServSafe

What exactly do we want to use their content for and what is the outcome of using them?

James Baldwin- the way allergens are currently covered in CFPM courses is very basic information.

Amani asked, do we need the materials?? James did say the materials have been vetted and accepted by stakeholders. Erin mentioned having them review our documents after they are completed?

Do we need to be coordinating more between the subgroups so we are all staying in our lane and not doing double work? Amani suggested that training starts sharing their work. But even if we do create extra materials, it will still all be put together and will be revised. It's better to start with too much information

vi. **Next call -** Subcommittee Status Reports - March 17, 2022.

vii. **Meeting Adjourned. -** Next meeting.

Meeting Number 10	Meeting Date **03/17/2022**		Meeting Time 2:00 pm EST

ii.	Scribe	Amber Potts
iii.	CFP Antitrust Statement	Amani Babekir
iv.	Previous Meeting Minutes	Amani Babekir
v.	Framework Points	Amani Babekir
vi.	Subgroup Update	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

i. Call to Order – Amani Babekir

ii. ROLLCALL 09/17 Voting Members present [*10 required for quorum]*

iii. Conference for Food Protection, Inc. Antitrust Statement – incorporated by reference; sent with each meeting notice via email message.

iv. Previous Meeting Minutes

David Reed made a correction in the minuets: page 23 comment from David Reed on the bottom of the page should say that what we do we include in the Food Code Annex, which does not change the Food Code. Annex is only guidance, where the framework would possibly live.

Amani asked for him to email the changes.

Devon from FDA thanks David for his comments and clarifies that the Food Code is the both annex and codified language, which cannot be changed.

Amani entertained a motion to approved previous meeting minuets. David Reed moved to approve minuets. Libby Thoma seconds the motion. Amani approved meeting minutes as amended by David.

No further discussion about the minutes.

Amani – proceed to vote on motion. Opposed = 0. Abstain = 0. *Motion passed* to accept minutes as amended.

v. Framework Points

Feedback from team members and FDA consultants about the framework.

Amani shared screen. We need to finalize first draft from each work group by the end of March. Training and Practices finalized draft. Working on notification and emergency team.

Discussion that framework to be a guidance for CFP website. We could reference or support the Food Code by referencing in the Annex of the Food Code. We may have to submit in a separate issue, Joe to check on that.

Comments/thoughts about framework? None.

Recommendation to look into FARE org has about allergens as resources and into different sections, similar to sections we are working on in subgroups. Each subgroup looks into their section through website and look into contents. Foodallergy.org/resources

- Consider adding anything missing.

- Add references to drafts (end section listing references used to create the draft). Then work later on how we will add it in the document.
- Need consistent terms throughout all drafts.
- Food Code defines some terms: Major Food Allergen, Food Employee, Food Establishment, …
- Which definition do we want used in the framework? Need volunteers to work on terms and intro section to framework.

Terms subgroup volunteers = None in chat.

Leaving to subgroup members to add more terms that need a definition. Feel free to add terms to list.

Recommendation to do a further review to review framework by FDA consultant and if we could get access to ServSafe/AllerTrain to look into framework to look at what we will create.

vi. Subgroup update:

Emergency – Erin Moritz Screen shared draft framework

Reviewed sections and key decisions.

7 sections:

- Section 1 poster/flyer posted where staff can see it
- Sections 2 - 3; learn more about allergic reactions, emphasized every allergic reaction and symptoms are different with different severities. Poster of potential symptoms of allergic reaction. Additional considerations
- Section 4 - dedicated to children
- Section 5 - procedural when customer reports a reaction
- Posters included as examples
- Section 6 - what is an epi-pen including pictures of examples and how to administer one with graphics

How does the larger group feel about using the brand name Epi-Pen? Other comments

Scott Vinson – comprehensive. Suggests we make sure this guidance remains ever green, so it does not have to be updated often, chances are it won't. Try to make them applicable and relevant for the longer term. Graphics may change, colors may change etc. Keep that in mind for lengthy descriptions of auto injectors.

Erin agrees. All from US other countries may have own brands. Good idea to add something about how not all Epi-pens will look like this.

Scott – maybe just include a brief section on the fact that these exist. No photos or maybe just one. Not really the food services role to be responsible for administering them, helpful to let staff know they exist. Not necessary to go into lengthy description of what they are and images. Document is very long and thought we agreed to keep them concise as possible, and this is just one subcommittee. Thinks to take a second look.

Erin – Establishment to decide if it's their role to administer the pen, they can disregard the entire section, but some establishments may want this information. It is our role to make the decision?

Libby – the first part says this is to be crafted to establishment own policies.

Erin – yes, we said that under purpose. Purpose to serve as a resource.

Libby read purpose. Erin – can add that you may not need all these materials based on situation. Libby – not meant to be 100% prescriptive.

Devin - any sections that are applicative in other workgroups? So, we can reduce document size.

Erin – to took entire framework and then shorten it.

Scott shortened document because they originally included emergency.

Amani – include everything and then reduce as a whole.

Mitchell, Cassandra - I have found that a couple of the training courses identify the epi pens generally as Auto-Injector Devices

Amani – any further questions?

Erin – would be interested if sections are not needed put those in the chat and we can discuss those. A draft is not ready to send out will send after the meeting tomorrow afternoon.

Amani – next section Training.

Amber went over the training draft.

Amani – please review all draft as they relate to their charges and make sure all components are covered.

Notification Tools Group – working on draft, received several comments and suggestions and also thank you Scott for making in plain language. Meeting tomorrow to finalize comments and draft and will send it out to larger committee.

Point about Icons and Spanish language – CFP does not have capability to offer this service, but we can explore if the committee members could provide this. Backup we can look for resources.

Amber – we have adobe stock we can use

Amani – no members who speak Spanish – ask larger council to see who speaks Spanish.

Move to Practices group

Scott Vinson – member companies said it's very important to have those for staff.

Already shared with full committee. Important that all staff members see this, so we added sentence to include that. Kept it concise and brief and plan language. One divergence from language – supposed to use term unpackaged food, did not include this term because we want to make sure not to forget food items made in the store. They won't be labeled from the manufacturer, avoided that term.

Should this group include signage to include in back of house? If so, another group may need to help. What font should we use?

Erin – regarding icons, Erin can help out with that. Would be helpful if there is which section you want an icon for.

Scott – we should use all the same icons. Color ones weren't as good. Choose at full committee level. Maybe Amani can provide those so we can all use the same ones.

Amani – add icons to draft and we can discuss to whole team.

Devon – clarify that definition of packaged in food code, under label section covers food packaged in a food establishment.

Amani – thank you and asking for volunteers for terms group.

vii. Meeting Adjourned.

Next meeting March 31, 2022.

Meeting Number 11	Meeting Date **03/31/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Previous Meeting Minutes	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Subgroup Update	Amani Babekir
viii.	Adjournment	Amani Babekir

MEETING MINUTES

Call to Order

Babekir, Amani: Hello everyone and thank you for giving us this time to join our meeting. This meeting will now come to order. We would like to do the roll call, Michelle.

Roll Call

Michelle: Yes, I would be happy to. Thank you, Madam Chair. <calls roll for voting members> OK, I will try to keep my eye out if any of these other people arrived that haven't said yes, I'll add them in Madam Chair. We have a quorum of ten.

Scribe – Michelle Hill agreed to take notes that will be verified via transcript issued by Teams.

CFP Antitrust Statement

Babekir, Amani: And I would like to remind you that it is the Conference for Food Protection. Antitrust statement is active in this call. And just keep it in mind. And if you want to reference it, please find it in the attachment of this meeting Invitation.

Previous Meeting Minutes

Babekir, Amani: I will entertain a motion regarding the minutes of our last meeting.

Mitchell, Cassandra: motion that we accept the Minutes as written.

Garvin, Amanda: I second..

Babekir, Amani: Is there any discussion or question about the Minutes? So now we could proceed to the vote on the motion … is there anyone opposed to the motion? Please say no or raise your hand. Do we have anyone abstain? Nay. The motion passes to accept the document as it is. Thank you.

Framework Points

Babekir, Amani: Now we could move to the second item in the agenda. Let me share my screen. I have a couple of points I wanted to bring to all of you to discuss and see if you have any suggestions about it. Those points came out of the review process. We have right now in the draft which we generated as part of our subgroups work on these drafts. I sent out drafts for your review, and we received some comments and really, we appreciate your review. If you did not get a chance to review these drafts, please try to do so. It is really very important to make sure that we covered all the essential components of this framework.

One of the questions is about research that looks into the icons which are used to notify consumers about the allergy - are those icons sufficient. Do they convey the right message? All of the issues that might be around the icons, has anyone evaluated them.

Michelle: The paper that I'm going to be referring to, Icon based digital food allergen labels is the shortened title. It is a conference paper that was published in June of 2020. It is particular to a device - a handheld device where you scan the barcode of food products and receive information about allergen content. The study was specific to Wheat.

People were more responsive to an icon for allergen representation versus it being written out, and the clear choice was for Icon, and they have good data to show that that's the most responsive way that people can - most recognizable way for people to view allergen on a label. And in this case, it was being displayed digitally. I would be happy to distribute this paper, after the meeting today and give you an idea of what we are looking for as far as research as well, if anybody else wants to look around to find good data on what is a better way to transmit information, pictographic, icon versus written language. It was particularly preferred by people that were traveling and not native to the country. That, or did not have the speech or language ability for the country that they were in. It is a study that was done in Germany, in German. People in Italy as well as Switzerland, using the tool as well. And they saw quite a substantial percentage of people that really preferred the iconography over the written word.

Babekir, Amani: Thank you, Michelle. And this is just one example of the studies. Yes, Scott.

Vinson, Scott: I really liked the icons that the previous Allergen Committee group had included in their document. Maybe it was Erin, but they shared it with - I think on our last full Committee call. I thought those icons were really good. To Michelle's research, I yeah, I think it's pretty obvious that if you're traveling in a foreign country and you don't read the language you would like to see icons. I know when I'm traveling in a foreign country and I don't speak the language, I always appreciate seeing icons on packaged food when I'm buying it at the grocery store because I have celiac disease so that stands to reason. But Erin, do you have the icons that you had included in your work group document that you could share? I thought they were really good.

Moritz, Erin: Yeah, I can pull it up. Is that alright, Amani?

Babekir, Amani: Yes, please.

Michelle: I just wanted to add here really quick, and I failed to mention that they also use color coding. Yellow was used for likely possibility of there being an allergen present and red was absolutely that allergen is present, so it helped to address the preferential allergen labeling question as well.

Moritz, Erin: Sounds like a really interesting study, Michelle. The icons in our particular section – are these ones you are referring to?

Vinson, Scott: Those are really great.

Moritz, Erin: These are just kind of cobbled together from - they're not from one specific source. I'd have to go back and find where I pulled the images from. But we could certainly develop our own set from existing sources as well, if that's something that the group feels would be beneficial.

Vinson, Scott: No, why? Why remake the wheel? I think the work is already done. I think these are perfect. They have both an icon and the words in English next to them. Why don't we just include these and use them across all of our subcommittee work products?

Michelle: Scott, I like your suggestion there. I do want to mention that the previous allergen committee did provide a set of icons and they were the standardized set from the International Association of Food Protection. And they're what are used across Europe. I don't know if that's something we care to match, but they do exist. They're very similar to these. They are triangle shaped and we wouldn't have to follow that necessarily, but very similar to these.

Vinson, Scott: Oh, the ones that were in the triangle. Yeah, I've seen those several times. I looked at the IAFP link when we were preparing our work product document and those are good. But whatever we choose, we should just use them across all of our subgroups and then - put them in our final work product at the committee level.

Michelle: Absolutely.

Babekir, Amani: And do we think that we need a requirement for those icons - just to give it to the food facility in case they did not use those specific icons?

Vinson, Scott: Remember, we're creating a guidance document. This is not regulation.

Michelle: I do agree with you, Amani, with the question that they should be provided as an optional set that could be used in the case that they are not already using a recognizable set.

Moritz, Erin: Yes, is that what you were asking, Amani?

Babekir, Amani: That is correct, and I would like to satisfy the question that came from our FDA consultant. Devin maybe will elaborate into his comments about the icons. In general, if we specify that the icons need to be word and image, the image needs to be colored or black and white. Devin, could you give us more details about your comments regarding the icons?

Dutilly, Devin: Yes. Thank you, Amani. Thank you everybody on the call for the discussion with the icons. It is really great to see that the work group is moving forward with highlighting and bringing awareness to the nine major food allergens … these are the most recognizable and the team members mentioned that the other ones were also recognizable. It begs the question from all of us, perhaps we should be considering, if we're looking at uniform use of allergen icons or notification systems. How is that going to be interpreted across the United States, from different parts, the United States, different cultures that are within the United States. It's just something to think about whether icons are chosen, the ones that are on the screen or any other ones. It's just something to think about - the uniform acknowledgement of one image representing the allergen of choice here. But this is something to consider. Thank you.

Vinson, Scott: What are you saying? Are these not universally recognized? What do you suggest?

Moritz, Erin: If I might jump in here, I think Devin is saying that specific images aren't going to be universally recognized across the US because we don't have one set that the US has all agreed on using. Is that what you were trying to say, Devin?

Dutilly, Devin: Yes, and that would likely require quite a bit of research and investigation to establish something like that.

Moritz, Erin: Yeah, I think that's way above kind of you know our charges. I feel like that would be an entire separate conference maybe.

Dutilly, Devin: Thank you.

Michelle: When I was doing research to try and find anything about allergen icon use and recognizability, the Codex Alimentarius had industry specific icons that it's been using for a long time and there's good research for that. And it says right on there that they're not meant to be used at the consumer level. And my question would be why not? They look very similar to these. I could see if I could pull those up, but are you guys involved with that at all with the Codex Alimentarius and the USA Codex? Or is that not in your purview?

Moritz, Erin: I doubt anybody at CDC is involved with that. Jenna, I don't know if you know if somebody, please feel free to jump in.

Seymour, Jennifer (Jenna): I don't.

davidread2861: I'm pretty sure FDA is a member of the Codex.

Dutilly, Devin: There's a number of folks that are involved with it. You're right. Jennifer and Erin from the FDA side of it. So those are good points you bring up - so it's been done before.

Michelle: I'm guessing the research would be there. They were presented at the official conference recently and like Scott was saying, if it's already existing, maybe we could just point to that and use that.

Dutilly, Devin - I guess just to take a step back - the Codex is internationally focused, you know, organization - FAO and WHO? The food code is going to be targeted towards domestic, right? So that would be those are two different populations within that scope. So that that would be the difference. FDA does have representation, as Jennifer and Erin had mentioned, on multiple Codex Panels and committees.

Michelle: To that point, are they available to be used? I know that we're speaking about the United States. However, parity across is not a bad idea. If within the larger world, and if it's already recognizable when people travel, perhaps it's a good set. That was just what I was thinking.

Dutilly, Devin:. Michelle sounds like a great suggestion to perhaps include that as an option or an example within the document. So great suggestions. I'm glad you were able to find that research and bring it up, so it's definitely a valuable comment for the group to discuss. So, thank you very much Michelle.

Babekir, Amani: Also, I have a question about the food industry. Sometimes they do use icons in their product. Are there standard icons or is it up to the manufacturer? Do you know anything about that? CDC or FDA?

Moritz, Erin: I do not know. If I had to guess, I would say that. It's probably, as Michelle said, industry specific, not standardized across all food sources and all food users.

Vinson, Scott: Speaking for industry, it is not, and I think that's kind of what we're doing with this document. We're trying to provide resources for industry.

Moritz, Erin: Yes.

Vinson, Scott: This is a guidance document for Food establishments, retail food establishments. So, we should probably ask people like me representing the industry. And I think that these icons here are pretty recognizable. And if you want to go ahead and include the icons that are used by the Codex Alimentarius, that would be fine too. For people who travel internationally a lot like me, that's probably not a huge part of the population, we throw it in there. Why not? But you know, giving more options, I suppose to industry is fine, but I don't see a problem with these unless somebody can point out something specific about these, then I don't think we need to do a lot of research about whether people can tell whether this is a fish or not.

Michelle: But to earlier points - there are concerns especially around the appearance of a milk bottle for that dairy allergy - it's casein that's the issue. It's a hard thing to represent and I guess what I was just really getting at is that if there's a standard that people are used to seeing already, whether its industry based or not, perhaps it's a good standard. I don't take issue with these icons. I think they're demonstrative of what they are. But I do know that discussion early on was about how representative are they? You know, do they actually transmit what we need to transmit?

Thoma,Libby: I would like to just pop in and say in our from retail, we also in H-E-B we use Boards across all of our departments within the store to communicate to our customers that anything made in store is going to have one of these top nine allergens and they're all listed. They are icons and then they have the verbiage and these are easily their placards. They're displayed throughout our stores - our goal is to make sure that our non-English speaking customers understand what those are as well because it has, you know the descriptions along with the icon and they're color coded but. Honestly, ours are color coded based on aesthetics - I wouldn't say that they're based on anything that has anything to do with the actual food itself.

Michelle: Are they similar to this icon set?

Thoma,Libby: I can. I'll send you one when I get home. I'm driving right now.

Michelle: Thank you.

Vinson, Scott: On the black and white versus color issues for the icons I we need to look at this from the perspective of an individual operator. So, in actual food service establishments, not all of them may have color printers on site. And if we're expecting people to print these off and post them in the back of the kitchen or the back of the house and the kitchen area, food prep areas, they may only have a black and white printer. I would suggest we not do color.

Michelle: Absolutely, I agree.

Thoma,Libby: I agree too.

Babekir, Amani: Hey, thank you very much for this discussion. Any extra points about the icons - I see Erin, you put your point in the chat. You made a very good point. Any extra comments?

Vinson, Scott: I have a question about Erin's question here. She writes in my mind there are two decisions we will have to make as a committee - which icons to use in our final document, and which to provide as resources to establishments. Shouldn't they be the same?

Moritz, Erin: There's multiple sources of icons available, and so we'll have to pick one to use within just our document that we're providing - if we include links to the last committees deliverable - it has three or four resources. I don't see anything wrong with that and that way the establishments can choose which ones they prefer. We'll just have to just decide on one set that we are going to use in this particular document and if it matches one of the resources we are providing, that's great.

Vinson, Scott: It isn't the document we're producing. We're presenting this document to the CFP.

Babekir, Amani: Yes, Scott, I think what Erin meant here, is to make it consistent through the whole document. What icons are we going to use on that document? Besides providing additional resources to the food facility for these icons.

Michelle: What I am hearing here is a difference between whether we're dictating an icon set to be used across industry versus an icon set that we're going to use within the CFP guidance.

Moritz, Erin: Yes. And I think deciding a set across industry is well beyond the charges for this committee.

Michelle: So perhaps we offer the icon set that we use as the standard within our document, and like we've said earlier, just giving references that link out, not necessarily including that icon set as a part of our document - just links to those icons.

Moritz, Erin: So an establishment might read our document and say these look great, this is good for us, we're going to use them. Another establishment might say, I don't like the milk bottle. I'm going to use something else, and we have provided those resources for them to look for other images.

Michelle: OK, so there should be a spot within the guidance documentation that says here's a source for other allergen icons and give the link, not necessarily depicting the icons within our document just for clarity's sake. Is that?

Moritz, Erin: That's a good question. I assumed that we would include those, but because those were from the previous committee, maybe that's beyond our group. Yeah, I didn't think of it that way, Michelle. That's a great question.

Babekir, Amani: Yes, we do have the notification sections and one of the main sections on that section is to provide various resources for these icons just to diversify the options for the food facility. Yes. Which option they would use.

Moritz, Erin: OK. Yes, that's right.

Babekir, Amani: And to make those icons consistent through the document. We are going to leave that to the template group because the template group is the one who's going to work on the format and finalize the look of the framework. So, whatever icons we are going to add to our drafts, we are going to send it over to the template team and then they will look over it and decide after they discuss it with the whole team which icons they're going to use through the whole document. Does that sound like a good suggestion? Scott, I see your hand.

Vinson, Scott: Yes. So, my understanding is that the document the Subgroups and the committee is producing that so will turn into CFP has one audience. Not two separate audiences. The one audience is retail food establishments. We are producing an operational framework for retail food establishments to help them with allergy awareness and so forth. We don't have a document that's audience is CFP and then stuff within the document that's audience is retail food establishments, the whole work product we are coming up with, the audience is retail food establishments.

Babekir, Amani: That is correct.

Vinson, Scott: OK. Thanks.

Garvin, Amanda: But we do turn in reports to CFP, correct?

Michelle: Correct. There are specific things that we need to talk about - it's basically benchmarking on how far we are within our charge.

Babekir, Amani: Yeah, we already submitted, we do submit Periodic reports to the CFP and we already send the second report to the progress of our work and then at the end of the whole work, we going to submit a final report and that's going to be approved by the CFP, and one of the components of that report is this framework. But the main objective of the framework is to address the control and prevention of the allergen within the food facilities. So, any extra points or suggestions before we move to the next point?

Subgroup Updates

The next thing is about training, and Amber is not with us, but I would assume there is a team member from her subgroup which could help with this question. Let me share my screen here one more time. OK, the question is about how to ensure proper training. How do we ensure the proper training? Is there any requirement, any kind of assessment we would like to suggest - Anything like that? I'm not sure if that is being covered in the training subgroup. During their discussions, I know at some point they were looking into a standard way to evaluate the components of a training. But I'm not sure how far they went through this discussion. So, I'm opening it for the whole team and also for the Members in the training subgroup if they have any comments about this one.

Michelle: Just to clarify, Madam Chair, are we looking for ideas around how to assess a person's knowledge, or are we looking at how to assess the material as it is presented?

Babekir, Amani: Yeah, it's either way, just we are looking for if there is a way we could add to this framework - to assess the knowledge, or to assess the quality of the training that is going to be provided. I would assume at the end its going to fall on the person who is trained, how we're going to assess his training - his knowledge. Do you have anyone from the training subgroup in our meeting today?

davidread2861: I'm on that committee - something has been mentioned is how do you assess whether the training is sufficient or not? But we didn't discuss any further details about that. I do know that if it's online training, often there are assessments included periodically and maybe a quiz or something at the end, but it's not like a proctored exam or anything. It's just to measure progress and knowledge as you go through, for example, an online course.

Michelle: Being part of that training Subcommittee, is there an element that you guys have introduced that would allow that opportunity or a recommendation for that to occur? Just maybe stating that that's necessary, that there be an assessment of knowledge in some way.

davidread2861: But it seems like there needs to be some sort of assessment, but that's just my opinion. I don't think we've gone into detail in the committee about that, which would be ideal because everyone could get the same type of training and then you could have an assessment process built into that training.

Michelle: Much like ServSafe does with their allergen certification.

davidread2861: Most online training has that and if you're doing in person training as well. Don't know if you need to be developing, you know, separate testing processes - I guess a lot of this could be done as online training.

Michelle: That and as opposed to what we could just ask for, is that there be an assessment that's done and leave it open to what they might think that could be. But the fact is that we need to assess how well trained that person, you know, if they've been trained properly.

davidread2861: Right.

Michelle: So maybe a framework of assessment, you know, please know these things.

davidread2861: I agree.

Michelle: Which is I guess is what our framework is maybe, already.

davidread2861: I know we were building online training for the regulatory community and it's based on competencies. So, you'll look at what competencies are needed to perform certain tasks and then you develop your training and assessment around those competencies.

Vinson, Scott: I'm sorry we are talking about creating test materials to include in this guidance document.

Michelle: I don't know that that's the intent of the conversation. I think that it's more centered around whether we recommend that there be an assessment of knowledge as part of the framework.

Vinson, Scott: I'm going to say I would say no. I think that's beyond the scope of our charge - we are supposed to create an operational framework that can be used in retail food establishments to help with allergy awareness. I don't think we need to be creating testing materials or you want to call them, assessments, whatever.

Michelle: We would advise that they perform an assessment - is what we would be talking about - not actually saying this is the assessment you must adhere to. Just advise that they assess that person's knowledge in whatever way they find would be applicable to their circumstance. It's so varied.

Vinson, Scott: Folks, I think we need to be a little bit realistic. We need just a reality check here for a moment. And I've talked about this before on other calls. The retail food industry is under tremendous pressure right now. Labor shortages supply chain. Ingredient shortages it it's a mess. We need to be very careful about layering on additional regulation. The devil to deal with, particularly medium and smaller sized establishments, so.

Michelle: I agree with you Scott.

Vinson, Scott: I would be against that. I would be against.

Michelle: It's a very valuable opinion that you're sharing, Scott, and the load is there for those people. However, just making sure that reminding them that they need to know if that person has understood what they've been told. What we're after here is just acknowledgement that they understand. Maybe it's they sign a document saying they've been trained; it could be as simple as that.

Vinson, Scott: And an additional document. And then that document would be kept where?

Michelle: It would be up to the Food establishment how they deal with that, like everything else, how you document and how you store it.

Vinson, Scott: Like storing documents on site, every single requirement has - there's a domino effect.

davidread2861: Well, I think the food code actually has some training requirements in it right now and I would assume there's some way that facility would have to track that. I mean, they have to show that people have been trained.

Michelle: It could be added to it.

Vinson, Scott: So, you have these things.

Michelle: Absolutely. It's part of your operating procedures typically. Standard operating procedures are. I've seen that most commonly, and it's usually one single form, and there's several items on that form you have been made aware that you need to inform about personal illness, then how that pertains to food production. It's knife work - that you understand how to use a knife, it's agreement to report illness within the home. It could be added to that - that I acknowledge that these are the nine allergens, and we deal with them … and you know I'm not trying to give language here, I'm just saying it could be part of that and they're already retaining that. Most likely so if they've got good procedures in place they would be.

Babekir, Amani: These are good discussions? I will collect all these points from our recording, and I will send it over to the training subgroup. And then they're going to discuss it and decide how they're going to address these comments, because the question about the training assessment is based on just the feedback we got after reviewing the draft of our documents, so that is the reason

for this question. Thank you everyone - and before I continue, just to the next step, I want to open the floor to the subgroups update. I know that you have done fantastic jobs on your drafts. Really, very good job combining and completing those drafts. I'm going to call the subgroups and give them the chance if they have any questions to the larger group - the emergency plan group - Erin, do you have any questions or any update?

Moritz, Erin: No, no questions. We got a few limited comments back and we've made changes based on those suggestions. And I think we need to go through and make sure the formatting makes sense, but other than that I think it's good to go. We are certainly open to other folks to still review it if you have a chance.

Babekir, Amani: And do you think you could send the draft?

Moritz, Erin: Yes, I think that's doable. We have a meeting tomorrow and I guess my plan at least was just to go through and make sure the formatting looks good and check spelling and all you know little stuff like that. And then I think it'll be good to go.

Babekir, Amani: Thank you, Erin, and uh, the emergency plan members. Now I'm going to move to the training subgroup. I know that is a draft being sent out for review from the training subgroup - Amber is not with us. Are there any comments from the group members about the progress of the draft?

Amber: Do you mean the draft itself - I sent the draft to you when we were done with it.

Babekir, Amani: OK. Thank you. So, I'm going to move to the notification tools group. We're going to have a meeting this Friday and we're going to go over some of the comments we received just to make further updates to our final draft. And then I'm going to move to the practice group. Scott, do you have any update?

Vinson, Scott: Yep, we finished our document and I sent it to you the other day.

Babekir, Amani: Thank you. I have all the drafts now ready and we still have a chance - if you want to review it and give us extra feedback, please feel free to do so. What our next step is going to be, let me just share my screen here one more time.

Michelle: Is there a central place that could we put those most up to date versions in our repository on Teams in the Teams folder for the allergen committee.

Babekir, Amani: Yes we could do that, thank you. What's our next step? My suggestion is to continue the subgroup meetings, just keep the block you have in your calendar for those meetings. Keep it on because what's going to happen? While we are reviewing it, we're going to come up with some questions, and we can receive comments and we are going to send it to the subgroups and you're going to work on addressing those comments or additions to your draft. So just keep those meetings in your calendar. If there is no request being sent to you, you could just cancel that meeting. But at least keep it on. We are going to compile all of these drafts together, put it in one draft, review it and validate it against ServSafe contents. Michelle has access to these contents, so she's going to review what we generate. It again is the components of the ServSafe allergy and training. Are we going to identify if there is anything we need to add? If there is anything we need to edit based on this review?

Also, we need to review it with FARE, so I'm going to go over the components of the FARE training and see if there are any additions we need to address in our drafts. The third one we suggested in our discussion is that we need to look at and also compare it to our documents is the AllerTrain. We don't have access to this training. If there is any member who has the contents of their training or materials and could help us to review and compare it to our draft.

Michelle: I'll reach out to Betsy Craig, the owner of AllerTrain and request access.

Babekir, Amani: Thank you, Michelle. And would you be able to do the review or?

Michelle: Most likely not, but I could put her in touch with whoever would be able to volunteer to do that.

Amber: Yeah, I can review that. That's our training.

Babekir, Amani: Thank you, Amber. So, do you have suggestions about any other materials to review and compare to our draft?

davidread2861: Are you looking for other online training?

Babekir, Amani: It could be online.

davidread2861: I know that FMI does have an allergen training course as well.

Michelle: I think we're looking for our hole, is what our goal here is.

Babekir, Amani: Yes - do you have access to the FMI training material?

davidread2861: I don't specifically. That training is available on the IFPTI website. I could inquire about its availability.

Babekir, Amani: OK. Thank you. Any extra points or suggestions about the review? We are hoping to complete the compilation and then the review within two to three weeks. And then we will send it over the template team to work on their charge. We're going to

work on the terms - and thank you very much to the notification subgroup members that agreed to continue working on the terms. We're going to be working on these and will provide it to the template team. If you want to volunteer to work with us on this term subgroup, please put your name on the chat or let me know through email. That is all I have, and I open it to all of you, if you have any extra suggestions or discussion?

Moritz, Erin: When you talk about terms, just to clarify, this is the group that will be deciding when we talk about and establish we're going to use the word food retail establishment or just establishment. When we talk about, you know, basically the definitions team, is that correct?

Babekir, Amani: That's correct, yeah.

Moritz, Erin: Ok, thank you.

Meeting Adjourned.

Babekir, Amani: Any extra suggestions or ideas? I think that concludes our meeting today and thank you, everyone, and I'm going to send any comments or feedback that I receive to the subgroup that is related to those comments and thank you very much for continuing to work on your drafts. Thank you. Have a nice afternoon.

Next meeting Thursday, April 14, 2022.

Meeting Number 12	Meeting Date **04/14/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour		Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Previous Meeting Minutes	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Subgroup Update	Amani Babekir
viii.	Adjournment	Amani Babekir

MEETING MINUTES

Call to Order

Babekir, Amani: Hello everyone and thank you for giving us this time to join our meeting. This meeting will now come to order. We would like to do the roll call, Michelle.

Roll Call

Michelle: Yes, I would be happy to. Thank you, Madam Chair. <calls roll for voting members> We have a quorum of eleven.

Scribe – Michelle Hill agreed to take notes that will be verified via transcript issued by Teams.

CFP Antitrust Statement

Babekir, Amani: And I would like to remind you that it is the Conference for Food Protection. Antitrust statement is active in this call. And just keep it in mind. And if you want to reference it, please find it in the attachment of this meeting Invitation.

Previous Meeting Minutes

Babekir, Amani: Now we could move to approving the Minutes. Could you please go to the version I sent out yesterday? To the end of the document, you will see our last meeting notes. I will give it 2 minutes for your review. And then we could entertain a motion. So I will entertain a motion regarding the minutes of our last meeting.

davidread2861: I just sent you some edits to the comments that I made to try to clarify at least what I thought I was saying.

Babekir, Amani: OK, that is great. Any other? To wait till we make the change on the minutes, and then we proceed with entertaining a motion on it or I will entertain a motion regarding the Minutes.

Michelle Hill: Madam Chair, perhaps somebody could make a motion to approve the amended minutes in our next meeting. So people have time to review that.

Babekir, Amani: OK.

Michelle Hill: What's the will of the committee?

Ben.Wagner: I motion to approve the amended meetings in the next meeting.

davidread2861: I second.

Babekir, Amani: Thank you. Any further suggestions? OK, so let's proceed to the vote on the motion. Is there any one opposed to the motion? Please say no or raise your hand. Thank you. Do we have anyone abstaining? Thank you. So the motion passes to approve the minutes next week, after amendment OK. Thank you.

Framework Points

Babekir, Amani: So now we could move to the second item in our agenda. Just they want to give you an update about the progress in the framework, and share my screen. What we did here, we put together all the sections we received from the subgroups. Thank you very much for your effort and the time you spent working on those documents. So as of now, we have the initial draft of the framework. So that is very good progress to our committee work. We put it all together. The first section is the training and then we added the handling piece. And here is the notification section. And then the third one is the allergic reaction.

We are also working on the definition section - the subgroup meets every Friday. We made good progress on listing all the possible terms that are commonly used in our draft and we are working on adding definitions to those terms. And thank you very much for Michelle and Devin and also for the subgroup members - they really put an effort and time into doing this. Another thing I want to say if you want to volunteer on the definitions of group, please send me an email. We are planning to conclude the work on those definitions within two weeks, so we will be able to send a draft to Devin. He volunteered to give it a revision on it from his side before we proceed with formatting the document and sending it out to the template team.

Any comments about the progress we have so far on the actual draft? And definitely we're gonna have a lot of discussion about it after this. I'm gonna hand off to Michelle and also I'm gonna tell you how I compare this document with the first sources by showing you all the sections in one draft. Do you have any questions, any comments about it?

Michelle Hill: Madam Chair, I see a hand raised - Jennifer.

Green, Jennifer - FSIS: I was able to review two or three sections - I'm not sure how many total sections it will be, but will we get a chance to review the entire document like this one, this version here that has everything included.

Babekir, Amani: That is for sure, Jennifer. After the end of this meeting, I will send out this version to all of the team members, so you will have a chance to review it and do comparison with whatever resource is available for you. So that is a good thing.

Green, Jennifer - FSIS: OK, awesome. Thank you.

Babekir, Amani: Any additional comments? Thank you. And I will give you an idea about how I compare it with the FARE resources. Let me share what I used here - I'm going to walk you through the FARE website and the resources I saw there.

I found a couple of resources - mainly for avoiding cross contact. They do have a portion for the emergency care plan. How to read a food label, and also they have Spanish versions. I tried to see if they have signage or icons in Spanish, and I did not see documents or procedures in Spanish, but we could reference it in our document. Going over these resources, I found that we covered everything in our draft. The only thing I added there is that they say to avoid the cross contact is to wash hands before preparing the allergen free meal - so I added that because I don't think we had it there in the best practices section. But other than that we are aligned with the FARE contents. Any discussion or note about this. OK. Thank you.

And now I'm gonna hand it to Michelle. Michelle has done a very good job - an awesome job on reviewing our contents against ServSafe. She added a lot of feedback and suggestions there and I will give her the floor to just walk us through our notes and discuss it with you.

Michelle Hill: I took some time and nitpicked through the ServSafe food allergen training modules that they offer on their website - it is a paid service. I teach this material frequently so it was fairly simple to go through and see how we matched up. I did not find any glaring omissions with the exception of defining anaphylaxis. I know that will be one of our definitions, but I think that we should probably say a little bit more about what anaphylaxis is, and I've made a note to that effect here on the right - That it's a serious allergic reaction that occurs rapidly and may cause death. That is how ServSafe defines it. And this is all up for debate. You don't have to use any of this or all of this. I'm just letting you know what I saw when I went through it. Any place you see A tag here, it's where I found actual language specific to those ideas addressed by the ServSafe curriculum. As I said, the biggest potion that was missing would be talking about anaphylaxis and then also the flow. We might consider changing the flow of this document. In particular, we start with the person in charge, which I think is appropriate. However, it seems like it flows much better if we go to the front of the House next and then the back of the House. And maybe it's because that's the experience that customer has that it makes more sense that way. But a lot of the trainings that I did observe all had the flow in that manner.

So it's just a how we feel about it, how it flows as far as the contents, everything looked really good. I didn't see, like I said, I didn't see anything that was a glaring omission. You are more than welcome to take time to look through this when you have time. And I was only able to complete this early this morning. So it's not a lot of time for people to be able to really walk through it. I'm not sure if you want me to go through each point here or if that's something we do offline. I'm open to any kind of questions or feedback regarding this. Madam Chair, is this what you were expecting for me to do, or would you like me to go through each comment I've made?

Babekir, Amani: Yeah, I think that is good. What is going to be our next move is I'm gonna send these documents to all of our committee members to comment on it, and definitely I encourage the subgroup leaders to talk to their group members to see if there is anything they need to address or make any change to their draft. Based on Michelle's comments, as far as she said, we don't need to add anything new. But if we see that we need to adjust some of the language, we need to do anything extra, we're gonna give the subgroup a chance to do that, and we are opening it for your suggestions also, If you have any.

Michelle Hill (Guest): Madam Chair, I guess the biggest thing I've noticed is that we don't really prescribe specific language and how these things should be spoken of. I don't know if that's something that is in our purview or if we just recommend that they obtain knowledge in that way - a framework for the knowledge is what I'm seeing it as. A lot of the comments that I've made give full blown descriptions of how it would be taught,, so I guess that's something we need to consider - how much of that do we actually include in the framework?

Babekir, Amani: Thank you. I'm opening it for discussion here. Michelle, could you go to the top of the document? Maybe we could go over some of the comments and see the feedback and then we could complete it if it is a definition.

Michelle Hill: Perhaps we do list symptoms, although this is addressed later on in this document, in the framework itself, it would fall under this area here how to recognize and respond - I think that that's cared for well in that latter part. I did break out each specific allergen from it just being an itemized list to being actual numbers to again reiterate that there are nine allergens.

Babekir, Amani: I see your comments about the guest - Keeping your guests safe starts before guests. Even walk through the door.

Michelle Hill (Guest): Yes.

Babekir, Amani: Could you walk us through this one?

Michelle Hill: This speaks to how to prevent cross contact and also to how to be more aware of what's gonna hit your door before it comes, especially if you're a facility that can take a reservation, this wouldn't necessarily be for retail food. And we're looking more at a sit down restaurant here. But either way having a clear policy ahead of time on what allergens are special requests that we can reasonably accommodate. And then having clear policies to communicate that information. Everybody in the operation should know what they can accommodate and not - within given reasoning. I mean, if you're making homemade bread on site, I don't think you're going to say you can accommodate gluten free. Or gluten sensitive.

Babekir, Amani: I know in our best practices section we did not address or we don't. We did not call out that there needs to be clear policy and communicated. Do we need to consider that point?

Michelle Hill: I think so. I think that maybe having a little bit more language using some of these ideas to fill in the blanks as far as specific things that we would like them to undertake - activities to undertake. I'd like feedback from the larger committee on this.

Babekir, Amani: Practice subgroup members, do you have any feedback or comments about this? You're gonna have some time to discuss it later - we have a very quiet team today.

Michelle Hill (Guest): I think it's a lot to process. You know, in our special ordering process, how do we actually handle these orders? Maybe being specific about how we do that? Although I believe that if you read our entire flow, it is addressed throughout each designation/segment of workers. I would like to see back of the house be third and front of the House to be second - I think the flow would be a lot better. That's something we could change right now if people agree to it - if they think it makes sense.

Babekir, Amani: Do we have any further discussion about the comparison with ServSafe? And how do we feel about the contents we produce and that we aligned with their content?

Eisner, Crystal (PHS): I feel it's aligned well.

Babekir, Amani: That's good. Thank you.

Michelle Hill: Are you speaking to the order of ideas here, or just overall that we've aligned well with ServSafe?

Eisner, Crystal (PHS): Overall with ServSafe.

Michelle Hill: OK. How do you feel about changing the order of how we talk about the training modules? Do you think it matters that we have a definite flow - maybe I'm the only one that thinks this flow is awkward.

Eisner, Crystal (PHS): Can you Scroll down? And so it's training and then you have person in charge and then what's the next?

Michelle Hill (Guest): The next one is back at the house and then it's followed up with front of the house. I would recommend that we do front of the House prior to back at the House. That's my only big idea.

Eisner, Crystal (PHS): You're doing it like the flow - as if you walk into a restaurant from the front door. Is that how you're doing it?

Michelle Hill: That's what I was thinking. It's the way a lot of other written material approaches this for training is that they go from the flow of a customer and so I think it makes sense, just for clarity sake, to have the two items swapped.

Eisner, Crystal (PHS): Yeah, that's the standard - why not stay with the standard?

Michelle Hill: Thank you. I do agree with that. Is that something we can just do or do we need to have this go back to the subgroup with that comment?

Babekir, Amani: We have Members from the training subgroup - in this portion of the training, that's right. Michelle, on the training section.

Michelle Hill: Correct. This is the training subgroup. If we'd like to take a, maybe somebody could make a motion to make this change. If you're comfortable as a group.

Eisner, Crystal (PHS): Is there anyone for that subgroup on the call right now? Maybe they had a certain reason why they did it in this order.

Babekir, Amani: Amber is not able to join us, but we welcome comments from other subgroup members.

Goddard, Vy (VDH): I'm on that sub group. I don't remember a specific reason for the flow that is really significant, so I'd be OK with changing the flow, but I'm only one person on that committee, so fine by me.

davidread2861: I was on that group as well, and I don't recall any specific reason for the way it was listed, so changing it would be fine.

Michelle Hill: Madame chair, how would you like to proceed? Do you think we need to have a vote on this or is this something that is a matter of course and I can just make the change and we'll move forward with this document for review?

Babekir, Amani: I think we could make the change and then we will leave it to the template team to work on the flow of the document, because this is gonna be their task. We have Amber with us, but she's not able to see the screen. But if you can hear us, Amber, just give us your feedback in the chat.

Michelle Hill (Guest): The change has been made, the flow is now within training. Number one, PIC, number two, front of House, number 3 back of house, and then the 4th recommended changes to the wording and this would be the food code Annex specifically - not the food code itself. I think this is good. I think it'll be important for people to really take some time and look at the comparisons that have been done. And you know, if we feel like there needs to be more language added in around certain ideas, just to flesh them out, if it's agreed that that's necessary, then we can do that.

Babekir, Amani: Yes, Scott.

Vinson, Scott: Michelle, can you scroll through the whole document so we can get a sense for the whole thing?

Michelle Hill: Absolutely. I'll start at the top. It's 19 pages.

Vinson, Scott: Is this a consolidation of all of the subgroups work?

Michelle Hill: It is. This is the training component that was produced by the training work group. This is the verbiage produced by the policies and Practices Group here. Here's the tools to notify, as provided by the subgroup. I did adjust this table - I recreated it because it was painful. And I did go through and drop in where the ServSafe material would align with the same ideas throughout the entire document - not just the beginning part. And then here's a blank example form they can use. The very last section is the emergency response guide and that includes several pictures or posters that people can print and use.

Here's the flow of what to do if something happens. And ServSafe is not very verbose on that - basically says make sure the person … it steps through exactly what we've done here for the most part, it's a lot lighter even than this, as far as what they tell people to do. This is more specific, which I think is good. And then here are the posters, with references of course.

How a child might describe it? I thought this was quite good. Actually this was a very nice graphic here - explanatory, and the references for each section - each part of the framework carries a references section.

Subgroup Updates

Vinson, Scott: Is there a section with sample Posters with icons - the notification group.

Michelle Hill: Yes. That is right here. It is part of the food allergy reactions - how to recognize and respond. So here's the 9 icons that we spoke of last meeting. These have not been adjusted in any way from the last meeting. They're intact as is.

Babekir, Amani: For the notification sections we have links, but we haven't added any actual icons there. I think Amber's team also gathered icons.

Michelle Hill: This is what we have right now is part of the framework. This is what it includes.

Babekir, Amani: Correct.

Michelle Hill: Did that answer your question, Scott?

Vinson, Scott: Yes - just scroll up to that page a minute ago - Symptoms of an allergic reaction. So this page here. You've got this section here. Symptoms of a severe allergic reaction. And then if you scroll down again on the next page, it's repeated.

Michelle Hill: It is - this would be intended to be hung separately. I think that the intention of this group was that it be found in both places? So just options I guess for people.

Vinson, Scott: And one is labeled symptoms of a severe allergic reaction and the other one is labeled symptoms of an allergic reaction. So is there a difference?

Michelle Hill: There can be - the severity matters. The question is, are they tipping into anaphylaxis or not?

Vinson, Scott: Well, I mean, but do we need the word severe - people are gonna notice that it's on one section and not the other. And they're gonna wonder why there's a difference. So maybe just make them the same.

Michelle Hill: I can make that as a note. Is that what I should be doing?

Babekir, Aman: Yes please.

Michelle Hill: OK.

Dutilly, Devin: To take a look at the number of work group members are on the call now. If you take a look at the each of those documents - I think some of the intent - like you had said Michelle very nicely - they will have them printed off and hung, and each of the documents can serve different purposes within the food establishment. Different locations that they are placed or hung. So that was kind of the intent for it. And so there's a little description above it. I believe that talks about that. Thank you.

Vinson, Scott: OK. So maybe somewhere on these pages if these are meant to be hung on the wall or posted somewhere maybe. Maybe that should be noted somewhere.

Michelle Hill: There is a list up here that calls out - it says below the below posters and Flyers are designed to be placed within your food establishment in locations such as, and then they give advice as to where each poster could appear that would make sense.

Vinson, Scott: Ah. Good.

Michelle Hill: So that's a good suggestion. They did a really good job on this, referring back out. In fact, any time that they had a spot that they could refer the user or the reader to a resource, they did so with this picture call out and then what it is - it was well done. The other part I liked about this is that they did layout examples of potential reactions and then what we do is that initial assessment of how severe is it? If they can talk or not, we do this. If they're unconscious, we do this, or semiconscious … and that in itself speaks to the severity and how we deal with it.

Vinson, Scott: I have one other suggestion. I've noticed that the word individual is used frequently in these pages. I would just suggest replacing the word individual with either person or people if it's plural. I find the word individual to be dehumanizing.

Michelle Hill: I can. I'll put that in absolutely as a suggestion to be considered as a Global change.

Babekir, Amani: Any additional thoughts or comments - and how do you feel about the length of the document? How many pages do we have, Michelle?

Michelle Hill: It's 19 pages in length, but we have to consider the fact that the final three or four pages, I believe 4 pages are posters - the cover page also wouldn't necessarily need to be always printed, so that would bring us down to 15 pages of actual framework.

Babekir, Amani: It's good. And we're gonna have the definition sections. So one of the ideas is are we going to have the introduction and then the definition section. The idea is do we need to put it in the front of the document or as an appendix? The end of the document - what are your thoughts on this? We're going to have around 15 Definitions. Do you think it's best to put it at the beginning or the end of the document as an appendix?

Michelle Hill: I typically see things like that defined ahead of time, but that's just me.

Goddard, Vy (VDH): I agree. I think up front would be great.

Babekir, Amani: At the beginning.

Michelle Hill: What I'm hearing is we would have an introduction page basically saying what we're doing, why we're doing it and then right after that the definitions, Correct?

Babekir, Amani: Yeah, that's correct. Yes, Scott.

Vinson, Scott: Normally I would agree. But in this instance, given our audience, and given the length of this document, I think having an introduction that is concise but approachable and maybe friendly and folksy in tone will be very good. But, then to have that

immediately followed by a lengthy definition section, I think it's going to be off putting if a person who's running a restaurant who's already stressed out, is immediately confronted with a very lengthy document like this, and then it has a page or two of definitions. They're going to - their eyes will glaze over and they'll just stop. So I would get right into the meat of the stuff first, and put the definitions at the end or in some other section. But to immediately start confronting people with a document that looks very technical in nature is going to be off putting.

Michelle Hill: To that, Scott, would it make more sense for us to call out the definitions as we flow through the document or would you just recommend that we have it be at the end and people can reference them as needed?

Vinson, Scott: Well, that's a good idea. Maybe having it woven in - maybe each time the word is used then you just put the definition in parentheses after it. Maybe that would be a better approach depending upon how long the definitions are.

Goddard, Vy (VDH): If I find a word no, I wanna be able to go to the beginning of the end and find that and not have to look through the documents and find the one place definition might be.

James O'Neal: Well, and we can continue this part of the conversation, I had a thought about the training piece. So however you wanna do that?

Babekir, Amani: Thank you, Jim.

Thoma,Libby: I agree with Scott - when we write our technical documents for our audiences, both in manufacturing and in our retail world, we put the definitions at the end. So let's just kind of a standard way that we do it in retail.

Babekir, Amani: Thank you. David?

davidread2861: I agree with that. I think it should be more like a glossary than maybe even calling it definitions. And that would be at the end.

Green, Jennifer - FSIS: At the end would be a good.

Babekir, Amani: Thank you. So the group of the template Ben - Ben you are the leader of the group. That correct? I don't have the list in front of me now.

Ben.Wagner: Yes, I am.

Babekir, Amani: Would you take the burden of Putting the document together and having. The option, it seems like we are leaning into putting the definitions by the end of the document, but it's hard to tell. Would you like to take the burden of Deciding on that with the team When you are working on the document, so you bring it here to our meeting and they could vote on it if they wanted this way or not.

Ben.Wagner: That works.

Babekir, Amani: Thank you.

Babekir, Amani: Yes, James.

James O'Neal: Looking at the training, it looks like a lot of it is a certain set of basic information that would be applicable to anybody that works there. Am I reading that correctly?

Michelle Hill: Absolutely, yes.

James O'Neal: And so just a thought. Would it be a good idea to say this is a training for anyone who works within the restaurant and then have it broken down into specific training for back of house front of house so it's not? I mean, it's really important, but it kind of looks repetitive. If I were to pick up this document and read through it the first time.

Babekir, Amani: Yes. Thank you - we could add a note, then we could refer it to the training subgroup to look into it.

Michelle Hill: If I can capture the essence - State that this is training for all who handle the food. Break out training.

James O'Neal: Yes, bullet Point C - list the major food allergies. It's the same for all of them. So if you could have just a section where kind of a general training and then if there's anything different for a backup House employee that they would need to know kind of the gist of what I was looking at.

Babekir, Amani: That's good.

Michelle Hill: I see. So we could say this is for instance, we could talk about there being general knowledge that everybody should have. And then specific knowledge of the job duty. Is that right?

James O'Neal: Yeah, exactly. Yeah.

Michelle Hill: I think that's a really good suggestion. I too found it repetitive. But I think that the intent here- I'm not on this subcommittee, so correct me if I'm wrong - the intent here was to be specific about what each segment of duties these people need, what they need to know to do their job correctly, as far as allergen control.

Goddard, Vy (VDH): Yeah, yeah, that was the intent. And there was like, if it were gonna be separated out, then they would have all the parts - we can talk about it within our group.

Michelle Hill: Yes, that's a good place for that, yes.

Babekir, Amani: It's good. Any further suggestions? I'm going to send out this document. Michelle, could you please send it out to the whole team members?

Michelle Hill: Yes.

Babekir, Amani: Please feel free to work with your subgroup on your section and just address the comments or anything that's added in the document. And we are gonna work on the definitions. And also if you are not even a member of any of the subgroups, if you have any additional thoughts, please send it to us. I'm going to give it like 2 weeks before we send the document to Ben. So if you feel like the change needs to be addressed by the template team, you could leave it and just leave a note - and they will handle it. Yes, Scott.

Vinson, Scott: Amani so now that the document is consolidated into one, is the work of the individual subgroups completed and we no longer need to have our subgroup meetings.

Babekir, Amani: Yes, I am going to send it to you. So we are still gonna have - from now and then - some meetings because it's gonna be a continuous process of editing the document. And I don't like to do all the work just in our general meeting. Just probably the subgroups will be better. To focus on each section individually and make the changes needed. I would say for example when I send out the documents, you probably need to call a meeting with your subgroup members to just go over the comments which are placed in your section.

Vinson, Scott: OK, alright. So someone will either Michelle or you will be sending this out to everyone and then the subgroup chairs should look at our sections and address any comments made in our section.

Babekir, Amani: That is correct. I would expect to receive four versions of the document - one from each subgroup after they address the comments that were placed on the document.

Vinson, Scott: OK.

Babekir, Amani: Within two weeks before our next meeting.

Michelle Hill: If I may mention - it might be useful - don't just spend time on your own section. It's very important that that section be right of course, to your subgroups liking, but comments are also welcome throughout the document, especially if you feel like it would add to the clarity and the conciseness of the information as it's presented.

Meeting Adjourned - Next meeting is April 28, 2022.

Babekir, Amani :That's correct, yeah. So any additional points or suggestions before we conclude our meeting today. So thank you everyone for joining us today. Have a very nice rest of the day.

Meeting Number 13	Meeting Date **04/28/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill via Teams Transcript	Council II Chairs Jo DeFrancesco/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour		Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Framework Points	Amani Babekir
vi.	Previous Meeting Minutes	Amani Babekir
vii.	Adjournment	Michelle Hill

MEETING MINUTES

Meeting Call to Order

Amani Babekir: This meeting will now come to order. Michelle could you please take the roll call and see if we have quorum?

Roll Call

Michelle Hill: [takes roll call of voting members]. Madame chair, we have a quorum.

Scribe – Michelle Hill agreed to take notes that will be verified via transcript issued by Teams.

This meeting is now being recorded.

CFP Antitrust Statement

Amani Babekir: I'll just remind you the conference for food protection antitrust statement is active in this call, so just keep that in mind and for your reference, it's attached to all our meeting invitations.

Framework Points

Amani Babekir: The first topic here we wanted to discuss is the draft of the Equal Consideration Section. They really took their time to write down this draft and I would like to get your opinion on it and see if we need to make any changes to it before we add it to the framework draft. I'm going to share my screen and if you have an issue following on the screen – you could open the documents I sent out. Can you see my screen?

Michelle Hill: Yes.

Amani Babekir: You can see here the documents – Vy is not able to join us today for this meeting, but you could provide your comments about this document. Please let anyone into the meeting as I'm not able to do that while I'm sharing my screen.

First, a summary about the allergens. And then in the knowledge section, just pointing out the sections we have in the framework. Here's handling the cross contact. And then food preparation and understanding the label - it's More like a generic thing, but that which could be used in food pantries and food banks. Just open it for your discussions if you have any comments. Any suggestions? And do you think this is sufficient to meet the charge? Consider this section: Equal Consideration

Devin Dutilly: Thank you again for welcoming me and thank you for all the hard work that everybody has put into this document and all the other work. I really appreciate it. And I think everybody on the call does as well. Could you just give a little background for the equal consideration in this document and how it's going to fit in with the rest of the framework?

Amani Babekir: I can - let me share the charges.

Devin Dutilly: Yeah, that would be great. Thank you very much, Amani.

Amani Babekir: Here is the first charge which is talking about developing a framework for the food facility and they said that they needed to consider several points and one of these points is F. And on that one, it says equal considerations for alternate food sources such as food pantries, food banks to ensure equity and access. And during our initial discussions, we felt like we needed separate subgroups to develop contents for each point. But for this one, one or two of us could just compile a couple of graphs and couple of sentences that will address these equal considerations.

Erin Moritz: If I'm remembering correctly, the purpose of subsection F was really to make sure that what we end up submitting is helpful not just for retail food establishments, but for also these other kinds of establishments. Is that correct, Amani?

Amani Babekir: That is what I understood, yeah.

Erin Moritz: Through the lens of knowing that a food pantry or a food bank might experience additional challenges beyond what a retail food establishment experiences or maybe just different challenges, not necessarily more.

Amani Babekir: Any additional point about the understanding of the f part of the charge?

Devin Dutilly: That's helpful. Thank you.

Amani Babekir: Based on this we felt the need to have just a separate minor section that addresses these facilities.

Devin Dutilly: If we go back to the definitions that we used, and if we do choose to use the definition from the food Code on food establishments, the facilities that are mentioned above would be encompassed in that definition. It depends on the definition this document chooses to go with, but if we are using the food code definition, the FDA would likely have comments on that, making a distinction between this type of establishment having different needs than another type of establishment. Although there is a distinction between the establishments I think when it comes to the requirements within the food code, the requirements would hold for both of those types of establishments because they all fall underneath through establishment, and if we could apply it to all food establishments So I don't think there's an objection to creating this, but just a just as a note, the food code covers to all of these, and so anything that would apply to one would also apply to the other.

Amani Babekir: And it seems from the developed draft here, most of the components refer to specific pages of the framework which we already developed, so other than understanding labels, seems like this is a different section here. Do we think that when it comes into the preparation and the training and knowledge and handling, the cross contact, do we need a section, a separate section? What are the equal considerations?

Ben Wagner: I'm not sure that we do. Looking at this - the understanding labels - is that to train the staff members to understand labels and if so, would we not use that elsewhere for retail food establishments to understand the labels of their ingredients? I don't know. To me this seems like we're reiterating, just to reiterate. Is there anything in here that is novel to food pantries, food banks, etcetera?

Erin Moritz: I think when we very first started discussing this, two of the main points were, just concerns, maybe additional difficulty communicating with the patrons, and then also having volunteers who maybe have less of a background in food safety. Someone will have to remind me if there were other concerns. I think what we have probably covers it technically, but I'm wondering if It may be good to call out those considerations at the beginning of this particular document, and I like the idea of pointing out specifically where they can go in the document to address those issues. And I don't - is there anybody from the group who worked on this document on the call?

Amani Babekir: We don't have an actual subgroup for this part of the charge.

Erin Moritz: OK.

Amani Babekir: I think there was Jennifer with her, but we couldn't recognize which Jennifer. Not sure if there is anyone who volunteers on that subgroup or that team …

Erin Moritz: It'd be interesting to me to see if she found some sort of resources pointing out specifically additional or different challenges within the food banks, and maybe there's not, but if there are additional or different challenges than it may be worth pointing those out at the beginning of this section

Amani Babekir: OK. Any additional points on this?

Ben Wagner: It's minor, but where it says for food is prepared on site I would say for foods prepared or repackaged on site.

Erin Moritz: Yes. This reminds me - that was another comment made way back - that a lot of these types of facilities will have a package of crackers or something that they'll open and repackage for distribution.

Crystal Eisner: Understanding labels from manufacturers of packaged food. And then are required by that too -

Amani Babekir: OK. And do you think understanding the label is it an important piece to add to our framework – should be considering adding it to the whole framework? Seems like it's ...

Crystal Eisner: It's general information. I think it's good to understand the label. As far as may contain or production facility – this is maybe, overall concern, not just this area - is this anywhere in our framework?

Amani Babekir: Yes - it's not. I don't think we have detailed information about understanding the labels.

Erin Moritz: I think if we did want to keep the section, we'd have to tie it back to specific challenges in in food banks or food pantries.

Amani Babekir: But would it be worth adding it to the whole document? Especially this program just understanding the labels?

Crystal Eisner: Alright.

Erin Moritz: I do like the that bullet. Eat all that differentiates. Contains versus may contain. I think that's worth putting in the main body of the document

Crystal Eisner: And just like the common allergies can have other names, for example. But for the dairy, the casein and so forth, unfortunately, we had a little girl where my daughter goes to school. Her grandmother bought her something online - juice that said dairy free, but it can't contain casein - and she actually passed away from a severe allergy. Yes, I think that's a good. Sorry, I haven't gone through all the bullets, but if we have not stated that elsewhere, I think that it is a good idea to.

Amani Babekir: OK.

Michelle Hill: I just wanted to mention I'm back finally. FYI and, if you were speaking about casein being listed, I'm all for it. It's necessary

Amani Babekir: That's good.

Devin Dutilly: And just as a general comment - we would, the cautionary, the PALs, the cautionary allergen labeling that is listed here - this is not something that we have issued a specific guidance on. It's not something that we would comment on or you use it, something that could be in lieu of good manufacturing practices or cleaning sanitation practices within a retail establishment Thank you.

Amani Babekir: Thank you.

Erin Moritz: I'm wondering if it's worth adding something? Another bullet, - something to the extent that Devin just said, note that simply saying something may contain an allergen is not an acceptable alternative when trying prevent cross contact.

Ben Wagner: So, was the concern that a food shelf would be labeling something themselves? Is that the concern?

Erin Moritz: I just don't know enough about food pantries and food banks to really know the best content for this section.

Devin Dutilly: We have a representative on the call here that is part of one of those groups or a represents one of those groups, I think Vincent, Scott - he represents a lot of large facilities - is he on the call? I think he had some comments about other groups he represents and I think you captured a lot of different groups that are in his organization as he happened to be on the call.

Amani Babekir: He's not able to attend.

Devin Dutilly: Probably valuable. OK. Any anybody else who represents those groups or have a large of volume?

Michelle Hill: I can speak from a person that's worked in the food bank before and it's not that we would label necessarily on the shelf that something has an allergen, but we would definitely be wanting to help assist them to determine if a packaged food did. And in this case, I believe we're talking to the presence of casein and not dairy or not lactose. You know, understanding what the true allergen is. And I think that's what we're trying to get at here is that. Does that answer part of your question?

Ben Wagner: I think quite honestly, we're all over the board on this. There's been comments about the fact that it may contain statement does not give a production facility a get out of jail free card for doing proper GMP, which production facilities understand. I don't know if food shelves do - I don't know if food shelves – that if they break something down and repack it, put their own labels on it or not. I think this is good information for anybody working in the Food service side of things, whether it's a food bank or a restaurant. Well, the question is, Is this information good information that should be for anybody reading the document and then we can refer back to it when we're talking to food service or not food banks specifically, or this equal considerations portion? Specifically.

I have an additional question. The bolded statement above – The understanding labels says have a staff member that's knowledgeable about allergens. Review the ingredients on the label with the customer to ensure … You wouldn't expect somebody to do that in a grocery store? Would you expect somebody to do that in a food bank?

Amani Babekir: OK, so I'm going to highlight this section here to discuss it later. Michelle, would you like to proceed - if there is any extra discussion on this and then move to voting on approving the Minutes.

Michelle Hill: Absolutely. I'd be happy to, Madam Chair.

Amani Babekir: OK, so please continue the discussion if there are any extra points regarding this part. And just to give you an update about the framework right now, we are in the process of sending it out to the template team and the target date is May 4 - we will compile it send it to the template team after we review it with the ServSafe comments.

Michelle Hill: Thank you, Amani. One quick question, Amani, what we have remaining then is to decide about this document, as far as closing discussion, and then voting on the previous two meeting minutes and then we adjourn.

Amani Babekir: That's correct, yes.

Previous Meeting Minutes

Michelle Hill: What is the will of the people present here? Would you like to continue the discussion on this document? I'd like to entertain a motion to either continue to discuss or to table it until we have more information about this particular section.

Ben Wagner: I put out a motion to table it until we have more information.

Michelle Hill: Thank you. Ben, do I have a second?

Darby Greco: This is Darby. I'll second that.

Michelle Hill: Thank you, Darby, so noted. We will reach out to Vy, and perhaps the next time we come around to this, we'll have her on the call. Thank you for your patience on this, everyone. I apologize for my absence from the meeting. I don't really know what happened, but that's what the transcript is for, right? At this point, if you could please pull up, and if need be, review the minutes from the previous two meetings. We had a request to make a correction to the document. What we would like to do now is take a moment to review those and then we'll come back. And I'd like a motion to be made possibly for us to approve those minutes as they appear or whatever discussion needs to ensue about the Minutes. So let's take 2 minutes to review those documents and hopefully everybody got them – Amani sent them out pre meeting.

Michelle Hill: The meetings that the Minutes that we need to approve start on page 33, this is meeting number 11 and it was held on March 31st and there were edits. There were a couple words that were edited, and corrections made. We were asked to hold off on approving these minutes until people could see those updates. And so that's what this document is. It runs through page 40.

Michelle Hill: And then the next set that we need to approve are from the meeting we had two weeks ago, April 14th, and this is the first time we were attempting to approve these minutes. they're quite long. These meaning there's got to page 49, 41 to 49. When you feel comfortable, if you'd like to make a motion to either table or to approve or whatever …

Ben Wagner: I motioned to accept both sets of the meeting minutes

Michelle Hill: Thank you, Ben.

Ben Wagner: As written.

Michelle Hill: So noted. Thank you, Ben.

Crystal Eisner: Then what was your motion? Sorry, I missed it – was reading.

Ben Wagner: I was moving to accept both sets of meeting minutes as written

Crystal Eisner: I second that.

Michelle Hill: Crystal, Ben, thank you. We have a motion on the floor if you would like to vote.

Michelle Hill: Unless I see or hear a number or an abstain. I will say that this motion passes to approve minutes. From both meetings as written Alright, I appreciate that. Thank you so much.

Meeting Adjourned

Michelle Hill: As usual, you guys are a great team. I really enjoy being part of this committee and I'm really very pleased to see the level of attendance at today's meeting and I look forward to seeing everybody again in the next two weeks when we meet again. Please feel free to reach out with any questions, comments, and concerns, and when you do send communication, please make sure you include both Amani and I on that email message If there's nothing else, I would like to adjourn this meeting.

Next Meeting set for Thursday, May 12, 2022.

Erin Moritz: Hey, thanks everyone!

MEETING MINUTES

Meeting Call to Order

Babekir, Amani: I now call this meeting to order. I will proceed with the roll call.

Roll Call

Babekir, Amani: [takes roll call of voting members] Let me count – So we have 8, missing one for the quorum.

Hill, Michelle: I see a Wendy Bell on the call - do we know you? I'm sorry. I don't mean to be rude. I don't recognize your name.

Bell, Wendy: Hi yes, I don't know if you saw Courtney's email, but I was moved into the vice chair role.

Hill, Michelle: Oh! Welcome!

Babekir, Amani: Welcome to the Committee, Wendy, we're glad to have you with us.

Hill, Michelle: Can we count her towards our quorum?

Babekir, Amani: Yeah, I don't think so. I wish we could do that.

Bell, Wendy: No, no.

Babekir, Amani: We can proceed with the with the agenda and then by the end of the meeting, if we have a quorum, Michelle if you see voting Members waiting to join our meeting that might help meet our quorum.

Hill, Michelle: Good.

Scribe – Michelle Hill agreed to take notes that will be verified via transcript issued by Teams.

This meeting is now being recorded.

CFP Antitrust Statement

Babekir, Amani: Thank you. And just I would like to remind you that the Conference for Food Protection Antitrust statement is active in this call. So just please keep that in mind during the discussions and the activity in this call.

Framework Points

Babekir, Amani: The next thing here in our agenda is to give you an update about the framework.

Babekir, Amani: I sent out the framework to the templates team along with the definitions, and I am so glad that we have Ben us today. I wasn't able to join the initial meeting, so hopefully Ben will be able to give us an update of the progress.

Wagner, Ben: You want that now, OK. So the team has met, we took the three documents that were provided by the larger committee.

The main framework, the definitions and the additional thoughts for food banks, etcetera. Sorry, I'm not thinking of the official titles. Anyway. We started to put everything together. We're going to place the definitions at the end of the document. We are currently working with pulling information throughout the document for the purpose and scope of the overall document as well as an introductory paragraph to the rest of the work.

We'll continue to meet on this about once a week through the rest of the month and then we're hoping to have some progress that we can show back to the group.

Babekir, Amani: Do you have any questions or do you need any extra volunteers to help with the work?

Wagner, Ben: I feel like the group that we have is pretty good. We will probably be bringing things, as we as we look at what we can clean up in the document, one thing that we did note is that nine major allergens are listed repeatedly throughout the document. Now we are thinking we can make the document shorter by having that laid out in the beginning of the document and then referencing back to it.

But we wanted to bring that to the various groups that had created their portions just to verify that they are with that they didn't have a reason for calling them out again in full list.

Babekir, Amani: Thank you. Thank you, Ben. There is any questions or comments to them?

Babekir, Amani: We can proceed to the next item on the agenda, which is the equal considerations document.

I know in our previous meeting we did not complete the discussion on this topic; we wanted to get more information from Vy Truong.

The information she gathered on the document – if she sees something that is different than the larger scope of the document we created, which related to them Equal consideration and the food banks. So that is one of the questions we had for you. What's your thought on it?

Truong, Vy (VDH): Hi - I tried to skim through the meeting notes right beforehand and I see that you guys made some good suggestions. Thank you. I don't have a lot to add, I'm not actually very familiar with food banks. I just wanted to make sure that this topic wasn't dropped, so I volunteered to get something drafted. And yeah, I noticed that I do reference the document a lot because I didn't want to be repetitive and so I felt like the only new thing to really add would be reading labels - however you guys want to incorporate that.

And I was thinking that for food banks, they might not want to read the whole document depending on how long it ends up being - that maybe they could pull just that portion.

I guess I'm still not sure exactly how the framework's going to end up working at the end; if it'll be like pullable sections like that could just be dedicated to other types of food service, or food banks for example, and they could pull those couple of pages and not have to sort through everything. So however, you guys want to put it together in the final stages of this, is perfectly fine with me. I'm not committed to anything in particular. I do think that some food banks prepare food on site, so a lot of the stuff that we had already created was great for that. And then the only new thing I thought that was really important was to understand those labels. So, if you guys have suggestions on rewording that or things that take away or add, feel free to do whatever you guys want with that draft.

Babekir, Amani: Thank you. Michelle collected very good suggestions about this section – Michelle?

Hill, Michelle: Thank you, Amani. I have a compatriot here in Minnesota - his name is John Carrillo, and he just retired from Aramark. He's been in food for a long time. He's been dealing with food banks in and out throughout his career. I did just speak with him briefly about what we had in our framework. And he responded very nicely to me. He pointed out that the best time to give allergen information would be when the person is picking up their food and it could be as simple as a slip of paper mentioning that the food they're received may or can contain food allergens, and that it may cause an allergic response, and again that could be based on what's in the actual container or box or bag, whatever they're collecting it in. In particular he deals with Second Harvest, which is a big outfit here locally. I don't know. I think their nationwide, but he says that they as an entity, they do a good job letting volunteers who sign up for corporate community days or general volunteering, where they pack bulk foods, they repack bulk foods. They're very open about the fact that they may contain allergens and ask people that have known allergens to do something else, so they enforce strict hand washing. They change aprons and gloves between tasks. People who may have an allergic reaction are given tasks away from handling that bulk food. So the big piece that I think we may want to add to this would be like what Vy said, maybe it's a simple sheet of paper that would tell them real quick. These are the allergens in your box. I don't know. Maybe that's too specific, but that's the feedback I got. I know it's one person, but that's what I have. Thank you.

Babekir, Amani: Thank you, Michelle. Any comments from the team?

Truong, Vy (VDH): Yeah, I think that that's great, because if we make it too complicated, it's just going to get lost. Some sort of handout? And I don't know how to do that because food banks are so varied. If it is one sheet of paper - should we list all the allergens? Because, it's not going to be able to be specific to a box because we don't know what is going to be in each of the boxes. I'm not really sure I haven't handle that.

Hill, Michelle: If I may - what he suggested - it would be as simple as, we provide them the nine allergens like as a grid and they would just check the box if they know that there's a known allergen. And so it would be really be a simple sheet that would say, here's the nine allergens check which ones are present and maybe even a half sheet that they just throw in the box and say be aware. That doesn't have to be what it is, but that's what he recommended.

Truong, Vy (VDH): I think that's a really good idea, but it's also really important to remember that some food banks like his are really big and really well organized, and some are a lot smaller. And what if they miss one of the allergens? Just because they're not aware, that could be pretty dangerous if someone was like, oh, there's no wheat, and there is.

So, I don't know somehow whatever we create, just making sure that we address - maybe giving them a checklist, but also addressing that there could be unknown allergens.

Hill, Michelle: I think that's excellent - that they, we, would note that the other thing he said is that when they do break out the bulk food, if it is allergy, they label it for allergens and again, like you're saying, this is Second Harvest, so big dog, but it's good advice.

Babekir, Amani: So are we good with having a section for the equal consideration in the Framework?

Wagner, Ben: I feel like it it's a good idea.

Hill, Michelle: I do too, yes.

Truong, Vy (VDH): I agree.

Babekir, Amani: Ben, would you like to take the effort of adding this section , with your team, to the framework?

Wagner, Ben: I think we already had decided that we were going to do something like that. Yes, with the information that we already have, plus if we get any other Experts that we can talk to that might have further information we want to incorporate and then we can bring that back to the larger group to approve.

Babekir, Amani: OK. Vy, would you like to join to join these efforts?

Truong, Vy (VDH): Sure ,I can. Or, if you just need anything from me, just feel free to reach out.

Wagner, Ben: I think we'll reach out if we need you. How's that sound?

Truong, Vy (VDH): Sounds perfect.

Babekir, Amani: That sounds good. Thank you very much

Babekir, Amani: Michelle, you could forward those comments to Ben so he will have it in his records?

Hill, Michelle: Yes, I am also on the template committee with Ben. So yes, will do.

Previous Meeting Minutes

Babekir, Amani: I think that is all the items I have in the agenda today. We are going to postpone the voting for approving the Minutes until our next meeting. Are there any additional thoughts or questions about the progress of the work, or any other thing?

Hill, Michelle: Amani, if I may - please take the time to review the meeting minutes and if you do have changes let me know prior to our next meeting and we can get those put in so that we can approve, you know have an easier time of approval if there are needed changes.

Meeting Adjourned

Babekir, Amani: OK. I think that's it. We made a very good progress and I think we're going to make our deadline, which is the end of this month, so we can send it out for the FDA to review, and hopefully by July we'll have our framework complete, and then we will proceed with what suggestions we have for changes to the Annex to the FDA Model Food Code. Thank you everyone. Hopefully see you in our next meeting. Next Meeting is set for Thursday, May 26, 2022.

MEETING MINUTES

Call to Order

Babekir, Amani: This meeting will now come to order. Michelle, would you like to do the roll call today.

Roll Call

Michelle Hill (Co-Chair): Certainly. Thank you. Madam Chair, we have a quorum of nine.

CFP Antitrust Statement

Babekir, Amani: OK, that's great. Thank you, Michelle. We just want to remind you that the Conference for Food Protection antitrust statement is active during this call, so let's just keep it in mind and we can proceed to the first item in the agenda, which is approving the last meetings minutes.

Previous Meeting Minutes

Michelle Hill (Co-Chair): Madam Chair, I cancelled the May 26th meeting we would have had two weeks ago because it was the day before Memorial Day weekend, and it was not a date that was listed on our master schedule. Today we need to approve two sets of previous meeting minutes.

Babekir, Amani: Two sets, OK.

Michelle Hill (Co-Chair): I do believe so, as we did not have quorum for the most-recently held meeting, and we couldn't vote on the previous meeting because there had been edits to that set of minutes that needed to be reviewed and approved.

Babekir, Amani: OK. Thank you, Michelle, for reminding us of this. Let's review the last two sets of meeting minutes as part of the documents which I sent out yesterday. I will give it 2 minutes so you can go over it before we vote.

Michelle Hill (Co-Chair): Madam Chair, just for clarity's sake, we will be voting on minutes from the meeting from April 28th meeting #13, which beings on page 47. The second set of meeting minutes is for the May 12th meeting #14, begin on page 53.

Babekir, Amani: Thank you, Michelle. OK. I will entertain a motion regarding the minutes of the last two meetings.

Michelle Hill (Co-Chair): Madam Chair, shall we entertain a motion for just the meeting minutes from April 28th to start?

Babekir, Amani: OK, let's do that.

Ben.Wagner: This is Ben. I motion to approve the meeting minutes from April 28th. Thank you.

Michelle Hill (Co-Chair): So noted. Thank you, Ben.

James O'Neal: And this is James. I'll second the motion.

Michelle Hill (Co-Chair): Thank you, James O'Neal, so noted.

Babekir, Amani: Thank you. Is there any discussion on the Minutes, any questions? No? Let's proceed to the vote on the motion. Is there anyone opposed to the motion? Please raise your hand. Do we have anyone abstaining? The motion passes to accept the Minutes as is. Thank you. So now I will entertain a motion regarding the minutes of the last meeting.

Ben.Wagner: This is Ben again. I move to approve the meeting minutes from the last meeting.

Michelle Hill (Co-Chair): Thank you, Ben, so noted. The meeting date is May 12th that we're speaking about.

Vinson, Scott: I second the motion.

Babekir, Amani: Thank you, Scott.

Michelle Hill (Co-Chair): So noted.

Babekir, Amani: Is there any discussion on the Minutes? Any questions? Thank you. Let's proceed to the vote on the motion. Is there anyone opposed to the motion? Please say no or raise your hand. Do we have anyone abstaining? The motion passes.

Framework Points

Babekir, Amani: OK, so now we will move to the second agenda item. I would like first to start by thanking the template team. They put together the framework, the different sections in just one document and they went over it and investigated creating additional sections, like the Introduction and the Table of Contents.

Devin Dutilly (FDA) is going to lead the comments regarding reviewing this document. He will have an internal review of the document and we are hoping that we're going to get FDAs comments by July 15. I'm going to give the floor to Ben, and all of you, to discuss the framework piece by piece. But I would like to bring up to you one of the suggestions which I received. Amber suggested that the document is very long. It might be very useful to small restaurants. And we probably need to create a kind of handout or more concise document than this one.

So first we want to discuss this point before we go into discussing all the sections of the unified document. What do you think about this suggestion? Yes, Michelle.

Michelle Hill (Co-Chair): Thank you, Madam Chair. I think it's an incredibly good point. I personally would recommend that we keep our long document but develop something that maybe is a single sided or a double-sided sheet of paper and perhaps it's as simple as we have a nice set of icons or pictographic representation of symptoms of allergy, as well as icons for representing allergens. Thank you.

Babekir, Amani: Thank you, Michelle. Yes, Erin?

Mortiz, Erin: I'm a big fan of more pictures and fewer words. Before we get started on that, it would be good to formalize what perspective we want this document to be from. We kind of ran into some of this when we were formatting it, but right now I think it's sort of written as an educational document. In some sections I think the original idea was to make it a template that an establishment could either print out or use or fill in their own information if they wanted to do something different than what's already in the document. And I think some sections are a very high-level list of, we should be including this in an establishment's plan. I think nailing down what perspective we're coming from and exactly how we want the establishments to be able to use this. We might want to establish that first before we do anything else.

Babekir, Amani: Thank you. Yes, Amber?

Amber Potts: Hello. So let me explain what I'm meaning. I like the framework and I think we should keep that document, but in addition, a smaller like pamphlet-type thing and I'll show you something I did to give you a visual, but just from experience – for the majority of small businesses, English isn't the first language. These second-language speakers may have a very difficult time implementing this or even understanding it.

Just even personally, I got about 14 pages in, and I had to stop and do something else, then come back to it because it's just a lot of information. I do think that the document could be trimmed down a little bit. I think there's some repetitive spots. Can I share my screen and give you an example of what I was thinking about?

Babekir, Amani: Yes, please.

Amber Potts: OK, so you may have seen these business plan type things, but just a quick flip through pamphlet of what this document says on a high level, of course, this isn't the final one, but I put together a flip book.

We could list everything here. You could see the major food allergens, and then some of them I put like casein for milk, and stuff like that.

Kind of just a more fun document, I guess to read and something that maybe is more digestible and could be easily translated into another language.

Babekir, Amani: Thank you. Yes, Scott?

Vinson, Scott: I think that's a neat and generous offer. I think it would be useful to some of the smaller establishments than even not so small. If Amber is generous enough to make the offer to create something like that, I would be in support of it.

Babekir, Amani: Thank you, Scott. Yes, Michelle?

Michelle Hill (Co-Chair): I think it's a great idea and it's I like the idea of it kind of pulling it out of being such a formal, serious presentation, not that it's not serious, but kind of like fun facts. You know, so really neat! Is that a template, Amber, that you developed that we could just plug into?

Amber Potts: Yeah. So here at NEHA and personally I use Canva. It's a website that they give you templates and then you just plug and play.

This was the one I found. It was in red. I turned it all into purple because I felt like that was food allergy, and then it popped up yellow to kind of bring attention to certain areas. Once the framework is more finalized and more final, I can basically plug and play on this document, and then send it over for review, definitely. By December this is doable, sure.

Mortiz, Erin: The goal for, we'll call it Amber's document, may be just for ease, especially like smaller establishments. Print it out and have it as a resource without doing anything to it. Is that kind of the goal with that?

Amber Potts: Yeah, that that was my goal.

Mortiz, Erin: OK.

Amber Potts: And then not necessarily even printing. It could be something digital. People could have easy access to.

Mortiz, Erin: Sure. OK.

Amber Potts: What is the access? It would be nice if we could have it translated into other languages – that would be pretty neat too.

Mortiz, Erin: Definitely agree.

Babekir, Amani: Right, thank you. And Amber, do you think you're going to need any help at any point?

Do you need an extra volunteer with you? Or you could handle it by yourself.

Amber Potts: Yeah, it would be nice to have one other person to kind of go back and forth with.

Babekir, Amani: OK.

Amber Potts: I'm not sure how to give them access into the NEHA Canva account, but it's as simple as me downloading it and doing it that way is fine too. It's going to be really relatively simple for me to just basically copying and pasting what's already in the framework. I'm not adding anything. And then Canva has a wide variety of stock photos to use, and then of course if we have any photos we could put in there, but just someone else to look at it and make sure I didn’t install anything wrong or miss copy or anything like that would be nice.

Babekir, Amani: That is cool. Yes, Scott.

Vinson, Scott: I'm happy to help with that Amber, if you like.

Amber Potts: Oh yeah, sure.

Babekir, Amani: Those great thank you, Scott. OK. Yes, Michelle.

Michelle Hill (Co-Chair): And if you wouldn't mind having a third, I am happy to help out with that as well.

Amber Potts: Yes, awesome.

Babekir, Amani: Thank you, Michelle. So that's great. We can proceed with working on our original documents and while Amber is getting ready to prepare her template for the other document and also, I think beside Amber's document, if we feel down the road, that we might need to add extra handout. Any additional documents also feel free to suggest as we could add it as an attachment to our original document.

I think now we could proceed to the second point in our agenda, which is reviewing the framework draft. Ben, would you like to lead this one?

Ben.Wagner: If you wish, so is the expectation that we're going to go through and make comments as a group or just an overview, or what are we looking for here?

Babekir, Amani: Yeah, if you could walk us through the changes you made to the document and if you have any comments or question or suggestion about a specific section, feel free to ask it to the team and then to discuss it, and then proceed to the second point on the document.

Ben.Wagner: High level, we did put a table of contents together for the document. We also put together an introduction section with a purpose and scope for the entire document.

This symbol means that there's an image available within the document that can be used. And then it goes immediately into the various sections for the charges we were given. The only changes we tried to do is to put a purpose in where it seemed appropriate. Other than that, not much has changed. I guess I was hoping the larger group would take a look at the overall flow of the document and see if, once again, like we've mentioned, if it's too wordy in spots, or if it seems not wordy enough in other spots. I don't have all the mark-up language showing here just because it is really chaotic. When you show all the markup, but the data is still there. If you want to look on Word for what markup is happened. Some of these notes that remain from me could probably be deleted. I didn't realize this version was going to go out to the whole group immediately without those being deleted. I don't have much else to say at this point, except at the bottom of the entire document we get into a short paragraph about equal consideration for alternative community food sources. I don't know if that needs to be beefed up. I would love for that group to look at this and make suggestions as to how that can be edited or changed or added to a lot of the information we were originally provided was also provided elsewhere in the documents. We kind of referred back to that. And we actually included it in another section. There was a part about reading labels. And we included that in a previous section where we thought it would fit. If that doesn't work for the entire group, please speak out. We have this Definitions Section. And then we go down to references and these were just references pulled from the various sections and concatenated, and I tried to put them in. A format that I thought looked appropriate once again, not an expert at that, so somebody else wants to take a crack at it, feel free. I'm open to any feedback people have. If you just want to let me know where you want me to focus on the document while I'm sharing, or I can stop sharing my screen.

Babekir, Amani: Thank you, Ben. Yes, Scott.

Vinson, Scott: It's been a while since I've looked at this document and now, I'm looking at it with fresh eyes again and in the food handling policies and practices section starting on page.

6, scroll down to page 7. There's a section at the top under 22D, I guess it's just new section D use ingredients that have been designated as allergen free on their packages, or otherwise determined to be safe for allergen free meals. So, in looking at this section again, I'm wondering if that should be included. If the person is preparing, you know, food service workers, preparing someone's meal they're trying to exclude specific allergens that the customers told them they need to avoid. So, if we're directing the Food service worker to do what is written in line D, does that mean they're going to be maybe confused and exclude any type of allergen, even though the customer might not be allergic to that particular ingredient? The way this reads in section D, it looks like we're telling the food service worker to just make the food, free of every major food allergen. I'm not sure that's what we're intending to say here.

Abel, Greg: No, you're intending to say, uh, not to use the offending proteins for that particular order.

Vinson, Scott: Well, that's not what it says.

Abel, Greg: Yeah, we have to somehow fix that, I think.

Vinson, Scott: Yeah, because it makes it look like they're supposed to only use ingredients that are labeled allergen free.

Mortiz, Erin: And is there such a thing as allergen free?

Abel, Greg: No.

Michelle Hill (Co-Chair): No.

Abel, Greg A: Yeah, we don't want to be making up a term here that's doesn't exist.

Vinson, Scott: Yeah, I think that section is really confusing and is going to confuse food service workers.

Michelle Hill (Co-Chair): Can we just delete it? I mean because the next statement I think is pretty clear.

Vinson, Scott: Yeah, yeah. I think we should just delete it.

Mortiz, Erin: And just for reference, this you know sort of the formatting group. Our charge was not to actually look at content. It was more just to make it flow a little bit better.

Abel, Greg: I would recommend not removing it at this point, but rather maybe rewriting it, because I think that's an important piece - using correct ingredients. I'm trying to think of what would work better there.

Vinson, Scott: Just say something like don't put anything the customers are allergic to in the meal.

Abel, Greg: Right, or maybe something like ensuring ingredients do not contain …

Dutilly, Devin: You could put free. You could put free from.

Abel, Greg: Yeah, and certainly.

Ben.Wagner: So, does the group want to bring suggestions to Scott on how that could be altered? And then Scott, do you want to take that? And once you have something you think is sufficient, bring it back and we can insert it, and change it.

Vinson, Scott: Sure. But frankly, I don't think we need specific instructions because it's superfluous.

Michelle Hill (Co-Chair): I think so too. Brevity is our friend.

Vinson, Scott: Yeah, somebody's earlier in the call said that the documents too long. I don't know, but we should be looking at parts to omit.

Michelle Hill (Co-Chair): Or that are redundant or obvious.

Vinson, Scott: Yes.

Babekir, Amani: I think here this piece is about ingredients. Have we covered anything related to the ingredients in the upper sections? You could scroll up here.

Vinson, Scott: Yeah, but I mean, it's just common sense. They've been told to avoid a certain ingredient because the customer is allergic to it. They're not going to put that ingredient in the meal, and you don't need to write it out. This is common sense. It doesn't need to be set.

Michelle Hill (Co-Chair): Maybe the intention of the statement originally was that you make sure that the ingredient you're going to use doesn't have that allergen.

Mortiz, Erin: Yeah, I was going to say if, let's say you use you use like a store-bought salsa or something. That's kind of how I took the purpose of that particular statement, although I was confused by it as well. Do we say any place else in this section to check the ingredients of the ingredients, so to speak? Or let's say there's like a sauce that goes into a recipe you have the ingredients of the recipe, but then if there's a sauce that's premade or something you also need to make sure that this sauce does not have the food allergen in it as well.

Vinson, Scott: Ohh, I think I see what you're trying to get at. So, I think the issue here is processed foods. So, if the food preparer is using an ingredient that is processed and might have its own set of ingredients, they should check them too.

Michelle Hill (Co-Chair): Isn't it two or more ingredients you must label?

Abel, Greg: That's it - yes.

Thoma,Libby: Hi, this is Libby. I just want to say, as common sense as it seems to be, I do think we need to make a statement that says, don't put allergens in the food.

Michelle Hill (Co-Chair): Yes.

Susan Algeo: Great.

Thoma, Libby: Today I went to a Taco restaurant. I ordered a Taco that is described on their menu board as being prepared on a corn tortilla. And when it came to me, it was on a flour tortilla. So, I said this is on a flower tortilla and he goes, Yes, ma'am, it is. Do you want it on corn? And I said, I do because that's how it's described on your menu board.

And he was like, Oh, OK, well, we'll fix it. But they intentionally made it not according to their advertised. recipe. So as basic as that is, I do think we need to make sure that they are following their procedures, so that the customer isn't misled.

Abel, Greg: So, what you're saying there for D is ensuring the foods and ingredients used are free of that offending protein.

Michelle Hill (Co-Chair): Correct. I like that.

Susan Algeo: Yeah.

Dutilly, Devin: You might want to consider using a term like, unexpected sources of food allergens

Vinson, Scott: I just put something in the chat that's concise and to the point.

Babekir, Amani: Thank you. Any other suggestion or comments about this point? Ben, would you like to scroll up to the beginning of the document and then we could go over the comments with the team. See their suggestions – I left peoples because I thought maybe we just need to bring them here to the team and see if they have any additional thoughts.

If any of your comments are not needed, please delete.

Ben.Wagner: Is everybody happy with that phrasing of what the term Food Service employees?

Michelle Hill (Co-Chair): I would recommend food workers because then you're including people that are volunteering.

Vinson, Scott: I agree.

Susan Algeo: I think we talked about this before. Doesn't the Food Code define a food employee versus an employee, and food employee encompasses all that food service. I can check but I think that I mean the food could have the definition, so I just didn't know if we want to get confusing.

Michelle Hill (Co-Chair): No, that's an important point.

Babekir, Amani: What do we have in the definition section then? We have one. As in food service or food employ.

Susan Algeo: I was just looking at, didn't see we have food employee. It's food employee this food handler in there.

Babekir, Amani: So do we want to keep it food employee on the whole document?

Michelle Hill (Co-Chair): Could we add a definition that's food worker that combines the employee and handler ideas? Where were these pulled from? Is this from the food code from the Model Food code?

Babekir, Amani: Yeah, that's from the Food Code.

Babekir, Amani: And we previously discussed this one as Susan said and we agreed to use the food employee.

Michelle Hill (Co-Chair): Oh, OK.

Mortiz, Erin: And do we? What was the objection to food worker? Did we? Talk about that at all. I can't remember.

Babekir, Amani: I think because it was listed under the definitions, the food employee and also, we had, I think, the food workers and then we said, it's a difference in the Food Code to make it consistent with the language of the Food Code. Let's just stick to the food employee.

Mortiz, Erin: OK. I do like food worker better at sounds a little bit more plain language but being consistent with the Food Code is also beneficial.

Babekir, Amani: Thank you.

Susan Algeo: The Food Code only has, from what I can see, food employee. They don't define food handler that I see in here, so that might have been from another source.

Michelle Hill (Co-Chair): Well, and what's highlighted on our working document here is Food service employee, so.

Susan Algeo: Right, so we show.

Michelle Hill (Co-Chair): We would move that, yeah, OK.

Susan Algeo: Probably swap that to food employee, right?

Michelle Hill (Co-Chair): Correct. Yeah, that's my assumption too.

Susan Algeo: OK.

Babekir, Amani: Yes, Amber.

Amber Potts: The question under scope right here, isn't all of this covered in the table of contents? Do we need to say it again?

Ben.Wagner: I'm sorry, what's covered in the table of contents.

Amber Potts: Uh, where it says scope. The document covers these topics. You go to the table of contents. You can see what the document covers. I don't know if we need to say it twice.

Susan Algeo: I think when we put it together, Ben and Erin, correct me if wrong. I think we were just trying to match other pages that had the purpose, scope and intro, so I think we're just following that concept.

Amber Potts: Ah, I see.

Mortiz, Erin: I'm fine with deleting it.

Susan Algeo: I mean, I am too, except for just keep in mind, I don't think most people read a table of contents. They might just jump into it. But agreed there's some repetition in here.

Mortiz, Erin: And I'm not sure lay audience is going to understand the difference even between a purpose and a scope.

Vinson, Scott: I don't understand the difference.

Amber Potts: Yeah, I think we need to be cognizant of our audience. I mean, high up corporate food safety, they're going to understand this. But that's not the majority of restaurants. But then again, the additional pamphlet we're going to put together may alleviate that. I don't know what the best thing to do is.

Mortiz, Erin: And I vote for deleting the scope from the introduction, with my non-voting member vote.

Vinson, Scott: I support that.

Michelle Hill (Co-Chair): I do as well.

Susan Algeo: Amani. Did you say that FDA was going to look this over? Once we've completed stuff and they're going to give us feedback or they have a current document?

Babekir, Amani: They have the current document, is that correct, Devin?

Dutilly, Devin: Yes, the document that was sent out on 6/6. So that document is the one that's been used for comments? That's what we're currently using.

Susan Algeo: We just want to be careful if we change too much, then uh, we might need to wait for that feedback.

Babekir, Amani: Yes.

Amber Potts: So I guess I wasn't here for that meeting. We sent this to the FDA to review. OK.

Dutilly, Devin: Sorry I didn't announce myself – I am Devin Dutilly with the FDA, with the with staff here. I've been one of the consultants along with Greg Abel. And then we also have CDC consultants on the call and then USDA representative as well. So we've all been kind of participating with and engaging actively across the board here so I think, we're just taking some time to provide some comments from other individuals within our agencies as well as just looking at the document now that's been put together in a complete framework.

Amber Potts: Yeah, that just makes me nervous cause it's I don't think it's written to the level that the FDA would - if the FDA was our audience, this would not be sufficient. It's not written like code language either, which I know it's not code, but it's OK. I'll just wait for the comments.

Dutilly, Devin: I think these comments are helpful, right. So I think it's great to work through questions, concerns within the group, so I think that's been fruitful discussion right now. I don't think that you should be discouraged from commenting right now.

Michelle Hill (Co-Chair): We actually might be like minded on what we want to change.

Susan Algeo: Umm.

Amber Potts: I think one other quick comment I had is just an editing thing. When we say major food allergens, sometimes we capitalize all the M and the F and the A and sometimes we don't. I just think we need to be consistent throughout.

Abel, Greg: Agree.

Vinson, Scott: Makes sense?

Babekir, Amani: Thank you.

Michelle Hill (Co-Chair): I did want to ask the larger group here under the intro, the first statement declaring that it's an immune system overreaction to a food protein isn't the fact that the immune system is reacting at all the problem? It doesn't necessarily indicate overreaction, it just means it's reacted. And it maybe it doesn't matter, but it did bother me …

Abel, Greg: Where are you? At what paragraph?

Michelle Hill (Co-Chair): There you go, you've highlighted it – Overreacts. It's the fact that it's reacting at all, that is the problem is it's not an overreaction, it's just a reaction.

Mortiz, Erin: Well, it's.

Amber Potts: Yeah. And it's written differently down in the emergency section, the sentence is written twice in different ways. I notice that as well.

Mortiz, Erin: So I think. In in my mind it it's an overreaction because it is reacting to something that's harmless.

Michelle Hill (Co-Chair): I see.

Mortiz, Erin: I can't remember if I was involved in writing this sentence or not. I do kind of like the overreacts because it adds a little bit more urgency.

Babekir, Amani: So what do we have?

Vinson, Scott: Given our intended audience is food service workers, maybe we can just avoid the issue altogether by just saying, People who have allergies to certain foods must avoid those foods in order to avoid getting very sick. Something like that. You don't really need to explain the medical issue, they just need to know that it that it makes him sick.

Babekir, Amani: I agree with that, and we already have a definition for food allergy in the definitions or technical definition. So you could use a simple term here.

Michelle Hill (Co-Chair): We could say something such as a food allergy happens when a person consumes a food they're allergic to.

Mortiz, Erin: That to me is kind of circular.

Michelle Hill (Co-Chair): It is.

Abel, Greg: Right, I think you want to be kind of prescriptive of what it actually is because you know, people need to get educated at some point to actually know what it is to so they can react properly. You know to make it so simple, might belittle the importance of it maybe.

Mortiz, Erin: Yeah, I remember having jobs as a teenager and a young adult. You know, there's always that little voice in the back of my head, at least where I just wanted to know why, otherwise I wasn't going to take it seriously. I think having a medical line about it is helpful, because otherwise it's just like, well, now you're just telling me what to do by saying they can't be exposed.

Michelle Hill (Co-Chair): To speak to that point too, Erin, I think that also it's such a muddy play, the definition food allergy is - people don't all agree on what it means. We have people tell us all the time they got an allergy, when really it's an intolerance.

Mortiz, Erin: Yeah.

Michelle Hill (Co-Chair): So I do like having clarity around the terminology because it it's a big difference between.

Mortiz, Erin: Right.

Michelle Hill (Co-Chair): You're not going to drop dead if you have an intolerance, so.

Babekir, Amani: So we have in the definition section, we have like two long sentences explaining the food allergy. Maybe we need just to look at it and see exactly how we want to rebuild it and bring it there - the section which we are discussing now.

Michelle Hill (Co-Chair): If I may real quick, I just realized we could delete that entire first sentence and still have a very good introduction.

Mortiz, Erin: Yeah. I mean, if we define it elsewhere in the document. Yeah, we could just start the intro at approximately … We just have to define it somewhere in the document, which I think it should be in the definitions table.

Vinson, Scott: Yeah, I have to jump off in just a few minutes and I'm I wanted to ask the group about a couple other things I found in on page 7. Before I have to jump off, I'm wondering if we've included things that maybe shouldn't be there on page 7, at the end of Section 4. It's right above taking food to the customer. That line, wash your hands with soap and water before touching anything else if you have handled a food allergen. Wondering if that is needed there, because presumably the food worker has just finished preparing and allergen free meal so do we need to direct them to wash their hands again?

Babekir, Amani: Before.

Vinson, Scott: Right after they just washed the equipment. It seems like an extra repetitive step that might annoy people and be unnecessary. What do you think?

Michelle Hill (Co-Chair): I would strike it, I don't see that it has a purpose either. It's not logical flow.

Vinson, Scott: Yeah.

Susan Algeo: Yeah, we're saying the meals complete then, yeah. They would move on to the next one and that step wash their hands.

Vinson, Scott: I don't know how it ended up, but it ended up there if I if I put it there, it was my mistake.

Susan Algeo: And we love encouraging people to wash their hands!

Babekir, Amani: Have we mentioned washing hands before preparing the meal on step number one?

Abel, Greg: Yes, that's the problem.

Michelle Hill (Co-Chair): Yes, it's always the first thing, hopefully.

Vinson, Scott: Yes, it's 4B.

Vinson, Scott: It looks like we can just get rid of 4 (i) and then my next question before I have to run. In Section 5, taking food to the customer, 5E, Review procedures and retrain the staff who prepared and handled the meal on these procedures before allowing them to remake the customers meal. OK, so I'm just seeing I've been in these situations before where I've been the customer. I've been very diligent about telling the person who took my order about my gluten intolerance and the meal comes out and it has gluten in it and I get the waiter's attention, or take it back to the counter and tell them about it. If they must, it's already taken a lot of time, and if I'm eating with other people, they're like halfway through the meals by this point, if the person who has to prepare the meal has to review the procedures and be retrained by someone. Again, before remaking my meal, it's going to take forever. And at that point, I mean, I've been in these situations where I've they bring out the meal, it takes them so long. By the time they get it to me, everybody else in my dining party is already done. And I just say sorry, you know. Thanks, but no thanks. We're going to leave. So I'm wondering if that should be omitted there and or saved for a later step because you want to get the meal by this time you've annoyed the customer because you've brought out a meal that has the allergen. So you want to remake it quickly. Of course, it's important not to screw it up again, but reviewing procedures and retraining that seems a little time consuming.

Michelle Hill (Co-Chair): Perhaps, Scott, we could say something such as corrective action must be employed and that corrective action phrase to a CFPM would be I'm retraining as I go. We teach to correct as you go, and maybe that's the intention of that part of the statement.

Vinson, Scott: Or yeah, or you could just put something in the preceding clause from in the previous sentence. Offered to remake the meal, allergen free, for the customer or something like that. But if I'm the customer, I don't want to wait until the person gets retrained, you know? Or it'll. It'll take too long.

Michelle Hill (Co-Chair): That or if you go to a sub shop and ask for gluten free bread in the middle of lunch and they break the machine down so they'll clean the slicer ...

Baldwin, James: Should not be referred to as a follow up corrective action.

Michelle Hill (Co-Chair): I beg your pardon. I think that's how we teach it.

Baldwin, James: Should that be referred to as a follow up corrective action? So not scarily good in process, but doing it as a corrective action after.

Vinson, Scott: Yeah.

Vinson, Scott: Yeah, I wouldn't use the words corrective action cause it sounds too formal and again we need to remember our audience here. I would put it in conversational language. Umm, but you know it can be added as a step.

Vinson, Scott: If after you deliver the allergen free meal, remade allergen free meal to the customer, then make sure that everyone knows the proper procedures.

Babekir, Amani: Or maybe we just need to delete before allowing them to remake the customers meal?

Michelle Hill (Co-Chair): That's exactly what should happen.

Vinson, Scott: Yeah. OK, thanks everyone for indulging me. By jumping ahead. I've got to run. Good luck.

Babekir, Amani: Thank you, Scott.

Michelle Hill (Co-Chair): I suspect that that whoever worked on this phrase was hoping that we would have this be a teachable moment, is probably the intention there.

Babekir, Amani: That is true. So, Ben, are you good with this one? Do you like to remove just Before allowing them to remake the customer meal, maybe you could add that on your comments there.

Ben.Wagner: I'm sorry. Can you send me the language you would like? I'm not making any changes on this right now. I'm just putting everything in comments. Initially, when our team went through this, the content we weren't concerned about it. So I feel like, if you guys want contact me, the groups that created the individual section content can make the changes.

Michelle Hill (Co-Chair): It's a good point, Ben.

Mortiz, Erin: Yeah, I would rather have the groups review their own sections again and send us the changes - like I said, we really did not look at content in the formatting group.

Michelle Hill (Co-Chair): Not at all, Ben. I think that what we could set how to satisfy this possibly would be to state in your comment strike before allowing them to remake the customers meal. That's the recommendation currently is what's in front of us.

Babekir, Amani: OK, so it seems. Thank you, Ben. It seems we are running out of time. So what we could do? I'm going to give it extra one week for you to review. And if you have any comments to add it to the document. And then I could send it out to the teams so they could go over their sections and make the needed changes. Does that sound like a good plan to all of you?

Michelle Hill (Co-Chair): Amani, just for clarity, does that mean when you say extra week, can you clarify?

Babekir, Amani: Yes, because I haven't received a lot of comments on the document. So I'm going to give it extra week or maybe two weeks. By then we will also have the comments from Devin and his colleagues. And please try to give it some time to go over the documents and make any comments about any suggested changes or any formatting we need to consider. After two weeks, I will send it out to the original subgroups so they could work on their sections and addressing those comments. That sounds like a good plan.

Michelle Hill (Co-Chair): Thank you. Yes.

Babekir, Amani: I'm going to give you one week for you to go over it, add your comments and suggestions before I send it out to the subgroups to work on editing.

Michelle Hill (Co-Chair): Our directive at this point is to provide you with our comments on the document as it is and then they'll be compiled and then we'll return it to committees, subcommittees to discuss and change.

Babekir, Amani: Yes. OK.

Thoma,Libby: Thank you.

Adjournment

Babekir, Amani: So thank you everyone. Thank you and have a good rest of the week and nice weekend.

MEETING MINUTES

Call to Order

Amani Babekir: I will now call this meeting to order. Michelle, could you please take the roll call?

Roll Call

Michelle Hill: Yes, Madame chair. [takes the roll call]. We have a quorum; we can proceed with the day's business.

CFP Antitrust Statement

Babekir, Amani: I would like to remind you that the Conference for Food Protection antitrust is statement is active in this call. So just want us to keep that in mind.

Previous Meeting Minutes

Babekir, Amani: And we could proceed to our first item in the agenda. We want to approve the previous meeting Minutes – the most recent is still being processed, so we will vote on the Minutes from June 9th. I sent it out just a couple of minutes before this meeting. If you could please open it and I will give like 2 minutes to review. And then we're going to proceed with the discussion and voting. OK, so I will entertain a motion regarding the minutes of our last the meeting from the June 9th.

Hill, Michelle: And just for clarity's sake, they run from page 57 to 71 of the Word document that was emailed by Amani.

Ben.Wagner: This is Ben. I move to approve the meeting minutes.

Babekir, Amani: Thank you.

Garvin, Amanda: I will second.

Babekir, Amani: Thank you. So, is there any discussion on the Minutes, before we proceed to vote? [long pause] Anyone opposed to the motion, please say no, or raise your hand. [long pause] Do we have anyone abstaining? [long pause] The motion passes to approve the Minutes as is. Thank you.

Framework Points

Babekir, Amani: And we could proceed to our first item in the agenda. We want to approve the previous meeting Minutes – the most recent is still being processed, so we will vote on the Minutes from June 9th. I sent it out just a couple of minutes before this meeting. If you could please open it and I will give like 2 minutes to review. And then we're going to proceed with the discussion and voting. OK, so I will entertain a motion regarding the minutes of our last the meeting from the June 9th.

Hill, Michelle: And just for clarity's sake, they run from page 57 to 71 of the Word document that was emailed by Amani.

Ben.Wagner: This is Ben. I move to approve the meeting minutes.

Babekir, Amani: Thank you.

Garvin, Amanda: I will second.

Babekir, Amani: Thank you. So, is there any discussion on the Minutes, before we proceed to vote? [long pause] Anyone opposed to the motion, please say no, or raise your hand. [long pause] Do we have anyone abstaining? [long pause] The motion passes to approve the Minutes as is. Thank you.

Babekir, Amani: So now we could go to the second item in the agenda, which is to continue reviewing and working on the framework. I sent out the latest version of the framework, and now let me share it with you. You could follow me on the screen if you want, or you could open your version. Can you see my screen?

Hill, Michelle: Yes, Madam Chair.

Babekir, Amani: OK. Thank you. So, I'm just going to go over some of the comments that we got from the previous meeting and add the notes to it. One of the things I noticed is that after we finalize the draft, we need to go back and change the table of contents because we deleted some of the sections and all of that. So, if the template, A team, is going to take care of this.

Hill, Michelle: I know how to do that, Amani. I'd be happy to assist in having that be completed.

Babekir, Amani: OK. Michelle, would you like to do it by yourself or ... Ben?

Hill, Michelle: I can work with Ben, if that's OK?

Ben.Wagner: This is Ben. That's fine.

Babekir, Amani: OK, that's good. Then the second one - we got a suggestion to make the document shorter than it is, and to highlight the definitions in the footnote of the document. So, per each page, if we see any word listed in the Definitions, we add it to the footnote of the page. What are your comments on this suggestion? Do you think it's better than the way it is right now, or we keep it as it is?

Ben.Wagner: So would that be replacing the basic dictionary at the end, or would it be just adding footnotes to every page and still having the dictionary at the end?

Babekir, Amani: I think from what I understood from the suggestion - and Devin, I'm not sure if he's with us today - is to replace the definition section, yes.

Dutilly, Devin: I'm here in the call, yes. I think the comment that I was passing along related to having it in the footnotes, in addition to having it in the in the definition section, just so that folks wouldn't have to flip to that section, or if they chose - on previous calls, someone had mentioned that somebody might just choose to print off 1 section and they may have it, or they might choose to, you know, print off only a small portion of it and not the entire document. They would still have some reference to what the definition meant, so both locations.

Ben.Wagner: I would just like to point out that it's not going to make the documents smaller, which, either way is fine, but I know that that's what the group seemed to try to be doing.

Hill, Michelle: I think that is an important point that's being made here. However, because I often print off one page of something and it's super nice to have that information contained at the bottom, it could be as small as six-point type.

Moritz, Erin: I kind of like the idea of having it in both places. I'm wondering if there's a way to, you know like Michelle is getting at, have it in smaller and maybe a lighter font, so it's less visually obtrusive. But I think we definitely need to keep the section at the back because they're all listed alphabetically - a quick reference there.

Babekir, Amani: Thank you. Any other point? OK. Thank you. So, I hear that the agreement is to have the some of the definitions in the footnote. Myself, I don't have experience doing that, who is going to take care of this one?

Hill, Michelle: I can work with Ben again. I've done a lot with this type of thing in Word.

Babekir, Amani: OK.

Hill, Michelle: Or anybody else is welcome. I'm just saying I'm happy to help.

Babekir, Amani: So, Ben, is that OK with you - that's to be taken care of under your subgroup, with Michelle.

Ben.Wagner: Yes, I think the subgroup can take it on.

Babekir, Amani: OK. That's good. Thank you.

Ben.Wagner: As long as you'll put a comment in here somewhere that that's what we're doing, so we don't forget.

Babekir, Amani: OK. We probably need to even give an idea here, or add the words that need to be added, under the footnote. They could be ...

Ben.Wagner: I think what the framework team can do is take the dictionary that we already have, do a search on the terms wherever the terms show up. We can mark that we need a footnote and then go from there.

Babekir, Amani: OK.

Moritz, Erin: Yeah, maybe with the exception of like food worker or something, I don't necessarily know if that has to be on every page.

Babekir, Amani: OK. Thank you. In the other point – here – we have couple of suggestions here - under this section, and Erin, I'm glad you are with us on this call. One of the suggestions is to - in this section additional consideration for the establishment is to make it simpler by just converting it to a checklist so it will be easy to read and the way it is right now. And also, we requested references when we were in the first draft round, but we probably wouldn't need it here. Just for the sake to make the contents here more simple. So, what do you think Erin and your group? You think that's something you will take care of? And if you have any other different opinion, please let us know.

Moritz, Erin: Yes, I think a checklist we can certainly try. I guess my hesitation is that I'm not sure all of these will apply in all situations and establishments. Would bullets be better? Any better than like A and 1?

Hill, Michelle: Perhaps it needs to be more of like a flow chart if then.

Hill, Michelle: That's a whole can of worms, isn't it?

Babekir, Amani: Yes.

Moritz, Erin: Again, I think a lot of these will overlap. Not all of them will be applicable in all situations. I saw one or two hands up.

Babekir, Amani: Yes - could you please speak up? I can’t see the hands.

Vinson, Scott: This is Scott. I have a question. It might be on the next topic we're getting to, I'm guessing, but the references.

I noticed Amani you highlighted some of the references in here. I think that's a reference to the Southern Nevada Health District. I'm wondering if we need the references in the body of this document, maybe they would be better placed at the end. I think we have two different audiences with this document. The first is really the folks at CFP who gave us our committee charge to come up with this document – I think they want to see our references - where we came up with this. Our other audience is the reader of the document, the ultimate reader, which will be the retail food workers. They're probably not really going to be that interested in seeing references in the body of the document. Maybe it's OK to leave it at the end if they're really interested, but they probably really don’t care about references, so maybe we should just put them all at the end.

Moritz, Erin: Yes, I think that's what we ended up doing for the other references. I think we probably just missed this section.

I agree. I think you know we have one Section - one short section at the end - with the References used to create this document.

Babekir, Amani: Yes, and we have …

Ben.Wagner: This is Ben. We did actually take any sections that were labeled as Reference sections from the individual groups and put them all as one at the end. Anything that was an inline reference we didn't touch.

Babekir, Amani: We do have a section where you have all the references combined, and even the breakdown by different sections, so it would be easy to refer to.

Moritz, Erin: Yes, I think that's fine. Just stay consistent with just keeping them all at the end.

Babekir, Amani: OK, that is good. So now we're going to come back to the point of making this section more concise because we have several points here. On our previous call, the agreement was let's work on trying to make this document more concise so the readers are comfortable going through it, I would say. We wanted to think about how we could put this section in a different way.

Moritz, Erin: So, to me this is at least when we were creating this, to me this is basically like a laundry list of things that establishments can think about when they're developing their plans and so I think anytime I see something that's a laundry list, I kind of expect it to be long because this is where we're getting very detailed and this is where somebody who is really thinking about the nitty gritty of their plan. They are the ones who are going to be reading this, so that was our thinking behind it because there are so many considerations, and those scenarios are going to be different based on the kind of establishment and where it is. We're certainly open to suggestions, but that was the point of this particular section, if somebody's really sitting down and thinking about what their plan is going to look like, these are things that that could help them.

Babekir, Amani: OK. And I agree that building an emergency plan is at the core of our charges. Any other suggestions about presenting this section in a different way? [silence] Could it be in a different or are we OK with it?

Garvin, Amanda: This is Amanda Garvin. Somebody had mentioned a checklist, an option for the checklist might be kind of something we do for a facility, and we have, like these are the SOP's that pertain to all facilities and then we have a list of, this is what pertains to some facilities so only included if applicable. So that might be an option.

Moritz, Erin: OK. So, kind of group it based on.

I don't know if these are specific enough to try to narrow down and say, this is good for a full-service restaurant, This is good for a Taco truck. Although that's one possible thing that we could consider doing. Thanks.

Hill, Michelle: Oh wait, we could know it for this section, like as a prelude to it, that it's meant to be used in that way, that you might not have answers to all of these questions. There. You do. You do say that might have additional questions to consider.

Moritz, Erin: We could certainly try to shorten the paragraph - I think that's doable. And then similar to - Michelle, what you were just saying? I wonder if there's some words we could add or change in the section title that just make it more like, If you're just reading this for general interest, don't bother with this section.

Hill, Michelle: Perhaps we could say something as easy as if you were intending to form an allergen plan - isn't this really targeting an allergen response plan? - so if you're looking to have that for your organization, that this would be what you need.

Moritz, Erin: Yes.

Babekir, Amani: And this is …

Hill, Michelle: Something similar. Right, yes.

Moritz, Erin: Writing a detailed plan, because this is very detailed stuff.

Babekir, Amani: And this is one of the elements of the charges, to show the customer how to walk through, or the restaurants staff how to walk through building these emergency plans.

Dutilly, Devin: Just commenting, I think that about shortening the document and some of the discussion right now, is there a need to do a small section - like a summary, an executive summary type document and then have the rest of the document exists … or something like that. I don't know if that's going to be helpful or not. Is it because the intent is to have it in a detailed emergency? Because you all had just said this is not an action plan or an emergency plan, detailed one, right. So, it's just the detailed one. And then is there some way we can go through each section and just scratch certain things and then make it a summary of what's in there that is also useful but not detailed. So, then we have like two documents, one is like an executive summary document and then one is like this. Based on what we already - not to creating more information - just using the existing language and wording and just scrapping certain text. It's just a thought.

Babekir, Amani: Amber has suggested to create like a short document from this version.

Moritz, Erin: And I think for this particular section, the poster that we developed kind of serves it as that executive summary.

Dutilly, Devin: OK. That makes sense.

Moritz, Erin: That's kind of where we were going with that poster.

Hill, Michelle: Quick. But.

Dutilly, Devin: Yes. OK, great, good.

Hill, Michelle: We might talk about how this is a detailed inventory of what you would need you know in order to do the plan or to comply with the chart - the poster, which I think is very effective, by the way.

Moritz, Erin: Yes, I like the idea of scratching that paragraph and maybe doing one sentence saying that this particular section is designed for – has detailed considerations for …

Hill, Michelle: Sorry. The final line might be enough. These questions and scenarios may be used as a practice drill for your food establishments staff or don't have to - maybe not even practice drill, but …

Moritz, Erin: We could just keep that sentence and say these questions, that scenarios may be used to develop a detailed emergency - allergen reaction and response plan, and can be used as a prep. And then delete the rest of that paragraph

Hill, Michelle: Yes.

Hill, Michelle: And may also be used as a practice drill.

Babekir, Amani: But now? Could you say the sentence one more time?

Moritz, Erin: OK. These questions and scenarios may be used to develop a detailed Emergency … Allergy reaction? What did we officially call it? An emergency response plan. And that gets to the other things I wanted to discuss about the section that you guys deleted. But let's finish up with this first.

Babekir, Amani: We could do that.

Moritz, Erin: And – can be used as a practice drill ...

Babekir, Amani: For your food establishment staff.

Moritz, Erin: Yes, I think the rest of the sentence is OK.

Hill, Michelle: As I said, you could strike, you could just say period after drill. I mean, it's obvious we're talking about your staff, but the …

Moritz, Erin: Yes, that's true.

Babekir, Amani: Do you want to make any change on the title?

Moritz, Erin: How about, could we use the word detailed in the title again?

Hill, Michelle: Forming a detailed response …

Moritz, Erin: Detailed considerations for the establishments.

Babekir, Amani: Or, for developing emergency response plan.

Hill, Michelle: Yes. Is that our charge? Let's call it what our charge is.

Babekir, Amani: Are you OK? So detailed. Consideration. It's not additional, is that right? Have we? Umm.

Moritz, Erin: We can remove additional, I think. I think really what we were going for was detailed instead of additional. I think that's good.

Babekir, Amani: Any point or any suggestion before we proceed on this section, are we good with it?

Hill, Michelle: If we're intending this to be a form, let's say that somebody could take and fill in. I don't know if that is the intention, but this could be set up with little boxes that could be checked as I move through and have spots to write. I don't know if that's our intention though, but if we wanted them to be able to just copy it and use it, that's something we might want to consider.

Moritz, Erin: Yeah, I'm not necessarily opposed to that. My only hesitation is some of these will be applicable to some establishments while others might not. But you know, it's certainly up to the establishment to decide if they're applicable or not. We could try a text box or a checkbox - otherwise you know even if bullet points might be a little bit less intimidating than the letters and the numbers. And you know, open to feedback from the group.

Hill, Michelle: But I've been looking to work on this with the template team. If or maybe Erin directly.

Moritz, Erin: Yes. OK.

Babekir, Amani: OK. That's good. So, we could proceed to the next point. Erin, you said you have a comment about one of the sections we deleted here from.

Moritz, Erin: Yes.

Babekir, Amani: From your part.

Moritz, Erin: All right. Can you guys all see this? For the most part, I was fine with, you know, all the suggestions here. I do want to take a moment to explain the rationale of why we kind of broke this down into different scenarios. Allergic responses look very different, and so lots of people when they think of an allergic reaction, they think of somebody sitting at the table clutching their neck because they can't breathe, but there's a really wide continuum of consciousness - ability to communicate. There're people like me, I have a peanut allergy, but it's very mild. So, I would actually be pretty mad if an establishment called an ambulance for me and be especially angry if I got stuck with a bill for it. And so, I'm definitely OK with deleting this kind of detailed suggestions. Basically, a flow chart but with words - but I do think we really need to work in somewhere else that a person could be alone, they could be with a group. And what do you do with them? They could be unconscious, which obviously you call an ambulance. But if somebody says, I ate a peanut from your dish, I'm just going to take a Benadryl. I think you know we want to basically draw attention to the fact that there's really wide continuum of severity and so I'm thinking it would make the section we were just trying to shorten a little bit longer, but I'm wondering if we could add this first.

Add somewhere in here, something like think about what role your establishment would play if the person is alone versus with a group. If they're in distress versus in distress but can still communicate. So, it would not be necessarily this kind of prescriptive steps

to take, but I do really want to get establishments thinking about beyond that sort of classic sitting at the table gasping for air, if that makes sense.

Hill, Michelle: I think it's really important, the point you're making, Erin, because they do present very differently, especially when you consider children versus older groups.

Moritz, Erin: Right. And so, if we do - like I said, I'm fine with deleting, you know, these step-by-step things, but we need to put it in here somewhere that it's not always going to be the diner sitting at the table turning red, clutching their throat.

Babekir, Amani: I'm wondering if this section or the message on this section being addressed is in the training section. Is Amber with us?

Amber Potts: I'm here.

Babekir, Amani: Have your team addressed you know the different level of reactions in your section and just to bring awareness about this.

Amber Potts: No, no we didn't.

Moritz, Erin: If we wanted to add a little blurb about that in the training section, that would be good. But like I said, I'd be happy if we mention it in the section that we were just working on too. I don't know if any other members of the emergency subcommittee are on – if they have thoughts.

Hill, Michelle: I don't know that they would be much point in graphics of people actually experiencing allergic responses. To show that there's a huge variation. Or is that just too difficult or too much?

Moritz, Erin: It's not a bad idea. I think it would be included in a very specific, day long allergy training.

Hill, Michelle: Yes.

Moritz, Erin: I think what we're putting together is a lot more broad than that, but I do like the idea, of course, I always like the idea of graphics.

Hill, Michelle: Picture says 1000 words.

Moritz, Erin: Yes.

Babekir, Amani: So, Erin, do you think you could … Yes, Amber, go ahead.

Amber Potts: I like the idea of keeping it broad as this is not the training. We're not developing a training per se, just a, you know, a document to help them write their own allergy plan. And so we, I think we should at least mention it, but I don't want to - and we have to remember they have no medical training. So, I don't want to put that kind of responsibility on a restaurant owner or server. And then I don't want them to interpret that as such either, so I think it's just a general statement. Basically, it's like if you've ever done lifeguarding - the drowning isn't as you see in the movies where it's splashing and yelling, there's no - it's silent. So, just an acknowledgement that you may not see what you think you're going to see - something like that - and then leave the training - when they take that training - for it to be a more in-depth kind of training.

Moritz, Erin: Yes, and what I do really want these restaurants to think about is there's going to be these wishy-washy scenarios where their staff are not going to be sure if they should call the ambulance. Like if somebody reports a reaction but they don't want an ambulance but they're turning red - you know these are these are actually the much more likely scenarios that they're going to come across. And so, they just need to be thinking about it. And even just be aware, like you said, Amber that you know … you're not gonna be splashing around in the pool yelling for help, metaphorically.

Babekir, Amani: Yes, Scott.

Vinson, Scott: Maybe this is already in the document, I can't see it at the moment, but maybe put something in there about, ask either the customer, or someone with the customer, if they would like the facility to call an ambulance. Because, like someone said a moment ago, you have some customers that might be annoyed if the establishment calls an ambulance, and they didn't want them to. Maybe they get stuck with a giant bill. So, is that in there? Oh yeah, there it is.

Moritz, Erin: And that's what we had here, but maybe that is too specific - it's I feel like that's an important enough question.

That if we for example, put an additional, you know bullet point down here, we could just call that out as like a sub bullet.

Vinson, Scott: But that's really all the establishment can do if the customer says no, or the person they're with says no. Then the restaurant can't do anything else - they can't constantly monitor the customer for possible other signs that aren't necessarily obvious signs that someone having an allergic reaction. I think we need to keep this.

Moritz, Erin: Some establishments might be willing to do that though.

Vinson, Scott: They might, but I don't think we need to spend a lot of time or take up a lot of space in this document writing about it. The main point we want to get across to the establishment is somebody might be having allergic reaction. Beyond the classic signs, there might be other signs. Ask the person or whoever is with him if you if they want you to call an ambulance, and then move on. They have a business to run.

Babekir, Amani: And we have it on #5. If you scroll to number 5. Here we have it. If someone reports an allergic reaction, I think that's where it is. Start is when the customer says I have an allergic reaction and then they will proceed with their steps. Do we need to add any clarification about the level of allergic reactions. and then ask them to first, ask the customer if he wants us to call the 911 or not?

Vinson, Scott: It really has to depend on what the customer wants. And this part in here. When in doubt always call 911 I from what I heard a moment ago from whoever said it, they don't want that necessarily. So maybe we should take that part out.

Moritz, Erin: Well, this is when in doubt.

Vinson, Scott: Well, yeah, and there's.

Moritz, Erin: Like if I was a business and somebody told me not to call 911, but then they stopped breathing.

Vinson, Scott: Well, that's just common sense.

Hill, Michelle: It is, and it isn't, though. I mean, what we're really asking here is what's the liability?

Vinson, Scott: If you put both messages in there, it's going to get confusing for these workers. If you put when in doubt, always call 911. But then you also say ask the person whether they want you to call 911. Which is it?

Hill, Michelle: I think that maybe it's personal discretion. The way we talk about this. What is the liability if somebody in your restaurant - they eat something and they drop dead. Are you responsible for that?

Vinson, Scott: No.

Babekir, Amani: What if …

Moritz, Erin: They told you that they had an allergy though.

Babekir, Amani: Yes, I think there ...

Moritz, Erin: I think I would assume the liability would depend on whether the customer mentions a food allergy.

Babekir, Amani: Yes.

Moritz, Erin: Like if they don't mention it then, well, that's a whole. I don't know. I'm not a lawyer, so will stop talking.

Babekir, Amani: Yes.

Hill, Michelle: So, it's a sticky wicket, I think really.

Moritz, Erin: It's very sticky wicket, yes.

Babekir, Amani: Yes, but there could be liabilities, especially if they label it in their menu, like for example, these dishes, gluten free. And then when I eat it, it turns out it is not, and I have reaction. Yes, that will bring them some liability.

Hill, Michelle: That's like misbranding …

Babekir, Amani: And we have it here on this section, on the first, on the second sentence, saying that procedures may differ depending on the severity of the reaction, so maybe just we need to add more clarification here. To address all of these doubts between calling 911 or asking the customer.

Moritz, Erin: So maybe I can draft - what? I would suggest - I hate to, you know, keep everybody talking about this for hours and hours - send it around to the emergency response group and then we can, you know, tweak it as needed and send it back to you, Amani. Does that sound OK?

Babekir, Amani: Yes, that sounds good.

Moritz, Erin: OK.

Babekir, Amani: And are you OK about the other deletions? Do you have any extra comments, Erin? Because there are additional things we might need also to delete in the section.

Moritz, Erin: Let me - I think there is only one other thing I wanted to kind of get your take on and I can just share it - share my screen again since I have it right up here - we have this particular poster …

Babekir, Amani: Yes, that was my question - about this poster.

Moritz, Erin: I think we like it because it did have some like facts underneath it and it's certainly one that a restaurant might want to print out and post somewhere if they like it. So basically, we could leave it in there as a potential resource for them. But I guess I'm OK with removing it if the rest of the subgroup is as well. It's just another resource that the establishment can use.

Babekir, Amani: Are there any comments about this one? Are we OK with keeping it?

Hill, Michelle: I think it's necessary.

Moritz, Erin: OK.

Babekir, Amani: Thank you, Michelle.

Moritz, Erin: OK.

Vinson, Scott: Wait a minute. Can you go back to that poster? Step four says go to the hospital. So, is that for? This isn't for retail food workers. They're not going to go to the hospital with them.

Moritz, Erin: No, this is a general yeah. This is a general.

Vinson, Scott: So, this a sign that we envision the establishment maybe posting, a customer facing sign, somewhere in the restaurant or facility?

Hill, Michelle: Yes.

Moritz, Erin: If they yes, they want to. It does make some good points. But yeah, it's not specific to retail food establishments.

Hill, Michelle: I really like it because it covers the full bases. If it's a true, you know if it ends up being a true anaphylactic response that you have to treat with an EPI pen. It covers all the bases.

Moritz, Erin: But I can kind of see where it might - it would be confusing. Now you know, we don't expect anybody from the food establishment to go to the hospital with the customer.

Vinson, Scott: So, this is really for people who have food allergies.

Moritz, Erin: It yeah, it's definitely possible, since it's from an ID.

Vinson, Scott: I'm not sure it belongs in this document. Then we're supposed to be developing guidance for the establishment.

Garvin, Amanda: I suggest a better place for it.

Babekir, Amani: Sorry, Amanda. What did you say? Couldn't hear you.

Garvin, Amanda: Sorry about that. I'd have to agree with that. I think that this is not quite the correct place for it, and I have. Like it's sounding like some of the stuff we've already said in different areas, so. I'm not sure if this is something we could just get rid of, and I do hear that you know it is important. As a response to definitely have the right responses, but I think this is another one kind of confusing it up again of don't call 911, call 911, wait, send up to the hospital. Oh, what should I go with them? I think we just need to kind of tone it down a little on this and, what can we do to get them to think about - when should you do the things?

Babekir, Amani: Thank you, Amber. Any other point?

Moritz, Erin: Does anyone very strongly oppose removing it?

Abel, Greg A: I have one point to consider.

Moritz, Erin: Sure.

Abel, Greg A: You looking at some surveys? I read someone where 65%. Of the surveyed say they wouldn't know how to cope if faced with the customer suffering an allergic reaction. So that's over half a staff and this was - the study was dropped at food service workers, so with that. With the 65% not knowing how to cope, you know, are we taking anything away from that guidance that would not benefit someone who is having an allergic reaction.

Hill, Michelle: To that point. That's why I like this document. Because there tends to be a lot of mystery - when I teach, I ask them how many people have actually seen a response.

Abel, Greg A: Mm-hmm.

Hill, Michelle: And especially the variance of response. I like that this addresses that. What's their experience? Maybe it needs to be called something else. Referenced in a different way.

Babekir, Amani: Ask. But.

Vinson, Scott: This poster is directed toward people who have food allergies. So, it's not really for the establishment or the people who work in the establishment. I'm going to actually call for a vote on this page.

Moritz, Erin: Sorry, could you say that again? I didn't quite catch it.

Babekir, Amani: You want to call for a vote.

Moritz, Erin: Oh OK. I do think you know, we throughout this entire document, you know, we do kind of have to balance. Of course, we'd like to include boatloads of information and make it 8000 pages long. That would be ideal if people would read it. But we also want to limit confusion as well and people don't like to read anymore. So yes, I certainly see both points of view.

Babekir, Amani: OK.

Hill, Michelle: You know, perhaps this would be better as a hot link at the end, saying these are some resources that we like, or we could recommend and maybe it lives there as a hot link or something they can follow if they choose.

Moritz, Erin: To me that's a happy compromise.

Babekir, Amani: Yes, or as a supplement to the document, because beside this draft, we're going to have the short version.

Moritz, Erin: Right.

Babekir, Amani: Of the work of the framework and we could have extra documents like this. As an attachment.

Hill, Michelle: I keep forgetting about that - the short version.

Babekir, Amani: Yes. So, are we fine with that? To delete it but still keep it as either attachment or add a link to it if we have a reference.

Hill, Michelle: Scott has his hand up, Madam Chair.

Babekir, Amani: Yes, Scott.

Vinson, Scott: I forgot it was still up. I think I still would like to call for a vote on this document. I don't think we need to include it as an attachment because it's not directed to our audience. It's directed to people who have food allergies, and I'm one of them.

Babekir, Amani: OK.

Vinson, Scott: So, I'm calling for a vote.

Babekir, Amani: OK. That is, that is good. So, let's do that before the end of the call.

Dutilly, Devin: What is the vote for? What is the question that you're asking to vote on?

Babekir, Amani: I will entertain a motion regarding this poster. Scott, you could proceed with your motion.

Vinson, Scott: I move that we vote on whether to include this, Food allergy aware - six that save lives page in our document.

Moritz, Erin: Or link can we specify cause now we have two potential solutions which would be – one, include as a supplement or a link, and then one solution would be deleted completely and move on with our lives.

Vinson, Scott: This is going to be a paper document in these facilities, so I don't think links will be very helpful.

Dutilly, Devin: I think that that was why some people were thinking of including the poster.

Hill, Michelle: Exactly. I was thinking about the suggestion we had about turning this into a smaller Canva-type app that there could be some dynamic linking there as well. If we were to include it in that space versus printed.

Babekir, Amani: So. I'm not clear very clear …

Vinson, Scott: I'll repeat it. I move that we vote on whether to include this document in whatever form. Bully printed page or link or whatever. I don't think this document is addressed to our audience.

Babekir, Amani: OK. Thank you, Scott. So, the motion is Do we need to include it in whatever version or not. Anyone 2nd?

Garvin, Amanda: 2nd.

Babekir, Amani: Thank you. So. You already heard the discussion about this, so I'm going to proceed to the vote. Is there anyone who opposed to the motion? Please say no or is raise your hand. Probably it will be easier to raise your hand so we could count it.

Ben.Wagner: I am confused as to what we're voting, if we vote yay.

Vinson, Scott: Just to clarify the motion is not whether to - the motion is to exclude this document from our guidelines.

Ben.Wagner: So, yay vote is to exclude, and nay vote is to include. Got it?

Vinson, Scott: Correct.

Babekir, Amani: So, the motion is to exclude, as he's said. So, if there anyone opposed to the motion. Which is to exclude this document. You can raise your hand so we could count.

davidread2861: So, this is to exclude it if you vote. If you raise your hand, you're voting to exclude it.

Babekir, Amani: You are voting. To not exclude it because I'm asking about, is there anyone opposed to this motion?

Moritz, Erin: So, the question is keep or exclude?

Babekir, Amani: That is right, and the motion is to kill it. So, if you are not with killing it, please raise your hand. Michelle, can you see the all the hands?

Hill, Michelle: Yes, Madam Chair. I see 4 to keep it and the rest to exclude.

Dutilly, Devin: I think there wasn't a vote for other side, right, there needs to be a vote for the other side.

Babekir, Amani: OK.

Vinson, Scott: Amani, you kind of, you kind of did it backwards, Amani, by asking for the no votes. You probably should just ask for yes votes. People who support the motion. The motion is to exclude. So ask for of the voting members. Who votes yes for the motion to exclude.

Babekir, Amani: OK so - Yes for excluding this poster from the document. Please. Raise your hands.

Hill, Michelle: Madam Chair, I see three hands that are in the yay for exclusion.

Babekir, Amani: So who abstains - any abstains?

Hill, Michelle: I do not see any hands raised.

Babekir, Amani: OK. So the motion is passed.

davidread2861: I thought there were four votes to keep it as well. You said there are only three votes to exclude it.

Hill, Michelle: I was under the impression that we were voting from the start all over again, and when she asked the question, I counted three hands raised in the affirmative to exclude.

davidread2861: Right. But I thought when you first did it - those that didn't want it excluded - there were four hands.

Babekir, Amani: The three is to exclude - the three are with the exclusion.

davidread2861: And four were to keep it.

Babekir, Amani: Yes, the motion failed.

Vinson, Scott: So the motion failed. Amani. You really need to vote Amani. You need you need as the chair to conduct a vote you need to ask for yay votes and nay votes. You need to ask for the yay votes first. There were three yay votes for the motion. The motion was to exclude and then the next step is to ask for the Nay votes. And I think there were four Nay votes. But you might wanna do it again, because I think there was some confusion.

Babekir, Amani: OK, let's do it again, because the way we usually doing it, we first ask about the person who is no say no to the motion, and then we count those people.

Vinson, Scott: Well, that's backwards.

Hill, Michelle: OK.

Moritz, Erin: Can I make an additional suggestion?

Babekir, Amani: Yes.

Moritz, Erin: Can we? I don't know if we can do this, but I'm wondering if it would be less confusing to say, the motion is to keep it. And that way if you vote yes, that means you like it. And if you vote no, that means you don't. But that might confuse things even more at this point.

Hill, Michelle: No, I think it's clarity. I think that would be clear. So if you're voting, if you raise your hand, you're to keep it, if you're lowering it, you're to get rid of it.

Babekir, Amani: OK. So I want to entertain another motion. I would like to entertain a motion.

Vinson, Scott: Did you?

Babekir, Amani: Regarding this poster.

Vinson, Scott: Did you dispense with my motion?

Hill, Michelle: No, we just changed it from a double negative to a positive. That's all we've done.

Babekir, Amani: Yeah, we because it seems like, you know, the Members here are confused about what we are doing because we kept jumping from yes, no, no, yes. So, we wanted to redo it again. So, it will be more clear.

Vinson, Scott: OK, I withdraw. I withdraw my original motion.

Babekir, Amani: OK. Thank you, Scott. So. I will entertain a motion regarding this poster. So, I want to hear the motion that say we want to keep this poster so we can vote on it. Erin would like to move?

Hill, Michelle: No.

Moritz, Erin: Am I allowed? I'm. I'm not. I'm a non-voting member.

Hill, Michelle: How about Scott?

Ben.Wagner: This is Ben. I move that we vote to include this poster in some form in our documentation - our document.

Babekir, Amani: Thank you. Wait a second.

davidread2861: I'll second it.

Babekir, Amani: Thank you. So, let's proceed to the vote on the motion. Is there anyone opposed to the motion? Please say no. I don't want to keep. Or raise your hand.

Vinson, Scott: I think everyone is confused by the way you pose the question you asked for. People who are opposed to the motion.

Babekir, Amani: Yeah.

Vinson, Scott: This is not parliamentary procedure - I think that's part of the confusion. The way you were conducting votes seems to be backwards.

Hill, Michelle: Madam Chair, if I may, perhaps we could ask for those that are in favor of the motion to exclude, to raise their hands.

Babekir, Amani: OK, people.

Ben.Wagner: The motion is not to exclude the motion is currently to include.

Babekir, Amani: The motion is to include – and watching this thing so the people who are in favor for this motion, please raise your hand.

Moritz, Erin: And the motion is to include.

Babekir, Amani: That's right.

Vinson, Scott: And this is only voting members, right?

Babekir, Amani: That's right.

Abel, Greg A: On the chat, Amber Potts had to leave but she voted to remove the poster whenever you get there, that's what that was counted or not.

Hill, Michelle: It was not. Thank you, Greg.

Hill, Michelle: I see five hands, Madam Chair.

Babekir, Amani: OK. So. I would see that the motion is passed, to include the poster.

Hill, Michelle: I think we have to ask for those to raise their hand that are not in favor of the motion. Am I incorrect about that?

Babekir, Amani: It's already passed, but I think we need to ask about abstaining. Is anyone abstaining?

Hill, Michelle: OK. I don't see any hands, Madam Chair.

Babekir, Amani: Yeah. Thank you. So, the motion passed to keep this poster and we keep, we can keep discussing how we want to include it. Do we want it to include in the actual document or move it somewhere else

Adjournment - Babekir, Amani: Anything else before we conclude our meeting today. OK. Thank you everyone.

v.	Previous Meeting Minutes	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Meeting Call to Order

Babekir, Amani: I call this meeting to order.

Roll Call

Babekir, Amani: Michelle, would you like to start with the roll call?

Michelle Hill: [Takes roll call of Voting Members] Madam Chair, we have a quorum. Our new quorum is 8. We do have 8.

Babekir, Amani: OK, that is great. Thank you, Michelle.

CFP Antitrust Statement

Babekir, Amani: I would like to remind you that the Conference for Food Protection Antitrust statement is active in this call. So just keep it that in mind during our discussions.

Previous Meeting Minutes

Approval of previous Meeting Minutes was tabled by the group as the processing for these documents is not yet complete.

Framework Points

Babekir, Amani: And let me first start by bringing up our agenda for today. I will share my screen. Can you see my screen?

Michelle Hill: I can.

Babekir, Amani: What we're going to do today is we will review the timeline of our work and introduce the FDA and the USDA comments that we received on the framework and decide on how we want to proceed with working on those comments and refining the framework. First, just looking back at our timeline, which we built together when we started our meetings. We are done writing the framework and now we need to refine it because we have other things to do - which is deciding on what changes we need to recommend for the food code. I remember from our previous calls we decided on working on indicating this framework in the Annex section of the Food Code, but we still need to refine our discussions on this part, so we need to dedicate time to do that. The suggested timeline - we need to keep in mind that we need to finalize working on the comments and finalize the framework by the middle of September. Because as I said, we need to work on the second charge and also our final reports need to be submitted. And Michelle, could you remind us about when the final report is due?

Michelle Hill: Certainly. There is an interim report due shortly here, that Amani and I are working on. It is the report to the Executive Board about how we've moved through the work pertaining to our committee's charges. The report will be published on the CFP

website at foodprotect.org. You are welcome to view our previous filing, which was the Spring report, to see the type of information and how will be reporting that.

As far as when our actual work is due, the master calendar has us slated to have everything completed and sent to our Council Chairs by the end of December 2022. The Council chairs prepare and suggest improvements to the report that are needed in order for the report to be submitted to the Executive Board to be included in the next biannual meeting in April.

Babekir, Amani: That's good. Thank you, Michelle.

Michelle Hill: Certainly.

Babekir, Amani: Any questions about the timeline, any points you want to bring up?

Vinson, Scott: Amani, this is Scott – I have a question. It looks like we're going to be missing the July 30th deadline to have the written framework completed, because we still have this review of the FDA feedback to complete, which you're saying is due by September 15th.

Babekir, Amani: Yes, that is the reason we must agree on a revised timeline - trying to complete it by September 15.

Vinson, Scott: Is there a way we can do all - track these things - or do they have to be done sequentially?

Babekir, Amani: This is what we'll discuss as the second topic - how we want to proceed. I emailed you each the documents with the comments we received from the FDA and the USDA. Would someone open voting – make a motion – like, do we want to do this in our general meeting or in our subgroups and it will be faster if we are able to do it in the subgroups because we could work all of us on it at the same time on the on the document.

We're will decide on that a little bit later in our meeting - just keep it in mind. If we are working within subgroups, that is the fastest way to meet our deadline.

Vinson, Scott: If we do the work in the subgroups, and by that we mean have each subgroup review this new FDA feedback. People who aren't on a particular subgroup won't necessarily get to see what the feedback was and have a voice on it. Is that right?

Babekir, Amani: Yes, so the general Group, if it's kind of format or stuff minor like that, could work on it together. If it's something essential the subgroup could suggest the change that they would like to make and bring it into the general meeting. That's what we are planning to do. Are we OK with that? And we could proceed that way.

Vinson, Scott: Well, speaking for myself, I think I would prefer and maybe we can do it on this call. I would prefer that if maybe the people from FDA who proposed or gave the feedback documents to you - I don't know if they're on this call or not, but maybe they could just sort of speak up as to each individual comment. Maybe if we could go through the 24-page document, just sort of page by page before the entire group, so that everyone has benefit of seeing what these proposed changes from FDA were. These documents sort of came as a surprise to me because I thought we had already done all of this reviewing and then for these documents to sort of come in after we already had two previous full committee calls to review all the pages – I wasn't anticipating that.

Michelle Hill: Well, wait now – we did announce that.

Babekir, Amani: We announced that, and we were expecting it because we kept checking in with Devin, our FDA consultant, about their timeline to give us their feedback. We were waiting for it while we were working on refining the draft on our side. We meant to make it a parallel effort, so we could save time and consideration of the comments wouldn't hurt our progress with the framework.

Michelle Hill: We have been waiting on the feedback. We've talked about it in several previous meetings. The meeting minutes are forthcoming for prior meetings - they are being worked on and will be out shortly.

We did discuss this, and I think this is part of the greater issue that we're talking about. You know that we're going to address is how do we move forward with this? Do we do it as a full committee? And I respect what you're saying, Scott, I think it's very important that everybody has a voice in how this ends up, at least looking in the end. But we've also sent these documents out with comments for quite a period of time now. You've had them in, everybody's had them in their possession, I think at least three weeks. Am I wrong on that Amani?

Babekir, Amani: That is correct. Once we received it, we send it out.

Michelle Hill: I was hoping that people would have been able to take time between then and now to have a good idea of what was being said so we could have a productive conversation. I like the idea of reviewing each one with the consultants here, but perhaps that's something we do in two weeks when we give them time to actually prepare to do that - just a suggestion. Thank you, Madam Chair.

Babekir, Amani: Thank you.

Vinson, Scott: Well, this is Scott again responding to Michelle. Yeah, I appreciate the fact that Amani did send these documents out a couple weeks ago at least, but some of these changes may be controversial. I don't know. This is something that really should be discussed and considered by the group as a whole, rather than forcing Amani to sort of take every - you know, there are a lot of people on this committee and to have everyone go through each of these three documents and give the thumbs up or thumbs down to each individual change that might be proposed - I'm not quite finished - change that might be proposed would be a lot of work for Amani. It just seems to make sense to me to just do it on one of these calls. Perhaps this one - we have a full hour. And whoever proposed them from FDA can just say here's what we're proposing here. If they're just minor things like, you know, formatting or syntax or whatever, I don't think anybody is probably going to object. But if there's substantive changes, that should be discussed for the before the entire committee.

Babekir, Amani: Yes.

Michelle Hill: If I may, Amani and I work on this together and it's not just her doing the function. She communicates because she has the ability to do that. So, I just wanted you to know that we are together, Amani and me. We co-chair this committee. The other part I wanted to say is that we are able to talk about this within the meeting. I think that's a very good idea. I don't know how - I guess this would be the point where we would ask Devin, and the other people that contributed to the review, to speak as to whether they're prepared for this today, we didn't let them know that this was what was going happen.

Babekir, Amani: Yes. I would like to add a note here, before we open the floor to Devin, really this is the communication I received from Devin and the group who added comments on the framework - that is all these comments are suggestions and just things we need to consider when we are refining our framework. So, it is not binding statements from any organization. These are the things that are highlighted, and I'm really appreciative of Devin, and also for Lauren from USDA, for walking me through their comments; How to understand it on the documents with the different colors and their suggestions on each point. We need to open the floor for Devin, and any other Federal Partner, to go over these comments 1 by 1 - that is something we could do also here.

But I want to also hear from the other committee members because all our idea is we need to work right away on those comments. Do we want to work on this as one group, including our FDA and USDA representatives? Going through these comments one by one and working on it in the general meeting, or we want it to do it in the subgroups?

That is something we could do - I'm going to need a motion on it, but before that, I open the floor to Devin and Jennifer, if you want to add anything or any points about your comments.

Devin Dutilly: Thank you, Amani and everybody else. This is Devin. Erin is raising her hand as well.

Maybe I'll make it just a brief comment and let Erin and Jennifer comment. Just as a point of clarification, the comments that I submitted, me being with FDA, they weren't just FDA comments, there are comments from other federal partners. So, these are federal partner comments, so USDA, FNS, FDA, FSIS, Erin included, and some other partners from CDC.

They all commented on the Framework, and I compiled the comments from the agencies and pass them forward. So, the comments weren't just from FDA, they were compiled comments from all three agencies.

It is exactly right to say they're just comments to consider and suggestions myself, Erin, Jennifer and Greg, and others from FDA, USDA and CDC have been working throughout this process to kind of express some of our thoughts as we move forward. And we do really appreciate the collaboration and partnership to help raise the awareness and to provide resources for our stakeholders when it comes to Allergens.

So, Erin had her hand raised, and she's been a great partner in this as well. And Greg as well is here, and Jennifer - so thank you.

Moritz, Erin: I was just going to ask if it's worth kind of doing a hybrid. You know, separate it out into the subgroups to, I guess deal with sort of the low hanging fruit that maybe doesn't need the entire committee to discuss, and then leaving it up to the groups to turn over any larger, sort of thorny issues that can be discussed with the larger committee. That was just kind of kind of my thought as to how to proceed. Over.

Babekir, Amani: Thank you. Jennifer, I think I heard something.

Green, Jennifer: I do appreciate the opportunity to contribute, and I look forward to seeing how everything's going to progress.

Babekir, Amani: Thank you, Jennifer. Now we're getting to the point to decide. And thank you, Erin, for your suggestion to decide how we're going to proceed. I sent an email poll, but unfortunately the quorum is 14 and I got just seven responses - 6 within the group working on the subgroup and one is working on the general meeting, so we need to vote on it now.

I would like to entertain a motion about how we're going to proceed with addressing the FDA and the USDA comments.

Vinson, Scott: Madam Chair, I have a motion.

Babekir, Amani: Yes, please.

Vinson, Scott: I move that the full committee now on this call just consider the comments.

On the three documents that you circulated and if Devin or someone else from FDA wants to speak to the suggestions that's fine. We can probably dispose of this fairly quickly, I'm guessing.

Babekir, Amani: OK.

Devin Dutilly: Yes, and just to clarify, I think that we tried to make the comments as clear as possible. So, you know we can - there's a number of us on the call, so we can try to clarify anything that might be needed. But we tried to make the comments as clear as possible and make any suggestions in there. I'm happy to walk through the documents on this call as an FDA consultant, I'm happy to offer any clarification on the comments that were compiled by the three federal agencies. Amani had asked the question, would somebody be prepared to help us walk through the comments today? And the answer would be yes. Thank you.

Babekir, Amani: Thank you. I just would like also to keep in mind, if we're going to work on it in the general meeting, we need to move the meetings to weekly instead of biweekly to be able to meet our deadline, so I have a motion on the floor to work on it in the general meeting. Can I hear a second?

Moritz, Erin: Can I quickly clarify something about the motion - Scott would the motion be to work on all the comments in the general meeting starting today, but potentially, move into weekly meetings at the same time as that, correct?

Babekir, Amani: That is correct. So instead of having biweekly, it's going to be at the same time weekly meeting.

Moritz, Erin: OK.

Vinson, Scott: Actually, that was not part of my motion.

Moritz, Erin: OK.

Babekir, Amani: I know it's not part of your motion, but just something to keep in mind if we're going to do it in the general meeting, we need to move the meetings to weekly because we wouldn't be able to meet our deadline.

Michelle Hill: Perhaps what we should do is vote on whether we want to do it in the larger meeting and then we'll vote on how we proceed with that motion. Is it weekly? Is it biweekly?

Babekir, Amani: We'll work on the motion working on the comments in the general meeting. Any second?

Amber Potts: [Seconds the motion]

Babekir, Amani: Thank you. Any discussion, any points on the motion? OK, so let's proceed to the vote on the motion. If you agree with the motion to work on the comments in the general meeting, please say yes. All raise your hand. And Michelle, could you monitor?

Michelle Hill: I have six people that have voted in favor - Voting members that voted in favor.

Babekir, Amani: OK. We'll give it extra one minute.

Michelle Hill: Amani, please remind me, do you and I vote on this? I can't remember. I don't think we do, do we? We do. OK. Alright.

Babekir, Amani: Is there anyone abstaining?

Babekir, Amani: Do you see any hands, Michelle?

Michelle Hill: I do not.

Babekir, Amani: OK, so the motion did not pass. We need 8.

Michelle Hill: That is correct, yes.

Babekir, Amani: Yeah. OK.

Any further comments or suggestions from the committee members? I know Erin you raised suggestion before. Any reactions or other suggestions to be presented - this question for the all the committee members.

Michelle Hill: So, we voted not to do it today, as a larger group, but we didn't necessarily agree on how to proceed moving forward. We should we perhaps entertain a motion regarding that.

Babekir, Amani: Do we want Erin’s suggestion to be a motion or there is any other suggestion or motions you want to present here?

Moritz, Erin: I can't raise.

Babekir, Amani: Correct.

Moritz, Erin: I can't raise a motion and I'm a non-voting member but, do you want me to repeat what I was suggesting and then somebody could motion on that?

Babekir, Amani: Yes, please.

Moritz, Erin: OK. My suggestion was to first start with subgroups reviewing the comments from the federal partners within their own subgroups and address any comments that they're able to address there. Any outstanding issues that they'd like the feedback from the larger group would be taken to the larger committee.

David Read: OK. I'm just curious if we do this in subgroups, if somebody from FDA would be willing to participate in some of those. Otherwise, it seems like it's easier almost to do it in a group, but if you do it by subgroups - rather than flounder around, if there's questions, it might be nice if we could have FDA on those subgroup calls.

Michelle Hill: Since they some of the subgroups are headed by our federal partners, so they're present in, and if they're not, we could certainly invite them.

Babekir, Amani: We have federal partners on our subgroups - the emergency plan we have Devin, and the training we have Greg, in the notification we have Devin, in the practices we have Greg, and on the template, we have Erin.

Babekir, Amani: We have a good representation for them on the subgroups and if we want to add more members, volunteers, that also could be done. I'm open also the opportunity now for that to be done. Do you think that is sufficient, David?

David Read: Yes, that'd be fine. I just know that they're busy and maybe haven't been able to make all of the subgroup calls, so.

Devin Dutilly: I think we, if needed, can figure out how to provide coverage. If one of us can make a meeting or something like that, we work together to provide comments on the documents. We, from FDA and I think I can speak for USDA and CDC as well, appreciate the partnership and we're here to support CFP and this progress. We'll definitely support, wherever we can and whenever we can - we'll provide coverage for sure. Thank you.

Babekir, Amani: Thank you. OK. We could define the members of each subgroup later in the meeting, but we still have to decide on maybe on how we want to proceed. I would like to entertain a motion. [Long silence]

Michelle Hill: Which means somebody has to make a motion for us to move forward - A voting member?

David Read: I'm sorry, could you repeat?

Eisner, Crystal: Yes, what was that? Can you repeat it?

Babekir, Amani: We need to have the motion to decide how we want to proceed. Erin suggested that we work on the comments in the subgroups, and then if there are any outstanding issues, we could bring it to the general meeting to discuss it. That is a suggestion that has been brought up, and the previous motion did not pass, which is working on the comments in the general meeting, so I would like to hear motion. What if you want to further discuss it – I would also like to hear it - about how we want to proceed, how we want to work on the comments.

Libby Thoma: To clarify, we have two options. One, we work in our subgroup with our regulatory partner, or we do it together in a in the total group, but that didn't pass, correct?

Babekir, Amani: That's correct.

Libby Thoma: I motion that we work through these comments in our subgroups, Madam Chair.

Babekir, Amani: Thank you.

Eisner, Crystal: And I second the motion.

Babekir, Amani: OK. Thank you. Is there any discussion, or any additional point on this motion?

Moritz, Erin: I do want to clarify that my suggestion was not just working on the comments with the subgroups, but it also includes if there are any comments that the subgroups do not feel confident making decisions with, we could still bring it to the larger group.

Babekir, Amani: Thank you. Libby, would you like to amend your motion to incorporate this or ...

Libby Thoma: Yes, I amend my motion to include that if there are any outstanding issues, we bring those to the large group.

Babekir, Amani: Thank you. OK. Any second?

Eisner, Crystal: This is Crystal, I second it again.

Babekir, Amani: Thank you, Crystal. OK. Let's proceed to vote on the motion. If there is no further discussion. If you agree with on working on the comments in the subgroup and bring any outstanding issue to the general meeting, please raise your hand or say, yes.

Michelle Hill: [Voting members vote] Thank you. I have 7 yeses.

Babekir, Amani: Thank you. Anyone abstain?

Vinson, Scott: Madam Chairman, point of clarification.

Babekir, Amani: Yes, Scott.

Vinson, Scott: How many voting, how many voting members do we have in the call?

Babekir, Amani: We have 8.

Vinson, Scott: And for a motion to pass, does it require a majority of voting members or a majority of people in the call?

Babekir, Amani: Eight, we need 8. Eight of the voting members.

Vinson, Scott: So, we need every voting Member on this call to vote in favor of something for it to pass.

Babekir, Amani: That's correct, yeah.

Vinson, Scott: Oh dear.

Babekir, Amani: Do we have any abstaining? Michelle, do you have any counts?

Michelle Hill: I have seven in favor. No abstentions. So, the assumption is that we should collect the No votes.

Babekir, Amani: Yes. This did not pass, we need 8. So, it seems like we need to find a way to be in the middle to bring both groups together.

Michelle Hill: Perhaps we begin the review – bring up the documents so we can all of us get a good look at them together and maybe entertain a motion to do at least that part today, with everybody still on this call. And then we can decide after we look at it, what kind of work is in front of us and form a plan … someone has to make a motion.

Vinson, Scott: Trying to move it, I move what Michelle just said.

Babekir, Amani: Yes, I think I think we need to do it that way. OK. So, Michelle, could you access the documents because we hosted all the documents, we received with the comments in the Teams side.

Michelle Hill: I got it fine with the call, but I have no access to any CFP files on Teams.

Vinson, Scott: Madam Chair, I have that e-mail open. I can share my screen if you'd like.

Babekir, Amani: But we were hoping to work on the same documents. If there is a way anyone of you could access the Teams side the CFP …

Babekir, Amani: The idea was if we are going to work on it in the subgroup, at least one member could be able to access the documents and help the team members to work on it. But it seems like we are not able to access it while we are in the call.

Vinson, Scott: Madam Chairwoman, this is Scott. I just shared my screen. Is this one of the documents you are referring to? This was in that e-mail you sent around.

Babekir, Amani: No, that is just the summary for the comments from the USDA. It's the other one which has the actual comments.

Vinson, Scott: OK, here it is. I think I've found it. Is this correct?

Michelle Hill: You've got it! Turn on comments or scroll down to see if comments are turned on. Oh, there they are.

Babekir, Amani: I don't think that is - what is that? Could you open the other one? You could start with that one.

Vinson, Scott: OK. Can you see this one?

Babekir, Amani: That is the one.

Michelle Hill: Thank you so much. If we can start making - reviewing at least the first beginning part of this right now, you could just send me your document. I'll make sure it gets left loaded where it needs to live. Is that OK with you Amani?

Babekir, Amani: Yes, that is OK. Let's start with the first comments. Could you maybe click on it so you could show the whole comment?

Vinson, Scott: Oh yeah, there.

Babekir, Amani: We could give it like a minute just to go over the comments and then we can discuss it.

Michelle Hill: Yes.

Babekir, Amani: OK. Let me now open the floor for the discussion on this comment.

Eisner, Crystal: The comment says consider changing it to major food allergen framework, but then it says, can you also include non-major food allergens?

Moritz, Erin: So, regarding the suggestion to change it to major food allergens, I think one of the key questions is if somebody comes in and says, I have an allergy to Jell-O, which is not one of the major food allergens. Do provide guidance here that can be used for non-major food allergens.

Michelle Hill: Am I wrong in assuming that the point of calling it a major food allergen framework is, that is the verbiage that appears in the food code - Is that right?

Abel, Greg A: Correct.

Libby Thoma: Correct.

Abel, Greg A: That's correct. And the document only applies to the major food allergens, the eight soon to be 9, correct.

Michelle Hill: Correct. Thank you.

Babekir, Amani: Also, would like to remind that our charge is addressing the major food allergens.

Eisner, Crystal: We should probably name it the same.

Michelle Hill: Do we need to entertain a motion to make this change?

Babekir, Amani: I think that will take long time.

Vinson, Scott: Maybe it'd probably be faster just to ask if anyone has any objections to any of these suggestions.

Michelle Hill: That's good advice.

Babekir, Amani: Are we good with the change? Are we good with changing the document title to major food allergen?

Vinson, Scott: Yes.

Babekir, Amani: OK. Any other point? OK. So, Scott, could you type that please?

Seymour, Jenna: I do hope that this other point within that comment is not missed about just having something somewhere that points people, like in this case with Celiac disease that came up a lot in discussions. Just pointing people to the gluten intolerance group. It's not like this document would have to say anything about it except to say if this is also a concern,

go here [insert GiG website address]. Just do not ignore what is obviously something that a lot of restaurants are hearing about and wanting to address.

Michelle Hill: We perhaps also could refer to the FDA advice on what is gluten free. That might be a good part of it too.

Devin Dutilly: I think that in addition, the broader question would be what Erin had said about these procedures these techniques, these points may also apply to other allergens as well, so you know it's not a major change to the document, but that's what the comment essentially is capturing - is that you don't need to make major changes, or perhaps you might need to make major changes, but small tweaks.

Babekir, Amani: To what?

Moritz, Erin: I think a long time ago, we did have some kind of verbiage in here about how this, even though this is the charge, is specifically for major food allergens, a lot of the materials are relevant to you know gluten sensitivities or any other food sensitivities.

And so maybe just a sentence or two in the introduction and then pointing, since gluten is such a such a prominent sensitivity, pointing to some gluten sensitivity resources.

Babekir, Amani: Do you think we could point to this in the introduction of the document.?

Moritz, Erin: To me, that's kind of where it fits most, because it's before we are even getting into the main purpose of the document. Or maybe if we end up doing a references page at the end possibly? Certainly open to other suggestions.

Michelle Hill: I did notice that the comment below the one we're working on also dealt with a similar or same issue. I'm wondering if it would inform our process.

Babekir, Amani: OK. And Scott, could you please change the title on the document to Major? Thank you.

I'm going to give it 30 seconds to go over the second comment.

Michelle Hill: And this might be how we achieve what we're trying to achieve, which is they're saying to add possibly a disclaimer on the scope of this document. We could say, yes, it deals with the nine major food allergens. However, it's also applicable to, fill in the blank, really.

Babekir, Amani: It seems like it's the opposite. It's like you disclaim that it is just the nine major food allergens.

Moritz, Erin: We'll have to state somewhere whether everything in here is just for the nine food allergens. And if we're saying that some of the parts can be used for others, then maybe it's not necessary to consider it a disclaimer. We just have to write something somewhere.

The key question is what we want to do about the fact that some of the stuff is going to be applicable to other food allergens and other sensitivities.

Babekir, Amani: But is it enough and sufficient for the other Allergens? If we want to generalize the document and say this is for major food allergens, but it could be applicable for other type of allergens, do you think that's a fair statement?

Moritz, Erin: I think we use wishy washy words like, it could be applicable to other food allergens and other sources of food sensitivities, etc.

Michelle Hill: Including celiac disease, perhaps.

Seymour, Jenna: I get a little uncomfortable with that one just because …

Moritz, Erin: OK.

Seymour, Jenna: That's why it was me that put that gluten intolerance group into the into the comment because they do training for restaurants on specifically how to deal with Gluten intolerance and celiac disease.

Michelle Hill: Yes, they are awesome - I was really glad to see that.

Vinson, Scott: I was going to try to add an asterisk here and then put down at the bottom what we just talked about a disclaimer, but I can't seem to figure how to do it, so maybe it would be better done on page 4 in the verbiage of the introduction.

Babekir, Amani: So do we want to say it's just for the 9 Major food allergens or it's also applicable to the others?

Moritz, Erin: I don't know how often this would happen, but I would hate for somebody to.

Say, I learned all this stuff and I have all this stuff, but somebody came in with a Jell-O allergy; now what do I do? And Jell-O allergy being an example of something that not many people have.

Michelle Hill: No, it's that allergy to gelatin, and I happen to have it – it is obscure.

Moritz, Erin: Oh, you do. OK. I'm sorry. I was trying to think of something very obscure.

Michelle Hill: The question I keep thinking of is would we change our behavior if we knew other information other than, Is it an allergy? and we would take hopefully the same precautions that we do for allergy that we would for Celiac.

Moritz, Erin: In anaphylactic shock to gelatin and your emergency response, I think should not be any different than if it were for one of the nine.

Michelle Hill: No.

Vinson, Scott: If we had that type of language, are we going beyond the scope of our charge?

Moritz, Erin: I think we would be dipping our toe beyond the scope. In in my mind, as long as we don't go in depth and discuss other scenarios. I guess it's just common sense to me that we could say something like that and be OK.

Vinson, Scott: How about something like this?

Moritz, Erin: Certainly, certainly open to other, you know, other opinions.

Babekir, Amani: I need to end the meeting at 3:00 pm because I have another meeting and I wouldn't be able to stay on the call. We need to stop it here and we could proceed on the other comments the next meeting.

Babekir, Amani: Do we want us to make this weekly meeting? I think we need ….

Michelle Hill: We didn't reach a consensus, did we?

Babekir, Amani: I hate to delay working on it for two weeks.

Moritz, Erin: For what it's worth, I think we're going to have to meet more often, especially if this is kind of the direction that we're going in, in terms of how we're going to address these.

Babekir, Amani: Please send me your suggestion if you think it's better, we move to the weekly meeting instead of bi-weekly so I can set-up a meeting for the next week at this time. We need to convene now.

Abel, Greg A: One quick comment – the document that was reviewed by the federal partners here was an older version, and I know you guys met two more times to revise the document. So, what you might have in the current version of the document may have changed since the comments on this revision, from what I understand.

Babekir, Amani: There are some changes here and we could look at it and compile it into one document.

Abel, Greg A: OK.

Babekir, Amani: Yes - before we proceed with the comments.

Michelle Hill: Thank you for making us aware of that. I'll work with you on that, Amani. I'll be happy to.

Babekir, Amani: Yes. Thank you, everyone. Scott, please send to us this version and see you either next week or the following week.

Michelle Hill: Stay tuned. We'll be asking your opinion on how we should move forward via e-mail.

Adjournment

Babekir, Amani: This meeting is now adjourned. Thank you.

Meeting Number 19	Meeting Date **08/18/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill via Teams Transcript	Council II Chairs Wendy Bell/Courtney Halbrook

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Previous Meeting Minutes	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Babekir, Amani: Michelle, would you like to do the roll call?

Michelle Hill: Yes, Madam Chair. I can do that. [takes roll call of Voting Members] We have a list of seven and I do believe that's our current quorum so we can proceed with the business of the day.

Babekir, Amani: OK. Thank you, Michelle.

Babekir, Amani: I would like to remind you that the Conference for Food Protection Antitrust statement is active in this call. So just keep that in mind.

Babekir, Amani: Let me share our agenda for today. I'm going to give you an update about our voting members.

So we could you could see how we ended up with the seven as our quorum.

Babekir, Amani: OK. So we're going to postpone approving the minutes of the previous meetings to the next meeting, so we're going to have almost like, 3 or 4 Minutes to approve, so hopefully we could do that in our next meeting.

Babekir, Amani: I want to also give you an update about our voting members. So two of our voting Members are not with us anymore. Vy has moved to a new job and is not able to serve in our committee and Cassandra, she retired. So they are very active members in our committee and it's a big loss for us. We should all the best to them. Both of them are representing the local regulatory, and we want to keep the balance of the floating members. So we moved one of our alternate members from local regulatory - Christine - to the voting members. So I'm really glad Christine has agreed to be a voting member in our committee. Hopefully this will make our voting process easier, and we will meet our quorum in our meeting. Any questions before I move to the next item in the agenda? [no questions are asked]

About the timeline.

I received a couple of questions about “what is our timelines” and we are looking into the extra work we need to do with the framework, we really got a little bit worried about our timeline. So, the updated timeline - that is per November 18 - we need to submit the final reports, the final documents and also the Issues we want to submit to the Council for the next Biennium.

All of these need to be ready for a round of review from the Council members, and then we're going to have a chance to make a second round of edits before the final solid submission. But this is the deadline - November 18th, so we need to be ready with all of our documents by then.

What we propose to do in order to finalize our work in the framework, because we're going to need also some time to spend on our Issues, we going to dedicate kind of four weeks to review the comments we received from our federal partners. In these four weeks we are hoping, and I sent an e-mail about this, we are hoping that we do some work or even just go over these suggestions and see which one we want to address.

Which one we think we could refer to maybe a future committee's charges. Or we could disagree with it and have a different opinion than doing any change on the framework. For the sake of time, we thinking what will be the way to do it? And because we couldn't come to an agreement in our last meeting, as to having a portion of the comments to be worked on the subgroups, and some portion we review it in our large meeting.

And thank you to Michelle. She put all of the comments in one document. And this way we could review it in our meeting, just look into the comments, see which one needs to be discussed here in our large meeting, which one we could, you know assign to the subgroups just by doing it so quickly.

And we did do this initial kind of work, me and Michelle, we worked through all of the comments, and we thought, OK, this one is one of the basic things that we need all of us to discuss in our large meeting. Some of it is format or just extra information needs to be added, which could be handled with the subgroups. Thinking about what we sent in the e-mail and what we suggested right now, I'm opening the floor for any suggestions, any comments and any points you want to raise before we move forward with reviewing the comments.

And I can't see any hands. Michelle, if you see hands.

Amber Potts: Scott has his hand up.

Vinson, Scott: Can I share my screen?

Babekir, Amani: Yes, please.

Vinson, Scott: OK, so I'm the leader of the group E, which focuses on Practices, and I will share my screen. So these people are in Group E practices, Ben Wagner, James Baldwin, Aubrey Noller, Greg Abel, Amani and James O'Neill Amani, you're on, I'm on, I didn't hear during the roll call many of the other folks in my Group E on the call - did I miss anyone who's maybe on?

Babekir, Amani: Yes, I know. Ben Wagner is traveling, so He is not able to join us on the call.

Vinson, Scott: James, are you on?

James O'Neal Yeah, I'm here, Scott.

Vinson, Scott: OK. Amani and Michelle, how many people does it take? How many people do you need to have a quorum on a Group to have a call?

Michelle Hill: I think it's just simple majority.

Vinson, Scott: Supermajority. OK. Well, I don't think we have it cause it's just me, James, Amani. I was going to ask my Group E if we could meet following this call at 3 pm or whenever this call ends, so we can perhaps dispose of some of the comments from our federal partners. Let me share my other screen to show my Group what they are. So I have reviewed the comments from Devin Dutilly: , one of our federal partners. Let me share my screen so you can see what they are. Here it is. So group E, we are actually "section B Food handling practices" in the framework document, and our section comprises two pages, pages six and seven of the framework.

Devin has submitted 20 - I counted them up across 2 pages - comments, most of them are picayune, and merely like suggestions or observations and don't require a great deal of any consideration? Some do, but I was wondering if my Group could maybe quickly dispose of them, act on them on a call after this call.

Does it sound like we have enough people to do that? I'm going to be out for the next two weeks. This is August, which is vacation time for people involved in the public policy making apparatus in Washington. It's and surrounding areas. So this is the time when we're out because Congress is out. So this. I can't work on it the next two weeks. I know you would want the subgroups to take it from here.

I guess we'll have to come back in early September to do it, if that's OK with you, Michelle and Amani.

Michelle Hill: One thing I wanted to point out, Scott is, and I don't know that this is the case, but there's more than just Devin's comments that are part of the considerations. So there were comments from FSIS.

Devin Dutilly: Yes.

Babekir, Amani: Yes.

Michelle Hill: Devin had condensed a bunch from other federal partners under his own name, so some of that data, of course, came from other agencies like USDA. Is that right, Devin?

Babekir, Amani: Yes.

Vinson, Scott: Well.

Devin Dutilly: Yes. Thank you for. Thank you for clarifying it, Michelle, that's correct. So the comments that were submitted, I submitted the comments and as we discussed previously, those comments were comments from USDA, FSIS, USDA, FNS and CDC as well as FDA.

So the comments that are underneath my name are compiled comments from the federal partners. So they're federal partners comments, even though my name appears. And we don't have ability yet to change who submits them, so they're all submitted underneath mine. So I compiled all the comments that were submitted, and we discussed the comments as federal partners. So those are federal partner comments. Thank you. Thanks, Michelle.

Vinson, Scott: OK.

Babekir, Amani: Also, Scott on the e-mail which I sent, I sent the version of the framework with merged comment because also we have comments from the USDA.

Vinson, Scott: That's what this document says at the top of the screen, doesn't it, merge comments?

Babekir, Amani: Ah, yes. That is the one, OK.

Michelle Hill: Ah, that's not the most recent one we sent, though. We sent one that was laid out in a landscape fashion with all the comments for everybody at the bottom. I did a clipping of each part where the comments pertained to and then they're all in a grid below the picture of what you're commenting on, or what the comments were on. Does that make sense?

Vinson, Scott: This is the document that Amani sent out last night.

Babekir, Amani: That's correct. Yes. So this is the actual framework with the comments, the document Michelle referring to is that second document on the e-mail which includes the list of all the comments. But Scott, you are good. That is the document you need to work on with your subgroup.

Michelle Hill: Even though no other partner comments are on that one?

Babekir, Amani: That should have all of the - that should have the merged comments.

Vinson, Scott: OK, so there are three documents in the e-mail you sent out last night. I'm sharing it on my screen here. I don't care if everyone sees.

Michelle Hill: What you should be looking at is federal partner comments.

Vinson, Scott: OK. Well then that was confusing, so I should be looking at this one.

Michelle Hill: In your attachments, there's one titled federal partner comments 8/12/22.

Babekir, Amani: Yeah, but that, that one, Michelle, that's contained just the comments, but if they are going to start working on the actual framework document, they need that one with both comments because we merged it together.

Vinson, Scott: OK, now I'm confused. So I think the document that I was originally sharing on my screen that said merged comments with all the comments in the right margin, I think that's the one we're that the subgroups are supposed to consider, correct?

Babekir, Amani: That's correct.

Vinson, Scott: OK, so I was right.

Babekir, Amani: Yes.

Michelle Hill: OK. And the one that I'm talking about it? Can you bring that up, please, Scott? Because there is some important information on that that I want people to be aware of.

Vinson, Scott: Which one is it called?

Michelle Hill: Federal partner comments 8/12/22.

Vinson, Scott: OK, let me pull up that e-mail again. So this one.

Michelle Hill: Yes.

Vinson, Scott: Federal comments.

Michelle Hill: Correct.

Babekir, Amani: When we were planning to review it, to go over that document just after Scott's point, yeah, we want to go over the list of these comments and then show you which one we think we need to discuss it here in our meeting and which one we could assign to the subgroups.

Michelle Hill: This seems like it's crazy because it's 57 pages, but, what was done was the information that the comments pertained to was clipped and pasted above as a static picture, so you can't actually change the data and then the first column there “D” that means it came from, you know, the Devin Dutilly: labeled stuff, and then you know what they said. And then in the far-right column, it's what Amani went through, and we decided, OK, or we thought about. You can of course suggest any changes, but we just did a quick look and thought, OK, who should work on this? Is it a whole group issue? Is it a template group issue? And Amani color-coded based on is it a? Is it a formatting particular or is it - what was the green again, Amani? I don't remember what the bluish green was.

Babekir, Amani: Yes, so these one that's we need to consider, we need to think about and the yellow is formatting changes or the blue also might refer to like text addition.

Michelle Hill: That third column would be used to actually make the language changes or suggestions. And then we can meet as a group and merge it all together. That was the thinking. You don't have to use this, but we've already done some of the vetting and we're just trying to improve the flow in the process. And so at some sections get repeated because they had multiple sets of comments. So if you see repeating same data, it's because there's still comments that have to be addressed.

Vinson, Scott: I am now totally confused.

Babekir, Amani: What we're trying to do with this one, which including all the comments, is to look at it here in our larger group and think about it. But as a subgroup, you need to work on that document, Scott, to look and see the comments. We want to ensure that you are using the right comments which have both the FDA and also the USDA comments together in the same document.

Michelle Hill: And FNS was separate ...

Babekir, Amani: Yes - so all the partners.

Michelle Hill: The original one you were showing.

Vinson, Scott: This one.

Babekir, Amani: Yes, do you see other comments beside the Devin comments? Do you see other comments with other names?

Vinson, Scott: No, they all have Devin's name. Click on each one. But he said that is just because he merged all of the agencies - Federal partners - into one under his name.

Babekir, Amani: Yes, you should see all the comments and labels.

Vinson, Scott: Well, there's one, yeah. There's one.

Babekir, Amani: OK, so that means you're good. Yes – FNS - that is another comment. So we merged both of them into this one document.

Michelle Hill: OK, I'm really glad you made that clarification, Amani, because all I was hearing was that it contained only Devin comments. So I'm glad to see FNS would be part of that too. So good - thank you, Scott.

Vinson, Scott: So the subgroups are to use this document that I have open now - that you all see on your screen - and each group should go to their section of the framework and consider so for example , you know the training group should consider each one of the comments.

Michelle Hill: Yes.

Vinson, Scott: OK.

Babekir, Amani: That's correct.

Vinson, Scott: So I don't have, it looks like enough people in the practices Group E to do this today. So my question for you, Amani and Michelle, is, is it OK if our group waits until early September?

Babekir, Amani: September? So you're going to have like early September, that's mean you're going to have like 2 weeks to complete it. Do you think this could be done within two weeks?

Vinson, Scott: Well, my group, we only have 2 pages. And it's 20 comments. Many of them are fairly innocuous - don't seem to require - I mean this is more a comment than anything that requires action. This section could be applied to all food allergens, but our regs are specific only to major food allergens. OK, and your point is, I don't know, but I imagine our Group is going to just say, OK, whatever. But there are some that are substantive, but I don't think it'll take two weeks or probably take one call.

Babekir, Amani: OK, that sounds good.

Michelle Hill: So Amani should we put a deadline on that like we would like to have data back by September 15th perhaps or?

Babekir, Amani: Yes, we agreed that this is going to be done within four weeks. So that means by September 18, we need to be complete, yeah.

Vinson, Scott: And so just so we all know all the group leaders know how many people do we need on our group calls to have a quorum.

Michelle Hill: I think they're subgroups, do they? Isn't it just a simple majority?

Babekir, Amani: Yeah, you don't need quorum because you're not going to be voting. But if you have enough people that you feel comfortable to proceed with, you know the change.

Vinson, Scott: Well, we may well be voting.

Babekir, Amani: You may, I don't ... Wendy? I think Wendy is with us. Hi, Wendy, can you hear me? Are you with us?

Bell, Wendy: Yes, I can hear you. And it's so I believe Michelle is correct as far as the subgroups, I would assume that you would bring your decisions to the main group if there's something that needs additional attention and just the nature of how many Members we have. And on this committee, it's I think we just need to proceed forward. And then if there's an issue we can bring it to Michelle and Amani and we can move forward from there.

Vinson, Scott: So we are not to vote in the subgroups we are to reach consensus on whatever we can where we can't reach consensus, we need to bring it to the full group.

Michelle Hill: That's awesome, yes.

Babekir, Amani: Yes, that's correct. That will make your job easier, without stress. Because we're going to have a chance to review the subgroup work in our large meeting. We're going to have two or three meetings to do that. So it's any critical things, any additional points, because now we're going to go to the document Michelle just discussed. Any additional points about the subgroup work?

Michelle Hill: I think it was Amber who said in the Chat that she would like to follow the same thing for her group. Is that right, Amber?

Amber Potts: Yeah, I agree. And ours is even smaller or like a page and a half. So it'll probably just take one meeting to go through the comments and that would be it. So I'll send a "when it's good for my group?".

Babekir, Amani: If that is good and for the notification group, I have a meeting this Friday and I moved it to, I think 3:30, so I could give Devin a chance to join us. Scott, would you be able to join if we move it a little bit later? I know you did not accept it or you're going to be on vacation. You are going to be out.

Vinson, Scott: What date are you talking about?

Babekir, Amani: Tomorrow at three.

Vinson, Scott: I'm on vacation. I'm traveling.

Babekir, Amani: OK, so it will be fine. So for the notification subgroup, we're going to meet tomorrow , and that should be the other one. Michelle is going to take care of the equal considerations' subgroup. So, Michelle, are you good with that one?

Michelle Hill: Yep. Thank you for reminding.

Babekir, Amani: Thank you. And I'm gonna send an e-mail to Ben for his subgroup and Erin, are you good with the starting your emergency plan group?

Moritz, Erin: Yeah, I'm gonna send out a "when is good" poll and just put some meetings on the calendar based on that.

Michelle Hill: Erin, I think you already do invite me, but could you for sure invite me for those?

Moritz, Erin: Yes, absolutely.

Michelle Hill: OK. Thank you.

Babekir, Amani: Thank you. It's great. And let me share that document which including all the comments together just to give it a look. So here are all the comments and I'm glad that we resolved the first two comments good with that one.

All these comments are related to formatting and having a footer section, so that will be taken care of by the template team. And this one - the one which you see I put committee on - we need to discuss it here.

These comments are about the title of the document, which is the retail food establishment.

Do we need retail on it? Amber, we discussed this one before here. Do we need it to keep it retail food establishment or … ? Consider all other all retail food establishment are not specifically called out in terms of special consideration for this type of food establishment. Do we need to think about other names or add any additional comments to the document? Just give yourself some time to go through these comments, which I'm just highlighting.

Eisner, Crystal: What's the current title?

Babekir, Amani: Now the title of our framework is "At retail food establishment" here, and also, we have it here, retail food establishment.

Moritz, Erin: Do we have the definition of that anywhere? We put that in our definitions?

Amber Potts: The food code calls it food establishment.

Babekir, Amani: We have it as food establishment, not retail. Even in the definition section.

Amber Potts: I think we should just put it as food establishment.

Moritz, Erin: I'm good with just food establishment.

Babekir, Amani: Thank you. Now we could move to the second one. So talking about food intolerance and sensitivity. Just take a moment to go through it.

Amber Potts: I think the only comment I would think is I don't like gluten intolerance. I would prefer like with I'm, I'm assuming it's referencing Celiac. Which is more severe? You know, I have a lactose intolerance, but if I eat it, I'm not gonna get severely ill. I think

don't we already have something that mentions it? I feel like we should mention it, but Celiac is it called a gluten intolerance? Is that what it's called?

Vinson, Scott: I have Celiac disease and it's referred to interchangeably as Celiac disease or gluten intolerance.

Moritz, Erin: Are there degrees of severity where you can be intolerant, but it doesn't rise to the point of Celiac disease?

Michelle Hill: Yes, and that's referred to as gluten sensitivity, not intolerance.

Moritz, Erin: I see, Celiac disease and gluten intolerance are synonymous. So, I think if anything, to be correct, we would refer to it as gluten sensitivity or Celiac/gluten intolerance, I guess, if people aren't familiar with the term Celiac disease.

I don't think that's really getting at what this comment is addressing. I don't know if we want to say it's not intended for gluten sensitivities.

Michelle Hill: You know, because really logic would dictate you don't treat them any differently. The answer is complete exclusion of the protein from the meal. So, is the behavior different?

Amber Potts: No.

Moritz, Erin: Yeah, that's a tough one.

Amber Potts: I don't know this much about food science. Can you have a product with wheat but not with gluten? And can you have a product with gluten and not with wheat?

Vinson, Scott: Yes.

Michelle Hill: Wheat is the greater allergy. Yes. And gluten. There are some wheat grains that are gluten, low gluten or no gluten. And that is the difference. So it's Gliadin across the board and then you can also have the Gluten as part of it, or separately.

Seymour, Jennifer: So I just, I just wanted to correct something because I was feeling like what was just said before, was not right. So I just checked, to back me up, that gluten intolerance is not the same thing as Celiac disease when they're talking about gluten intolerance, which is talking about people with issues of bloating, etcetera, that is not Celiac.

Vinson, Scott: I mean, look, the advocacy groups, there are several advocacy groups for people with Celiac disease, some of them call themselves the Gluten Intolerance Group.

Seymour, Jennifer: Right. Although I'd take GiG does work on addressing issues for people with gluten intolerance as well as Celiac, which might be why GiG is called that.

Vinson, Scott: Look, I think I'm probably the only person on the call who actually has Celiac disease, so maybe.

Seymour, Jennifer: No, I do also, sorry I do.

Babekir, Amani: I do, I also have it, Scott.

Vinson, Scott: OK, well, when we were diagnosed, we were diagnosed with Celiac disease, right?

Seymour, Jennifer: Yes.

Vinson, Scott: And our doctors also referred to it as gluten intolerance. Gluten is a protein that is found in wheat, rye, barley and sometimes oats, due to cross contamination.

Babekir, Amani: To address the intolerance and sensitivity, and also to consider mentioning gluten specifically so, do we want to do that?

Amber Potts: I think it's worth a mention.

Moritz, Erin: Yeah, I think so. There's what we call it, which ultimately, we'll have to come up with something we agree on, but the larger comment is whether we feel comfortable saying that what we've put together can be used to prevent exposure.

Amber Potts: Right.

Moritz, Erin: People from being exposed to gluten? So there's kind of two questions that were discussing.

Michelle Hill: The point I was trying to make earlier is if the behavior is different then we need to talk about it differently. But if it's the same behavior you're gonna employ to control the problem we could say, the concepts contained here, or the advice is guidance. It effectively, when implemented well, will effectively control for Celiac, gluten intolerance, whatever you're going to say, … I don't know if that's agreeable, but ...

Moritz, Erin: I think that's the goal of what we set out for at the beginning … was to have it be helpful in both situations.

Michelle Hill: Yes

Michelle Hill: And from a person that teaches this stuff it just seems like the confusion is around boots on the ground. Confusion is, "Is my behavior different? And if the behavior keeps the allergenic protein controlled, you still need the same skill set. Reading the label, knowing the how it is prepared, what's its flow …

Vinson, Scott: Right.

Babekir, Amani: But is it? Is it sufficient? So is it sufficient to control gluten – the information we include here? Or could it be used as part of the gluten control?

Michelle Hill: Well, really any allergy.

Vinson, Scott: It's probably not. I mean our charge was to control for the eight allergens. Rye and barley aren't among the eight Major or nine major allergens. So we probably should just include a sentence in here, something like ….

Michelle Hill: They don't exclude Rye, Barley, because those are types of wheat grains. They're in the grass family. So those are descriptions or examples of how we talk about that allergen in the food flow and labeling.

Vinson, Scott: Say that again, Rye and Barley are types of wheat.

Michelle Hill: They're in the wheat family. And so when, for instance, when you look at a fish allergy, it also says like cod. I can't remember what else I see if I asked, flounder, cod? Or when they talk about shellfish, they say lobster, shrimp, crab, am I wrong about that? People on the food code? That's meant to give you examples of what that allergen is.

Babekir, Amani: Probably I think wheat is just the wheat.

Devin Dutilly: What you had said is correct. The food code, the allergen definition, major food allergen definition, contains those examples behind it. Yes, that's correct.

Michelle Hill: What? Which means they're included as part of that allergy they're describing the allergy. What's under this umbrella of allergy?

Vinson, Scott: So you're saying because the nine major food allergens include wheat, that barley and rye should also be understood to be one of the nine major food allergens?

Michelle Hill: Absolutely. In fact, the way it is taught by most companies that train people for the CFPM is to learn what are the derivatives - what is this allergy? We can say dairy, but really you need to read the label for casein. So if you go back through and read the food code, it's gonna give you parts to include examples of what is included under that major allergen category, or within that category there's actually ...

Seymour, Jennifer: But that that really surprises me. I agreed that barley is a grass, but that not ... so it might be included in the category that are grasses, but to say that it's automatically excluded when wheat is excluded, that seems very suspicious to me.

Michelle Hill: I'm not wrong on this. So can you guys please speak to this, the people that know about this from the FDA, Devin perhaps?

Devin Dutilly: Yes. So, just to clarify the way that the major food allergens are defined in the food code aligns with the same way that they're aligned within the FD&C Act. I'll just go to it just so that I'm not misquoting anything here. So the major food allergens read, "Milk, egg, fish quantities such as bass, flounder, cod, and including crustacean shellfish such as crab, lobster or shrimp, tree nuts such as almonds, pecans or walnuts, wheat, peanuts, and soybeans.

So it provides such as behind fish and it provides a such as behind crustacean shellfish it currently, as it's written, it does not provide such as behind wheat. That's the question.

Babekir, Amani: Yeah. So.

Michelle Hill: The framework we teach from includes descriptions like for the egg it would be yolk and then white because they're different protein structures. You can be allergic to one and not the other. Umm so interesting.

Vinson, Scott: Rye and barley are not wheat. But and I don't think it's their commonly understood to be wheat, it's probably an academic question for our purposes. So we should definitely mention in this comment that people who have been diagnosed with Celiac disease are intolerant to gluten and gluten is found in wheat, rye, barley and frequently also oats.

Babekir, Amani: So the main the main question here I think, and we have an agreement on it, is that we should mention gluten in our introduction of the document, as an example.

Moritz, Erin: Yes, I think at the very least, we need to say something about it. Because people are going to say well to this apply to gluten and personally, my opinion is that much of what, if not all, of what we've developed can be used for gluten. I'm not super familiar with all the processes that can happen in food establishments, so am definitely interested in hearing what other people think.

Vinson, Scott: I think we should list them, so that people in the restaurant, the food service workers, know they need to be aware that people who have Celiac or gluten intolerance or even gluten sensitivity need to watch out, not just for wheat but also barley and rye, oats, which may be present in the facility.

Michelle Hill: Have you ever seen it labeled that way? Scott, I'm just curious on a consumer label, have you ever seen it? Where they do, they just say wheat and wheat probably is present. Do they say wheat and parentheses?

Babekir, Amani: Yes.

Vinson, Scott: On boxes, on the consumer on the ingredient labels, yeah. You will frequently also see them in a restaurant or food service setting. It's gonna be less common - the consumer's not gonna see it, but the people working in the back of the house may see those ingredients listed on ingredient panels, in product packaging.

Michelle Hill: And it'll be listed as gluten or as wheat.

Vinson, Scott: They'll be listed as wheat, rye or barley. It won't be listed as gluten. That's very, very, very rare to actually see gluten in a product panel. Unless the product is actually gluten, I mean you will see gluten. You can buy gluten at the grocery store.

Seymour, Jennifer: Right, sometimes you'll see vital wheat gluten listed or something like that.

Michelle Hill: I was wondering how does the world treat Rye, barley that aren't wheat, do they list it as a wheat allergy? I mean, is the allergy the list for wheat or do they not list for barley? Is barley not considered? Do they ever call out barley?

Seymour, Jennifer: I would think yes.

Vinson, Scott: Barley's a separate grain. Barley is not considered wheat. It's a separate grain. So is rye.

Seymour, Jennifer: I think I have definitely seen a barley mushroom soup. And you know, that would not be labeled as a problem for a wheat allergy?

Vinson, Scott: That's correct.

Seymour, Jennifer: Something come like that? Yeah.

Babekir, Amani: OK, so I think, yeah, I think so. The introduction group needs to consider gluten on when they are working on their introduction, do we need to mention any cautious statement that is this document might not be sufficient to control gluten.

Seymour, Jennifer: I think so. Yeah. I think so. And that's where I think we were talking last time about including the link to the Gluten Intolerance Group, because just right away, I think of things like, you know, malt that's made from barley but people may not associate because it doesn't say barley or all those kinds of things, where if you really want to understand and make something gluten free you have to know a lot more about all these different, like what we're talking about, Emmer or and triticale and spelt and all these things that people would have to understand to make things gluten free that aren't necessarily. I mean it. Those last ones would be related for the wheat allergy, but I think both are good examples, or the fact that oats are often contaminated.

Seymour, Jennifer: All those things are worth having a link to somewhere else for understanding the issue of gluten.

Vinson, Scott: Yeah, but we shouldn't put links in this document, because I mean, they're probably gonna be printed out. So we should just list them out. It just put in the def in parentheses behind gluten and put all of the things that fall that contain gluten. All the grains that contain gluten, wheat, rye, barley, oats. Barley malt.

Moritz, Erin: And we direct them to the home page of good websites - I think the Gluten Intolerance Group - list out the name of the organization.

Seymour, Jennifer: I think the Gluten intolerance Group is the place to direct them, even if it's not a link, just direct them because they work so heavily in restaurants and helping restaurants to be appropriate for people.

Moritz, Erin: So even if it's printed out, we can say. Please go to gluten intolerance group at … and then list the website of their homepage.

Seymour, Jennifer: Yes.

Moritz, Erin: If they want to follow up on that, they'll at least have the home site web page, which hopefully will stay at least stay the same for a while.

Devin Dutilly: I think the intent of the comment was to provide some sort of disclaimer and including, if it says something, this is not intended to address this, but, “here you can get more resources” and so and there's a resource section at the bottom that we have so even if the links are printed off, you could put the actual live link so someone could type in the resource section at the bottom, so we could potentially put it in two areas, but that's just a thought, but the intent of that comment as Erin had mentioned, and Jennifer too, is to capture what is or is not and if it is, don't just say nothing's available. You know adding something like, the GiG might be a resource for someone who is looking for this - so there is something available.

Babekir, Amani:

Babekir, Amani: And that's good. Thank you. And I think we could move to the next one. This one is questioning the document, should it be framework or a toolkit?

And as per our charge is called framework. So do you have any other opinion on this comment?

Amber Potts: No, I keep it as framework.

Moritz, Erin: Yes, to me, a toolkit is a document where we would put a bunch of links to other sources. We do have a couple posters, but I think what we put together maybe is not like in the strictest definition of either one of those, but to me it's more, it has stayed more of a framework.

Babekir, Amani: OK. Thank you. The second one is about adding sections a limitations section to the document, so the user could understand where, how this document was developed; to frame any topic that might be forthcoming or emerging?

Amber Potts: Yeah, I like this. I think we should add at least where who developed this, why we developed it that way. People can learn about CFP and all kinds of things.

Babekir, Amani: OK.

Moritz, Erin: I don't understand why it's a limitation section.

Amber Potts: Yeah, I don't know if that's the right word. This is not regulated; you know enforceable code.

Michelle Hill: We wouldn't necessarily call it guidance either then, huh?

Amber Potts: Disclaimer, I don't know.

Babekir, Amani: No.

Moritz, Erin: Yeah, I think something towards the end may be detailing how it was developed. And then, if there's any disclaimers, like especially important disclaimers, we might want to have them at the beginning and in the section at the end.

Babekir, Amani: OK.

Moritz, Erin: That's what they were going for with limitations.

Babekir, Amani: OK. It's good. So let me see - what is - so this one. This one is talking again about a disclaimer and the language and disclaimer to let the readers know some of the documents could be generalized, so I think we addressed this one already. What do you think?

Amber Potts: Yes.

Babekir, Amani: This one is talking about temporary food events. Do you think we need to address that one, or is it out of the scope?

Amber Potts: But this is considered - what does that charge have about? What does ... they use alternate? What was the wording it used?

Babekir, Amani: Equal consideration.

Amber Potts: For alternate. What's it say?

Babekir, Amani: Yeah, alternate food sources such as food pantries, food bank, probably this is the one.

James O'Neal: Well, and I think if we're going to use the definition of food establishment from the FDA, I feel like … let me pull it back up. The definition of food establishment includes an operation that is conducted in a mobile, stationary, temporary or permanent facility or location. So I think that would fall under that.

Babekir, Amani: OK.

James O'Neal If we're going to utilize that definition, I think we would probably have to address it.

Babekir, Amani: So do you think we should address it under the equal consideration section or?

Amber Potts: Yeah, I think so. Although they need a lot more training because they don't, some people do this at temporary events. They don't do it for a living. You know what I mean? They just want to sell their whatever. I know, as someone with an allergy, I don't eat at Temporary events, so it's just not safe.

Babekir, Amani: OK. So this one talking about Major food allergy versus food allergies. We recommend changing this term, presumably food allergy. What do you think?

Amber Potts: What section is this coming from?

Babekir, Amani: This section is on the person in charge on probably a food allergy definition, food allergy.

Amber Potts: OK. Is this for the training section?

Babekir, Amani: For the training, yes, under …

Amber Potts: Yeah, we'll discuss that in our group and get back to everyone.

Babekir, Amani: The comment is to use through the whole document cross contact. That is one of the comments and also this about sanitizing, and equipment used for preparation, for preparing the customers allergy free meal. So. I'm not sure what it behind these comments, other than just to bring awareness.

Moritz, Erin: So are they saying that just washing and rinsing should be enough? I'm assuming like the soap would destabilize the proteins, maybe.

Devin Dutilly: I think the comment for sanitizing is not relevant because of the wash, rinse and sanitizing procedures in the in the food code that relates to microorganisms, so …

Moritz, Erin: Oh, yes, the definition of sanitizing is reducing microorganisms. OK, I get it.

Michelle Hill: Yes.

Devin Dutilly: So using the term for microorganisms, so sanitizing doesn't - you have the term is not defined towards removing or denaturing proteins, so.

Michelle Hill: Yes, and that would be an extraordinary chemical too, wouldn't it?

Babekir, Amani: Yes, but you still need for the proper cleaning. You still need to sanitize food contact.

Moritz, Erin: Yes, that's what I think. We should maybe leave it like that just because we don't want them thinking like they're still gonna have to properly sanitize it for microorganisms I would think, maybe they won't.

Babekir, Amani: That that is the proper procedure, yeah. To wash, rinse, sanitize.

Moritz, Erin: I get what the comment is getting at, but I don't necessarily know if removing sanitizer is the best approach.

Amber Potts: Is there science?

Vinson, Scott: But you don't sanitize between every customers meal preparation, you do it maybe once or twice a day, but it's not. It's not routinely done between each meal.

Babekir, Amani: Do you just wash and rinse and that's it? If you're gonna wash and rinse it, you're not …

Babekir, Amani: Yes, you probably need to do the third.

Moritz, Erin: Yes, it has to be with soap for sure.

Michelle Hill: The steps we teach as you guys have been saying are wash, rinse, sanitize, air dry.

Babekir, Amani: OK. So we're good keeping it.

Amber Potts: Yeah, I just have a question.

Vinson, Scott: This is one of those. So this is my group, our section in the Practices section. So we didn't know we would be addressing issues that so, so are we supposed to just remember our subgroup. Just remember that we've already addressed this at the full group level. So we don't need to discuss it when we have our subgroup call. Oh, OK. Got it.

Babekir, Amani: That's correct, yes. So I'm going to send out this document after we get done. And this one, we have just one. I think this does not use the allergen free terminology. We use it here, allergen free meal.

Devin Dutilly: I have to I have to jump off the call. Thank you very much. If you have any questions I would. This is just a just a personal recommendation, but if you are holding meetings and you think you would benefit from previous conversations of a federal partner being present, I would think that if you would like that please feel free to include all the federal partners on the on the meeting invite so that everybody is aware that they're occurring.

So if you need some input or something like that, feel free to include all the federal partners in the meeting. So at least somebody may be present on the meeting. So just to keep that in mind. So thank you very much. Again, thank you.

Babekir, Amani: That's great. Thank you, Devin.

Devin Dutilly: Thank you. Bye.

Babekir, Amani: Yeah, I think, yeah, I think we are over time and so that was the last one. We could keep it for you, Scott. So to discuss it to discuss it in your subgroup. <meeting adjourned>

Meeting Number 20	Meeting Date **09/01/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill via Teams Transcript	Council II Chairs Wendy Bell/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour		Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Previous Meeting Minutes	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Review changes by training, emergency and notification group

Template group with work on it

Two volunteers joint equal consideration group (get names from Michelle)

Issues will be worked on in the next meeting

Devin suggested issues to reform committee, update previous year notification and promote the current documents.

Amani suggested an issue for posting the framework in the CFP

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Framework Points	Amani Babekir
vi.	Adjournment	Amani Babekir

MEETING MINUTES

Babekir, Amani: Michelle, would you like to take the roll call?

Michelle Hill: Certainly. [takes roll call of voting Committee Members]

Alrighty, we have eight, so I think that meets our quorum.

Babekir, Amani: Yes, thank you, Michelle.

Babekir, Amani: And just would like to remind you that the Conference for Food Protection, antitrust, this statement is active with this call. Just keep that in mind and we could get it started with our agenda items.

Babekir, Amani: First thing I want to share is the progress we made on the framework. I'll just give you an overview from the version which I have. Michelle and Ben, they are working on the format, and I will give them a chance to just give us a summary about what they are doing. I will share with you what we have done before we hand it to the format team. Can you see my screen?

Michelle Hill: Yes.

Babekir, Amani: What I've done here, I just combined together all the updated sections which I received from you. And we already reviewed it in our large meeting, so I just accepted all the changes and I kept some of the comments which need to be addressed by the template team.

We still have the introduction section we need to work on, and the template team will take care of that one. The training section. We have it here. All good. We have the handling section, food handling policy and practices, and it is all good here.

And we have also the notify customers check section, which is clean.

There are just notes for Michelle, and then to address some of the points, and adding the footnotes. The emergency response? We added here the updated version.

And, Wendy, since you are with us today, can I ask you a question before I jump to the next point in our agenda?

Bell, Wendy: Sure. I'll try my very best to answer.

Babekir, Amani: We were wondering about using existing pictures and the copyright around the pictures, … I sent out, I think, an e-mail about it, but we are still waiting for the response. I'm wondering if you could give us some insight about using the pictures in our documents and what is the copyright concerns that we need to address or any concerns about the copyright?

Bell, Wendy: I will figure this out with Vicki as she is who we present these questions to. So let me get a working e-mail and that way maybe we can get an answer before the meeting's over or we can definitely get one as soon as possible.

Babekir, Amani: That is great. Thank you very much, Wendy.

Bell, Wendy: OK. Thank you.

Babekir, Amani: So there's just one of the points that we need to clarify about the pictures. Other than that the section is ready. All good. And then I have we have the equal considerations section that Michelle is leading ...

Michelle Hill: Yes, and I'll have an update for you … its yet to come.

Babekir, Amani: OK, that's good. And then we have the definition section - and there is a couple of comments here and I think at one point we started discussing it … I wanted all of us to take an action while we are in the call and make the change on this section.

Ben Wagner: Amani?

Babekir, Amani: Any question before we address the comments on this section and get the update? Yes, Ben?

Ben Wagner: Michelle and I had worked on all the comments on the copy that you sent us for the framework, and we took those comments in the definition section and so we did make some changes based on those comments, that we thought would work for the group and we planned to have the group review and agree.

Babekir, Amani: That is fantastic. That is great, Ben. Do you think you covered all the comments here on the definition section, so I wouldn't need to worry about it?

Michelle Hill: Yes.

Ben Wagner: Correct.

Babekir, Amani: OK, that is great. And what about the definitions section? Also you will take care of that one, OK? I think that's all the updates; any questions before I turn it over to Ben and Michelle, if they want to add any extra information about the updated document.

Michelle Hill: Amani I'd like to share my screen if that would be OK with Ben. Is that OK with you? I think I have the most recent.

Ben Wagner: You do have the most recent copy.

Michelle Hill: OK.

Babekir, Amani: Yes, please go ahead.

Michelle Hill: OK. Thank you. Good. Alright, so the this is a dynamic table. It will update when we tell it to, so we won't have to worry about page numbers being right or wrong as the formatting changes. We did universal cleanup when it came to punctuation. Spacing of information on the page - we employed styles so that it's a predictable change when it does occur. So if you see something you don't like visually, let me know and it could be changed. We can now make one change through the style guide and have it update globally.

I've also removed any hyperlinking to the external world. Any linking that does occur or would occur as this gets published would be within the document itself.

Ben, thank you for doing this, dropped in all the definitions as per the definitions at the end of this document, they've been dropped in as footnotes, as agreed by committee.

We did things such as reorder the listing here because we looked at how it was actually listed officially within the Food Code, and so we've carried this convention throughout on how this gets listed so that it's always the same information appearing the same way.

We also made adjusted the title of the document to “Major Food Allergen Framework,” as that is the title, and we've carried that through to the Header for every page.

We've given a uniform look to the statement of purpose throughout - any time this appears, it'll look like this, where it's all cap and underlined.

Again, the flow here, the allergens are listed just as they appear in the same order here.

We did make sure we did correct leveling throughout so that all information appears at the correct level as part of an outline format. There's good continuity here visually on how things are appearing - visually clean things up.

Ben Wagner: Michelle, do you wanna take away the carriage return marking and all that?

Michelle Hill: Yep, I'm happy to do that. Thank you. I'm so used to seeing it that way. I don't even realize it. So thank you.

Pagination will change as I increase the font size as well. I went up to a 12-point font. We were at 11-point, and I printed it and it's really hard to read. It's a lot of information on the page. It put us up one more page, but I think we can play with spacing and keep it capped at 24 pages.

Umm, we did have a recommendation to make this a full sheet size sheet. So I wanna show you how it will look like when it goes to print for the person using this guidance.

This is our example. A lot of the icons did not carry through and so I went to just using regular keystrokes and we can talk about this if you guys don't agree. If this doesn't make sense, but if it's an X we've defined that as having the allergen present. If it's a lower-case M, it means it may contain the allergen depending on how it's been prepared. We also cleaned up the labeling on this table. It's called table one example, food allergen matrix used to say, food allergen table. All the stuff we've looked up all of it referred to as a matrix when it's laid out such as this.

I put a new graphic in here - the blueberry smoothie contained other ingredients and we just trimmed it down to what it might actually contain. This is the blank matrix, so this is Table 2, the template food allergen matrix. We've added this other four columns here called other components, and we've dropped in a footnote at the bottom that says a table such as this could be customized for gluten free and other food intolerances and sensitivities by utilizing the other components column, which is what these four are on the far right. So the idea here is that they could print this, have a clean copy and pencil it in. I did print it and it is easily used in this state, so I don't know about giving more space for that. I was able to legibly use it as a person would in the field.

Cleaning up some of this stuff, waiting for feedback on whether we're gonna keep these pictures of the auto injectors, and then we did drop in this table down here. We eliminated the little icon with the verbiage around they're being posters available because it was already listed here, so we just made it into a table and then we'll call the page number once the pagination has been set and all it really does is just tell you what the poster title is and it talks about how these are examples of posters that can be placed this section, the food allergy reaction, emergency Response Guide section is the only one that employed the use of that icon. So instead of having it at the beginning of the document calling out saying this would be used.

We figured that this would be a more efficient way to address that issue, and perhaps a clearer way. And so then we took direct language from the way these posters are named and made sure that's what we call them in the table. And then this is the equal considerations for other community food sources - FARE has a very nice guide available which we will be parsing information from for the correct language here, and then we'll call it out as a reference. There's quite a bit, so there's some nice guidance there, so I'll drop that in. We did clean up how this appears.

This is the definitions section - we decided to go with bold with the definition starting on the next line. The table was pushing out to too many pages, and we felt like this was more visually pleasing and kind of more of a traditional way of doing it.

So if you have feedback on that, that can be changed and, that's it. So hopefully I made sense.

Babekir, Amani: Do you have the reference section?

Michelle Hill: Yes. Oh, I wonder why that's not showing up. Ohh yeah, here it is. I'm sorry. I just had to go one more time. Yeah, I was just trying to figure that out right now. And I'm glad you brought that up because what we were wondering about is we've got the footnotes. Do we drop in another series of maybe superscript? That says, “here's our references”, or how do we wanna call it out?

Moritz, Erin: I thought that we took out all in-text references.

Babekir, Amani: So I'm wondering if we have the footnotes, do we need the references section at the end of the document?

Michelle Hill: All that's included in the footnotes at this point in time other than that table reference description - the footnotes are carrying the definitions of the words at their first appearance.

Babekir, Amani: So question to the committee, what do you think? Do we need to keep the reference section by the end of the document?

Moritz, Erin: Sorry, could you clarify?

Moritz, Erin: Are they? Are there references in the footnotes, or is it just the definitions in the footnotes?

Ben Wagner: So currently the footnotes only came from the original definitions table. The first time you see that word, that word or phrase, the definition is given in a footnote, none of the references are currently footnoted.

Babekir, Amani: Ah, I see. OK.

Michelle Hill: And maybe it's just because I was looking at it as a place that we were defining words, but obviously footnotes can be anything. So it would just be another footnote, if that's what you guys want to do. And that would eliminate the references section, potentially.

Although we do have the definition section still, even though they're referenced throughout.

Moritz, Erin: My personal preference would be to leave the reference section in. I feel like putting them in footnotes would just make it even messier with something that not everybody is going to be using.

Michelle Hill: The other thing to that point, Erin, after I printed this because I don't, I don't know how many people actually have printed this, but when you go to functionally print it, it is really nice to have that sheet, with just the references as part of a printout.

Babekir, Amani: That is good. I think we're gonna keep it as it is. Any comments from the team? Any suggestions? OK, so I think that's very good work, very nice work. Thanks to all the subgroup teams – you have done fantastic jobs just addressing all of the comments and updating your sections. So thank you very much and thank you Ben and Michelle for making it look very pretty, as it is right now, very good job.

Michelle Hill: Thank. Thank you, Madam Chair. I have run a spell check and it's a good thing I did because we had some misspelled words. And I also ran for whatever it's worth. I went through the process of reviewing it within word for readability and all of that 100% across the board for editing for whatever. It was really good scoring, easily read.

So yeah.

Babekir, Amani: That's good. What about, do we have any kind of template or format that we need to follow for the Conference of Food Protection when it comes to the guidelines?

Michelle Hill: That's a good question.

Bell, Wendy: This is gonna be posted on CFP website, correct.

Babekir, Amani: That's correct.

Bell, Wendy: So that is another Vicki question, because I know that the Food Defense Committee gone through some of those same issues, and I can try and look up what she said. But there are some stipulations to that, and I can definitely provide those to you.

Babekir, Amani: Thank you. Anything else before we go to our Issues? Thank you, Michelle.

Michelle Hill: Certainly. Thank you.

Babekir, Amani: That's good. So since we are good with our framework and we are within our timeline which will need to submit the framework by November 18, along with our Issues. We plan to work on the language until the end of October. So then we will have some time to put it in the right format and all of that.

So here just some of the points I wrote down just from our discussions from the comments, while we are working on the framework. Just wanting to refresh our discussion on this point. What do you think? What is the best way we could point to this framework in the food code? And I'm opening for discussion. If you raise your hand.

Michelle Hill: I was wondering if anybody from FDA could speak to that. I don't know who's on the call and looking here.

Michelle Hill: I don't see Devin on the call today.

Babekir, Amani: I think, yeah, I think Greg's maybe with us.

Abel, Greg A: We could put it in the as an annex right into the food code has a big annex section of resource materials. It could be proposed to be put in as a tool for those establishments wishing to create a food-allergen friendly environment, and here's the guidance to do so.

Babekir, Amani: OK.

Abel, Greg A: I think that's the most appropriate, it can be another direction. It could go is as is CFP supporting document to food allergens as well.

Babekir, Amani: And does it need to go in the food code?

Abel, Greg A: In the annex section, there's seven annexes for in some of the annexes, there's examples of the inspection form. There are examples of employee health policies that establishments could use to develop their own written policies. So and then there's chapters that talk about how to do a risk-based inspection, the public health reasons behind the provisions in the food code. And then there's an annex on references … there's one possibility to entertain - could it be another annex on food allergen management in retail establishments, and then if that doesn't go, it can be supported and recognized by the CFP on their website. I think there's an outdoor cooking guideline that committees have worked on over the years, and that's on the CFP website that people reference oftentimes. So we could go either direction and, in my knowledge, the big one would be to get the document into the Food Code as an Annex and then every time the Food Code is published it will be there.

Babekir, Amani: OK. Thank you.

Abel, Greg A: So two routes.

Moritz, Erin: I was also wondering if - Greg, you can certainly steer me in the correct direction here - but if there's anything in here, like any piece of it that might be worth requesting to put in the codified language, you know that would be strong enough to be held up.

Maybe it's, I know this might be the previous CFP, but something like requiring a list of ingredients used, or requiring maybe an emergency response plan, just like a small a small piece of what we put together that might be, you know, strong enough to put into the codified language. Does that ever happen in these kinds of situations, Greg?

Abel, Greg A: When these food allergen committees started forming, that was back in 2007. The first hurdle we got was to recognize that food allergens are real, and we made the person in charge to be knowledgeable on them, right? That was the first piece we got. I don't know the direction of where FDA is going with the last committee and some of the recommendations what was accepted? What's gonna be used? One thing, with putting food allergen management systems in the code as codified language, it would be difficult to enforce because a lot of inspectors aren't trained to recognize, like your example and learn about a list of ingredients. Provided you know, I think that could be a future endeavor, but to make sure that list is accurate, how do we enforce that right? And how do … who keeps track of that? But perhaps the idea of having the emergency response to an allergen event could be something that could be required, kind of like how we have written notification of a diarrheal and vomiting plan. You know, that's a requirement in the food code that all establishments have a way to rectify diarrhea and vomiting in the restaurant. Having an allergen response plan could be certainly something that could be taken from this document and suggested that that also be in a food establishment.

Moritz, Erin: And I think would be easier to enforce than something like an ingredient list.

Abel, Greg A: I've done this for The City of Minneapolis School District system, I think they have 80 schools - to develop an allergen free menu and my gosh, just on something that's simple as a school system that receives commodities. How difficult and time consuming it is to make sure that's accurate? So it's almost a whole new division of food safety, right?

Some manufacturers are some establishments and some states, like Minnesota for example, they keep, in the deli - if they have one - they keep a list of the ingredients that they use to make their Deli products. So if a consumer did ask, they can go to a binder or some kind of reference system and say, OK, we use this particular product, and this product contains these ingredients. So they could tease down any hidden Allergens, right? It's not a requirement, but some establishments do keep a list of ingredients voluntarily.

Moritz, Erin: So it does sound like, if we really wanted to take a small piece of this - something like requiring an emergency allergy plan - that would be one direction. My other question I have is, if this goes in, for example, as an Annex, could we still advertise it, you know, publish it through CFP?

Abel, Greg A: That's, you know, that's a good question. I don't know the answer for that - I can find out.

Babekir, Amani: OK.

Moritz, Erin: So I'm just wondering if it's like an either-or type situation or if we can do multiple steps.

Garvin, Amanda: Multiple.

Michelle Hill: Yes, I believe it's multiple as well.

Abel, Greg A: OK, I think you could advertise it and say, hey, this is where it's at. This is where it's published. It's published in the food Code Annex. It's published also at the CFP website.

I think it's a great tool, what's been created here. If those of you that have been around for a while, when FALCPA was passed in 2004 and became effective in 2006 , that public law said that FDA would work with CFP and develop a Food allergen guidance type manual, right. That was back in 2006. I was actually one of the authors of that manual, and we worked on it for two years, and it was kind of kind of doing the same thing that this committee is doing except this committee's work is a little more - we've learned a lot more about food allergens, a little more detail, there's more resources. I think it's easier to use. But FDA's document that was created in 2007, 2009, it never did pass our executive leadership, so I never did come out. We never did follow up with that public health law, so now the committee's kind of doing this work.

Babekir, Amani: Yes.

Abel, Greg A: I think it's great work.

Michelle Hill: So glad to hear that. Thank you, Greg.

Babekir, Amani: That's good. And to your point, Erin, about the previous committee works and any change to the food code they did - when we reviewed the previous work, we found in a couple of events that they did manage to add extra wording in the provision of the food code pertaining to allergens, so that's something. Also we could, besides creating the framework, change the food code. So you have the option now for the Annex, the CFP website and - do we want to add some of the nuggets inside the provisions of the Food Code? Amber, you suggested the emergency plan … anything else you think might be beneficial to addressing the whole profession there? What about the notification of the customer or …

Moritz, Erin: Yeah, that's kind of where my mind went next would be some sort of Notification requirements. Although I think that could get very messy if we really wanted to go down a rabbit hole with it.

Abel, Greg A: The notification one is very hard to do right. Remember, the city of Saint Paul, MN, one of the council members tried to pass a city law that he wanted all restaurants to declare and notify all food allergens that are possible in the menu. And at that time, food allergen people and groups came out to testify against it, because of the inaccuracy of it.

Who's gonna create the list when ingredients change? Especially right now you look at our food supply chain from a food manufacturing side - ingredients are changing left and right, left and right. Big companies can't get their main suppliers and they have to change micro ingredients a lot. So with that in mind, if something comes in, that's an allergen - who keeps track of all those menu details? And when you get into a retail environment, a restaurant, not a chain, that's everything's processed in a certain way, but more independently owned. We have different chefs making different creations. Here I mean, gosh, you know, having a notification is good, but on the other side, the case that notification was not accurate, and someone made their decision on that written notification and then had a reaction, right? So it's very difficult to enforce and to make sure it's accurate, if it becomes a food code provision in my opinion.

Babekir, Amani: Thank you.

Michelle Hill: Greg, I love what you just said and I'm thinking that maybe our opportunity to be part of the Food code language would be just around understanding how important a label is and accurately labeling things for allergen derivatives. I don't know if that's something that we can be very specific about, but as a consumer that's my biggest problem … is it correctly labeled … cause it's not.

Abel, Greg A: Yes, right. And people that live with this condition - if they have children and themselves, I mean, the first piece, the written notification, gives them a clue of what to eat, and start to ask questions. The next piece is to talk to the chef and find out how things are actually made in the kitchen or talk to the manager to get the assurance that your food definitely is going to be safe to eat.

Michelle Hill: Yes, I've lived it. I agree with you completely. Soy oil hides everywhere and my kid was so allergic to it, he would just projectile vomit. I'd be like, “you didn't tell me about the soy oil you used”.

Abel, Greg A: I have three celiac kids and I've been living with it for I don't know, 20 some years before FALCPA. In my spare time, I run a nonprofit and we have a booth at the State Fair of Minnesota, a gluten intolerance awareness booth and celiac disease, and we play the “Jeopardy” game to engage people, to come in, and it's surprising to me where we're at today. How much ignorance there is out there about even food allergens and gluten, cross contamination and such. Any education or awareness is great.

Vinson, Scott: A lot of times I've observed that people confuse gluten with glucose. So if you tell them that you're gluten intolerant, they think you can't have anything with sugar.

Babekir, Amani: So what about the training piece? Since we are talking here about awareness, I know in the food code there is some pieces about the training when it comes to allergens. If there is anything we want to add there …

Michelle Hill: To be more prescriptive in that regard, yes, I would love to know how to do that. Let's talk about that. I teach this stuff too and I would love to be able to say, look, you have to know this.

Abel, Greg A: Yeah, I think you know, in the certified food Manager courses that are accredited, there's an allergen chapter in those courses, right?

Michelle Hill: In the same place as physical contamination.

Babekir, Amani: So you think that probably will satisfy the detailed information about allergen training … we don't need to add anything extra?

Michelle Hill: How do you talk about knowing and understanding derivatives or how it appears in the food you're serving, because that's where I see people fall down anytime auditing for allergy. It's like going into the Bloomington School district here, which I'm working with right now for allergen control across their 17 schools. I'd love to talk to you, Greg, because this is the problem. It's a hairy beast. And so you have to assess your risk. You know, how many people are at risk and how are they at risk and then carrying that also to - because the schools have to keep not just the food safe, but the classrooms too. So my son is so allergic to soy that washable paint is soy based and he will break out in a rash any time he is exposed to it. So even understanding that allergens can be tactile, aero-inhaled and consumed, all of that's important! I don't know if that fits here, but ...

Babekir, Amani: I see. So I guess we need. To figure out if we want to stick this in the Annex and make changes or comments around addressing the framework in the Annex section or trying to figure out which pieces, we want to add to the actual Food Code.

Michelle Hill: Can we do both?

Babekir, Amani: So if you want to do both.

Let's figure out what nuggets we want to add there beside the emergency plan. We touch on the training - bring up the section of the food code that is addressing this training and look at it. Where do you think the emergency plan will go within the Food Code?

Michelle Hill: I like Greg's idea of having it be part of its own Annex or …

Babekir, Amani: Yes, but I mean, if we want to address it in the provision section of the Food Code - you want to add something?

Abel, Greg A: You would probably want to put it in Chapter 2. And I'm looking at it. OK, in Chapter 2 called 2-5 “Responding to contamination events”, and that's where the cleanup of vomiting and diarrhea events is located. So to me it seems like it would fit under Chapter 2-5 along with this “responding to food allergen events.”

Babekir, Amani: OK.

Abel, Greg A: Seems the most logical.

Moritz, Erin: And would we get any kind of push back? For considering an allergen, a contamination, do you think?

Abel, Greg A: Umm gosh, you know ...

Michelle Hill: We could call it a contaminant.

Abel, Greg A: Yeah, you know, it depends on who's looking at it, right? I mean, for 95% of the population, it's not right or whatever the statistic is. We could call it something else. “Responding to adverse … “ we could make a new chapter, “responding to ...”.

Moritz, Erin: How about we could call it something like, maybe based on the symptoms. For the medical result. Like for example, anaphylaxis.

Michelle Hill: We could say also that it was Food allergy - we could say it's a contamination event due to cross contact.

Moritz, Erin: Yes, I mean, I guess so for example, if somebody says, “don't make my meal with nuts” and nuts are in it, then it technically would be a contamination event ...

Michelle Hill: … due to allergen cross contact. I don't know why they have to be mutually exclusive. It's only because we think of that way ...

Moritz, Erin: This is me, putting on my little, tiny little regulator hat of what I might think if something like that came across … I think if that's worth pursuing, then yeah, let's do it.

Abel, Greg A: And then you would have to, if you pursue it through as CFP issue to add to a food code, then you'd have to be prepared to say, “well what should this Response plan include” - and it's in the document. And then what happens then is states will have to adopt it. And then that would mean all retail establishments would have to have an allergen response plan. So that means a booth at a State Fair would have to have one. That would mean a temporary food event for a car rally would have to have one, a restaurant, a grocery store Deli - which is fine. I mean, that is the scope of the food code.

Michelle Hill: I say yes.

Abel, Greg A: Yeah, it's kind of like the vomiting and diarrhea clean-up plan, right? We just want people to have some kind of a notion that you just don't go out with a mop and clean it up because if it is norovirus, I mean the person who's cleaning it up could spread it to the rest of the staff or other customers. So you want to take some types of precautions, even though it's something that's not going to, you know, take down a restaurant from operating, I mean, at least having that plan out there, and if we can get compliance of a certain percentage each year and increase that, then boom. You know, slowly get there with an educational piece, even though it's requirement.

Babekir, Amani: James … I see James’ hand.

James O’Neal: Yes - we're looking for somewhere to fit it ... could it fit … Chapter 2, section 103.11, which is a person in charge duties. I think it could possibly there as far as that the person in charge is knowledgeable about allergens and however, we wordsmith that, that could be a possibility.

Abel, Greg A: Yes, another good spot under subparagraph - that talks about employs properly trained, and food allergy awareness. So it could fit there too, and also say, “include an emergency response plan to an anaphylactic reaction.

Moritz, Erin: We just tack on ... trained in food allergen awareness and actions to take in response to a severe allergic reaction, or something like that ...

Abel, Greg A: Yeah, that would be easiest path. Thanks for that recommendation. Whoever gave that, I don't see you on my Teams list. Yeah.

Babekir, Amani: Thank you, James. Yes, Scott.

Vinson, Scott: I just want to clarify that this framework we've developed is just voluntary and not mandatory, is that right?

Babekir, Amani: That's correct.

Abel, Greg A: Yes.

Vinson, Scott: OK, the reason I ask is because some of this some of the discussion … go ahead ...

Moritz, Erin: But then whatever we decide to put in - any little bit into the food code - that little bit would become a requirement, but not the entire framework. That's my understanding, Greg. Is that correct?

Abel, Greg A: That's correct.

Moritz, Erin: OK.

Vinson, Scott: If it makes its way into the Food Code, which is a model code - then the States and local jurisdictions have to adopt it. The reason I ask is because we want to be careful that we don't Inject provisions into the food code that are controversial or could be construed by some state legislatures or agencies as too onerous, because that will discourage adoption of the food code. My organization has supported universal adoption of the most recent version of the food code across all jurisdictions, and we encourage all jurisdictions to update their food codes. But there is this movement afoot. We had a speaker from NEHA yesterday – they talked to my food safety task force members yesterday about this. This food freedom movement, which is causing some legislators in some states to reject the Food Code, and to not adopt it … and we don't want that to happen. So I want us to avoid a situation where we – especially with smaller establishments, which I don't represent, but they're not represented in these conversations – so somebody has to sort of bring up their interests. Do we keep this as a voluntary framework in that we don't try to shoehorn into the food code - subsets of this framework - to try to get it to be made mandatory. I have a feeling, I'm just getting an inkling from some of the earliest discussions, that some people on this call are trying to do that … that could backfire on us in the long term because some jurisdictions could then be less likely to adopt the food code. We don't want that to happen.

Babekir, Amani: Thank you. It's good.

Michelle Hill: But it's part of our charge, though. Correct, Amani - that's part of our charges, yeah?

Babekir, Amani: Yes. So what is happening here beside the framework - we wanna bring awareness about the framework, so it doesn't have to do anything about making it like a law to follow. And one of the things is to address it in the Annex of the Food Code, which is not kind of regulations there. The Annex is just kind of differences and more clarification to the provisions section of the food code. The other piece is to add, maybe three words on the provisions section of the food code. For example, the word of "emergency plan." We are gonna discuss that further, but just let's conclude what we are discussing here.

Chapter two. We say we're talking about the knowledge of the person in charge and maybe one of the pieces we say there, besides knowing the food allergy, also know the response plan if there is any event. So just maybe one sentence or two or three words. That's what we are discussing here and that's still under discussion and this is a good point to be aware of Scott. Amanda?

Vinson, Scott: So the response plan is one part of this framework document, and so what we're talking about is just including those provisions in this framework document, what to do when an allergen gets into a customer's meal, in that kind of a situation, putting that into the food code only.

Babekir, Amani: Yes. Erin?

Moritz, Erin: If we decide to go this route and essentially make something required, it's gonna have to be very basic for the exact reasons Scott just talked about, and it has to be doable too.

Babekir, Amani: Correct. Amanda, I wanna give you a chance before we end our call as I see, your hand.

Garvin, Amanda: You already said it Amani, but I wanted to highlight it again - is putting this in the Annex 2 "References", which I really think we should try for, is a really great idea and that is a way for us to put it in the food code. Look under Annex 2 - anything they have used to help with the food code is in here and some of the documents we've done through CFP are in here too. So not only putting it on our website, but definitely putting it in Annex 2 for sure. And I also do very much like the idea of having … I'm saying that the person in charge does have to be knowledgeable on allergens but not too in-depth, of course, but they should be knowledgeable. I think that's a great point, though, if we're gonna say they need to be knowledgeable, we might want to say how far do they actually be knowledgeable? Because I know that's something that an inspector could do very easily.

Abel, Greg A: Well, that part's in there - this demonstration knowledge on allergens.

Garvin, Amanda: It was in there.

Michelle Hill: Yes.

Abel, Greg A: It talks about the person in charge describing foods identified as major food allergens and the symptoms that major food allergens could cause to sensitive individuals.

Garvin, Amanda: To when we were saying that knowledge, but we were saying duties, Mm-hmm.

Abel, Greg A: Well, there's two parts - one is demonstration of knowledge and then the other piece talks about the duties, and the duties' part talks about that employees are. trained or have food allergy awareness, as duties require.

Garvin, Amanda: Yes, and I thought it was in there, but then, which one did we mention earlier? Somebody mentioned something earlier that I thought was excellent beyond there, OK.

Abel, Greg A: Duties, and I think Scott brings up a very good point when you start qualifying things, especially on food allergens like this. I'd be very careful if states are going to adopt this because I would give you example, North Dakota adopted the food code by reference and the legislators tagged on that they didn't want required - they didn't want the person in charge to have certified manager certification because they looked at the state of North Dakota and that was an added expense. So everything got passed except for that. So you know, putting something in on this nature and especially without health departments having the staff to enforce something like that.

Babekir, Amani: That's good.

Abel, Greg A: You know, might not get passed, so it it's. It's a delicate balance. There's one provision that's in the food code that hardly anybody knows about. It's an allergen control piece. And that piece is, and if you read the food code carefully, it says when you go from raw fish to another raw animal food protein, you have to stop, wash, clean and sanitize because of a fish allergen. So many people read right past that, and so many jurisdictions that do catch it say we're not enforcing it right now. They're not going to enforce allergen control as a mechanism in the code. This piece here I think is so robust with information sits in Annex 2 I think has its best shot of being part of the food safety culture of including food allergens.

Babekir, Amani: Yes. Thank you.

Moritz, Erin: But you said it's not either or.

Abel, Greg A: Say that again?

Moritz, Erin: So we could put this in the Annex and then take a little piece.

Abel, Greg A: You still can, yeah.

Moritz, Erin: And make codified ...

Babekir, Amani: Amber?

Abel, Greg A: If you decide to like maybe having a … Go ahead …

Amber Potts: I just wanna re-read our Charge for this specific topic. Just "recommend changes to the food code that support retail food establishments to operationalize Framework to prevent and control food allergic reactions." So maybe we can start next time with just seeing if we can vote on whether we want to actually put that in the code defined section or if we want to add that to the Annex or neither and just add it to the CFP website, but whatever we do should be supporting retail food establishments.

Babekir, Amani: And thank you, Amber, and thank you for the suggestion. Yes, I think in our next call that's gonna be our main objective – to vote on which option we wanna go for and focus on it, so I will just put down all the summary of the discussion we've done today and go from there. We don't have a lot of time you know to decide on this, just maybe two other calls to finalize this so we need to agree on our path moving forward. So thank you very much. It's great discussion. Thank you everyone and see you next in our next meeting.

Meeting Number	Meeting Date		Meeting Time
22	**10/13/2022**		2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill via Teams Transcript	Council II Chairs Wendy Bell/Courtney Halbrook

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Framework Points	Amani Babekir
vi.	Adjournment	Amani Babekir

MEETING MINUTES

Babekir, Amani: Hi everyone, and thank you for joining us today. I don't see Michelle, so probably she will join us later. This meeting will now come to order, and I remind you that the conference for food protection antitrust statement is active during this call.

Babekir, Amani: I'm going to just go over the attendance. We have six voting members, so unless we have more people joining us, we wouldn't be able to vote. We can discuss things without voting. Then we could vote during a future meeting.

Babekir, Amani: First item on the agenda. I want to share with you the updated framework and really, its very good job being done here - from the subgroups and also from the template team – just making it a pretty, and very concise, document. I hope you get the chance to go over the Framework, so if you have any comments or any notes, feel free to share it in our meeting today because we don't have a lot of time remaining to keep working on this document. By the middle of next month we need to submit it for its first round of review by the Council. So we have just a couple of meetings to go over it. Feel free in between, if you have any comments, to send them our way.

There are couple of components here we need to discuss together as a group. I know I will start first here with the introduction section. We did add this section, which highlighted it in yellow to address the point about not restricting this Framework to just controlling for the Major Food Allergens, but all food allergens. But also there is a recommendation here to add a “limitation” section. As you can see on this comment - to address that this document is not covering all types of allergies. And maybe something needs to be also addressed in further work. What do you think? Do you think this part - which we added in the yellow – sufficient that this document is only focusing on the nine major allergens and there are other types of allergens, or you think we need more added language to the document? I will give you a couple of minutes to just go over the text we added and also hear the comments being addressed, by Devin here. If you could please admit people, if that is possible to do, and speak up because I can't see hands raised.

Vinson, Scott: So I see the parts you highlighted in yellow there. So you're asking us whether we approve of that sentence. That you highlighted in yellow, and whether we want that to be included in the document?

Babekir, Amani: Yeah. So.

Babekir, Amani: That section we all agreed on and we added it here in our meeting. What I'm trying to say is, “do you think that section is sufficient to address the comments here?” Or do we need to add anything further to the document?

Vinson, Scott: Oh, I see. Well, I like that sentence.

Ben Wagner: I feel like it's sufficient.

Babekir, Amani: Right. Thank you. Any other point or any other opinion? We good?

Dave Read: I think it looks good.

Babekir, Amani: OK. Thank you. There is this one about the limitation ...

Michelle Hill: Madam. Madam Chair, if I may, I jumped on. I'm here now. I apologize for my lateness.

Babekir, Amani: No problem. Thank you, Michelle. So we have this comment here. So, just going to give you a couple of minutes to go over it - it's about adding a section that is addressing the limitation of the document. Do we need to add this section?

Michelle Hill: Madam Chair, if I may, we did address this - we added language around this earlier in the document. OK. Oh, I see.

Babekir, Amani: Yeah, that is the one highlighted in yellow. So you think that is sufficient, are we good that is sufficient, or we need a separate section to address limitations?

Vinson, Scott: I think it's sufficient.

Babekir, Amani: So there is another one here also, and Ben wanted us to address it as a group. So before we go to the next comment, just I want to give you also an update about the image. I know we have questions about it, about the copyright. So the response we got from the Council is to keep the image in the document. We could blur the brand names here on the image, but also there is another option. We might need to delete the whole image, so this is still under discussion, but there are two options. We could blur the brand names, or we could do away with the whole images.

Michelle Hill: I'd be happy to blur the brand if that's how people wanna go. It's an easy fix for me.

Babekir, Amani: Thank you, Michelle.

Babekir, Amani: So this is about the equal consideration section. And Michelle, you might be able to respond to this one.

Michelle Hill: Yes. Thank you, Amani. This was put together with resources used from FARE and also USDA. I do have to drop in the references. I have notes around that to show where this information came from, but it was lifted directly from FDA and FARE and then just listed in a way that matched the document. I am totally open to input on whether it has to change or if it's acceptable. We just had to get something plugged in there that was from a reliable source.

Babekir, Amani: Thank you, Michelle. And do you think this comment from Devin, that it seems like this section is just hanging and we need to increase attention to the inclusion within the document.

Michelle Hill: Yeah, that's a good point, Madam Chair. I did notice that in the very beginning we addressed it in the first paragraph of our framework that we will have equal considerations for other Community food sources, and that wouldn't necessitate this section be here if you want to strike that language, that would be one way to go about it. We do talk about having a section that directly deals with this.

Babekir, Amani: Yes.

Ben Wagner: It was part of our charges, wasn't it?

Michelle Hill: It is indeed, yes.

Babekir, Amani: That is correct. So have we mentioned it in the introduction.

Vinson, Scott: Amani, are you asking whether we want to delete that entire section E?

Babekir, Amani: No, the comment we have resolved it, we don't need to do any action.

Vinson, Scott: Yes, I don't want to delete section E.

Babekir, Amani: No. OK. Then we have this comment here - the comment adding a footnote about food label formation being made available … have we addressed these one, Michelle in this section?

Michelle Hill: Yes, that is correct, we did adjust language for this.

Babekir, Amani: Is it under this section or where … ? Here are the comments ….

Michelle Hill: Oh yes, we recommended doing food label information made available in … And I think that's your bullet. “Allow consumers the opportunity to review original food packaging so they can read the labels, know the importance of reading every label every time, etc.” so maybe we don't need that.

Babekir, Amani: We don't need a note?

Michelle Hill: Well, we might though cause this section’s referring to specifically when you're feeding a large group of people. We might want to even have information posted. I know it doesn't say that, but that was the discussion around that item.

Babekir, Amani: So do we need to add any additional language to address this comment, or we are good to go? Going to give you some time …

Vinson, Scott: So we're specifically looking at bullet #2 under that sentence when offering foods to large groups.

Babekir, Amani: That's correct.

Vinson, Scott: Is that right? Bullet #2 is while most sections of this document aren't applicable to both food service venues etcetera. We're basically just telling the reader that they should have the staff of these facilities be mindful of allergens and how they're disclosed on food labels - that seems sufficient to me.

Babekir, Amani: OK, so we could resolve that one. And last one here. So there is recommendation, we have the definition of food intolerance/sensitivity, we have this definition, and the recommendation is to add more language. I don't know if you already added this. This is a way more detailed definition so are we good to add this definition instead of that one? Give you a minute to go over it.

Vinson, Scott: Just reading through the definition as a person who has celiac disease, I'm a little bit concerned that this proposed definition from FNS might seem to minimize the importance or severity of food intolerances. They say they're generally not life threatening. Over time, if a person who has celiac disease, for example, continues to consume gluten they may eventually get intestinal cancer, and so can be life threatening over time.

Michelle Hill: Absolutely. And I was considered with this definition. We talked through this quite a lot and it really is the case, I prefer the one that's listed there. But that's just me and it's for the same reason that Scott is bringing up.

Seymour, Jennifer: I guess the thing that I'm trying to understand here is celiac disease is an autoimmune disease. It's not a food intolerance.

Vinson, Scott: That's true. So.

Seymour, Jennifer: Right. So I guess you know maybe there is a need to possibly make that clear … I don't know if there's a way to but … You know, and that's where the difference between gluten intolerance and celiac disease, or important distinctions.

Vinson, Scott: Maybe we just sidestep the whole issue by not getting into the particulars because they may not be relevant for purposes of this document. To a reader, we just want to make sure that readers of this document, food workers, primarily food retail settings, are aware that they need to be careful about ingredients. Some people have allergies which could become immediately life threatening. Some people have food intolerances or perhaps other conditions which make ingestion of certain substances dangerous for them. I don't know that we need to get into the precise definitions and nuances involved because you're correct, Jennifer. The way that sentence reads now “Food intolerance/sensitivity and adverse reaction to a substance and food that does not involve the immune system” is not entirely correct, at least with regard to celiac disease, which is an autoimmune condition.

Babekir, Amani: And I agree with that point. I agree with you, Scott. Any additional thoughts? Or points?

Vinson, Scott: If we were to just omit the whole section, would that present problems?

Michelle Hill: We decided that it needed to be defined and it's a footnote.

Abel, Greg A: Why not just add celiac disease as an autoimmune - as another category? Food intolerances/sensitivities are celiac disease and/or autoimmune disorder.

Babekir, Amani: So do we add here to the language of the definition or here in the title?

Abel, Greg A: Wherever it makes sense, maybe I was thinking the title.

Michelle Hill: We need to look up where this is footnoted, where it first appears. Maybe that would help inform us of how we should change that.

Babekir, Amani: I think it was on the first page.

Michelle Hill: It's pretty early, yeah.

Babekir, Amani: Here you see food intolerance.

Michelle Hill: Yeah. So how is it used in the document? I wonder where it appears. Right here there … it says that I think it's probably earlier. Higher up, yeah.

Babekir, Amani: Yeah, it was on the 1st section.

Vinson, Scott: Yes, scroll up a little bit to footnote 11. Let's see how it's used in context.

Michelle Hill: There it is. It's at first bullet. No. Sorry. Amani, go down to the next page again, please, under ‘training’.

Vinson, Scott: There it is 1A.

Michelle Hill: Yes, 1A. So actually this is very important we get this right because we're telling them that these are the definitions that they need to know.

Babekir, Amani: Also here. Here we have intolerance and sensitivity.

Michelle Hill: So what's up higher too? That's probably where it should be footnoted, and it should look like the other one.

Babekir, Amani: Yeah. We could add - decide you know - the intolerance sensitivity and autoimmune disorders thing or specifically celiac disease, or any other disease.

Vinson, Scott: Because I'm not aware of any other autoimmune disorders that relate to food, maybe we just name celiac disease specifically. Does anyone else know if there are any others?

Michelle Hill: Yes, there's Crohn's disease, which can be ...

Vinson, Scott: Is that triggered by certain foods?

Michelle Hill: Absolutely. And so is colitis. Certain forms of colitis.

Thoma,Libby: Yeah, IBS.

Michelle Hill: Yep. or lymphocytic micro lymphocytic colitis, for sure - directly related. Because I have it, so I have that too. It sucks.

Vinson, Scott: Which I have it too, but I've never been told that it's triggered by any certain foods.

Michelle Hill: Ohh well.

Vinson, Scott: That's why I ask.

Michelle Hill: Interesting. We have different doctors.

Babekir, Amani: So on we talk a lot about autoimmune response I think or immune system response something like that on the definitions …

Michelle Hill: Wonder how FARE talks about it. Should I look that up real quick and see if we can find?

Babekir, Amani: Umm OK, try that.

Babekir, Amani: Here we cover it, because at the end of food allergic reaction, and how our immune system responds to the food? If it is part of disease or not, but it is an interaction between the immune system and the food. That should be sufficient. Because even Celiac disease that's how it's happens.

Michelle Hill: I have from the Cleveland Clinic a definition of “when you have a food intolerance, it means your digestive system has a hard time digesting and then in parentheses breaking down a food.”

Babekir, Amani: OK, so it does not involve the immune system. So we are good with that one. And the question is - the definition we put here for the food allergic right? “Food allergy,” he did say involves the immune system, wouldn't that cover also Celiac disease?

Michelle Hill: Yes.

Babekir, Amani: I think we are good here and we probably wouldn't need to add all of these details in this definition. Are we good with leaving the definition as it is for “food intolerance”?

Michelle Hill: Amani. Do you mind? I'd like to drop some stuff into the chat that I've just … you did too. OK, good, let's see ...

Vinson, Scott: I just put something in the chat that maybe we could consider putting in that first paragraph or I think it was near the top of the document. At the beginning, when we talk about the fact that this document technically only covers, you know, the nine major food allergens, but that readers should be aware that customers may have other issues involving ingestion of certain other foods.

Thoma,Libby: What if we said “to assist consumers with allergies food sensitivities? To autoimmune disorders? And intolerances? ...

Babekir, Amani: And do you think you can live with that? Could be added to the definition I just highlighted in yellow - like in addition to what we listed there, we added ‘audio immune disorders’.

Thoma,Libby: I think so.

Vinson, Scott: I would prefer that we name them specifically, the way I've done in my comment in the chat, because we need to remember our target audience, the reader. Most consumers are going to reference specifically the condition that they have. If they're talking to a food service worker preparing their meal, they're going to say, oh, I have Chron’s or I have IBS or something. They're not going to say, ‘I have an autoimmune disorder’. People don't talk that way in real life, so I would get specific with the name so that readers can be all on alert for those specific conditions.

Thoma,Libby: Yeah.

Michelle Hill: And of course, we'll cover all bases by saying and any other immune kind of thing, because there's a lot of stuff we don't know about as a collective group, yeah.

Thoma,Libby: I agree.

Michelle Hill: And everybody loves Wikipedia. I dropped theirs in, but it's kind of an interesting way to talk about it … “detrimental reaction, often delayed.”

Vinson, Scott: Yeah, looks good.

Babekir, Amani: OK. And shall you have added here the definition for the intolerance? Do you think that needs to be addressed here where we have the definition.

Babekir, Amani: We're good. On that one, keep it as it is.

Vinson, Scott: Frankly, I would get rid of it. Because of the issues discussed at the beginning of the document that we just went over. And this just muddies the waters. This formal definition, you know, at the end of the document kind of muddies the waters.

Babekir, Amani: I think we use it in different places here through the whole document so. Mm-hmm.

Michelle Hill: It was standardized to appear that way, yeah. I'm not against deleting the definition, but I think that's something our large group has to talk about and have.

Babekir, Amani: Yeah.

Michelle Hill: How does it … what are the consequences of not defining it? If there are any, I don't know.

Vinson, Scott: But we defined it at the at the front of the document.

Seymour, Jennifer: I think the section which we added here - we gave examples here, but we did not define what is the intolerance and sensitivity.

Michelle Hill: Yeah, think Scott got a really good point here. It's like, “if we don't treat it as being something really other than just that - by calling it out everywhere that it appears you know, maybe we don't treat it as a defined term. Is it cited on the next page … I forgot where …

Babekir, Amani: Yes. So besides here it's defined on the next page where we have “Training”, and it's being called out ... the definition of food allergy and also food intolerances.

Michelle Hill: Maybe we say “definitions of food allergy, cross contact and our understanding of food intolerance and sensitivity” ...

Babekir, Amani: And now my opinion, because that is going to take some work, to just remove the definition and make it just as a sentence. But “intolerance and sensitivity” is still gonna be a question. If I'm a reader, or so we are talking here about food allergy. What? What is the difference between food allergy and intolerance and sensitivity? Why is it being mentioned in three different ways?

Vinson, Scott: Yeah, this is tricky.

Michelle Hill: The way that FDA addresses it on their website is in the way that we have it.

Babekir, Amani: Yeah, they define it separately from food allergies, so I lean towards keeping the definition as it is. What? What do you think? Do you think this is good … and the other committee members?

Vinson, Scott: We can always punt and just let FDA decide what to do. They're going to be writing it ultimately anyway.

Babekir, Amani

Babekir, Amani: Yes. I'm going to delete this comment and leave it as it is. If you feel the opposite, let us know. We are gonna work on it through next week, so just tell us if you have an opposite opinion about it. We could proceed to the next discussion. Save it here. And this way we addressed everything on the document, and we will work on it to finalize it. I’ll work with Michelle to finalize it and it will be ready to be ... I will send it out to the Council, and we will send you a version.

Hopefully a week before we do that, so if you have any final revision or comments, you will get a chance to do so. I think that's it. Any other point before?

I switch into the second document. Any additional point before I move to the next topic. OK, let's move to the next one – it’s about our Issues, and hopefully you got the chance to see the document which I sent out before our meeting.

I listed the Issues which we thought about, we talked about, and I got the

Council II Chairs to help put it the best way to address the Issues, and how we could submit it to the Council. We're gonna all go over them one by one, making sure that's we are OK with each one of them. If we wanted to keep it as it is, or if we don't want to submit it.

The first one is to submit to the committee the final report and we're gonna need an Issue for that and just asking the Council to review and acknowledge the committee work, so this is the first. Are we good with the first issue?

Vinson, Scott: Yes.

Babekir, Amani: Any comments? OK. Thank you, Scott. Any other comments? We good? Second one, and this is one of the least options we could do for the sake of our framework is to get it posted and the CFP website. To do that, we need an Issue. So, we're gonna create an issue asking the Council to post this document to their website and we will specify the file type, such as a PDF file. Any comments about this Issue? Another point - we will ask them to remove the older version so to update the older version which has just the notification section from the previous committee, with this framework packet. Any comments or suggestion on this one?

Michelle Hill: Madam Chair, so the suggestion is that we would pull the current document from the website and then somehow merge it with what we currently have or check for commonality. And if we've missed something we add it in …. Or are we asking to replace that document specifically?

Babekir, Amani: The thing is because right now I think on the on the website there is one document which we use to generate our notification section.

Michelle Hill: Yes.

Babekir, Amani: That document is from the previous committee. So we worked on updating and enhancing all the content of that document in our Notification section. So the suggestion from the FDA is to ensure that the old version is being removed from the website. So it wouldn't be used by the food retail and instead they will use this updated version.

Michelle Hill: Thank you.

Babekir, Amani: Yes. Any other comments or suggestion? Are we good with this Issue?

Michelle Hill: I like it. I think it's good - necessary.

Babekir, Amani: OK. And then the third one, we talked about it in our previous meeting, is to ask the Council to re-form the allergic committee to address those Issues, which we could in address, or we listed as limitations to our document, in a new framework or a new guideline?

Michelle Hill: So we say we're going to continue or re-form the committee, and these are going to be the charges, so future work OK.

Babekir, Amani: Yes, it is not us, but we will ask. The Council is to re-form the committee, similar to what's done to our committee, because last year, last term, the allergen committee asked to re-form the committee and that's the reason we had this committee. We are hoping to do the same thing for the next term, ask for the allergen Committee to re-form because there are Issues on some points that need more clarification. Such as allergen cross contact and all of that in the food retail.

And this one is flexible. If you feel like there is an extra charge we need to add, we want, we need to remove the charges from here. We gonna have some time to review it probably in our next meeting to refine it and we will try to present it the Issue format set by the CFP. So we could work on it, but how do we feel about it? Do we feel we need to do that or not? We need to re-form the committee, or not?

Michelle Hill: I think we have to re-form the committee.

Babekir, Amani: Do you agree with that?

Vinson, Scott: I have a question.

Babekir, Amani: Yes?

Vinson, Scott: Are we using the word reform in this context? Reform like “RE dash form” or “reform”?

Babekir, Amani: Yes, it's re-form.

Michelle Hill: To reform to form again, maybe say yeah, yeah.

Vinson, Scott: To form again. OK, so re dash form OK.

Thoma,Libby: Would we have to go through the whole application process again as well?

Babekir, Amani: Umm, yeah. So if it's re-formed it could be stand-alone committee, and people have to apply and all of that. Similar to the way we've done it in our committee.

Thoma,Libby: OK. So we don't just get too re-up basically for this one.

Babekir, Amani: That's correct, yes.

Vinson, Scott: So we're being asked to reconstitute the committee.

Babekir, Amani: Ah, that's a neat term.

Michelle Hill: That or re-establish or form again, yeah.

Vinson, Scott: Reestablish. Yeah. OK.

Babekir, Amani: OK. So that's …

Michelle Hill: Amani, I think the confusion for this is that we should drop in a dash between the “re” and “form”, under Issue 3, just so it's clear what we're speaking about. Thank you.

Babekir, Amani: OK. But “reestablishes” means the same committee, or you referring to the same meaning we have here Scott?

Vinson, Scott: I think technically. Well, I'm not quite sure … Issue 3, was that part of our …

Charge from CFP? Technically, I think what they're asking us to do is to reconstitute the committee. Are we?

Michelle Hill: Or continue the work of continue the committee, yes

Babekir, Amani: I think they use some similar language in the previous term. You know the previous committee they use this kind of language, but we still could go back and see how it was done on the last term and I think there is a format. I'm not sure about the actual language. But Scott you asked about our charge.

Vinson, Scott: Right.

Babekir, Amani: Our charge is to create the framework and also suggest any changes to the Food Code. What I'm trying to say here is, do we want to ask … because there are things we have to ask the Council - like to approve and acknowledge our work.

And if we think there is a need for further work to be done to ask the Council to re-form a, you know, the committee. Or we could do nothing about it, and just ask to acknowledge and review our report.

Vinson, Scott: So, this committee that we're all serving on now, our job was to come up with a framework for the major food allergens. So with this Issue 3 here on the screen, we are then going to go back to CFP, ask them to reconstitute, recreate, reestablish the allergen committee again for next time and next time they're gonna be addressing these new issues, one of which is our Issue one. Figuring out what to do about the non-major food allergens because we've already addressed the major food allergens, am I getting this right?

Babekir, Amani: That's correct, yeah.

Vinson, Scott: OK. So in addition to #1, the non-major food allergen stuff, we're gonna ask this new allergen committee, which will be put together next time, to do these eight things. I'm not sure I understand. Why we are? Why this existing committee is being asked to address … where did this Issue 3 come from? What are these eight things? What was the genesis of the ….

Babekir, Amani: Sorry – can you hear we have a fire alarm in our building.

Vinson, Scott: Ohh.

Babekir, Amani: So I need to leave, and we could discuss this in our next meeting. But I have I have to leave the meeting.

Michelle Hill: So as Co chair, I guess we'll come back to it.

Vinson, Scott: Oh, I was gonna say, can she just leave it on? And maybe we'll …

Michelle Hill: Maybe she can. I think someone else actually started the meeting.

It's possible we might be able to continue it. David, did you start the meeting, Dave Read?

Dave Read: No, I did not

Michelle Hill: OK, I thought I saw that somewhere, but it hasn't died, I guess.

Vinson, Scott: Right. We're still going so ...

Dave Read: Ohh, well I might have, I might have been the first one to sign in …

Michelle Hill: I think that if you stick around.

Dave Read: It come it comes up on Microsoft Teams is where it comes in.

Michelle Hill: Sure. Yeah. I think that you're our host today.

Dave Read: Ohh wow, I had no idea.

Vinson, Scott: Well, we still have a Co-chair in Michelle, so we can continue, I think.

Michelle Hill: Wait, we could.

Dave Read: Yeah. In essence, I've been on a few CFP committees. So generally what happens is you decide if there are Issues that have come up that you wanna have a future allergen committee to consider. It doesn't mean the same group members are there. You reapply for membership in each conference. Generally they will keep most of the original members if they're interested again, and then they also add a few new members as well.

Vinson, Scott: Who came up with this list? This Issue #3 and the 8 items under it?

Michelle Hill: Through previous meetings. It's kind of like a laundry list or running list of what people have said over time and what we've discussed in previous meetings. It's completely flexible. That's why she had it displayed because it's up for debate, absolutely.

Vinson, Scott: Through previous meetings of what, this committee?

Michelle Hill: That's correct.

Vinson, Scott: Well, I think that's this is really the purview of the CFP. This isn't really our domain. They need to review the work product that we've come up with before they can decide what the next steps are.

Michelle Hill: This is just part of the flow. If we want to have an allergen committee to address anything that's existing moving forward, now is our chance to re-form it. So we need Issues to do that.

Michelle Hill: And so we can certainly strike stuff that doesn't make sense, or we don't think it's within reach. Yes.

Thoma,Libby: And see if we can add to that list as well.

Dave Read: Or delete.

Thoma,Libby: When would that work happen? When would we find out whether or not a 2023 Allergen committee has been formed and … whether or not we're going to be serving on it?

Michelle Hill: It happens during the biennial meeting. So in April, in Houston, when we all get together to do this work officially, that's when we'll submit our work for our first Issue saying we've completed the current work of this committee, so please accept our work. The second Issue is to update the documents on the CFP website and post this one. The third Issue concerns “do we need to continue this committee? If so, what Issues present themselves and this is what our entire committee is doing.

Courtney Halbrook: Yes.

Michelle Hill: Membership at that time, as it stands, would vote. Am I right on that Courtney, is that understanding correct?

Courtney Halbrook: Yeah, absolutely. It's just, excuse me, I was just about to try and … but you guys were doing such a great job of explaining it, but I think you nailed it. I think Dave nailed it. You've nailed it, Michelle. Typically, in the Council process at the meeting in April, your final report is submitted as you guys described, begging at the result of knowledge for separate Issues. They're requesting both. The document we posted and then the third Issue would be, to request that the committee be continued with these charges.

Sometimes the new charges stem from the previous charges that you didn't quite finish or complete, and you want to keep working on them, or over the course of working on those charges, you discovered other things. They're brought to the table for inspection, and other potential work, that the allergen committee could do. And so you're asking what to do with these charges? It's at the Council, so it's important that those charges are well written, and carefully prescribed, so it's very clear what the work will be and it's not too flexible.

You know, that's just the way – it is difficult for the body discuss if you don't have really good charges. And then the Council will review that. And we'll discuss and debate the need to continue the allergen committee and the Council will debate and vote whether or not the committee should continue.

That would be on the list of all the committees, including the conference, that people can sign up for. And if you want to continue your participation, you sign up. You don't, you don't. And there will hopefully be you Members that sign up to join. That's where we got, after all the signups are done. There is work to place all of those people. Everybody really gets their first choice, but it's how

many ... another 100 people sign up to be on the allergen committee, obviously we have limits people will serve. This is announced afterward. I don't know exactly when after. Fairly quickly you are notified what your committee you signed up for will work out.

Michelle Hill: Yeah. And this current biennium was really fast because we're working on a truncated schedule. So it'll be a little bit different, I think that by October … It's April … How does that work? When does the new biennium start then? Right away in April?

Courtney Halbrook: Yes.

Michelle Hill: After the biannual meeting, OK.

Courtney Halbrook: That starts pretty much right away, and then you'll have the full 2-year cycle to work on …

Michelle Hill: Well, that'll be nice.

Thoma,Libby: I was gonna say these last two years have flown by.

Courtney Halbrook: Yeah!

Michelle Hill: Yeah, it's only been, what, 18 months? Really? It was a year in September that we've been formed.

Courtney Halbrook: That's why it's really important to decide as a group. I said this already, but four should work. You guys have collectively agreed that you've done everything you were asked to do.

Vinson, Scott: Courtney, it's really hard to hear you. You're coming in and out and there's some background noise and so I have not caught what you've been saying during the last five minutes or so.

Courtney Halbrook: Technologized. Sorry, I think it's probably my microphone wasn't working great today.

Vinson, Scott: My impression of Issue 3 is that we're getting a little bit over our skis here. Whether or not to reconstitute the Allergen committee for the next CFP is really the purview of one of the councils.

Michelle Hill: It's council two.

Vinson, Scott: It seems like a breach of protocol for a committee, I mean we report to one of the Councils - Council II, in this case, we report to them - seems a little bit like we're trying to usurp their role and tell us what we want them to tell us to do next time. That feels like a breach of.

Michelle Hill: This is custom. It's customary.

Dave Read: Hey, that's often the way it's done. Yeah, it's often the way it's done is that a committee will come up with the Issues that weren't part of the charges that they think need to be addressed. And then you propose that the committee be reestablished. You list some thoughts on what those Issues are. And then the Executive Board will probably decide whether they're gonna do that or not, or if there's some other Issues that come up that they wanna add to the charges. And again just because it's reformed, you reapply if you want to participate in the next committee ... It's not an automatic that you continue on.

Courtney Halbrook: This is Courtney. Can you guys hear me better now?

Michelle Hill: Yes, ma'am.

Courtney Halbrook: It is customary for the Co-chair or the chair and vice chair of a committee to Identify future charges for that committee, if there are any. I don't feel like some of the specifics that you land on for the future charges you will need to be careful that you're not just creating a charge out of thin air to work on. There is a meaningful need for it to be part of the committee's work, and that would come from prior charges that you guys have worked on that have identified new and continuing work.

There could also be Issues that are submitted at Conference for Council to hear that pertain to allergens and the allergen related sections of the food code and that sort of thing. So Issues can come that way as well. Oftentimes, how committees are formed is because an issue was brought to council and it's deliberated and if there isn't quite a consensus on the issue or it needs a little more exploration, a committee is often formed and so it can go both ways. It’s definitely committee Chairs and vice chairs, along with the remainder of the committee, and voting and consensus, it is customary for you guys to identify future charges. Doesn't mean they're gonna go into effect. They will be reviewed by Council II and voted on by Council II and submitted to the State Delegates at the end of the Conference for voting. And that's how it all works. So, I wouldn't be too worried about that. Scott, you are following the protocol. It's just when you identify what you think the charges will be for the future that you have to be very specific and that they need to be meaningful.

Michelle Hill: Thank you so much for that, Courtney. I appreciate it.

Vinson, Scott: It's new to me. I've served on other committees, and we didn't operate this way. So this is new to me.

Courtney Halbrook: What I would do to help, and I can help you, Michelle, if you have trouble finding any … I would go back and look through some of the past Issues and you might have to go beyond just the last biennium. You might have to go to the one before

that to look for some Issues that were submitted to Council II that would give you an example of a committee seeking to extend their charges.

Michelle Hill: Yes, ma'am.

Courtney Halbrook: And you could see, you know, kind of how they wrote the Issue, how they worded it, what those charges looked like in comparison to previous charges, and, that might be helpful too. If you can identify a couple of those as examples to look at maybe, you guys can share that at your next meeting with the whole committee to talk through this a little further.

Michelle Hill: Yes, I like that idea quite a bit. Thank you. That's well advised. And we do have that information. It's not going to be a hard thing to put that together for everybody. That's something we did right in the beginning, when we first set our committee up, was to review the past so we could see the path forward where the hang ups might be. So absolutely, I think that's excellent. If there's anything further this … we're at-time now for this meeting, I guess. Does anybody else have anything they need to put forth or … ?

Courtney Halbrook: All good here.

Michelle Hill: OK. Well then, I will officially adjourn this meeting. Please be aware that we'll be sending out e-mail shortly here with requests of review from you all. So thank you so much for your time and have a good afternoon.

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Issues points	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Babekir, Amani: Hi everyone. And this meeting will now come to order. We need to take the roll call Michelle; would you like to proceed with that?

Michelle Hill: I certainly would thank you, Miss Amani. [call the roll]

We have six voting Members present, three non-voting members present. I don't think that meets our quorum for voting purposes.

Babekir, Amani: OK, thank you, Michelle. So we don't have a major thing that's we need voting on today. So we just going to continue discussing our Issues. Hopefully you got the chance to look into the draft, which I sent out yesterday. But first I want just to give you an idea about what happened in the last committee, what issues they submitted and how they submitted. So to just get an idea the way they've been doing it in this committee. Before I do that just I would like to remind you about the Conference for Food Protection, antitrust statement and it is active. And thank you to Michelle because she dug into the previous issues and converted them into words to be easy to look at and she put together our draft for the issues we are planning to submit, so let me first share with you. Can you see my screen?

Ben Wagner: Yes.

Babekir, Amani: OK. Thank you. So as you can see in this one, the previous committee. The first thing they asked for is to acknowledge, you know the committee and their final report. And they thank the committee members and note that their work is complete. They ask for the re-creation of the allergen committee and that is the one which we were, you know, discussing in our last meeting and just back and forth about what is the best way we could do this.

So this how it's been done, it's just to ask for the re-creation of the committee and then we suggest Issues for this new committee. As you can see, we listed out the Issues we've been working on. It's starting from one, to two, to three. And then they have also another Issue that's they are asking the documents they developed to be posted in the website. And here is how they did it - it's just asking for the acceptance of the document by the CFP and authorizing the conference to make any necessary edits, and to post it on their website.

Another issue also they submitted is to make the change in the food code. And they have couple of issues under amend the food code. And they are giving more details here. So if we are thinking about making any changes into the provision section of the food

code we have to learn the language and where we need to put it and all of these details. So all their suggested changes - where in the language in the provisions section of the food code - so they provided all the language here.

OK, so that is just an idea about what happened in the last committee. Any questions before we proceed to our version which we drafted?

Michelle Hill: Amani, did you want me to share my version or the version that was sent out? Or are you going to do that?

Babekir, Amani: Can you see it on the screen?

Michelle Hill: Yes.

Babekir, Amani: So here the first one. We are asking to acknowledge here the committee final report and thanking the committee members, so we already agreed on our last meeting that we are OK with this section. Then here we are asking for the re-creation of the allergen committee to complete the following seven charts we listed. I'm going to open it now for discussion. What are your questions, suggestions, comments ... do you agree with this? Do we charge anything, we need to add? Just feel free to take the floor and just let us hear your voice.

Michelle Hill: Madam Chair, if I may, as putting this together, I just took the language, as was written in the draft document from our prior meetings. I'm curious about if item number 7 is correct. If anybody on the call is who asked for this, could you please speak up and tell me if this is right or correct it or whatever, and if not, we'll figure it out. But.

Babekir, Amani: Yeah, Michelle, this one was actually came out of the notification subgroup, which I was in charge.

Michelle Hill: OK.

Babekir, Amani: And Devin suggested that this is one of the points which is not very clear in our notification section and maybe needs more details of how we could provide the chef with more tools to identify allergens.

Michelle Hill: Alright, thank you for that clarity. If I may ask, who just arrived on the call, please, Welcome …

David Read: Well, this is Dave Reed. I was not able to get in through Microsoft Teams, so I ended up having to call in. Not sure if there's a new announcement there, if I missed it.

Michelle Hill: No, but you're welcome and glad you found a way. Thank you for being here. I'll mark you present.

Babekir, Amani: So David, now we are discussing the re-creation of the Allergen committee which we were discussing in our last meeting and just listing here all of the charges that we think might be worth looking at and discussing in the future committee, and all of this is from one to seven came out of our framework discussion, or just putting together the materials for all of the sections.

Amber Thompson: How long does the next allergen committee have to complete these charges, if we choose seven of those? What's the time frame? Is it two years?

Babekir, Amani: It is. It is 2 years but it is out of our hands because it's will be a new charge. It will be a new committee and they need to put their timeline on it, but the ideal time is 2 years.

Amber Thompson: OK.

Babekir, Amani: Any committee to finish their charge? Do you think that is too much or?

Amber Thompson: So we had we didn't have two years, right we had like …

Michelle Hill: A year? Yeah.

Amber Thompson: One year, right - less than a year. OK. Two years. No, this is fine. I think for one year. No, this but two years. Yeah.

Michelle Hill: And I think some of these will end up being that we direct other things to be done. It seems that we would have to ask for some kind of major study to be done around non-major food allergens, although I think that there's something really good posted at FDA right now on that specifically. Is that right? Does anybody know about that document? I'll hunt it down.

Babekir, Amani: Are we good with this points and with this section? OK, I think we are good with that one. So this is the first issue that we're going to submit. We're going to have another week also to look at it. So from now up to the end of next week, if you have any comments or any suggestion feel free to send it to us before we finalize the draft.

Michelle Hill: I just put into the chat a direct link to the FDA document. It's draft guidance on evaluating the public health importance of food allergens other than major food allergens. And it was what I was referring to just a moment ago.

Babekir, Amani: Thank you, Michelle. So this is the second issue here and this one is to publish the document on the CFP website, and giving more details about the title and giving the authorization to the conference to make any edits and to post it as a PDF format on the website. Any comments or change on this one? OK. So we are good with that one. And the third one is … the one which where we ask for this document to be included in Annex 2 of the Food Code. And I remember from our previous discussion's the recommendation we got from the Council and so we are going to ask for the document to be acknowledged in the Annex.

Michelle Hill: The way that this is written is that it would be in its full printed form, not just as a reference – it is actually a document that is present in its entirety within its own Annex is how this was framed. I don't know if that's right, but that's what I read.

Babekir, Amani: Remember in our last meeting, Greg said we need to identify the section where even in annex where we want to insert this.

Michelle Hill: Yeah. So there needs to be clarity here. I mean obviously we need to talk about this.

Babekir, Amani: Yes. But where do you think is the best place we could add it? Which section in the Annexes?

Amber Thompson: How many pages?

Michelle Hill: It's 22 pages.

Michelle Hill: As it's formatted right now. We could certainly reduce that. We wouldn't need a cover page, you know, and a table of contents, so what like 20 pages, 10 back-to-back.

Babekir, Amani: If you want to share the screen.

Moritz, Erin: '6 Steps to safety' from an emergency response plan that I think we just took that from.

Michelle Hill: Perhaps we suggest that it's just the language we keep and anything that refers to an outside published graphic, there's a direct reference as to how that can be found otherwise.

Babekir, Amani: Yeah.

Michelle Hill: I don't know how do they do that within the food code normally?

James O'Neal: So are we looking to where this would fit within the Annex? So I guess under what chapter is that what we're looking for?

Babekir, Amani: That is correct, yeah.

James O'Neal: OK, one section, let me pull it back up, a - Demonstration of knowledge, 2-102.11, Section 9. It describes foods identified as major food allergens and symptoms.

Eisner, Crystal: I think that sounds like a good area. We have not adopted the food code yet here in Harris County. Demonstration of knowledge does sound like it would be the best place.

Michelle Hill: So are you suggesting that it be addressed within the Annex that deals with demonstration of knowledge of a CFPM, or is it in the actual code that you're suggesting we would insert this under what the required education would be?

Eisner, Crystal: I think it would have to be under an Annex.

Michelle Hill: OK.

Eisner, Crystal: In my opinion.

Michelle Hill: Yeah, I think it has to be as well. So would it be the case that we would say in the demonstration of knowledge section, the 2-102.11 Section 9 – we would have a "please see Annex page, blah blah blah"?

Amber Thompson: So are we asking them to just take what we've created and put it in the Annex? So they're not going to do that. I mean, it's FDA who writes the food code, so it's going to have to go through like major revisions and all sorts of reviews and edits and I think the limited time. Looking at the food code, in Annex 3 public health reasons under food allergens person in charge, it talks about food allergies or increasing food safety is a Public health issue, goes on to talk about the "Why?". This came about in 2008, CFP passed an issue, but some parts of the Annexes gives a link to an FDA, another FDA web page. And so maybe we could house it on the FDA website.

Michelle Hill: That's an excellent idea.

Amber Thompson: For example, there's a link that says "food defense". So you click it and it takes you to the FDA food defense, you've got food, defense tools, plan builder. I don't know who wrote all these. So maybe that is an option. The FDA's website could link to CFP, which houses the Framework. That way it doesn't have to go through all the FDA approvals and all the Paper reduction act and all that kind of crazy stuff. Yes?

Michelle Hill: So are you suggesting, Amber, that it would be language that would appear in Annex 3 under L "Food allergens person in charge duties?" That would be a link out to CFP, where our document lives? OK. Sure.

Amber Thompson: Yes, if that's allowed. If not, then it would have to link to FDA, which would then link to CFP. I'm going to look through here and see if there's any other place I see a link that's not FDA and see if that's even in there, so.

Michelle Hill: OK, I think this is the right track.

Babekir, Amani: Yeah. So do I. Any additional thoughts on this?

Michelle Hill: One more thing, Amani, if you don't mind. Amber, was there a point in time where we discussed something about making an interactive, like an application does … ? Am I remembering that right?

Amber Thompson: Yes, it was going to be a Quick guide, right? A visual tool that had the major pieces of that framework in it. For those that maybe have a hard time reading where it's easier to just grab a booklet that has pictures and words, of course. But uh, more kind of shows them what to do instead of telling them what to do. , I'm looking through here. I do see outside links. I see a couple to ANSI, FSIS, Food marketing institute, restaurant.org. Here's a guidance on responding to food emergencies. We could have some kind of guidance on responding to food allergens or something like that, and they could house it here.

Michelle Hill: What is that again? In section … ?

Amber Thompson: Well, the guidance looks like they're located in Annex 2, which is the reference section.

Michelle Hill: Alright, thanks.

Amber Thompson: We could create a Food Allergen reference section in Annex 2.

Moritz, Erin: Would it be helpful if someone shared their screen?

Amber Thompson: Ohh yeah here.

Michelle Hill: You don't have a good imagination there, Erin.

Amber Thompson: I'm on one screen today, no. OK, so I'm in the food code.

Moritz, Erin: I mean, I could make stuff up, but.

Amber Thompson: See here references and then on four it's food defense guidance from farm to table. We could possibly add a 5. Major Food Allergen guidance or something like that. And then that way for future allergen committees, that's where they could house all the other guidance tools, tips, all that kind of stuff could be here, because if you go to this, Section 4 …

Michelle Hill: I wonder, I wonder if people would read this. I know I have been through this with a fine tooth comb before, it's just hard to remember what's there.

Amber Thompson: Oh yeah. I mean, you could read it and then reread it and find completely new stuff.

Michelle Hill: Yes.

Amber Thompson: It's like watching a really long movie and you watch it again. Like I don't remember that scene. Where did that scene come from?

Michelle Hill: Yeah. Or who's that character?

Amber Thompson: Right. They like their references, don't they?

Michelle Hill: I think other people have good ideas like we do! Chapter 4?

Amber Thompson: There you go. So if you go to this section, guidance on responding to food emergencies. And then we talk about CFP here and then it … Well, there was a section right here, "FDA publications". OK, you can click these links. Then you have USDA publications - so we could link … so there's some things from the National Restaurant Association, Food Marketing Institute , CDC, so we could possibly do what they've done for food defense, but for food allergies.

Babekir, Amani: Sounds like a good suggestion. Any comments on this one? And we probably need to define the language we going to put there.

Amber Thompson: Yeah, right.

Babekir, Amani: Uh, along with the link, yeah.

Amber Thompson: Right.

Michelle Hill: So is that something we can do over e-mail between people or as a committee or?

Babekir, Amani: Yeah.

Amber Thompson: Maybe if one or two people want to tackle the wording and then we all decide if we like it or not. And you can just possibly mimic what's already here, that it will be accepted more readily.

Michelle Hill: Amber, do you want to work on that with me and Amani?

Amber Thompson: Sure.

Michelle Hill: Anybody else want to be involved?

Michelle Hill: Don't mean to draft you, Amber, but you have good ideas.

Amber Thompson: It's OK.

Babekir, Amani: Any more volunteers? So I think, yeah, we could, we could work with you, Amber and let's say maybe early next week, we could work on this one and we could communicate by email to see your availability, to make just a very quick meeting, to put together the language. Does that sounds good, Amber?

Babekir, Amani: So, I think that we'll finalize our Issues. So we're going to have three Issues. One and two, just about addressing all the charges and the third one, the last charge ... our committee is asking to make a change in the food code, so these are the changes we would suggest. Any additional comments, suggestions? Do you think there is any further work we need to do or we are feeling good about it?

Michelle Hill: I should know this, but what's our next steps overall?

Babekir, Amani: Yeah. So about our next step, just we're going to, you know, put together the draft for the issues and also our framework draft. Then we're going to submit it to the Council in the middle of next month.

They will give it a review. And then hopefully they wouldn't send it back to us with a major change or anything. But we're going to have second round of review before we finalize.

Michelle Hill: Thank you.

Babekir, Amani: Amber, about the summarized document you're going to put together. I remember you said by the end of the year, like December. That is the rough timeline you give to us.

Amber Thompson: Yes.

Babekir, Amani: Probably, yeah, probably we need to submit it to the Council for review. Not sure if we have to do this by the middle of November or not, but I will keep you updated if it needs to be submitted by the mid of November. Would you be able to make it?

Amber Thompson: Uh, if with help, I can show you what I started working on it. Then I stopped. I was doing it through NEHAs Canva account. It's very easy to use. You just pop in information. I just grabbed a template and decided that was OK, so we can work on this then when we meet in Mid-December. If I can have someone help me with it, that should be fine

Babekir, Amani: OK, so probably Monday, Amber, we could meet and decide if we want to proceed working on it. I think it's better if we prepare it by the middle of November

Amber Thompson: Right.

Babekir, Amani: Any volunteers to help Amber with this document?

Michelle Hill: Amber, I'm always available too. I don't want to be volunteering for everything under the sun, though. Other people need to be involved too, but I'm certainly happy to help anyway I can.

Babekir, Amani: OK, that's good. So we have a good plan to do that, and finalize the language that we need on our third Issue.

Michelle Hill: Yes.

Babekir, Amani: And in our next meeting, we have bunch of meeting minutes we need to approve. We were a little bit behind on putting together our meeting notes. So we're going to spend some time, Michelle, to put it together and probably we're going to dedicate a lot of time in our next meeting on it and then we will decide what we are going to do about our future meetings - if we wanted to keep them on our calendars or if we want to make some changes on it, so we're going to decide on that later. Anything else? Any additional point before we conclude our meeting today? Thank you. [meeting adjourned]

Meeting Number 24	Meeting Date **11/10/2022**		Meeting Time 2:00 pm EST

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Issues points	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Babekir, Amani: So hi everyone. Thank you for attending the meeting today. And I'll just remind you about the Conference for Food Protection, Antitrust statement is active in this call. Now our meeting come to order and Michelle, would you like to take the attendance?

Michelle Hill: Sure. I'd be happy to. [calls the roll]

We have 6 voting Members present.

Babekir, Amani: OK, Thank you, Michelle. So we don't, we don't have critical things to vote on today, so hopefully we will be able to finalize the Issues we have in our agenda and in our whole committee work because probably this one might be our last meeting. But before we do that, let's first get an update about the summary, because in our last call, we thought about, getting Amber ready to proceed with creating that short document. But they discuss it together, with her team members, and they decided not to proceed with it. Michelle or Scott - do you want to give us update about this one? But I don't see Amber with us.

Michelle Hill: I'm happy to speak to it. The meeting consisted of myself, Scott and Amber. We had quite a discussion regarding how to proceed. The original discussion was seated around creating a small application that could be used to share allergen information that anybody with a smartphone which most people have these days, would be able to have it right there at their fingertips. We ran into conflict because who is sponsoring it? Is it a CFP application? Is it data from USDA, FSIS, who? Who owns it basically, and who condones it, who endorses it? It just got kind of hairy. So we decided that if that's a tool that people want later on, that they can certainly readdress doing that at maybe in the next committee.

Michelle Hill: Is that your take on it, too, Scott?

Vinson, Scott: Are we talking about the same meeting the one we had just the other day?

Michelle Hill: Yeah.

Vinson, Scott: When we talked about the development of a pocket guide?

Michelle Hill: Correct. Yeah, it originally started out with the discussion of it being electronic being built in Canva, and then we migrated over to the discussion regarding it being a pocket guide. Yes, that's correct.

Vinson, Scott: Yeah. So we identified …

Michelle Hill: Oh, that's right, we did, didn't we? We pulled out content.

Vinson, Scott: We - I think we had a pretty substantive discussion about the type of content that we thought would be most useful for the audiences who would be using the pocket guide, the Food service workers themselves. So we went through the entire 22-page framework document and identified the most relevant parts that we want the audience to look at and that would be sections B, 1 – 5 of the framework document, as well as C, 4. A, B and D, 1.

Michelle Hill: That's what I have in my notes too.

Vinson, Scott: And we discussed in particular figures by 5, on page 16, the importance of including those icons to talk about the symptoms that people demonstrate when they're having an allergy attack. Then also graphics of the types of reactions that children can have when they're having an allergic reaction. Then we talked about the format of a pocket guide. If it's in printed format, it could be on paper stock and be either in a sort of a trifold 6-sided document, or a front and back smaller card stock-size double-sided document.

But I think we all agree that the intended audience would be the Food service workers themselves.

Babekir, Amani: We don't have time to create the actual document or the digital version of other content.

Vinson, Scott: Yeah, we, simply were identifying the most relevant parts of the of the longer framework document that we thought the FDA should focus on for inclusion in a possible pocket guide or electronic version of a pocket guide, whichever direction they decided to go. But we wanted to at least identify the parts of our framework document that we thought should be included.

Babekir, Amani: OK.

Michelle Hill: Kind of like “mission critical: This stuff must be known”. That type of information. Didn’t we discuss having language put into the current framework? Maybe a paragraph that's just describes …. quickly, like if you wanted to have a shorter version, this is what it should absolutely have contained. Or was it that we were gonna just keep that in our notes to tell FDA? OK.

Vinson, Scott: I don't remember if a decision was made on that. Michelle, I think you said you were gonna talk to Amani about the best way to proceed on that.

Michelle Hill: Yeah, yeah, and I forgot. Oh we did OK. That's right.

Babekir, Amani: And yeah, and we discussed it. Yeah, we discussed it. Michelle. Yeah, we discussed it and we found out that we don't have enough time to include it in the actual framework because we have to be done with it next week by the next week. But they there is an option I think to have it as a supporting document.

Michelle Hill: So what she's talking about is that when we submit our Issues, we have the opportunity to submit anything we want in support of our argument for the Issue. And this could be a simple document that we write out that would be how to create - or most the most critical points - about allergen control or something like our framework. These aren't the right words, but to catch what I'm saying.

Babekir, Amani: Hmm, that's correct. So are we OK with that option? If there is any other suggestion or any objection of this option? So I think we could proceed with that one and just take what you concluded from your meeting, and just put it in a short document. That's it and include it as an attachment to the Issue.

Michelle Hill: OK.

Babekir, Amani: Then the second topic in our agenda are Issues which we're gonna submit to the Council and thank you to Michelle. She spent a lot of time trying to put it on the correct format and adding all the public health significance language. So I'm going to give her the floor to walk us through what she's done on our three Issues. So now we have three separate documents, each one consists of one Issue.

Michelle Hill: Correct. Thank you, Amani. This is a condensation of a lot of people's work. I just happened to be the one in-putting. So, if you have comments, questions, please. We're gonna have to make these choices today. We need to really figure this out.

What the language is and what we're doing. So this first Issue is the traditional first Issue, which is asking them to accept our final report which is like the quarterly reports that Amani and I have been required to file. And this one just shows the wrap up of the work.

Included with the final report will be the attachment of the meeting minutes, in addition to attendance records for each meeting. We will be circulating an e-mail shortly here that will have the Minutes attached and we will give you a couple few days to review and make comments, request changes, and then I think we're gonna have to probably do an e-mail vote or something like that to get them passed. We do need to have them passed and approved by next Friday as they're part of this. They're submitted along with the final report.

So this is Issue one in the allergen committee final report, and what we're asking them to consider for the next biennium is to is to accept our report, acknowledge it, and accept it, and thank the committee members for their completed work. And then re-creation

of the allergen committee to complete the following three charges. This terminology, “re-creation” is a part of the template, and it is necessary language that cannot be modified. That is the word they use. So there's a 20-page document published by CFP. It's available on their website. If anybody would like to look at it, it's well worth a read and it's called , “Issue Pre-Submission Guidance”. It is how to fill out the final report template. It walks you through step by step. It's an enormous amount of information. I was really surprised, but we did it right as far as I can tell. So these are, this is language we're gonna “use existing research and resources”. So item one of the next charges will be using existing research and resources to identify the non-major food allergens, and how to control for them and expand the major food allergen framework to include this information.

So we're basically asking the next committee to embellish on our framework, to cover when we can or how we are able to anything that's a non-major food allergen. Support guidance on how to control cross contact including receiving, storage preparation and service. Letter “B” is identifying, gather existing research and resources, to form an allergen control toolkit for all aspects of the flow of food. Things in a toolkit could be lists of derivatives on how an ingredient can be named on a label, an allergic component. It would be an example letter “C - identifying established tools to ensure implementation and compliance when notifying a consumer about food allergen”.

So this is how do we know that we've implemented, and we have compliance around notification, which was something that the 2018 and 2020 Biennium’s dealt with. And then #2 here “recommend changes to the food code that support retail food establishments to optimize operationalized framework to prevent and control food allergic reactions.” Again, this is standard language carried throughout the BIENNIUMS for this type of request. It's always the same language.

And then #3, “report back findings recommendations to the next biennial meeting of the CFP - again template language is required. I have no control over these things … What do you think about the charges, and should I proceed to public health significance or how do you wanna do that, Amani?

Babekir, Amani: Yeah, there any comments about this section? OK, sounds good.

Michelle Hill: I'm hoping people had a chance to read it before the meeting. This public health significance was data that we pulled together from different sources, and they're also cited here. So any of the references are where we pulled either quotation (and they’re footnoted). And again, this is a convention laid out by CFP on how you list this type of information when you're using a reference to support your public health significance statement. So this talks about it, focuses on the fact that cross-contact is a really big deal.

And that that's pretty much what we're looking for - cross-contact control in addition to more knowledge around non-major food allergens and how they impact things.

And hopefully you've been able to read the statements and have changes or input … it would be very welcome here. To be short, to the point, Amani and I worked the language together, but we are certainly open to changes ... just had to get something pulled together. Should I read out the public health significance statement?

Babekir, Amani: Let us give them time to read it.

Michelle Hill: I'll leave it up on the screen.

Babekir, Amani: Let us give it a couple of minutes for people. Comments? [waits two minutes] OK, I think that's enough time. Yeah, you can proceed.

Michelle Hill: OK. Umm at the recommended solution, I think we'll be getting good feedback from our

Council II co-chairs. What should be put here? I simply cut and pasted from the top portion, and then I read the whole big document about how to do things and it says you can't do that. So I'm hoping you'll give us some good feedback on how to review this language. But we're basically saying what our solution would be and it would be to re-form the committee and undertake the charges as we presented them. The attachments that go along with this document will have the final report that we will submit to the Executive Board for approval - again, that's next Friday.

And then attached to that, we'll have meeting minutes, meeting attendance, and then we'll also include these supporting attachments. These are meant to give background information to the Council when they're thinking about the current Issues that we're presenting here. So the two documents that we recommended as supporting attachments are “components of an effective allergen control plan.” It's a framework for food processors, which if you guys take a look at that, here's the link to FAARP out of U Nebraska. It's an excellent framework. It's well done, and it could be a good guideline for the future Committee, if they undertake and pursue these charges.

The second is the “draft guidance from FDA on the non-major food allergens. All they talk about - anybody can pull this document off the FDA website, and this will be very useful to the next committee as well if they need it so any impact or input on this would be welcome too always. Do you think there's other stuff that we could include that would support our argument for proceeding as we've recommended.

Babekir, Amani: I think also we could include the Summary document of the Framework.

Michelle Hill: OK. So regarding the summary document? Yes. Thank you. And we'll call it ... I don't know if this is what people want, I'm just typing ... we call it whatever you want. I'm just trying to work it on the fly.

Babekir, Amani: I think we could use our Framework title; we just will highlight that it is a summary.

Michelle Hill: Perfect. Thank you. Alright, so that's Issue one. I'm not hearing much about this. If you guys think of stuff after the meeting, please just e-mail us, if it strikes you later.

Here's Issue 2. This deals directly with the request to post the major allergen framework document to the CFP website. Again, specific language that's been dictated ,that we need to use around this issue, or as we propose this issue. So we've requested that this document entitled “Major Food Allergen framework”, and we're authorizing the CFP to make any necessary edits prior to posting the document. The edits would be things such as consistent format and non-technical content. Any changes cannot affect the actual meaning of the document.

The third was to prior to posting this document, we want it reviewed to remove any potential violations of the commercialism comity policy. We did remedy that a little bit ahead of time by blurring the brand names on the image of EAIs.

And Issue number 4 - we're going to remove the CFP-approved document “food allergy notification, a guidance for industry” for the simple fact that it's been incorporated into our framework document, and it's perhaps redundant at this point. So, that's the charge. Here's the public health significance. This is a long one … FARE - they have an awesome content.

Babekir, Amani: Michelle, I have Scott. Yes, Scott?

Vinson, Scott: I raised my hand prematurely. Go ahead, Michelle. I'll ask my question in a moment.

Michelle Hill: OK, all of this is footnoted. A lot of this data was taken from the FARE website itself. It just got reorganized a bit to be cobbled together in a way that makes more sense. We did draft some language, but I just would like people's input on this. All right. Thank you, Scott. That's all I'm gonna say about that.

Vinson, Scott: Yeah. So my question is, “Are we sure?” I see that most of this document’s Issue consists of our actual framework document. I just wanna make sure of that, because we had confusion on the call that the three of us had the other day about whether we were using the most updated version. Are we sure that this is the most updated version of the framework document? .

Michelle Hill: Yes, I have. Yes, we do have the most recent addition, absolutely.

Vinson, Scott: OK.

Michelle Hill: That's a good question. So if you - anybody wants me to make anything bigger so they can read it better, I can do that. I can try and get the “public health significance” on one screen, if people want to review that. Again, this is the committee’s words, so people need to have their input. You know, I'd really appreciate it actually. I've never submitted an Issue before ever to the conference, so this has been a big learning curve for me too. So, I'll stop messing with it so you can maybe read it.

Babekir, Amani: Going to give it a couple of minutes, so feel free to read it from the screen or you could pull up the document I just sent this morning.

Vinson, Scott: I looked at it earlier today and it looked fine to me. Are we voting to approve things today or do we not have a quorum or?

Babekir, Amani: Yes.

Michelle Hill: We don't have a quorum, but this technically – Amani and I – are responsible for filing these as the Co chairs, but we don't wanna just file stuff, we want everybody's opinion, so it doesn't necessarily have to get voted on, but we do need input and it's on a tight timeline at this point and that's why we're doing this, is that right Amani?

Babekir, Amani: Yeah. And I, Scott, we did vote on it in our previous calls.

Babekir, Amani: This is the bulk of the of the of the Issue, which is what we want the CFP to consider. We discussed it. We said that's what we're gonna ask - the whole document.

Vinson, Scott: Yeah. So you're just asking us if you filled out the paperwork properly and it looks fine to me.

Michelle Hill: Essentially that, and if there's any glaring omission or a statement that you don't agree with. Sometimes things get left out - more eyes are better than just mine and Amani’s. So we want you guys to know you're part of the team too. It's not just us generating this stuff - there should be consensus.

Michelle Hill: So this is Issue 2. Should I pull up Issue 3?

Babekir, Amani: Let's give it extra minute, just to go over it.

Michelle Hill: I'll try and center this so it's readable again.

Babekir, Amani: OK. [waits two minutes]

Babekir, Amani: Michelle, thank you. Can proceed to the third one?

Michelle Hill: So this third Issue, this was probably the hardest one. I think that we've worked on these charges for the next committee essentially. No, I'm wrong. Excuse me. Pardon me. This is not that. This is where we want to insert this into the food code. And actually what we're aiming for is the Annex … Annex 2, specifically. So the title of this document "major food allergen framework", we wanted to be included within Annex 2 of the Food code. So we're requesting that CFP send a letter asking FDA to add the document to Annex 2. And then we say the reference could be added in the following places within an Annex 2. And we give them 3 possibilities.

These are not in any order. They caution us, as we draft Issues, that we don't have multiple decisions within an Issue. It would be that these are suggestions and where it could go, but they're free to do what they'd like with where it gets inserted. So letter "A" deals with what we've listed here and is the actual page in the printed Food Code. The current one listed on FDA 2017 supplemental edition and then the PDF page that this content falls on, because they're different numbering conventions. So for clarity, we did include that we were thinking about going in as #5 in a list of things within references Section 2, and we would title it, "Food Allergens", maybe "Food Allergen Control", whatever …. And then we could house our major food allergen framework document there. And so then it's part of the of the Annex 2 section. And then because we have made a heading for "food allergen" information, we can keep adding content in that same spot. So it's kind of like building a little bit of a house for us in that way for the future. Letter "B", it's gonna be what we could do it within a list that's already there, and it would become item number 8 of that list. Or letter "C" - it would fall as letter "W" of another list. These are lists about how to train people and what's expected of them.

Babekir, Amani: Michelle.

Michelle Hill: Demonstration of knowledge and then the specific language would be CFP Council II Allergen Committee 2023, "major food allergen framework" - that's the document. And then we gonna provide the link to the CFP website where the document will be hosted and it must be the HTTP, the full link printed which makes sense. And then here's the public health significance again.

Babekir, Amani: You'd like to give it like a couple of minutes just for the people.

Michelle Hill: Sure. [a few minutes pass]

Babekir, Amani: Yes, David – are you speaking? We cannot hear you …

David Read: I'm sorry, I was on mute. I have a quick question on where it says "a reference could be added in the following places within next two ..." Are you considering one of those places or in each of those places?

Michelle Hill: No, you're right. That's a good catch. So we should say the reference could be added in one place.

David Read: One of the following places, OK.

Michelle Hill: Thank you. We did contemplate asking for our own Annex, but we think because there's already these - we fit well within the information already provided in these sections that it wouldn't, it didn't seem like it was a real complicated ask to insert this language.

Babekir, Amani: Yes.

Michelle Hill: In the Annex.

Vinson, Scott: So under Section 1 here, we are just providing FDA options of places to put the reference to the framework in the Annex, A, B and C are just options.

Michelle Hill: Correct.

Vinson, Scott: With that, they could consider …

Michelle Hill: We wanted to be specific around this because it has a better chance - as what we've been told - if we have very specific placement in mind.

Vinson, Scott: Yeah. Well, and that obviously required a lot of work on ...

Michelle Hill: Both of us. Yeah, we were busy.

Vinson, Scott: Someone spent time, probably yours, Michelle, and I just wanna recognize that work and you know, commend you both for a job well done.

Michelle Hill: Well, thank you. We had other people involved too, but thank you, yeah.

Babekir, Amani: Amber also was included, though. Yeah.

Michelle Hill: Now, thanks for that, Scott. Yeah, it's a lot to get your head around the CFP language stuff too. You gotta be right about that or it'll just come right back to you so had to be pretty decisive with wording.

Babekir, Amani: Do we have anyone from FDA today?

Michelle Hill: I thought I saw Greg - Greg, are you on the call?

Greg Abel: Yes, I joined via phone. I could not get on Teams.

Michelle Hill: That's what I thought. I saw a 612-area code and I thought "that might be Greg." Good.

Babekir, Amani: Do you have any comments about this one? Do you see those suggested areas?

Greg Abel: So I'm on the phone so I can't see. I'm sorry I could not log on video for some reason.

Babekir, Amani: No problem. So if you've got a chance, just look at Issue #3. See if you have any comments that would be great.

Greg Abel: Yeah, yes, that'll work … e-mail.

Babekir, Amani: Thank you. You could proceed, Michelle.

Michelle Hill: Thank you. This next section is the "public health significance". So we had to state our case as to why we'd wanna do these things. We lifted the language from the first part of the Food Code. It's actually the preamble that talks about what is the purpose of the code? I just didn't think we could say it any better than it had been said.

So the next statement here is of my creation and it's in addition … the FDA Food Code contains a series of Annexes which provide the backup information, Scientific data, references, rationale, etcetera, for the guidance guidelines in each chapter. If you want to further understand the why behind something in the food code, the annexes give you that information."

So here we point out, "Why would we even choose the annex?" And then we say here "by publishing the major food allergen framework within the Annex of the Food Code, FDA would be further clarifying its satisfaction of CFP Issue 2008-III-06, which has to do with allergen control and educating people around food allergens and promoting awareness. So, once included, as are part of an annex, additional framework documents could be listed, including any future CFP-published documents around allergy control and the prevention of cross contact. You think of any better way or different things to add there, let me know it this is good enough.

Babekir, Amani: Any comments, suggestions? OK, I think that's good.

Michelle Hill: I have nothing for attachments for this document. I don't know that we need attachments. Maybe we attach the actual printed pages with our language inserted into that area, of what we'd like so they know how we'd look depending on where they choose to put it. Other than that I can't think of anything else we could add, so open to ideas. Or maybe we leave it blank, I don't know.

Babekir, Amani: Yes, Christine.

Christine Sylvis: Hello. I was wondering, for the attachments. I think I've seen it before where you can cross reference the framework from the other Issue.

Michelle Hill: Yes, that's a good idea.

Christine Sylvis: So I think they'll be able to do that. And then I'm sorry it took me a few minutes to go through all the pages and the Food Code. So let me get back to the PDF or the Word document? So when we're asking … location on page 309 of the PDF.

Michelle Hill: Yes.

Christine Sylvis: We're asking for #5 entitled "Food allergen".

Michelle Hill: Yes, so instead of it just being four items, there would be 5 on that list.

Christine Sylvis: I've lost pages … now the very last thing in Annex 2, so it would be listed there as a #5, but then it would be #5 …. It would have to go at the end Annex 2 … I was looking at #4 where it says, "Food defense". So if we are doing that, we might need to say "#5 food allergens" and have an introductory statement about that and then have it listed as a reference publication. So actuality it would be listed as #5 on that page, but it would be inserted on page like 336. And we might, if we're going to do that, we might want to have "introduction" language prepared.

Michelle Hill: And so let me see if I'm understanding this correctly. Listing it as a fifth item on the list will necessitate that we actually have the framework published or is that not what you're asking?

Christine Sylvis: No, it could still be a reference.

Michelle Hill: OK.

Christine Sylvis: I'm just looking at #4 where it has the “food defense” guidance from farm to table, which is #4 on page. I think it was 309. I don't have enough screens. And then that is actually on page 333, where it's mentioned, and it has an introductory statement and then a list of reference publications.

Michelle Hill: Yes.

Christine Sylvis: So I think we would follow that same framework. Is that right, Greg?

Greg Abel: Yes.

Christine Sylvis: Is where it would go as #5, but the content would go under #4 which is on page 336.

Michelle Hill: While the PDF has its own pagination and then there's the printed number on the bottom of the page and what I'm having trouble with is that bottom number is not 306, maybe the printed number is 306 ...

Christine Sylvis: It's 336.

Michelle Hill: Yeah, here we go. 336. OK, now, now we're talking. Yes, yes. Right here. You got it. That's what you're saying. We need language around. Yes, yes.

Christine Sylvis: So if you scroll up just a little bit, you'll see where number four starts, right there. Ohh yes. So you would need a number five with the little introductory paragraph and then have the reference, as a link.

Michelle Hill: So the PDF is 389, and the code is page 333. I'm just writing this down, so I know where to start, and then we'll have a #5. So, d you think we should have language around that already prepared? I think you're right. Good. Thank you. I didn't even ... I can't believe we didn't even extrapolate out to that point. We should have done that because you know it's important, well, necessarily, where we could also drop in, any future guidance too if we get a #5 … this I really like.

Christine Sylvis: Yeah, I like that idea.

Michelle Hill: Yes, I like the fact that this is like a little house for it. I feel like it could really live here and make sense.

Babekir, Amani: And we could make that introduction a more generic introduction so be open to host other documents related to ...

Christine Sylvis: So yeah, it is when you're searching for the page number, it is 309 which is 253.

Michelle Hill: Thank you. There you go. Bless you.

Christine Sylvis: So it would be #5 there. At the very top. Would be food allergens or?

Michelle Hill: So it's page 309 of the PDF 253 of the code. OK. And that's why we when we run out the Issues, we've got very specific language. Well, this will require an introductory paragraph. Since we've got this up, maybe we should look at Page 320 as well, which was another place we thought maybe this could live. Under “management and personnel”, it would be number #8.

Babekir, Amani: Yes.

Michelle Hill: Chapter 2 ... Management personnel … demonstration. That's right, under “demonstration of knowledge”. OK. Yeah, it would be a #8. And it would just reference our document. I guess we could put it … I don’t wanna muddy the waters, but this is the other place ... I really like the other place better. And then we had a third place ... let's look at that real quick too, page 375. And this would be adding after “the bad bug book”. It'd be letter “W”.

Babekir, Amani: Yes.

Michelle Hill: So it's under supporting documents, and they're supporting documents to … this is the FDA list of guidance for reference - so it's a long, long list. So we'd be letter “W”.

Babekir, Amani: We have 12 minutes left. We could spend like 5 minutes just working on the language we wanna add as an introduction.

Michelle Hill: Yes. It's got to get done, so yes. All right, so I'm going to just start typing it here so that we can all see it and we'll figure out where it lands later.

Babekir, Amani: Just asking for volunteer. We just, we just need couple of sentences just to introduce whatever content is related to allergens. That might be referenced on that section.

Michelle Hill: Here we go …

Babekir, Amani: We're still looking for the section.

Michelle Hill: I am … I finally found it.

Babekir, Amani: OK.

Michelle Hill: So here's Section 4. So we'd be looking to write a similar paragraph like this, and then list our publications.

Babekir, Amani: So let's give it a minute. Yeah, let's give it a minute for the people just to look at that section and then we could articulate something related. Do you think people would say something similar like “the following summary of available resources around Allergy?”

Michelle Hill: I'm just going to start by cutting and pasting that statement. Keeping it simple sometimes is best.

Babekir, Amani: Christine, do you think that's enough?

Christine Sylvis: And I'm looking at the other four sections. They are very short. Just saying, “here's a list of resources” for the most part.

Michelle Hill: I'm really glad you brought this up ...

Christine Sylvis: I was looking for the other ones for some inspiration.

Michelle Hill: Yeah. I didn't even think about where it would actually, what that #5 meant. It's just too much. So I guess what we'd be saying here is that if we do list it as #5, we would say … “proposed language ...”

Christine Sylvis: Looking at, I was looking at writing some other Issues for a different committee. I think we would put that at the bottom in the recommended solution part, so the recommended solution there is a template for just adding it in with the underlying language.

Michelle Hill: Yeah, I saw that too.

Christine Sylvis: Language to be added.

Michelle Hill: We should do that. We should have it be like we exactly how we want it to appear. Like #5, blah, blah blah, OK. Yeah, that makes sense. OK. I saw that there is a template or guidance on how to write all that out appropriately.

Babekir, Amani: Any suggestions about the language? OK. And then we could work on the formatting. OK, we're gonna have up to Friday, we probably need to finalize everything by Wednesday afternoon, so if you have any comments, any suggestions, feel free to e-mail us by Wednesday, by next Wednesday afternoon.

Michelle Hill: November 16th. I think that I think that's reasonable.

Babekir, Amani: And also, as Michelle said, we're going to send out the minutes of all meetings we have. I think around 5 minutes from our previous meetings need approval.

Michelle Hill: Well, yeah, that's only 100 pages Amani.

Babekir, Amani: Yeah, we haven’t approved them. It's a little bit hectic to go over it because what we've done in most part of those most recent meeting is we use the transcript of the Teams – now it is word by word.

Michelle Hill: It's a good read, it's an interesting read.

Babekir, Amani: We’re going to need your approval. The other thing is we were gonna have four meetings, I think. Nothing left for meetings in November because we have Thanksgiving. And then we have, I think one or two meetings in December.

Yeah, we gonna receive the review because we're gonna send those documents to Courtney, and we're gonna receive feedback from them and we have up to December the 2nd to send it back to them. We will look have meeting in between, but if we need the Committee opinion on any update or change, if it is not like formatting on stuff like that, you might hear from us, we're gonna send you an e-mail and we need your response, if you want to make any change on the on our documents.

Michelle Hill: I was gonna say and just so you all know, we'll be very specific on our ask. And it would just be only for substantiative stuff that you know, content that matters kind of questions.

Babekir, Amani: Then for the meetings in January, there is 3 meetings in January. I'm just gonna keep them in the calendar in case we need them, but you're gonna see me, cancel them if we've done all the review and we submitted our documents, we don't have any standing Issues, I'm gonna cancel those. I want to close by just saying big “Thank you” to all of the committee members. It's great work. Very good job. It was my pleasure and my honor to work with all of you on the Committee.

Michelle Hill: I second that Amani, and I think we've had a very active group. I'm really glad that we were all able to treat this as a consensus forming process throughout and I found that we all dealt with each other with great respect, even though there might have been disagreement over content, so it has been my pleasure as well and I loved being your Co chair Amani. I really have enjoyed my time with you.

Babekir, Amani: Thank you, me too.

Babekir, Amani: Thank you. And I hope to see you at the Conference of Food Protection next year.

Michelle Hill: Yeah, that'd be nice, everybody. Alright.

Babekir, Amani: Thank you everyone.

Meeting Number 25	Meeting Date **12/05/2022**		Meeting Time 2:00 pm EST
Co-Chair; Meeting Chair Amani Babekir	Co-Chair Michelle Hill	Meeting Scribe Michelle Hill via Teams Transcript	Council II Chairs Wendy Bell/Courtney Halbrook
Advisory - FDA Greg Abel Advisory - CDC Erin Moritz Advisory - USDA Jennifer Green	Advisory – FDA Devin Dutilly Advisory – CDC Jenna Seymour		Advisory - FDA Mary Cartagena

AGENDA

i.	Meeting Call to Order	Amani Babekir
ii.	Roll Call	Michelle Hill
iii.	Scribe	Michelle Hill
iv.	CFP Antitrust Statement	Amani Babekir
v.	Issues points	Amani Babekir
vi.	Framework Points	Amani Babekir
vii.	Adjournment	Amani Babekir

MEETING MINUTES

Amani Babekir This meeting is called to order. We have asked you to meet with us today to finalize the four Issues we will be submitting to the CFP for consideration. Michelle could you please display the Issues for consideration?

Michelle Hill Yes, my pleasure.

Eisner, Crystal Is this the way it was brought it to us when we first got the charges?

Michelle Hill It may have been. It's been through a couple different rounds already with Courtney and Wendy, so I can't guarantee that this is the same language. We ended up re-working the Issues. It was three and then we were told to split Issue 01 into two separate Issues.

Babekir, Amani But the main language is the same to what we discussed in our meeting and we approved so you don't see very major changes here. The one that cross contact is being recommended by Devin Dutilly, I know he was not able to join us, but if you think there is more clarification we could add from your prospective.

Abel, Greg A When did Devin make that recommendation? Long time ago?

Babekir, Amani Yes - for this one, while we were working on our subgroups.

Abel, Greg A A long time ago. OK.

Babekir, Amani Uh, yeah. A long time ago. He suggested to have this charge for the future committee in order to address cross contact, so I guess we're trying to understand what do you think are the main concerns when it comes to cross contact from the FDAs perspective.

Abel, Greg A Well, probably more or less just advice on how to manage food allergens. And, I think to identify the non major food allergens and to be aware of cross contact scenarios, as there's so many of them.

Babekir, Amani So we include examples of ...

Abel, Greg A Uh, depending on, I mean could be shared equipment, shared oils, shared surfaces. It’s more … I don't know what Devin had in mind about controlling cross-contact.

Babekir, Amani Thank you. Yeah, it was actually.

Abel, Greg A But what do we have in our … what’s some of the … isn't some of that advice already in what the Committee has prepared?

Babekir, Amani So we have, yes that’s what we had - there's like one extra or something.

Michelle Hill Yes. However, this is kind of two requests in a way because it's asking it to identify the non-major food allergens and how to control for those, in addition to expanding that to be included in the framework.

Abel, Greg A What would that be? To me it'd be like, OK, so here are the major food allergens, the 9 coming up in 2023. And if you get a request by consumer that something else might be a food allergen to them, that chef for those food service workers could use some of the same knowledge for that particular allergen.

Babekir, Amani This correct, yeah. Crystal, I think I saw your hand up. I mean Christine.

Christine Sylvis Hi, this is Christine Sylvis. I had it up and I took it down. I was just confirming that A, B, and C relate only to non-major food allergens.

Babekir, Amani Yes … the thing is … this came up while we were working on our actual major food allergens which includes, you know, the nine major.

Babekir, Amani But things, yeah, but since in number one, we are talking here about non-major food allergy, and probably that includes expanding cross contact to include the non-major food allergens. We did touch on cross contact in our framework, but I guess we need extra more detailed information about it … it seems especially for receiving and storage, and preparation.

Michelle Hill Also, I'd like to point out that this is actually a huge ask. If you read #1 "using existing research and resource to identify the non-major food allergens and how to control for them", that's telling our next committee that they need to identify what the non-major food allergens are. Am I wrong in reading that?

Christine Sylvis That's definitely how it reads. So there are, of course, other countries that have additional allergens then eight or nine, but people can have allergens to all different types of food, so I'm just not really understanding what food establishments would be expected to do … control cross-contact just for the identified non-major food allergens or for any allergen that somebody might have. You would think that the process would be about the same as what they would do for the identified allergens.

Michelle Hill Except that they take big steps to control for the big nine and if they're not aware of an allergen present, it will cross-contact throughout the flow. You can't like, let's say, if somebody says I can't have.

Michelle Hill I don't know. I can't even fill the blank. I'm sorry.

Abel, Greg A Broccoli.

Michelle Hill Umm, thank you. Broccoli. Yeah and.

Michelle Hill So I think that's what drove this bus was, how do we control for the stuff that people tell to us after the fact? It's as simple as. "you can't eat that."

Abel, Greg A But I think it's just a matter, I think when I'm trying to go back to those comments back in June when this type of stuff came up. The framework worked on the 9 major food allergens, but making sure that people know that there are several other food allergens out there, like Christine mentioned, there's 163 plus possible foods that some people has been allergic to at one time or another. Maybe just raising awareness that there may be a request or a concern from a patron that they might be allergic to something else, that is not a major food allergen and the controls would be the same. And if there's no controls in place for them already, well, like Michelle said, "you best not eat that food."

Maybe it's a simple answer that "hey, these are the major food allergens defined by FALCPA, and these are non-major foods, but they still can be a problem for certain people.

Michelle Hill Yes.

Abel, Greg A Just to be aware.

Seymour, Jennifer So it does seem like they're probably like assuming the 163. We're not just going to list all of those various foods - I doubt that that would be helpful. It seems to me, from having experiences with people who have these problems with non-major allergens, that what they really need is staff and restaurants to really understand what is in their food, understand the names, the ingredients to be able … there's so many restaurants you walk in and they have such lacking information about allergens. I've a friend who has a severe dairy allergy and you go in and people say, oh, "well, you can't eat that cause eggs in it." They just don't understand food in some fundamental ways. And maybe it's more about that dealing with the other … those outside of these really controlled strictures is about just being able to have some basic understanding of what various foods are. Having some way for someone to look that up to be able to know what is in every food that they have if they need to. I mean that's becoming fairly common in chain restaurants where you walk in, you say something strange and they pull out a book and you know, have pages and pages of notes about what is in every food. I see that more and more often.

Babekir, Amani That is what I'm talking about …

Michelle Hill Me too. And I think that you've hit upon a very important part of this, as far as just everybody being better educated about derivation of ingredients and how they can be depicted on a label or, having good working knowledge of what's in the food that people are serving. Transparency.

Michelle Hill Maybe that's maybe when you just say …

Babekir, Amani What would you do?

Michelle Hill Something different than what we've said.

Babekir, Amani And then have that sort of be like just this …

Abel, Greg A But wouldn't it be? I think in the future, wouldn't it be nice to have a requirement that places keep a list of ingredients in a book right in a binder, so everything they have in stock would be a resource that you could look up the ingredients. This is the product ... this is what's in it, right?

Babekir, Amani Right.

Michelle Hill So an allergen matrix for all product on hand?

Abel, Greg A Yeah, I think in Minnesota there is one Deli chain where they do keep that matrix. A folder of "OK, they're getting this deli salad, but they have a garlic allergy, so let's look in this 3-ring binder of everything that goes into each salad.

Babekir, Amani So for the points A, B, and C, to make logic out of it is to make it related to the non-major food allergens. The points A, B, C, that are addressing the non-major food allergens, in which we said it is a limitation when it comes to our framework. We did not address the non-major food allergy. Do we agree with that … that A, B and C, are asking them to focus on the named major food allergen and address A, B, and C, and then we could add the recommendations which you just discussed, to add more clarification.

Michelle Hill So do we need to rephrase this or is it clear enough that we're speaking directly about this being our big goal? Maybe what we do is we say existing research and resources to identify non-major food allergens and how to control for them, period. And then a second part of the charge would be to include the request to update the framework. Maybe that makes it easier.

Babekir, Amani Yes.

Amber Thompson You could even just leave it like that and then put D as that. Is that what you meant? OK, sorry. Yeah.

Michelle Hill No, no, you got it. No, that was good ... I did not know where it was going so …. it's awesome. Thank you.

Babekir, Amani So do you want to add the extra points? That's Michelle and Jennifer, I think. Yes, Greg and Jennifer, they said about the awareness and all of these points under "A".

Michelle Hill I feel like by striking the word "the" from this main sentence, now we don't give a quantity to it, it's just to identify non-major food allergens versus all allergens. To me, "the" means "this is a definitive list."

Amber Thompson Yes, that's better.

Seymour, Jennifer Just one point that has come up … a weird allergen of someone that I know. You know right there preparation comes into it, but it looks like that word preparation is just In terms of cross-contact, but I think there also are some issues with preparation that might not go into ingredient lists. And what I mean by that is I know someone who can't eat vinegar, and vinegar is put in water sometimes to cook things. So it's this idea of even understanding preparation methods. I could easily see that not being on an ingredient list. Another one that has come up because of this allergen is that most chicken is brined in pickle juice, and people don't think about that and don't know that. And it doesn't seem again to be on the ingredient list or it's on the ingredient list as only "brine". People don't think of that as being vinegar, so I've encountered a lot of these weird things. It's about the way people do things to make cooking work better, but it doesn't really get considered as an ingredient to a lot of people.

Abel, Greg A Well, that would be education, right? Because it has to be excluded, right? If it's going to be packaged. Then, though, if it's a major food allergen, it has to be included on the label.

Seymour, Jennifer Right, right. It's just this is an example of one that isn't a major food allergen.

Abel, Greg A Right.

Seymour, Jennifer And I would be surprised if it's even listed in the 163 ... never encountered another person with that problem.

Abel, Greg A Don't hold the 163 as the magic number ... I just threw that out. I don't know if that's the actual ...

Michelle Hill No, it's in excess of 170.

Seymour, Jennifer Yes.

Abel, Greg A OK, I remember hearing 163 maybe 15 years ago, so ...

Michelle Hill Yeah, FAARP is a really good place to get that number.

Michelle Hill How about if we drop in here preparation, including knowledge of preparation methods? I don't know if that helps alleviate that issue.

Babekir, Amani So it should be a big issue. And when it comes to receiving, I think, Greg, you said something about the matrix or something, I can't recall it ...

Michelle Hill An allergen matrix?

Babekir, Amani Mm-hmm.

Michelle Hill When you are in the act of receiving large bulk food, sometimes you stack it wrong or you put it in the fridge and it spills or drips causing cross-contact.

Abel, Greg A During receiving, OK.

Michelle Hill Umm. Yes.

Michelle Hill "How to prepare" no, how about including using an allergen matrix or is that too prescriptive?

Abel, Greg A I think that's too prescriptive. We'd have to define what we mean by a matrix. I mean, a matrix could be a suggestion as a helpful hint, "right now, here's a way to manage … "

Michelle Hill How about including "during receiving"? Maybe that helps too … that's what we mean during the act of receiving.

Abel, Greg A Right - because once you receive it, now it becomes the storage.

Michelle Hill Yes. OK.

Babekir, Amani What about the storage? Do you need to define "Dry" and "Cold" storage or as you said …

Michelle Hill When I teach about storing, it implies any type of storage, whether it's hot or cold. But that's from my perspective as somebody teaching CFPMs … that's our audience.

Abel, Greg A Storage to me means anything regardless of temperature, right?

Michelle Hill Being held properly, is all we worry about, right?

Babekir, Amani I remember we wanted to add more clarification to them to make it very obvious.

Michelle Hill Yes.

Amber Thompson Receiving, storage, holding. We call it holding. Like you know, especially if it's like a salad bar. You don't want to drop peanuts in the, you know, cheese or whatever it is …

Michelle Hill Excellent.

Michelle Hill And that's a great example. When we set up a salad bar, it's always the allergen is in front so you don't drip, drip, drip from the back. This only helps if you know what the allergen is, so …

Babekir, Amani If we are good with this one, we could go to the next one.

Michelle Hill This is a huge ask … this is a very big ask.

Eisner, Crystal For #1, because anyone can be allergic to anything.

Babekir, Amani It's more. It's more for style, so we probably need to define what is the objective of this allergen control toolkit. So they will have a clear idea what is the purpose behind it.

Michelle Hill Yeah, maybe we should say the allergen control toolkit would include information or methods of food preparation ...

Amber Thompson More specific even, cover the major food allergens.

Michelle Hill Well, I think it would include both major and non-major allergens.

Babekir, Amani We might need to give an example of what is the toolkit we are talking about. Is it just a document? Is it checklist?

Amber Thompson Yeah, it could be …

Eisner, Crystal … Infograms …

Amber Thompson Yes, that's what I was thinking.

Michelle Hill And an allergen matrix …

Amber Thompson Yes … you could say, "For the purpose of ..." That way we know what for the purpose of.

I don't know how you would say this, but basically, that the food workers can easily identify … not identify, but easily ...

Amber Thompson

Michelle Hill … support which could …

Amber Thompson Digest this information or something like that.

Eisner, Crystal Identify, no.

Amber Thompson For ease of use for food service workers, or for ease of implementation, or something like that. Better understanding of controlling allergens.

Michelle Hill OK. Yeah, that's awesome. Makes me feel a lot better. What do you all think?

Amber Thompson Well, have an idea, but this will kind of change the format, but it may be more helpful overall … if we said ... "use the existing research and resources to expand upon the major food allergen framework, and is guidance on how to control non-major food allergen cross-contact. That way this allergen control toolkit is for both major and non-major food allergens.

Michelle Hill Yes.

Amber Thompson Because we really like that idea of a toolkit, but we just don't have time to put something like that together.

Michelle Hill Right. OK. Did I get this first part right … "to expand upon the major food allergen framework to include cross-contact"?

Amber Thompson Yes, to include A, B, C, then we don't need D. You could say "guidance on how to control non major food allergens."

Michelle Hill OK, run that by me again. I missed what you said.

Amber Thompson Yeah, "guidance on how to control non-major food allergen cross contact"

Michelle Hill Awesome.

Amber Thompson Would you consider Celiac part of the non-major food allergens?

Michelle Hill Umm, I would.

Amber Thompson How to control non-major food allergen and … ?

Abel, Greg A You think in the, you know, we kind of made a point to keep the guidance to just "allergens".

Amber Thompson OK.

Michelle Hill Because dealing with Celiac didn't change behavior was our rationale for that, right?

Amber Thompson Right, right. OK.

Babekir, Amani Along with you. OK, good.

Michelle Hill Just want to make sure we have the right reason for not expanding.

Abel, Greg A I think a lot of lot of celiac people just say "I have a wheat allergy". It's too hard to explain.

Babekir, Amani Yes, that's the case. And it seems we are almost out of our time. We can extend the meeting extra half an hour. So, if you are free please stay on the line, OK.

Babekir, Amani Thank you. So we could proceed.

Michelle Hill Are we all good with this revised number one statement?

Babekir, Amani Looks good to me.

Amber Thompson I don't need a comma there … Use existing research and resources to expand upon the major food allergen.

Michelle Hill Thank you.

Amber Thompson Framework to include.

Michelle Hill Awesome.

Amber Thompson Service, identify. Gather at some research.

Amber Thompson Yeah, I like the way … I like this.

Babekir, Amani Are we asking them to update the "major food allergen framework" document?

Michelle Hill I think we say that the first part, don't we here, "using existing research resources to expand upon" … you know, you're right, we don't talk about it actually improving the document.

Babekir, Amani We just ask them to update the document to make it ... part of our toolkit.

Amber Thompson Umm, no, I feel like the toolkit is for the food workers to understand allergen control.

Michelle Hill OK.

Amber Thompson Umm, not necessarily about notifying customers.

Michelle Hill Good point.

Amber Thompson I'm curious about compliance when notifying a consumer. Compliance implies that there's ordinance in place, so I don't know if there's codified language in the food code about notifying consumers. I know there's for labeling. But I don't know if that's expanded to restaurants.

Abel, Greg A There's nothing to notify consumers in the food code.

Amber Thompson OK, maybe we can change that word "compliance" to … Umm … "established tools to ensure …"

"Abel, Greg A How would you want to notify them? And if that's the case, what's the danger when you miss something? So I look at it from another point. As a note, I think it's great for large franchises that have controls in place that can list all the ingredients. But what if you have an independent? I mean, look how much trouble our …

Amber Thompson Umm.

Abel, Greg A As it is now, and if it's required to inform the consumer, they're going to say, "oh, no, this has nothing in it", but someone's going to forget something and then that person's going to have to suffer a reaction.

Amber Thompson Right, right.

Abel, Greg A You see the danger? I think that's dangerous. I would never trust it. Except for maybe a large chain that has the resources to actually have a standardized menu.

Amber Thompson Umm.

Abel, Greg A And look at all the times I messed up, with my even my home cooking, you know?

Amber Thompson Right.

Abel, Greg A So compliance we're "notifying the consumer about ..." but a compliance can indicate there is a regulation.

Amber Thompson Right.

Michelle Hill Yes … as well as a way to assess their ability to comply.

Abel, Greg A Yes.

Amber Thompson The allergen framework has a section about notifying consumers, right?

Michelle Hill It does, yes.

Abel, Greg A And how does it? Is it suggestion or how does? How is it suggested that they be notified?

Michelle Hill It's a whole section. Hang on I can bring that up.

Babekir, Amani And I think this one came up when we were working on the notification section.

Is to have those. tools, I think. And we said, B is a charge for the next committee.

Amber Thompson OK.

Michelle Hill So here's the framework on tools to notify. Here's menu item self-service. Here is the Allergen Matrix, menus, and signage …

Abel, Greg A OK, so in this situation we're just providing a toolkit if someone chooses to notify. These are some examples and how it can be done, right?

Michelle Hill Right.

Abel, Greg A Versus making it a requirement so.

Michelle Hill Correct.

Abel, Greg A You know, I think that's fine because it's the suggest it's toolkit. Hey, if you want to take the extra level, here's how you can notify your consumers.

Amber Thompson We could maybe say was meant for non-major food allergens. Maybe that's what this meant.

Babekir, Amani Yes.

Amber Thompson When notifying consumers about non-major food allergens.

Babekir, Amani Yes, as I recall, this came up when we were discussing, the notification section, so it wasn't part of the non-major food allergy.

Amber Thompson OK. I just don't like the word compliance. I think maybe if we can find a different word that would be fine.

Michelle Hill How about support? "Support tools to identify," "tools to support food workers when notifying customers about food allergens …"

Babekir, Amani To notify a consumer on how to ensure … that's compliance with this is standard operating procedure ….

Michelle Hill I see.

Babekir, Amani Maybe here, next to the tools, we say, "This includes standard operating procedures."

Michelle Hill Yep.

Amber Thompson Yeah, standardized menus or something like this. Full ingredient lists.

Babekir, Amani But I think also here on this one we want to have the restaurant make sure that their workers comply with whatever standard they have there to notify the customer.

Amber Thompson Right. They support and educate. Yeah, that's a hard one because it's really the restaurants, and that may be included in the framework under "training".

It's actually codified language that says, in the food code, that the person in charge is to ensure that food employees know about the major food allergens as it relates to their duties or something like that.

Michelle Hill Right.

Abel, Greg A Yeah, but that's not, I think, how that was written. It wasn't intended to make an allergen free entree safely.

Amber Thompson Right, right, right.

Abel, Greg A Yeah.

Babekir, Amani And I think to that piece, I remember when I walked into a restaurant and I ordered pizza, which is, you know, the gluten free one. And then they brought me the dish. I ate it and it wasn't the gluten free one.

Michelle Hill Oh my God.

Babekir, Amani So yeah, there is a missing piece here … how do you track ...

Amber Thompson Yeah, you. Yeah, right.

Abel, Greg A I think there's when you're working with humans, there's missing pieces everywhere. I remember Buffalo Wild Wings having a gluten free menu item on the menu and my son would order certain wing coating. Then the person at the different store said “well, you can't have this because it's has gluten in it” and my son says “well, it's advertised gluten free and we eat it up in the north location.” She said, “Yeah, it says that on the menu but our chef does it different, so there's gluten in it.”

Amber Thompson Yeah. Well, that's liability right there.

Babekir, Amani Yes!

Abel, Greg A Isn't that crazy? Even they're not conforming to their own standardized recipes?

Babekir, Amani Umm. Yeah. And maybe we need to help them establish some kind of standard to make sure if they have a gluten free thing on the menu it is actually gluten free.

Abel, Greg A Well, that's just that person not caring or understanding … just adapting the menu, the recipe to their own liking.

Michelle Hill And it even happens with school lunch. A lot actually. They want to add cheese to everything, so it is no longer dairy free … You need standardized recipes. You have to follow the recipe.

Amber Thompson Yeah, I'm curious if Buffalo Wild Wings corporate knew about that chef because that would be a fired chef, if that was my chef.

Abel, Greg A Yeah, exactly right.

Michelle Hill Me too. Me too. Yeah.

Amber Thompson That's ridiculous beyond all.

Abel, Greg A Mm-hmm.

Amber Thompson You can't choose what you how you want to prepare something. Open your own restaurant. The frustrates me.

Michelle Hill Especially when it's off menu like that. Yeah, that's not OK.

Amber Thompson That's a lack of education.

Babekir, Amani And maybe we need some kind of like a controlled checklist to ensure before you serve the dish, it is really gluten free, or whatever, as it's announced on the menu.

Abel, Greg A I think I think Scott came up with some language on one of the subcommittees about that exact thing, right?

Babekir, Amani Yes.

Abel, Greg A I thought we worked on something that I forget what Amber was at on the committee we were on. I forget all the committees and all their little pieces to the puzzle, but one of them was kind of having an assurance that the food that the food going out, there's a checks and balance and the food goes, goes out, that it is truly.

Amber Thompson Umm. Like a QA, right?

Abel, Greg A Yes.

Michelle Hill Like a final allergen plate check or something.

Amber Thompson Right.

Abel, Greg A We worked on that concept, yeah.

Michelle Hill I don't know if that's new concept and people are going to be like, what are you talking about. But I did drop that in.

Babekir, Amani Hmm.

Amber Thompson You could just put quality, QA person, or quality assurance person, then?

Michelle Hill Oh, there you go. Quality assurance.

Abel, Greg A But isn't what, but this is this A, B, C ,D and all relates to non-major food allergens not defined right?

Michelle Hill No, we define that. So now up here we start our charge with, we're going to “expand upon” and then we dropped in “non-major food allergen” under “Control for”. So all the rest of B, C and D - all apply too. Including major food. Am I wrong about that? You guys OK? Good. OK.

Amber Thompson Right, right, including the non.

Abel, Greg A But wasn't some of that stuff already developed this year? But we've talked about some of the stuff. So you're saying just review it and expand on it?

Michelle Hill Mm-hmm.

Abel, Greg A Just continue the work is what you're saying.

Babekir, Amani And I think to your point, some of these ideas have been touched on in the "Preparation" section, I think, but it's not too much, so it was probably one or two points about that.

Abel, Greg A Hey, did you guys know when FALCPA got passed in 2004, got implemented 2006? There was a charge in there, a part of the law, that FDA was supposed to work with the Conference for of Food Protection, to produce a food allergen control manual.

Amber Thompson Umm.

Abel, Greg A I worked on that from 2007, for couple several years. And it just never got past. We were going to submit it, but it never got past our executive leadership of FDA.

Michelle Hill Boy, that would be a valuable tool because that's something you could share with people.

Abel, Greg A Right? It was so disheartening not to have it be put out there. But no I can't share it. I don't even have it.

Michelle Hill OK.

Abel, Greg A I mean, it wasn't even passed, so it's not even a final document. But and I forget the reasons why it never … because what if FDA authored it … would someone take it as a standard of, you know, a certain level when it's was meant to be guidance not …

Michelle Hill Not the law.

Abel, Greg A Not the law, right. You know, it's like, "well, FDA says so" - it could have been some of that. There were seven of us that were working together. We talked everything - about these concepts here. Now, what, 10-1/2 years later, we're doing it again, but in a different format. I just think how far we could have been ahead in this country if we would have had that 10 years ago, 15 years ago.

Michelle Hill Well, Greg, you, and I both know that we've been spinning the same wheel, and that's why I write my food blogs too. I write "9allergens.com" where you can print out all the derivations for all nine major allergens as ingredients and how they might appear on a label because there's no other place to find that. I think that's something FDA should house, too. Tear sheets of their allergy section could be better, like "this is how it can appear on a label …" and list every instance.

Michelle Hill Like whoever thought sesame would be lurking in tomato products. But it is.

Abel, Greg A Oh my gosh, I never thought that really.

Michelle Hill It's in the base product. They add sesame in, as part of tomato paste, and it's not on the label as such, it is listed as "extracts, spices" because it is an antioxidant and it doesn't impart serious flavor. It happens when they cook tomatoes during the first cook, so it gets distributed to other purveyors with it as part of it the tomato product and it is not labeled for sesame. I wonder … I'd love to know somebody in the tomato world because I know people in the bun world and it split that world in half, you know, sesame, no sesame seed bun ...

Amber Thompson Ohh wow.

Michelle Hill Yeah.

Amber Thompson There's gonna be a lot of non-sesame buns soon.

Amber Thompson We're not wanting to support the Food service worker, we're wanting to support the person in charge who's in control of the food service workers job, of notifying the consumer, which is a very long sentence …

Amber Thompson Person in charge. When training, yeah, there we go. Training, I would say employees.

Michelle Hill Ohh OK well, if I say food workers that include people that don't get paid … like volunteers at food shelf?

Amber Thompson Oh, that's a good point.

Michelle Hill I had to go through and standardize the whole document, so it's in my head.

Abel, Greg A But we I guess in the food code, we call the "food employees."

Michelle Hill Oh, you do? OK.

Abel, Greg A Yeah.

Michelle Hill Even if they're not being paid.

Abel, Greg A Umm, Yeah.

Babekir, Amani So I have to jump to another meeting at 3 … so if we could finalize this and then just jump to the other to the other issue.

Michelle Hill OK , Let's go to Issue 3. This deals with how to amend the food code.

Amber Thompson OK.

Michelle Hill Umm, we have to pick a spot – as we offer three options listed and there can only be one.

Babekir, Amani Yeah. We suggested the three options, so have to pick one and then also and then give FDA the flexibility to pick wherever they want.

Michelle Hill And all of the discussions we had around this and this is just me talking. I love #1A.

Abel, Greg A Can you blow that up?

Michelle Hill Umm yeah.

Amber Thompson Letter “A.”

Michelle Hill Yes

Abel, Greg A Yes.

Amber Thompson Yes, I like this one too. Make it its own #5 dedicated section to everything we want to add, including all the future work. Sure.

Michelle Hill Yep. And then letters “B” and “C” are listed within Annex 2, just not is such a prominent spot.

Amber Thompson Yeah, yeah. I'm. I'm. I'm down with a there or 1A. Yeah.

Babekir, Amani Yep.

Michelle Hill How about everybody else? Anybody objecting to that? All right.

Babekir, Amani Yeah, I'm with you on that one.

Michelle Hill Good, that's done. And I won't even say “A”, I'll just say ...

Amber Thompson There we go.

Michelle Hill Yes. And I must cite this right, I'll make sure it's cited. There’s a big document on how to make things look right issued by CFP that I will check. OK, so that is done.

Babekir, Amani Remember to add “or a location where deemed appropriate by FDA.”

Michelle Hill Yeah, I have Courtney's e-mail saved in another file so … Amani, I'll make … I'll fly speck this ... I'll send it to you and then forward on ... OK, awesome.

Babekir, Amani Umm. Yes. And do we feel good about the one which we were working on?

Michelle Hill Should I bring it back up?

Abel, Greg A As far as food employee as defined in the food code, it means “an individual working with unpackaged food, equipment and utensils are food contact surfaces,” so the food code defines it as a “food employee.”

Michelle Hill OK. Thank you.

Michelle Hill Are we OK with this letter C?

Amber Thompson Training. Workers are notifying consumers about food allergens.

Amber Thompson I like it the way it's re-worded with training because we're supporting the training.

Michelle Hill Yes. OK. I don't want us to feel super rushed. I know its due today …

Amber Thompson No pressure.

Michelle Hill Uh-huh.

Babekir, Amani Good, good. That's great.

Michelle Hill We did it.

Amber Thompson Yes, looks good.

Babekir, Amani Thank you for joining and thank you for your input - it's really valuable.

Michelle Hill We could not have done it without you. Really appreciate everything.

Babekir, Amani This meeting is asjourned.

Major Food Allergen Framework

Conference for Food Protection
2023 Biennium
Council II: Allergen Committee
Publication Date: _____

[This page is intentionally blank.]

Contents

Introduction

PURPOSE This document is to serve as a voluntary operational framework for FOOD ALLERGY[1] prevention and control of the MAJOR FOOD ALLERGENS[2] (as defined below) using existing research and other evidence-based materials for FOOD ESTABLISHMENTS[3] and OTHER COMMUNITY FOOD SOURCES[4]. Readers should be aware, however, that people may have other allergies beyond the major food allergens, and food establishments may employ the same practices outlined in this document to assist CONSUMERS[5] with allergies, FOOD INTOLERANCE/SENSITIVITY[6] beyond those listed herein.

Readers should be aware that consumers may have other food allergies, intolerances, or sensitivities (such as celiac disease, Crohn's disease, IBS/IBD, and others) which, although not technically allergies, are triggered by ingestion of particular foods.

SCOPE This document covers food allergy training of FOOD HANDLERS[7]; food handling policies and practices; consumer notification tools for food allergens; a food allergy reaction and emergency response guide; and equal consideration for other community food sources.

BACKGROUND A food allergy happens when a person's immune system overreacts to a food protein. Approximately thirty million people in the U.S. have food allergies, leading to 200,000 emergency department visits per year. FOOD ALLERGIC REACTIONS[8] vary in severity, from mildly itchy skin and lip swelling to severe, life-threatening symptoms (ANAPHYLAXIS[9]) and death. In the United States, 51% of adults and 42% of children with food allergies have experienced a severe reaction.

1 "Food allergy" means the reaction of the body's immune system to certain proteins in food. Reactions can vary in severity from mild symptoms involving hives and lip swelling to severe, life-threatening symptoms, called anaphylaxis, which may involve shock and fatal respiratory problems.

2 "Major Food Allergen" mean the allergens in foods that cause over 90% of allergic reactions: milk, egg, fish (such as bass, flounder, or cod), crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, soybeans, and sesame.

3 "Food establishment" means an operation that (a) stores, prepares, packages, serves, vends food directly to the consumer, or otherwise provides food for human consumption such as a restaurant; satellite or catered feeding location; catering operation if the operation provides food directly to a consumer or to a conveyance used to transport people; market; vending location; institution; or food bank; and (b) relinquishes possession of food to a consumer directly, or indirectly through a delivery service such as home delivery of grocery orders or restaurant takeout orders, or delivery service that is provided by common carriers.

4 "Other community food sources" means food sources that are made available to the public on a need basis, e.g., food bank, food shelf, food pantry.

5 "Consumer" means a person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale

6 An adverse reaction to a substance in food that does not involve the immune system, e.g., the inability to process or breakdown a certain food such as the milk sugar lactose which can lead to discomfort or have ill effects.

7 "Food handler" means a person who handles food utensils or who prepares, processes, or serves food or beverages for people other than members of their immediate household.

8 "Food allergic reaction" means an adverse health effect arising from a specific immune response that occurs reproducibly on exposure to a given food. The immune response can be severe and life-threatening.

9 "Anaphylaxis" means a life-threatening allergic reaction due to over-release of certain chemicals in the body resulting in shock when a person with an allergy is exposed to an allergen. Allergies to food, insect stings, medications, and latex, are most frequently associated with this type of severe response, and may include skin symptoms or swollen lips, difficulty breathing, reduced blood pressure, and gastrointestinal symptoms.

The **Major Food Allergens** that cause over 90% of all allergic reactions in people are these types of food:

- Milk
- Eggs
- Fish (such as bass, flounder, or cod)
- Crustacean shellfish (such as crab, lobster, or shrimp)
- Tree nuts (such as almonds, pecans, or walnuts)
- Wheat
- Peanuts
- Soybeans
- Sesame[10]

This guide includes example procedures, considerations, and resources that a food establishment can use to respond when someone notifies the food establishment about a food allergy or reports an allergic reaction. It also provides a framework for providing consumers accurate information about food ingredients so they can make informed decisions when ordering.

Although comprehensive, this guide might not provide everything that needs to be considered for a food allergy reaction and emergency response plan. It might also contain materials that are not relevant to every food establishment, so please consider internal procedures or standard operating procedures when using this material.

10 Sesame has been added to the list of Major Food Allergens via the FASTER Act of 2021, effective January 1, 2023.

A. Training

PURPOSE This is a framework to educate food handlers about (1) the Major Food Allergens – milk, egg, fish (such as bass, flounder, or cod), crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, soybeans, and sesame; and (2) other allergy and intolerance issues they may encounter.

Duties in food establishment (intensity of training increases with responsibility)

1. PIC - Person in Charge (PIC)[11]

Training should include

a) Definitions for food allergy, food intolerance/sensitivity, and CROSS-CONTACT[12].
b) List of the symptoms of a food allergic reaction, including anaphylaxis.
c) List of the Major Food Allergens in FDA's Food Code.
d) Dangers of food allergens and how to prevent cross-contact.
e) Using proper cleaning methods, such as wash, rinse, and sanitize, to prevent cross-contact.
f) How and when to communicate with consumers and staff about food allergens.
g) Special considerations related to food allergens for workstations and SELF-SERVICE[13] areas.
h) How to handle food allergy requests.
i) How to deal with food allergy emergencies.
j) Proper food preparation for guests with food allergies.
k) How to read a food LABEL[14] and understand the importance of food labels.
l) Personal hygiene practices to prevent cross-contact.
m) How to receive and store foods that contain Major Food Allergens to prevent cross-contact.

2. Front of house; wait staff, hostess/host, to-go personnel

Training should include

a) Definitions for food allergy, food intolerance/sensitivity, and cross-contact.
b) List of the symptoms of a food allergic reaction, including anaphylaxis.
c) List of the Major Food Allergens in FDA's Food Code.
d) How to handle food allergy requests.
e) How to deal with food allergy emergencies.

3. Back of house; Food handler *(as defined in FDA's Food Code)*

Training should include

a) List of the Major Food Allergens in FDA's Food Code.
b) Dangers of food allergens and how to prevent cross-contact.
c) Cleaning and personal hygiene practices to prevent cross-contact.
d) In-depth knowledge of MENU[15] items and preparation as it relates to assigned duties.
e) Proper food preparation for consumers with food allergies.
f) How to read a food label and understand the importance of food labels.

11 "Person in Charge (PIC)" means the person present at a food establishment who is responsible for the operation at the time of inspection.

12 "Cross-contact" means the unintentional transfer of an allergen from a food or food-contact surface containing an allergen to a food or food-contact surface that does not contain the allergen.

13 "Self-service" means areas where a food handler is not present to serve a consumer and the consumer is responsible for serving themselves. Examples: buffets, salad bars, sushi bars, or display cases.

14 "Label" means a display of written, printed, or graphic matter upon the immediate container of any article; and any word, statement, or other information that appears on the outside container or wrapper of the retail package.

15 "Menu" means all written and verbal lists of foods prepared and offered in a food establishment.

4. Understanding Labels

a) Manufacturers of PACKAGED FOOD[16] products that contain a Major Food Allergen are required by law to list that allergen on the product label – including if they are, or are a component of, a flavor, color, incidental additive, or spice (i.e., sesame paste).
b) There are several ways the allergen can be listed, so CONSUMERS[17] must read product labels carefully.
   i. The allergen may be listed in a 'Contains' statement.
   ii. If the product does not have a 'Contains' statement, consumers should review the entire ingredient list.
   iii. A 'may contain' or 'produced in a facility' marking is a voluntary, separate allergen advisory statement when there is a chance that a food allergen could be present. Anything labeled in this manner should be considered to have an allergen present.
c) Common allergens can have other names. For example, caseinates (in all forms), and whey (in all forms) are all milk proteins.
d) Although the same allergen can be present in multiple ingredients, its "food source name" (for example, milk), or common or usual name, must appear in the ingredient list just once to comply with LABELING[18] requirements.

SUPPLY CHAIN CONSIDERATIONS Manufacturers change their ingredients and production methods continually and without warning; it is especially important to read the ingredient label, and ingredient statement, for the presence of major food allergens with each shipment. Contact the manufacturer in advance if you have questions about food allergens that may be in a product.

e) Major food allergen labeling information can be found within:
   - FDA's "21 CFR 101", https://www.ecfr.gov/current/title-21/chapter-I/subchapter-B/part-101
   - USDA's "Allergens – Voluntary Labeling Statements," https://www.fsis.usda.gov/guidelines/2013-0010
   - USDA's **"**FSIS Compliance Guidelines: Allergens and Ingredients of Public Health Concern: Identification, Prevention and Control, and Declaration through Labeling," https://www.fsis.usda.gov/sites/default/files/import/Allergens-Ingredients.pdf

16 "Packaged" means bottled, canned, cartoned, bagged, or wrapped, whether packaged in a food establishment or a food processing plant. "Packaged" does not include wrapped or placed in a carry-out container to protect the food during service or delivery to the consumer, by a food handler, upon consumer request.

17 "Consumer" means a person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale.

18 "Labeling" means all labels and other written, printed, or graphic matter upon any article or any of its containers or wrappers or accompanying such article.

B. Food-Handling Policies & Practices to Help Consumers with Food Allergies

PURPOSE Example policies and practices are provided here that will reduce the risk of a consumer being exposed to a food allergen.

With food allergens, it is **very important** to avoid having **even small amounts** of an ingredient to which a consumer is allergic come into contact with their food, utensils, tableware, and packaging. The unintentional transfer of an allergen from a food or food-contact surface containing an allergen to a food or food-contact surface that does not contain the allergen is called **cross-contact**. Sometimes it is obvious when an allergy-causing ingredient has gotten into a food through cross-contact because the ingredient can be easily seen, but other times it is not obvious, and great care should be taken to avoid these situations.

Following these guidelines, which apply to **all food handlers** who come into contact with food, beverages, and any food preparation surface, can help consumers with allergies avoid potentially life-threatening allergic reactions.

Train relevant staff in the following procedures

1. Food & Ingredient Storage

a) **Label** and segregate unpackaged foods containing one or more of the Major Food Allergens away from each other, and store separately from other foods and ingredients. *Make sure to read ingredient labels to check for the presence of allergens before labeling and segregating.
b) Spills of any of the Major Food Allergens should be cleaned up immediately, following the usual cleaning procedures used in the food establishment. If any Major Food Allergen accidentally comes into contact with other food ingredients that do not contain that allergen, these ingredients should be excluded from use.

2. Self-Service Items

a) For food items that were made on site, **label** the food items, or place **signs** next to the food items, that clearly identify the presence of one or more of the Major Food Allergens, or keep ingredient lists on site that identify the presence of one or more of the Major Food Allergens.
b) Labels and signage should be in both English and Spanish, and/or other languages appropriate to either the establishment, or the geographic area.

3. Taking a Food Order

a) When a consumer informs staff they have a food allergy, intolerance, or sensitivity, immediately **notify** the Person in Charge (PIC) or designated person (manager, chef, or key employees).
b) Help the consumer **identify** menu items that contain ingredients to which they are allergic and offer suggestions for alternative menu items.
c) If no alternative menu options are available, politely **inform** the consumer.
d) If it is possible to **modify** a menu item so that it does not include ingredients the consumer must avoid, inform the consumer, and ask if the modification would suit their needs.
e) **Verify** with the food handler that the proposed menu item modification is possible, feasible, and can be done safely for the consumer.
f) Make a **note** on the consumer's order that they have a food allergy/intolerance/sensitivity and which ingredients they must avoid so that other food handlers are aware.

4. Preparing a Food Order

a) Thoroughly clean all areas and equipment that will be used for preparing the allergic consumer's meal, even if those areas had already been cleaned for normal use.
b) Wash hands thoroughly before preparing the allergic consumer's meal. In some situations it may be necessary to change apron/chef coat, if previously soiled with potential allergens.
c) Use dedicated equipment or physically separate products to prevent cross-contact.

i. Use color-coded or specially marked supplies, uniforms, equipment, and utensils designated for preparing allergen-free meals.
ii. Avoid using the same cooking medium (e.g., oil or water) and surface (e.g., grill, prep table) when handling ingredients with and without allergens.

d) Use ingredients that do not contain the allergen(s) to which the consumer is allergic. Check ingredient labels for packaged foods.
e) Prepare food in a manner that eliminates cross-contact. All preparation, including garnishes, should be done by only one food handler who is dedicated to ensuring the meal is allergen-free, and who is not preparing other consumers' meals at the same time.

i. **If a mistake is made**, and an ingredient to which the consumer is allergic is accidentally included in the meal, it is **not sufficient** to simply remove the offending ingredient, because cross-contact will have occurred. In case this happens, **re-make** the consumer's meal.
ii. Wash your hands with soap and water before continuing preparation to avoid potential, or additional, cross-contact.

f) Cover the meal with a clean lid to prevent cross-contact and mark the meal as "allergy" so other staff are aware.
g) Notify the PIC, or designated food handler once the allergen-free meal is prepared and ready for service.
h) Wash, rinse, and store special equipment for allergen-free meals to be ready for next use.
i) Wash your hands with soap and water before touching anything else if you have handled a food allergen.

5. Delivering a Food Order

a) Verify with the food handler who prepared the meal that it does not contain the allergen specified by the consumer.
b) Ensure no cross-contact with other meals occurs during transport of the meal to the consumer.
c) Use a separate meal tray to deliver the meal.
d) VERIFY with the consumer that the meal meets their needs.
e) Discard the meal and offer to re-make it for the consumer if the meal contains ingredients to which the consumer is allergic. **Notify** the PIC. **Review** procedures and **retrain** the food handler(s) who prepared and handled the meal on these procedures **before** allowing them to re-make the consumer's meal.

C. Tools to Notify Consumers about Major Food Allergens

PURPOSE The purpose of this guidance is to provide examples of how to give consumers accurate information about food ingredients that are, or that contain, Major Food Allergens so they can make informed decisions when ordering. Giving incorrect or incomplete information can put consumers at risk for allergic reactions.

Consumers with food allergies depend on accurate allergen information when deciding what to eat. It is most effective to tell the consumer both verbally and in writing (e.g., on labels and menus) about the presence of food allergens and the risks of cross-contact.

1. Food Allergens in Menu Items & Self-Served Food[19] Items

a) Review your menu and source ingredients.
b) Use a table (see "Figure 1: Example Food Allergen Matrix" below), listing each menu item and noting the presence of major food allergens including all ingredients such as egg washes, sauces, garnishes, etc. Remember, a food might have more than one allergen.
c) Print "Figure 2. Allergen Matrix – Major Food Allergens Present in Menu Items" (following page) and use it for staff and consumers.
d) Assign a person in charge to regularly, at least once a year, review the food allergen table and update it as needed to verify the ingredients have not changed. Review and update when ingredients, suppliers or processes have changed, and/or a new item has been added to the menu. Consider off-menu items, seasonal and specialty items.
e) Have accessible the full list of ingredients for menu items for consumers with allergies or intolerances beyond the top nine. Consumers may be allergic to ingredients beyond the Major Food Allergens, like gluten. Understanding the full list of ingredients may help you better assist these consumers.

2. Create a Food Allergen Matrix *(based upon your current menu items)*

Figure 1. Example Food Allergen Matrix

Food Items*		Major Food Allergens								
		Egg	Fish	Milk	Peanut	Sesame	Shellfish	Soybean	Tree Nut	Wheat
Breads or Breaded	Bagels	X		X		m		m		
	Gluten Free biscuit	X		X				m	m	
	Sourdough bread									
	Croutons	X		m		m			m	
	Onion rings	X		X						
	Chicken nuggets	X						m		
	Mac and cheese	X		X						
Cheese	American			X						
	Provolone			X						
	Cheddar			X						
	Peanut oil in fryer				X			X		
Lettuce Salad	no Dressing									
	with Dressing	X		X				X		

"X" Contains this allergen.

"m" May contain this allergen or is processed in a facility with this allergen.

19 "Self-served food" means Restaurant-type food that is available at a salad bar, hot food bar, buffet line, cafeteria line, or similar self-service facility, and is served by the consumers themselves. Self-service food also includes self-service beverages, such as drinks dispensed from a soda fountain and coffee available on a self-service basis

Figure 2. Allergen Matrix[20]

Major Food Allergens Present in Menu Items

Food Items *	Major Food Allergens									Other Components			
	Egg	Fish	Milk	Peanut	Sesame	Shellfish	Soybean	TreeNut	Wheat				

"X" Contains this allergen.
"m" May contain this allergen or is processed in a facility with this allergen.
** Include off-menu items, seasonal and specialty items.*

Created on:_____ Reviewed on:_____ Next review:_____

20 A table such as this could be customized for gluten-free and other food intolerances and sensitivities by utilizing the “Other Components” column.

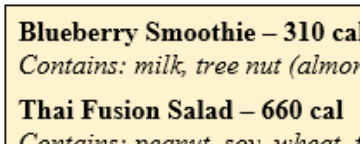
3. Menus & Signage

Design and update existing menus (including those for online ordering, catering, specials, and take-out) to ensure names and descriptions of **all** food items include Major Food Allergens present in each food. For example:

a) Have signage to notify consumers and food handlers an allergen menu exists.
b) Next to each menu item, include text to specify allergens (e.g., *Contains egg, milk*).
c) Use images (or "icons") of food allergens next to menu items where they are present. Include a key so consumers know what the icons represent. Links to websites with pre-made icons are included below.

Figure 3. Examples of notifications

Example 1: In-menu allergen notification.



Example 2: Allergen icons.

4. Talk with Consumers

a) Encourage staff to **ask consumers** about any food allergies they might have.
b) **Provide a list** of menu items and their ingredients for food handlers and consumers as a reference.
c) **Appoint at least one trained food handler per shift** to respond to consumer requests and questions about food allergens.

5. Other Ways to Inform Consumers

a) **Static clings** on display cases provide Major Food Allergen information in consumer view. **Tags or tents** next to food items also work well.
b) **Counter cards, table-talkers, or signs** at the point-of-sale or pick-up to inform consumers.
c) Consider **placing a sign in a prominent location**, when contact with a Major Food Allergen is possible or unavoidable (e.g., French fries prepared in the same fryer as breaded [wheat-containing] items).
d) **Websites** where you can find graphics and other icons for food allergens include:

i. International Association for Food Protection (IAFP) Food Allergen Icons
https://www.foodprotection.org/resources/food-allergen-icons/
ii. StateFoodSafety Allergen Icons
https://drive.google.com/drive/folders/1z_Ie5yxvWq5vFLnWnR7FeIXZDQePhygI?usp=sharing
iii. Erudus Food Allergy Icons
https://erudus.com/standardised-food-allergy-icons/

D. Food Allergy Reaction & Emergency Response Guide

PURPOSE This section is to serve as a resource for food establishments when writing a food allergy reaction and emergency response plan. This guide includes example procedures, considerations, and resources that a food establishment can use to respond when someone reports an allergic reaction. Although this section was written specifically for food allergies, some parts are applicable to reactions caused by other exposures, such as bee stings. Example informational posters are included for you to use within your food establishment.

1. What an allergic reaction may look like

Allergies are complex and allergic reactions can vary from person to person.

Allergic reactions can present in many ways. Food allergic reactions vary in severity, from mildly itchy skin and lip swelling to severe, life-threatening symptoms (anaphylaxis) and death. Some signs and symptoms only affect one part of the body (for example, hives around the mouth). Some signs and symptoms mean that multiple areas of the body are affected (for example, dizziness).

Even within the same person, reactions can differ from food-to-food and day-to-day. For example, a person might experience itching around the mouth after eating an almond, but they could have difficulty breathing and require emergency care after eating a peanut. Even reactions to the same food on different eating occasions can cause different symptoms in the same person.

Different people, including children, experience different symptoms too. For example, not everyone experiences nausea or diarrhea during a reaction. Likewise, it is possible to have a severe life-threatening reaction (anaphylaxis) without any skin symptoms, such as a rash or hives.

2. Allergic reactions in children and adolescents

Children can experience serious food allergic reactions, with an alarming number of fatal anaphylactic reactions occurring during adolescence. Milk, egg, wheat, and soy allergies are more common in childhood than adulthood.

Children can have difficulty communicating what they are experiencing during a reaction. Some children put their hands in their mouths or scratch at their tongues. Their voices may change (for example, becoming hoarse or squeaky), and they might slur their words.

3. If someone reports an allergic reaction

These are **examples** of potential actions to take when a person reports an allergic reaction. Procedures may differ depending on the severity of the reaction. Food establishments should evaluate their need for internal procedures or additional steps. based on corporate policies or other circumstances.

*** When in doubt, call 911 ***

a) Clearly direct one person to dial 911 and report an allergic reaction.
b) Follow the directions of emergency services personnel and the food establishment's food allergy emergency response plan.

4. Epinephrine auto-injectors

a) What is an auto-injector?
EPINEPHRINE AUTO-INJECTORS[21] are medical devices for injecting a measured dose of epinephrine directly into a person experiencing an allergic reaction. The devices are designed to be given through clothing. Multiple brands of auto-injectors are available in the United States, and other countries, and may look slightly different. In the U.S., you cannot buy an epinephrine auto-injector unless you have a prescription from a health care provider. Food establishments will not be able to stock an auto-injector for general use.
Epinephrine auto-injectors have specific directions for use printed directly on the device. **Always follow the instructions printed on the auto-injector**. Always call emergency services when an auto-injector needs to be administered, as a relapse is possible.

b) Here are some example images of what an epinephrine auto-injector might look like; not all auto-injectors will look like these.

Figure 4. Examples of Epinephrine auto-injectors (EAIs)

5. Additional considerations for the food establishment

The following questions and scenarios may be used to develop a detailed food allergy reaction and emergency response plan and/or can be used as a practice drill. Not all questions and scenarios will apply to a food establishment and some food establishments might have additional questions to consider.

a) What ingredient information will be provided to a consumer if they ask? Will this information be written or verbal?

i. If a person experiences a reaction, their first question will be if the allergen was present in any of the food(s) they ate.

b) The exact numbers to dial to reach emergency services should be clearly posted by all telephones.

i. Is there an additional number to dial or extra step to get an outside line?

c) Each person should be aware of any role they play during an emergency. You may consider who will:

i. Be the primary person in charge and ensure each person is performing their duties.

21 A device for injecting oneself with a single, preloaded dose of a drug. The device typically consists of a spring-loaded syringe activated when the device is pushed firmly against the body.

ii. Call emergency services and relay information.
iii. Direct and meet emergency medical services? Are there clear instructions available on how to find the food establishment?
iv. Interact with and physically assist the consumer, if necessary.
v. Keep the area around the person experiencing the reaction clear.

d) Will the food establishment keep any allergy-specific supplies (for example, antihistamines or itch creams) on hand? If yes, when will they be used?

REMINDER Epinephrine is the only medication that can treat a severe allergic reaction and must be prescribed by a health care provider.

e) Will staff have permission to search a person's belongings for an epinephrine auto-injector if they are unable to assist?
f) Can staff administer epinephrine auto-injectors? If yes, which people have permission?
g) Is there an automated external defibrillator ("AED") available? If yes, are staff trained to use it?
h) What are the procedures if the person experiencing a reaction does not want to call an ambulance? If the person leaves before the ambulance arrives, who will pay for any charges incurred?
i) Is there a debriefing and/or reporting requirement after the incident? If yes, include those steps in the allergic reaction response plan.
j) Modify the response plan, as necessary, to better prepare for future incidents.

6. Examples of Posters *(that can be placed within your food establishment to support food allergy preparedness and emergencies)*

E. Equal Consideration for Other Community Food Sources

Other community food sources provide healthy, nutritious food to those in need. For individuals with food allergies, it can be difficult to find safe foods. People with food allergies may need additional support and it is important to consider the food sources' ability to do the following:

- Have at least one well-trained person that is available to speak with those who have allergy concerns. It is important to identify foods that do not contain *at least* the Major Food Allergens so appropriate suggestions can be made.
- Allow consumers the opportunity to review original food packaging so they can read the labels. Know the importance of reading every label, every time, as ingredients can change without warning.
- Make sure staff understand the dangers of cross-contact and how to avoid it. Find out what procedures are in place to avoid cross-contact in the storage and/or preparation of food, if it is being prepared on site, so it can be shared readily.
- If food is cooked and/or served on the premises, be sure workers knows how to recognize the signs and symptoms of anaphylaxis and what the protocols are for a food-allergic emergency.

When offering foods/meals to large groups, encourage preparation of meals that are free of the Major Food Allergens.

- If foods or meals with food allergens are served, provide materials (e.g., signage, labels, tags, tents) in prominent and visible locations to inform consumers.
- While most sections of this document are applicable to both food service venues as well as other community food sources, special attention should be paid to the understanding of how allergens are listed on food labels and the availability of food label information.

Food Sources During an Emergency and Disaster Preparedness

Whether an earthquake, hurricane or wildfire, natural disasters, in addition to man-made ones, can happen at any time, often with little notice. Establish procedures for accessing allergen-friendly foods during an emergency. A crisis is never a time to experiment with a new food or product.

Fig

Food Allergy Reactions

Nine Major Food Allergens

- Milk
- Eggs
- Fish
- Shellfish
- Tree nuts
- Peanuts
- Wheat
- Soybeans
- Sesame

Symptoms of a Severe Allergic Reaction

LUNG
Short of breath, wheezing, repetitive cough

HEART
Pale, blue, faint, weak pulse, dizzy

THROAT
Tight, hoarse, trouble breathing/ swallowing

MOUTH
Significant swelling of the tongue and/or lips

SKIN
Many hives over body, widespread redness

GUT
Repetitive vomiting, severe diarrhea

OTHER
Feeling something bad is about to happen, anxiety, confusion

OR A COMBINATION
of symptoms from different body areas.

FOR **MILD SYMPTOMS** FROM **MORE THAN ONE** SYSTEM AREA, GIVE EPINEPHRINE.

If someone is having a SEVERE ALLERGIC REACTION…

INJECT EPINEPHRINE IMMEDIATELY

Follow the instructions on the device.

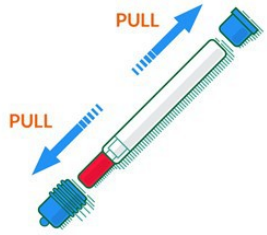
CALL 911

Tell them the individual is having an allergic reaction.

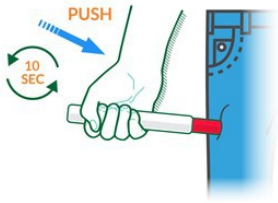
LAY them down.

If breathing is difficult or they are vomiting, let them sit up or lie on their side.

STEP 1. Prepare the epinephrine auto injector for injection by following the instructions on the device.



STEP 2. Administer the injection by firmly push the needle into the leg until a click is heard or felt. Hold the device there.



Written allergic reaction response plan is can be found here: _____

Adapted from Michigan Department of Agriculture and Rural Development, Michigan Restaurant Association, https://www.foodallergy.org/living-food-allergies/food-allergy-essentials/food-allergy-anaphylaxis-emergency-care-plan, and https://www.fda.gov/food/food-labeling-nutrition/food-allergies

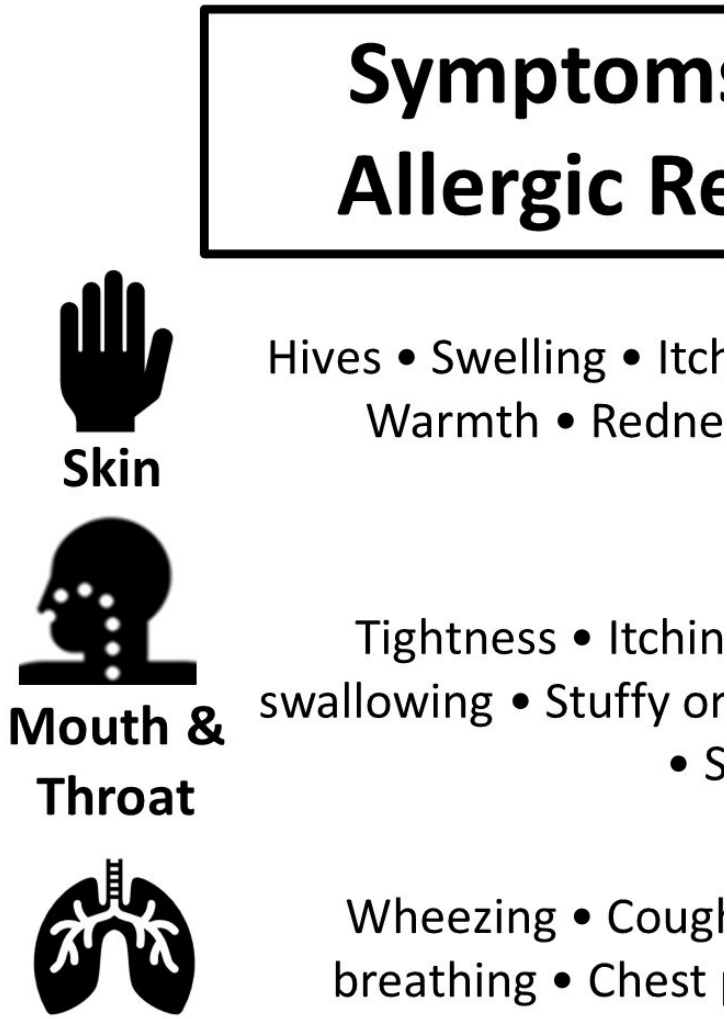


Figure 6. Symptoms of an Allergic Reaction

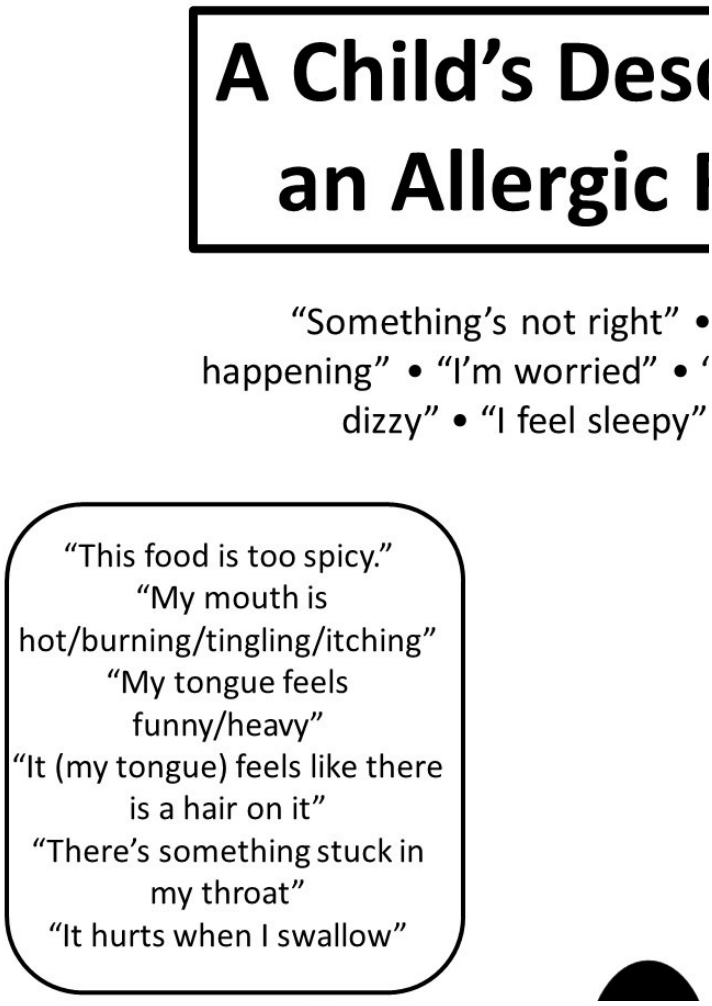

Figure 7. A Child's Description of an Allergic Reaction

Figure 8. Food Allergy Aware - Six that save lives

FOOD ALLERGY AWARE

SIX THAT SAVE LIVES

1

The Symptoms

Signs of a serious food allergy reaction – known as anaphylaxis – are 2 or more of the following after eating a suspect food:

- Hives, itching and/or skin redness
- Swelling of the tongue, lips or throat
- Breathing difficulty, wheezing or coughing
- Stomach cramps or vomiting or diarrhea
- Feeling faint / drop in blood pressure (If only this 1 symptom, it is still anaphylaxis.)

2

In Anaphylaxis: Use the auto-injector right away. Call 911 and report a food allergy emergency.

Epinephrine shots are given via the auto-injector to the outer thigh muscle. This is considered a very safe drug. Antihistamines are acceptable as secondary medication only. They won't halt anaphylaxis. Allergists say: err on the side of using the auto-injector.

3

Time is of the Essence

In studies of those who have died of anaphylaxis, they did not receive an epinephrine injection, or they got it too late, after a reaction had progressed. In anaphylaxis, prompt use of the shot is always essential.

4

Go to the Hospita

A person who had an eme epinephrine shot must be to hospital for observation. transport, IF symptoms ha improved within 10 to 15 n a second auto-injection s be given.

5

Reclining is Best

During the ambulance r the person having the se reaction should be lying d with the legs raised (this im blood flow). NIAID guidel recommend the patient re oxygen and IV fluid.

6

Don't Go It Alone

No person should be exp to be fully responsible fo administration of an epine auto-injector. Assistance anaphylaxis is crucia

From allergicliving.com. Based on guidelines from NIAID and the Canadian Society of Allergy and Clinical Immunology.

Definitions

Anaphylaxis
A life-threatening allergic reaction due to over-release of certain chemicals in the body resulting in shock when a person with an allergy is exposed to an allergen. Allergies to food, insect stings, medications, and latex, are most frequently associated with this type of severe response, and may include skin symptoms or swollen lips, difficulty breathing, reduced blood pressure, and gastrointestinal symptoms.

Consumer
A person who is a member of the public, takes possession of food, is not functioning in the capacity of an operator of a food establishment or food processing plant, and does not offer the food for resale.

Cross-contact
The unintentional transfer of an allergen from a food or food-contact surface to a food or food-contact surface that does not contain the allergen.

Epinephrine auto-injector
A device for injecting oneself with a single, preloaded dose of a drug. The device typically consists of a spring-loaded syringe activated when the device is pushed firmly against the body.

Food allergic reaction
An adverse health effect arising from a specific immune response that occurs reproducibly on exposure to a given food. The immune response can be severe and life-threatening.

Food allergy
The reaction of the body's immune system to certain proteins in food. Reactions can vary in severity from mild symptoms involving hives and lip swelling to severe, life-threatening symptoms, called anaphylaxis, which may involve shock and fatal respiratory problems.

Food establishment
An operation that (a) stores, prepares, packages, serves, vends food directly to the consumer, or otherwise provides food for human consumption such as a restaurant; satellite or catered feeding location; catering operation if the operation provides food directly to a consumer or to a conveyance used to transport people; market; vending location; institution; or food bank; and (b) relinquishes possession of food to a consumer directly, or indirectly through a delivery service such as home delivery of grocery orders or restaurant takeout orders, or delivery service that is provided by common carriers.

Food handler
A person who handles food utensils or who prepares, processes, or serves food or beverages for people other than members of his or her immediate household.

Food intolerance/sensitivity
An adverse reaction to a substance in food that does not involve the immune system, e.g., the inability to process or breakdown a certain food such as the milk sugar lactose which can lead to discomfort or have ill effects.

Label
A display of written, printed, or graphic matter upon the immediate container of any article; and any word, statement, or other information that appears on the outside container or wrapper of the retail package.

Labeling
All labels and other written, printed, or graphic matter upon any article or any of its containers or wrappers or accompanying such article.

Major Food Allergen
The allergens in foods that cause over 90% of allergic reactions: milk, egg, fish (such as bass, flounder, or cod), Crustacean shellfish (such as crab, lobster, or shrimp), tree nuts (such as almonds, pecans, or walnuts), wheat, peanuts, sesame, and soybeans.

Menu
All written and verbal lists of foods prepared and offered to consumers.

Other community food sources
Food sources that are made available to the public on a need basis, e.g., food bank, food shelf, food pantry.

Packaged food
"Packaged" means bottled, canned, cartoned, bagged, or wrapped, whether packaged in a food establishment or a food processing plant. (2) "Packaged" does not include wrapped or placed in a carry-out container to protect the food during service or delivery to the consumer, by a food handler, upon consumer request.

Person in Charge (PIC)
The person present at a food establishment who is responsible for the operation at the time of inspection.

Self-served food
Restaurant-type food that is available at a salad bar, hot food bar, buffet line, cafeteria line, or similar self-service facility, and is served by the consumers themselves. Self-service food also includes self-service beverages, such as drinks dispensed from a soda fountain and coffee available on a self-service basis.

Self-service
Areas where a food handler is not present to serve a consumer and the consumer is responsible for serving themselves, such as at a buffet, salad bar, sushi bar, or display case.

Train relevant staff in the following procedures:

1. Food & Ingredient Storage

a) Label and segregate unpackaged foods containing one or more of the Major Food Allergens away from each other, and store separately from other foods and ingredients. *Make sure to read ingredient labels to check for the presence of allergens before labeling and segregating.

b) Spills of any of the Major Food Allergens should be cleaned up immediately, following the usual cleaning procedures used in the food establishment. If any Major Food Allergen accidentally comes into contact with other food ingredients that do not contain that allergen, these ingredients should be excluded from use.

2. Self-Service Items

a) For food items that were made on site, label the food items, or place signs next to the food items, that clearly identify the presence of one or more of the Major Food Allergens, or keep ingredient lists on site that identify the presence of one or more of the Major Food Allergens.

b) Labels and signage should be in both English and Spanish, and/or other languages appropriate to either the establishment, or the geographic area.

3. Taking a Food Order

a) Encourage staff to ask consumers about any food allergies they might have.

b) When a consumer informs staff they have a food allergy, intolerance, or sensitivity, immediately notify the Person in Charge (PIC) or designated person (manager, chef, or key employees).

c) Provide a list of menu items and their ingredients for food handlers and consumers as a reference.

d) Help the consumer identify menu items that contain ingredients to which they are allergic and offer suggestions for alternative menu items.

e) If no alternative menu options are available, politely inform the consumer.

f) If it is possible to modify a menu item so that it does not include ingredients the consumer must avoid, inform the consumer, and ask if the modification would suit their needs.

g) Verify with the food handler that the proposed menu item modification is possible, feasible, and can be done safely for the consumer.

h) Make a note on the consumer's order that they have a food allergy/intolerance/sensitivity and which ingredients they must avoid so that other food handlers are aware.

4. Preparing a Food Order

a) Thoroughly clean all areas and equipment that will be used for preparing the allergic consumer's meal, even if those areas had already been cleaned for normal use.

b) Wash hands thoroughly before preparing the allergic consumer's meal. It is necessary to change apron/chef coat, if previously soiled with potential allergens.

c) Use dedicated equipment or physically separate products to prevent cross-contact.

   i. Use color-coded or specially marked supplies, uniforms, equipment, and utensils designated for preparing allergen-free meals.

   ii. Avoid using the same cooking medium (e.g., oil or water) and surface (e.g., grill, prep table) when handling ingredients with and without allergens.

d) Use ingredients that do not contain the allergen(s) to which the consumer is allergic. Check ingredient labels for packaged foods.

e) Prepare food in a manner that eliminates cross-contact. All preparation, including garnishes, should be done by only one food handler who is dedicated to ensuring the meal is allergen-free, and who is not preparing other consumers' meals at the same time.

   i. If a mistake is made, and an ingredient to which the consumer is allergic is accidentally included in the meal, it is not sufficient to simply remove the offending ingredient, because cross-contact will have occurred. In case this happens, re-make the consumer's meal.

   ii. Wash your hands with soap and water before continuing preparation to avoid potential, or additional, cross-contact.

f) Cover the meal with a clean lid to prevent cross-contact and mark the meal as "allergy" so other staff are aware.

g) Notify the PIC, or designated food handler once the allergen-free meal is prepared and ready for service.

h) Wash, rinse, and store special equipment for allergen-free meals to be ready for next use.

i) Wash your hands with soap and water before touching anything else if you have handled a food allergen.

5. Delivering a Food Order

a) Verify with the food handler who prepared the meal that it does not contain the allergen specified by the consumer.

b) Ensure no cross-contact with other meals occurs during transport of the meal to the consumer.

c) Use a separate meal tray to deliver the meal.

d) VERIFY with the consumer that the meal meets their needs.

e) Discard the meal and offer to re-make it for the consumer if the meal contains ingredients to which the consumer is allergic. Notify the PIC. Review procedures and retrain the food handler(s) who prepared and handled the meal on these procedures before allowing them to re-make the consumer's meal.

6. If someone reports an allergic reaction

*** When in doubt, call 911 ***

a) Clearly direct one person to dial 911 and report an allergic reaction.

b) Follow the directions of emergency services personnel and the food establishment's food allergy emergency response plan.

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME **Committee for the Evaluation of Intended Use Hazards during Retail Meat Grinding**

DATE OF FINAL REPORT: *12/5/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☐ ***Council II*** ☒ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Hilary Thesmar, FMI and Ellen Shumaker, NCSU

COMMITTEE CHARGE(S):

Issue # 2020 III-015

1. Evaluate prior developed 'CFP Beef Grinding Log Template Guidance Document' to consider inclusion of information for the prevention of common hazards known to be associated with grinding processes:
   A.) "Intended Use" policy, purpose, and control measures including supply chain communication.
   B.) Examples of common control measures, such as supplier guarantees or certificates of analysis and ongoing verification;
   C.) Reference to FSIS guideline for minimizing STEC in Raw Beef Processing Operations (https://www.fsis.usda.gov/guidelines/2021-0007)
2. Consider developing educational materials (e.g., handout(s) to support grinding log assessment by regulatory authorities, industry personnel, and the public. Examples may include:
   A.) Educational fact sheets detailing hazards represented by the non-intact handling of beef intended for whole intact use;
   B.) Plain language explanations of "Intended Use" policy purpose.
3. Evaluating potential changes to the Food Code to address the hazards associated with establishments grinding of beef that is manufactured as "Intended for Intact Use".
4. Determining appropriate mechanisms for sharing the committee's work, and
5. Reporting progress back to the next Biennial Meeting in 2023 and the committee's findings and recommendations may be presented at the subsequent Biennial Meeting if necessary.

COMMITTEE WORK PLAN AND TIMELINE:

The committee was established in October 2021 and began work on the charges in early November 2021. The committee completed charge 1 and began work on charges 2 and 3.

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***

   The committee held calls via MS Teams every two weeks. Calls dates were 11/2/2021, 11/16/2021, 11/30/2021, 12/14/2021, 1/11/2022, 1/25/2022, 2/8/2022, 2/22/2022, 3/8/2022, 3/22/2022, 4/5/2022, 4/19/2022, 5/3/2022, 5/17/2022, 5/31/2022, 6/14/2022, 6/28/2022, 7/19/2022, 8/23/2022, 9/6/2022.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a. Charge 1- Guidance document was created and is complete
   b. Charge 2 – The committee considered developing educational material and determined that the committee lacked the qualifications and experience to develop educational materials. The committee had expertise in food safety management and mitigation of risk. The committee focused on the guidance document and encouraged food safety education experts to draft educational material based on the content in the guidance document.
   c. Charge 3 – The committee spent considerable time contemplating potential food code language changes and determined that the FDA Food Code Annex 2 section K is the appropriate location for the guidance document and to provide resources for regulatory officials and the industry. Recommending language in the Food Code was contemplated and many committee members expressed concern about the confusion with multiple agencies having regulatory authority as well as concerns about local and state resources to train regulatory officials appropriately. For all of these

reasons, the committee agreed that the FDA Food Code Annex 2 section K is the appropriate place for the reference to the guidance document.

d. Charge 4 – The committee recommends that the guidance document be posted on the CFP website for access by CFP stakeholders.
e. Charge 5 – Completed report and guidance document for CFP website

3. ***Charges INCOMPLETE and to be continued to next biennium:***

none

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***
☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

Issue #1: Report – Committee Name:
Committee for the Evaluation of Intended Use Hazards - Issue 1- Committee Report

1. Charge of the Committee

Council III of the Conference for Food Protection (CFP) formed the Evaluation of Intended Use Hazards during Retail Meat Grinding committee with the directive to:

1.) Evaluate prior developed 'CFP Beef Grinding Log Template Guidance Document' to consider inclusion of information for the prevention of common hazards known to be associated with grinding processes

A.) "Intended Use" policy, purpose, and control measures including supply chain communication

B.) Examples of common control measures, such as supplier guarantees or certificates of analysis and ongoing verification

C.) Reference to FSIS guideline for minimizing STEC in Raw Beef Processing Operations (https://www.fsis.usda.gov/guidelines/2021-0007)

2.) Consider developing educational materials (e.g., handout(s) to support grinding log assessment by regulatory authorities, industry personnel, and the public. Examples may include:

A.) Educational fact sheets detailing hazards represented by the non-intact handling of beef intended for whole intact use

B.) Plain language explanations of “Intended Use” policy purpose.

3.) Evaluating potential changes to the Food Code to address the hazards associated with establishments grinding of beef that is manufactured as “Intended for Intact Use”.

4.) Determining appropriate mechanisms for sharing the committee's work, and

5.) Reporting progress back to the next Biennial Meeting in 2023 and the committee's findings and recommendations may be presented at the subsequent Biennial Meeting if necessary.

2. Introduction

This committee was charged with enhancing the Conference for Food Protection (CFP) "Guidance Document for the Production of Raw Ground Beef at Various Types of Retail Food Establishments"[1] to include information on how retail food establishments can prevent common hazards associated with beef grinding processes.

Shiga toxin-producing *Escherichia coli* (STEC) is estimated to cause 265,000 illnesses in the US annually, including 3,600 hospitalizations and thirty deaths. To date, at least four outbreaks have been associated with beef ground at retail that was not intended for grinding (e.g., trim from intact steaks or roasts, and "pull backs"). Inadequate grinding records and insufficient sanitation between source lots at retail have hindered public health investigators' ability to determine the ultimate source of the implicated beef.

After reviewing the 2014 CFP beef-grinding document, the United States Department of Agriculture, Food Safety Inspection Service (USDA, FSIS) guidance documents and beef supplier risk elimination program presentations, the committee proposes the following changes and additions to the guidance document including:

1. Definition of "Intended Use", its purpose and regulations,
2. Beef product examples in both categories (intended and not intended to be ground) and what risk is associated with each,
3. Recommended common control measures that can be done in a retail setting to reduce risk, such as supplier communication.

The Committee agreed that creating educational materials was out of the scope of the committee and should be created by experts in education based on the needs of their communities following the release of this guidance document.

This document is intended to be guidance for retail food establishments that grind beef and to assist with creating protocols and training materials for their establishments. The recommendations are not intended to replace, or otherwise serve as, the rules and regulations applicable to food establishments in any given federal, state, local or tribal jurisdiction. Please refer to the appropriate inspection authority in your jurisdiction for further guidance. Inspectors often have deep expertise and can assist with food safety management programs and compliance with existing regulations.

[1] CFP Beef Grinding Log Committee. "Guidance Document for the Production of Raw Ground Beef at Various Types of Retail Food Establishments". Conference for Food Protection. 2012-2014. Available from: http://www.foodprotect.org/guides-documents/cfp-beef-grinding-log-template-guidance-document/.

3. Definitions

Note – These definitions generally represent terms used in retail establishments. When multiple definitions are available from regulatory agencies applicable to retail establishments, references are provided.

Active Managerial Control
Active managerial control means the purposeful incorporation of specific actions or procedures by industry management into the operation of their business to attain control over foodborne illness risk factors. It embodies a preventive rather than reactive approach to food safety through a continuous system of monitoring and verification.[2]

Batch/Set
An identified quantity of beef that is ground based on specific attributes, such as percent lean, which will all be labeled as the same product.

Bench Trim
Product derived from cattle not slaughtered at the establishment.[3] In retail establishments with meat cutting operations, bench trim is generated in store. (Retailers tend to use the terms bench trim and trim interchangeably)

Chub
Rolls of ground beef that have been packaged to keep air out.[4] Chubs come in a variety of packaged sizes.

Customer requested grinding
As a service to customers, retailers may offer grinding of a cut of beef selected by the customer from the service case or packaged product that was not originally intended to be ground. This product is subject to the recordkeeping requirements for ground beef.

Grind Cycle
The amount of ground beef (measured by quantity and/or time) for one **lot** of product as documented by complete sanitation cycles. A grind cycle may include multiple batches/sets within a sanitation cycle.

Ground Beef
Chopped fresh and/or frozen beef or veal with or without seasoning and without the addition of beef fat as such, will not contain more than 30% fat, and shall not contain added water, phosphates, binders, or extenders.[5]

[2] 2017 FDA Food Code Annex, page 551.
[3] FSIS Directive 10,010.1. Available from: https://www.fsis.usda.gov/sites/default/files/media_file/2020-07/10010.1.pdf

[5] *9 CFR 319.15a*

Intact Meat
A cut of whole muscle(s) meat that has not undergone comminution, mechanical, tenderization, vacuum tumbling with solutions, or reconstruction, cubing or pounding.[6]

Intended Use
How the federal establishment (producer) intends the product to be safely consumed or if further processing or further controls are needed. *9 CFR 417.2(a)(2)* requires each establishment to identify the intended use or consumers of the finished product. The product's intended use may affect the **STEC** controls in place at both the shipping and receiving establishments. Establishments that purchase beef from slaughter establishments should be aware of the slaughter establishment's intended use for the specific products they receive. [7]

Lot
For the purposes of FSIS requirements in *9 CFR 320.1(b)(4),* a lot is defined as the amount of raw ground beef produced during particular dates and times, following clean-up and until the next clean-up, during which the same source materials are used.[8]

Lot code
Defined volume or timeframe of finished product.

Non-Intact
Non-intact beef products include: ground beef; chopped beef; flaked or, minced product; beef that is vacuum tumbled with solutions; beef that an establishment has mechanically tenderized by needling (including injecting with solutions), cubing, pounding devices (with or without marinade); beef that an establishment has reconstructed into formed entrees; beef with proteolytic enzymes applied; and diced beef less than ¾ inch (dial setting) in any one dimension on average.[9]

Mechanically tenderized (non-intact)
Manipulating meat by piercing with a set of needles, pins, blades or any mechanical device, which breaks up muscle fiber and tough connective tissue, to increase tenderness. This includes INJECTION, scoring, and processes which may be referred to as "blade tenderizing," "jaccarding," "pinning," or "needling."[10,11]

[11] Federal Register Vol. 80, No. 95 Monday, May 18, 2015 (p. 28153-28172) Descriptive Designation for Needle- or Blade-Tenderized (Mechanically Tenderized) Beef Products.

Primal cut
From FDA Food Code: A basic major cut into which carcasses and sides of meat are separated, such as a beef round, pork loin, lamb flank, or veal breast.[12]

From FSIS: Primal parts are the wholesale cuts of carcasses as customarily distributed to retailers. The round, flank, loin, rib, plate, brisket, chuck, and shank are primal parts of beef carcasses. Veal, mutton, and goat primal parts are the leg; flank, loin, rack, breast, and shoulder.[13] *(For the purpose of this document, only beef and veal are in scope.)*

Production Cycle
Consists of one or more **Grind Cycles.**

Production Log
Documents used to facilitate or supplement the recordkeeping requirement for ground beef. Some retailers find it helpful to maintain a production log that contains additional details on timing and products used to help with internal records. Production logs are not required in the FSIS regulation on recordkeeping, and do not take the place of the official records required by FSIS. See Appendix for a sample production log.

Pull backs
Retail packaged cuts, such as steaks or roasts, removed from the self- service refrigerated display cases and either reworked into smaller cuts, such as stew beef or cube steak, or ground product. “Pull-backs” can be ground separately but are sometimes co-mingled with in-store produced bench trim.

Recordkeeping requirements for beef (grinding log)
FSIS finalized a rule on December 21, 2015, requiring additional records be kept for establishments and retailers grinding beef. The rule is titled “Records to Be Kept by Official Establishments and Retail Stores That Grind Raw Beef Products.” [14]

Re-work
Changing the form of a meat or poultry cut by reprocessing it down into smaller pieces or transformed to a different product to maximize shelf life.

FDA Definition: Rework means clean, unadulterated food that has been removed from processing for reasons other than insanitary conditions or that has been successfully reconditioned by reprocessing and that is suitable for use as food.[15]

[12] U.S. Department of Health and Human Services, U.S. Food and Drug Administration. FDA Food Code. 2017.
[13] *9 CFR 316.9(b).*
[14] Records To Be Kept by Official Establishments and Retail Stores That Grind Raw Beef Products. *Federal Register*.2015. Available from: https://www.federalregister.gov/documents/2015/12/21/2015-31795/records-to-be-kept-by-official-establishments-and-retail-stores-that-grind-raw-beef-products
[15] *21 CFR 117.3*.

Standard Operating Procedures (SOP)
Written procedures that an establishment develops and implements to prevent direct contamination or adulteration of product, internal protocols. [16]

Sanitation Standard Operating Procedures (SSOP)
Written procedures (specific to sanitation) that an establishment develops and implements to prevent direct contamination or adulteration of product, internal protocols. [17]

Subprimal cuts
The first division of a whole carcass is into primal cuts. The four major **primal cuts** into which beef is separated are chuck, loin, rib and round. All primal cuts may or may not be intended for use in ground products. **Primal cuts** are then divided into subprimal cuts. Examples of subprimal cuts of beef are the top round, whole tenderloin, and rib eye. Any subprimal cut may or may not be intended for use in ground products.[18]

STEC
FSIS uses the term STEC to refer to Shiga toxin-producing *Escherichia coli* (*E. coli*) O157:H7 and six non O157 serogroups O26, O45, O103, O111, O121, and O145 that are adulterants in raw non-intact beef and raw intact beef intended for non-intact use.[19]

Trim
Beef products produced from in-house source materials.[20] (Retailers tend to use the terms bench trim and trim interchangeably)

Vacuum packaged
Source product (**primal cuts**) packaged in vacuum packed bags from supplier are typically considered to be **intended for intact use**.

4. Intended Use

Federally inspected beef suppliers (approved suppliers to retail food establishments) should determine the intended use of the products shipped including the determination if the product is meant to be safely consumed (following proper food handling practices) or if further processing or further controls are needed for the product to be safety consumed.

Through regulations specified in *9 CFR 417.2(a)(2),* FSIS requires each establishment (supplier) to identify the intended use or consumers of the finished product. The product's intended use may affect the STEC controls in place at both the shipping and receiving establishments. Intended use of beef products for use at retail should be known, communicated and considered when planning production of retail packaged products. The intended use for the purpose of this document is to facilitate the safe consumption of the beef product or to clarify if additional controls or treatment is needed.

STEC is not an adulterant on raw intact beef products, such as steaks and roasts, which are "intended" for intact consumer use. This is because STEC contamination would be limited to the exterior surfaces of intact beef products and, if these products remain intact, normal consumer cooking will destroy any STEC on the outer surfaces, even if the product is cooked to a rare or medium internal state. STEC is an adulterant in raw non-intact beef products (ground beef) and raw intact beef products intended for raw non-intact use because the same consumer cooking practice will not destroy any STEC that have been internalized by the non-intact processing. STEC is also considered an adulterant in products for which the intended use is not clearly defined or supported.[21]

USDA FSIS documentation in askFSIS states that regulated establishments (beef suppliers) should[22]:

- Identify the intended use of the product as per *9 CFR 417.2(a)(2).*
- Develop decision-making documents based on objective measures which identify the intended use of the product. A hazard analysis must be included with the documents and must be consistent with the establishment's assertion that the product in question is/is not for use in raw non-intact product.
- Have measures in place to restrict products that are for intact use only. Such measures may include letters to the purchasers, website postings, bill of lading communications, and a receipt of acknowledgement that the purchasers understand that this product is intended solely for intact use as described in detail by the posted askFSIS answer "Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts".[23]

[21] "FSIS Industry Guideline for Minimizing the Risk of Shiga Toxin-Producing Escherichia coli (STEC) in Beef (including Veal) Processing Operations". Available from: https://www.fsis.usda.gov/guidelines/2021-0007
[22] "Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts". AskUSDA. https://ask.usda.gov/s/article/Adequate-Support-for-the-Intended-Use-of-Beef-Primal-and-Subprimal-Cuts
[23] Supporting the supply of raw beef intended for intact use. AskUSDA. Available from: https://ask.usda.gov/s/article/Supporting

Some acceptable ways that the establishment can support that primal and subprimal cuts are intended for raw intact product include:

- The establishment communicates the intended use to the receiving establishment or facility by making the letter of intended use available on the producing establishment's company website and references the letter of intended use on bills of lading.
- The establishment receives letters of guarantee showing that all product is used in raw intact product only and maintains on-going communication with the receiving establishment or facility to verify that product is being processed as raw intact product only.
- The establishment has a contractual agreement with the receiving establishment or facility so the producing establishment has knowledge of the receiving establishment or facility's production process.[24]

Intended use should be considered when retailers are grinding primals, subprimals, purchased trim, boxed beef, or other components (e.g., mechanically separated beef or partially defatted beef fatty tissue) that are not accompanied by records of negative *E. coli* O157:H7 or other STEC test results.

Supplier labeling designating the intended use is not required. Therefore, retailers should work with their suppliers to be sure they understand how the supplier will communicate the intended use of beef products. There are various ways a supplier can communicate the intended use of beef to the retailer. Following are some examples:

- Direct communication with the supplier of raw beef products
- Receiving a letter identifying the intended use with each lot of product
- Contractual agreement with the supplying establishment
- Receiving a Certificate of Analysis (COA), testing results, or similar documentation showing the basis for the supplier’s designated intended use
- Documentation showing that the product has been tested and found to not contain *E. coli* O157:H7 or other STEC
- Other documents such as Bill of Lading or Letter of Guarantee
- Using a code or labeling to identify the intended use of the product

If the retailer is unclear on the intended use of a product, they should contact their supplier for further clarification.

[24] Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts". AskUSDA. Available from: https://ask.usda.gov/s/article/Adequate-Support-for-the-Intended-Use-of-Beef-Primal-and-Subprimal-Cuts

5. Recordkeeping for Beef Ground at Retail

Existing regulations from FSIS require that all facilities grinding beef (including retail establishments) maintain records regarding the source materials and cleaning and sanitation practices. In a rule published in December 2015, FSIS specified the recordkeeping requirements in *9 CFR 320.1(b).*

Official establishments and retail stores are required to maintain records that fully disclose:

1. The establishment numbers of the establishments supplying the materials used to prepare each lot of raw ground beef product;
2. All supplier lot numbers and production dates;
3. The names of the supplied materials, including beef components and any materials carried over from one production lot to the next;
4. The date and time each lot of raw ground beef product is produced; and
5. The date and time when grinding equipment and other related food-contact surfaces are cleaned and sanitized.

Records can be in any format but should be legible and accessible at all times. Records must be maintained for one year. When feasible, all retailers are encouraged to adopt electronic recordkeeping to collect and maintain this important data in a secure and usable format. Technology will facilitate accurate and timely tracebacks, although smaller retailers may find it challenging due to limited financial and human resources support to move to digital records. Retailers that adopt electronic recordkeeping should develop SOPs to address how to capture key grinding data for system issues or malfunction.

Template: Sample Recordkeeping Template for Grinding Beef

Retail Establishment Name: Store # **Retail Establishment Production Date**

Date and time of grind (required)	Manufacturer name of source material used for product produced (required)	Establishment number(s) of establishment providing source material (required)	Supplier lot #s, product code and/or pack date of source material used (required)	Date and time grinder and related Food Contact Surfaces cleaned and sanitized (required)	Comments	Information linking to the retail package (recommended)

6. Retail Practices, Risk Reduction, and Supplier Communications

Implementing retail practices and strategies for reducing risks in the retail meat department should be part of an Active Managerial Control program. Active Managerial Control is the purposeful incorporation of specific actions or procedures by management into the retail operations to attain control over foodborne illness risk factors. It embodies a preventive rather than reactive approach to food safety through a continuous system of monitoring and verification.

Beef Handling and Grinding Practices at Retail

A producer or supplier of beef cannot verify that all pathogens have been eliminated from raw beef. However, producers have procedures in place for handling, treating, and testing beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of contamination. The risk control steps taken by a supplier are used to designate the intended use of the meat once that meat is in a retail facility.

The risks associated with beef at a retail establishment will depend on several factors including how the supplier intended the beef to be handled, processed, labeled, and sold at retail. When implementing retail practices, the risk should be considered based on product type and intended use.

All the practices in the following examples are permitted. Some of these practices are based on following the supplier's intended use designation for the product. Other retail practices may present additional risk because they are not in accordance with the supplier's intended use and these are designated as non-intended use practices.

1. Practices/Products Based on Intended Use

Beef products from a supplier that are intended to be consumed intact.

> Examples: Steaks, roasts, smaller cuts of beef such as stew beef or primals in vacuum packaging. It does not include meat that has been ground, comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded.
>
> Rationale: These products are least likely to have contamination. Contamination, if present, is on the cut surface only. These pieces of beef may have surface contamination, but the outside surfaces will receive sufficient heat treatment when cooked by the consumer to render them safe.

Beef products from a supplier that can be cut at the retail facility provided they retain an intact surface that will be heat-treated when cooked by the consumer.

> Examples: Primals, sub-primals, or large roasts that are cut into steaks or smaller pieces. It does not include meat that has been ground, comminuted, mechanically

tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded. Nothing has been done at retail to introduce pathogens into the interior of the meat and any contaminants will remain on an exterior surface.

Rationale: Contamination, if present, is on the cut surface only. These pieces of beef may have surface contamination, but the outside surfaces will receive sufficient heat treatment when cooked by the consumer to render them safe.

Beef that has been ground, comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded by the supplier. This is non-intact meat which the supplier intended to be consumed in this form.

Examples: Beef ground by the supplier (may be pre-packed or bulk), cubed steaks, mechanically tenderized steaks. In all these examples, the meat was converted into non-intact beef by the supplier.

Rationale: Although this meat is not intact, the supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

Beef that has been ground or comminuted by the supplier but will be re-ground at the retail establishment. This is non-intact meat which the supplier intended to be consumed in this form.

Examples: Large chubs or containers of ground beef or coarse ground beef that will be re-ground at the retail facility.

Rationale: The supplier has already converted this beef into non-intact product. The supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

Beef trimmings from the supplier that are intended to be ground at retail. This meat will be converted into non-intact beef at retail.

Examples: Combo bins of trimmings, fat, and other small pieces of beef intended by the supplier to be ground at retail.

Rationale: The supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

2. Practices Not Based on Intended Use

Non-intended use practices may require additional controls to help mitigate risk of cross contamination if STEC is present on the exterior portion of the beef prior to grinding. Although the controls will help mitigate cross contamination, they will not address the risk of STEC in the product. Examples of non-intended use include the following:

Beef that is intact and which the supplier did not intend to be ground at retail. Intact beef that is not intended by the supplier to be comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded at the retail establishment.

> Examples: Converting store-generated trim (bench trim, market trim, case trim, block trim), re-work, pull-backs, and customer orders into ground beef. Cubing steaks or needle tenderizing beef at the retail facility.
>
> Rationale: Although suppliers have procedures in place for handling, treating, and testing beef in accordance with a HACCP plan and under FSIS federal inspection, this product did not receive any additional treatment or testing to further reduce the risk of STEC contamination. The supplier did not intend for this meat to be converted into non-intact beef at retail.

Controls to Reduce Risk at Retail

There are steps that can be taken at retail to help reduce the risks of contamination of beef. These include developing a written beef grinding protocol that specifies, at a minimum, segregation, separation, grinding practices, lotting, recordkeeping, and labeling.

Retail practices may include:

- Grinding product in small batches to reduce co-mingling of different products
- Labeling products with different source materials to ensure proper identification
- Maintaining complete and accurate production logs and grinding logs
- Segregating products based on designation of intended use
- Establishing consistent grinding sequence (Examples: from intact to non-intact; from most lean to higher fat content)
- Separating production cycles based on type of products or species
- Designating shelf life and/or use by date
- Sourcing meat from approved suppliers following all FSIS regulations

Additional good retail practices include:

- Rotate supply first-in first-out and pay attention to dates.
- Avoid mixing species unless intentional and clearly labeled. Clean and sanitize equipment between species.
- All food contact surfaces should be cleaned and sanitized before use.
- All products should be held at proper temperatures.

- Properly label all products with source, date, time and other required information.
- Avoid mixing multiple products from different suppliers because it makes the recordkeeping and traceback difficult.
- Control other hazards including foreign material.
- Develop a written cleaning and sanitizing program.

The control program should address the cleaning and sanitizing of food contact surfaces, equipment, utensils, implements, and the meat processing areas including frequency of cleaning, cleaning/sanitizing chemicals and tools that will be used. The time of each cleaning and sanitizing should be documented in the recordkeeping system for beef ground at retail. Training is recommended for all employees with responsibilities for cleaning and sanitizing.

Refer to the FDA Food Code and your state, local, tribal or territory requirements for cleaning and sanitation best practices. Section 4-602.11 of the FDA Food Code states that all food contact surfaces shall be cleaned at least every four hours. The food code provides for cleaning less frequently than every four hours if the utensils and equipment are held in a refrigerated room and cleaned according to the frequencies provided in the food code. (See *2017 FDA Food Code* Section 4-602.11)

Temperature	Cleaning Frequency
5.0°C (41°F) or less	24 hours
>5.0°C -7.2°C (>41°F -45°F)	20 hours
>7.2°C -10.0°C (>45°F -50°F)	16 hours
>10.0°C -12.8°C (>50°F -55°F)	10 hours

Breaks in the grinding cycle

When grinding beef, intentional breaks in the grinding cycle are critical and should not be overlooked. A break in the grinding cycle is a combination of a complete cleaning and sanitizing step in conjunction with no carryover of product. Breaks should be used to separate lots, batches, or cycles of product to reduce the risk of cross-contamination. Breaks in the production of ground beef can be the difference between needing to recall product from only part of a day or all product produced over several days. The day and time of all cleaning and sanitizing breaks in the cycle should be documented and included as part of the grinding log.

Employee Training and Personal Health and Hygiene

Proper training of all employees with access to food production, storage, and packaging areas is essential. Only properly trained employees should be allowed in designated areas.

The Food Code and/or state and local regulations have guidelines for employee health and hygiene including illness procedures and policies for hand washing, proper clothing, coverings, hair restraints, gloves, etc. Local, state, and federal regulations should be followed at all times.

Retailers should develop specific training programs for the employees, certified food protection manager (CFPM), and person in charge (PIC) specific to working in the meat department. This includes grinding practices and protocols along with collecting, recording, and maintaining grind log data during their daily job duties.

Lotting at Retail

The package of beef produced at retail must be linked to the lot code(s) of the product from which it was made, i.e., the source product. The retail-ground lot should have a supportable definition and should link the packaged product to the source material.

Official establishments and retail stores are to define a lot of raw ground beef product as the amount of raw ground beef produced during particular dates and times, following clean-up and until the next clean-up, during which the same source materials are used. This ground beef recordkeeping lot definition is distinct from the STEC lot definition used by official establishments; the establishment lot may not be the same as retailer lot.)

The practices above also apply to product that is comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded at retail.

Communication with Suppliers

It is important that retailers understand how a supplier indicates the intended use of beef products. Suppliers should provide information on the intended use so retailers can assess the risk associated with grinding different types of beef products.

Intended use should be considered when retailers are grinding primals, sub-primals, purchased trim, boxed beef, or other components (e.g., mechanically separated beef or partially defatted beef fatty tissue).

Supplier labeling designating the intended use is not required. Therefore, retailers should work with their suppliers to be sure they understand how the supplier will communicate the intended use of beef products. There are various ways a supplier can communicate the intended use of beef to the retailer. Following are some examples:

- Direct communication with the supplier of raw beef products
- Receiving a letter identifying the intended use with each lot of product
- Contractual agreement with the supplying establishment
- Receiving a Certificate of Analysis (COA), testing results, or similar documentation showing the basis for the supplier's designated intended use
- Documentation showing that the product has been tested and found to not contain *E.coli* O157:H7 or other STEC
- Other documents such as Bill of Lading or Letter of Guarantee
- Using a code or labeling to identify the intended use of the product

7. Regulatory Requirements

Procedures outlined in this document are based on well-established food safety principles and set forth as guidance for planning and conducting safe grinding activities at retail. The use of this guidance is voluntary, and it is not a regulatory document. Retail food establishments that participate in beef grinding should operate in accordance with any applicable federal, state, and local food safety statutes and regulations. For example, retail food establishments conducting grinding activities may also be subject to the FDA Food Safety Modernization Act (FSMA) as well as applicable Current Good Manufacturing Practices (CGMPs) or USDA Food Safety Inspection Service's (FSIS) requirements. It is important that retail food establishments understand all legal and regulatory requirements, as well as industry guidelines, governing the safety of food throughout the grinding process

State, territorial, and local establishments with regulations modeled after the FDA model Food Code should include the following in their operations:

1. Presence of a Certified Food Protection Manager (U. S. Food and Drug Administration, § 2-102.12(A))
2. Compliance with Food Law (Approved Source) (U. S. Food and Drug Administration, §3-201.11(A))
3. Compliance with Food Law (Safe Handling Instructions) (U. S. Food and Drug Administration, §3-201.11(F))
4. Packaged and Unpackaged Food-Separation, Packaging, and Segregation (Food Storage) (U. S. Food and Drug Administration, §3-302.11)
5. Equipment Food-Contact Surfaces and Utensils. (Cleaning Frequency) (U. S. Food and Drug Administration, §4-602.11)
6. Employee Health (U. S. Food and Drug Administration, Subpart 2-201)
7. Hygienic Practices (U. S. Food and Drug Administration, Part 2-4)

It is strongly recommended that establishments focus on the following:

1. Establishing active managerial control, including developing policies, training staff, and maintaining detailed logs/records.
2. Understanding the concerns associated with using beef that is not intended for grinding.
3. Understanding the importance of having a clean break in the production cycle.

9. Appendices

Appendix 1 - Production logs and additional records

A Beef Grinding Log may be used in conjunction with a company's beef production log (or cutting list) log. Production logs are used by retailers to project and produce specific types and amounts of steaks and roasts needed in a production cycle. A fall-out benefit of a production log is that they collect the source material of any bench trim that may have been produced by the retailer while fabricating steaks and roasts for the refrigerated display case. For those retailers grinding bench trim, this becomes the easiest way to collect the necessary data. Production logs or cutting lists will need to contain the supplier establishment number, manufacturer's name of the primal, and pack date and lot or serial number of the primal. (Note: Beef packers will reuse lot and serial numbers. However, documenting *both* the lot or serial number and pack date or use by date for a source material would make the lot or serial number unique.) Retailers will then need to file together both the production log and grind log for record keeping. The *Sample Primal Production Log for Retail Food Establishments below* shows the pertinent information that must be tracked on a production log if an establishment is grinding in-store produced bench trim and/or pull back material.

Completed grinding records must be maintained for a minimum of one year[25]. All such records should be accessible within 24 hours and are required to be maintained at the location where the raw beef was ground.

Production Log for Trim
Sample Primal Production Log for Retail Food Establishments

Examples for use include customer requested grinds and pull backs

Store Location: Store #55			**Production Date**: 08/04/2022	
Primal Product Name as Listed on the Box	**Vendor/Supplier Name**	**Establishment #**	**Lot Number**	**Pack Date**
BEEF KNUCKLE	Swift	3D	7846515	07/24/2022

*Note: This sample production log is being provided as an example to visually provide the pertinent information that must be tracked (in addition to a beef grinding log) if an establishment is grinding in-store produced bench trim and/or pull back material. This document must not be misconstrued to prohibit an establishment from keeping this information in a different manner or format.

[25] 9 CFR 320.1(b)4

Appendix 2 - Required and recommended information for records

Required Recordkeeping (9 CFR 320.1(b)	Recommended data elements for records
	Retail Establishment Name
	Supplier Name
(A) The establishment numbers of the establishments supplying the materials used to prepare each lot of raw ground beef product;	Establishment Number(s) of Beef Supplier
(B) All supplier lot numbers and production dates;	Lot Number of product ground Pack Date of product ground
(C) The names of the supplied materials, including beef components and any materials carried over from one production lot to the next;	Common Name of Primal
	Common name of product made
(D) The date and time each lot of raw ground beef product is produced; and	Date and time of grind
(E) The date and time when grinding equipment and other related food-contact surfaces are cleaned and sanitized.	Date and time for cleaning and sanitation of grinding equipment
	Link to package label created by retailer

Appendix 3 - Examples of language for intended use from beef suppliers

Suppliers typically provided intended use information in letters of guarantee (LOG) or other information posted on their websites. The following are examples of LOG from beef suppliers:

1. Charge of the Committee

Council III of the Conference for Food Protection (CFP) formed the Evaluation of Intended Use Hazards during Retail Meat Grinding committee with the directive to:

1.) Evaluate prior developed 'CFP Beef Grinding Log Template Guidance Document' to consider inclusion of information for the prevention of common hazards known to be associated with grinding processes

A.) "Intended Use" policy, purpose, and control measures including supply chain communication

B.) Examples of common control measures, such as supplier guarantees or certificates of analysis and ongoing verification

C.) Reference to FSIS guideline for minimizing STEC in Raw Beef Processing Operations (https://www.fsis.usda.gov/guidelines/2021-0007)

2.) Consider developing educational materials (e.g., handout(s) to support grinding log assessment by regulatory authorities, industry personnel, and the public. Examples may include:

A.) Educational fact sheets detailing hazards represented by the non-intact handling of beef intended for whole intact use

B.) Plain language explanations of “Intended Use” policy purpose.

3.) Evaluating potential changes to the Food Code to address the hazards associated with establishments grinding of beef that is manufactured as “Intended for Intact Use”.

4.) Determining appropriate mechanisms for sharing the committee's work, and

5.) Reporting progress back to the next Biennial Meeting in 2023 and the committee's findings and recommendations may be presented at the subsequent Biennial Meeting if necessary.

2. Introduction

This committee was charged with enhancing the Conference for Food Protection (CFP) "Guidance Document for the Production of Raw Ground Beef at Various Types of Retail Food Establishments"[1] to include information on how retail food establishments can prevent common hazards associated with beef grinding processes.

Shiga toxin-producing *Escherichia coli* (STEC) is estimated to cause 265,000 illnesses in the US annually, including 3,600 hospitalizations and thirty deaths. To date, at least four outbreaks have been associated with beef ground at retail that was not intended for grinding (e.g., trim from intact steaks or roasts, and "pull backs"). Inadequate grinding records and insufficient sanitation between source lots at retail have hindered public health investigators' ability to determine the ultimate source of the implicated beef.

After reviewing the 2014 CFP beef-grinding document, the United States Department of Agriculture, Food Safety Inspection Service (USDA, FSIS) guidance documents and beef supplier risk elimination program presentations, the committee proposes the following changes and additions to the guidance document including:

1. Definition of "Intended Use", its purpose and regulations,
2. Beef product examples in both categories (intended and not intended to be ground) and what risk is associated with each,
3. Recommended common control measures that can be done in a retail setting to reduce risk, such as supplier communication.

The Committee agreed that creating educational materials was out of the scope of the committee and should be created by experts in education based on the needs of their communities following the release of this guidance document.

This document is intended to be guidance for retail food establishments that grind beef and to assist with creating protocols and training materials for their establishments. The recommendations are not intended to replace, or otherwise serve as, the rules and regulations applicable to food establishments in any given federal, state, local or tribal jurisdiction. Please refer to the appropriate inspection authority in your jurisdiction for further guidance. Inspectors often have deep expertise and can assist with food safety management programs and compliance with existing regulations.

3. Definitions

Note – These definitions generally represent terms used in retail establishments. When multiple definitions are available from regulatory agencies applicable to retail establishments, references are provided.

Active Managerial Control
Active managerial control means the purposeful incorporation of specific actions or procedures by industry management into the operation of their business to attain control over foodborne illness risk factors. It embodies a preventive rather than reactive approach to food safety through a continuous system of monitoring and verification.[2]

Batch/Set
An identified quantity of beef that is ground based on specific attributes, such as percent lean, which will all be labeled as the same product.

Bench Trim
Product derived from cattle not slaughtered at the establishment.[3] In retail establishments with meat cutting operations, bench trim is generated in store. (Retailers tend to use the terms bench trim and trim interchangeably)

Chub
Rolls of ground beef that have been packaged to keep air out.[4] Chubs come in a variety of packaged sizes.

Customer requested grinding
As a service to customers, retailers may offer grinding of a cut of beef selected by the customer from the service case or packaged product that was not originally intended to be ground. This product is subject to the recordkeeping requirements for ground beef.

Grind Cycle
The amount of ground beef (measured by quantity and/or time) for one **lot** of product as documented by complete sanitation cycles. A grind cycle may include multiple batches/sets within a sanitation cycle.

Ground Beef

2 2017 FDA Food Code Annex, page 551.
3 FSIS Directive 10,010.1. Available from: https://www.fsis.usda.gov/sites/default/files/media_file/2020-07/10010.1.pdf
4 "Ground Beef Packaging, What's the difference?" Meat Science Organization. 2017. Available from: https://meatscience.org/TheMeatWeEat/topics/fresh-meat/article/2017/04/26/ground-beef-packaging-what's-the-difference

Chopped fresh and/or frozen beef or veal with or without seasoning and without the addition of beef fat as such, will not contain more than 30% fat, and shall not contain added water, phosphates, binders, or extenders.[5]

Intact Meat
A cut of whole muscle(s) meat that has not undergone comminution, mechanical, tenderization, vacuum tumbling with solutions, or reconstruction, cubing or pounding.[6]

Intended Use
How the federal establishment (producer) intends the product to be safely consumed or if further processing or further controls are needed. *9 CFR 417.2(a)(2)* requires each establishment to identify the intended use or consumers of the finished product. The product's intended use may affect the **STEC** controls in place at both the shipping and receiving establishments. Establishments that purchase beef from slaughter establishments should be aware of the slaughter establishment's intended use for the specific products they receive. [7]

Lot
For the purposes of FSIS requirements in *9 CFR 320.1(b)(4),* a lot is defined as the amount of raw ground beef produced during particular dates and times, following clean-up and until the next clean-up, during which the same source materials are used.[8]

Lot code
Defined volume or timeframe of finished product.

Non-Intact
Non-intact beef products include: ground beef; chopped beef; flaked or, minced product; beef that is vacuum tumbled with solutions; beef that an establishment has mechanically tenderized by needling (including injecting with solutions), cubing, pounding devices (with or without marinade); beef that an establishment has reconstructed into formed entrees; beef with proteolytic enzymes applied; and diced beef less than ¾ inch (dial setting) in any one dimension on average.[9]

Mechanically tenderized (non-intact)
Manipulating meat by piercing with a set of needles, pins, blades or any mechanical device, which breaks up muscle fiber and tough connective tissue, to increase tenderness.

9 "FSIS Industry Guideline for Minimizing the Risk of Shiga Toxin-Producing Escherichia coli (STEC) in Beef (including Veal) Processing Operations". 2021. Available from: https://www.fsis.usda.gov/guidelines/2021-0007.

This includes INJECTION, scoring, and processes which may be referred to as “blade tenderizing,” “jaccarding,” “pinning,” or “needling.”[10,11]

Primal cut
From FDA Food Code: A basic major cut into which carcasses and sides of meat are separated, such as a beef round, pork loin, lamb flank, or veal breast.[12]

From FSIS: Primal parts are the wholesale cuts of carcasses as customarily distributed to retailers. The round, flank, loin, rib, plate, brisket, chuck, and shank are primal parts of beef carcasses. Veal, mutton, and goat primal parts are the leg; flank, loin, rack, breast, and shoulder.[13] *(For the purpose of this document, only beef and veal are in scope.)*

Production Cycle
Consists of one or more **Grind Cycles.**

Production Log
Documents used to facilitate or supplement the recordkeeping requirement for ground beef. Some retailers find it helpful to maintain a production log that contains additional details on timing and products used to help with internal records. Production logs are not required in the FSIS regulation on recordkeeping, and do not take the place of the official records required by FSIS. See Appendix for a sample production log.

Pull backs
Retail packaged cuts, such as steaks or roasts, removed from the self- service refrigerated display cases and either reworked into smaller cuts, such as stew beef or cube steak, or ground product. “Pull-backs” can be ground separately but are sometimes co-mingled with in-store produced bench trim.

Recordkeeping requirements for beef (grinding log)
FSIS finalized a rule on December 21, 2015, requiring additional records be kept for establishments and retailers grinding beef. The rule is titled “Records to Be Kept by Official Establishments and Retail Stores That Grind Raw Beef Products.” [14]

Re-work

11 Federal Register Vol. 80, No. 95 Monday, May 18, 2015 (p. 28153-28172) Descriptive Designation for Needle- or Blade-Tenderized (Mechanically Tenderized) Beef Products.

12 U.S. Department of Health and Human Services, U.S. Food and Drug Administration. FDA Food Code. 2017.

13 *9 CFR 316.9(b).*

14 Records To Be Kept by Official Establishments and Retail Stores That Grind Raw Beef Products. *Federal Register.*2015. Available from: https://www.federalregister.gov/documents/2015/12/21/2015-31795/records-to-be-kept-by-official-establishments-and-retail-stores-that-grind-raw-beef-products

Changing the form of a meat or poultry cut by reprocessing it down into smaller pieces or transformed to a different product to maximize shelf life.

FDA Definition: Rework means clean, unadulterated food that has been removed from processing for reasons other than insanitary conditions or that has been successfully reconditioned by reprocessing and that is suitable for use as food.[15]

Standard Operating Procedures (SOP)
Written procedures that an establishment develops and implements to prevent direct contamination or adulteration of product, internal protocols. [16]

Sanitation Standard Operating Procedures (SSOP)
Written procedures (specific to sanitation) that an establishment develops and implements to prevent direct contamination or adulteration of product, internal protocols. [17]

Subprimal cuts
The first division of a whole carcass is into primal cuts. The four major **primal cuts** into which beef is separated are chuck, loin, rib and round. All primal cuts may or may not be intended for use in ground products. **Primal cuts** are then divided into subprimal cuts. Examples of subprimal cuts of beef are the top round, whole tenderloin, and rib eye. Any subprimal cut may or may not be intended for use in ground products.[18]

STEC
FSIS uses the term STEC to refer to Shiga toxin-producing *Escherichia coli* (*E. coli*) O157:H7 and six non O157 serogroups O26, O45, O103, O111, O121, and O145 that are adulterants in raw non-intact beef and raw intact beef intended for non-intact use.[19]

Trim
Beef products produced from in-house source materials.[20] (Retailers tend to use the terms bench trim and trim interchangeably)

Vacuum packaged

15 *21 CFR 117.3*.

20 FSIS Directive 10,010.1. available from: https://www.fsis.usda.gov/sites/default/files/media_file/2020-07/10010.1.pdf

Source product (**primal cuts**) packaged in vacuum packed bags from supplier are typically considered to be **intended for intact use**.

4. Intended Use

Federally inspected beef suppliers (approved suppliers to retail food establishments) should determine the intended use of the products shipped including the determination if the product is meant to be safely consumed (following proper food handling practices) or if further processing or further controls are needed for the product to be safety consumed.

Through regulations specified in *9 CFR 417.2(a)(2),* FSIS requires each establishment (supplier) to identify the intended use or consumers of the finished product. The product's intended use may affect the STEC controls in place at both the shipping and receiving establishments. Intended use of beef products for use at retail should be known, communicated and considered when planning production of retail packaged products. The intended use for the purpose of this document is to facilitate the safe consumption of the beef product or to clarify if additional controls or treatment is needed.

STEC is not an adulterant on raw intact beef products, such as steaks and roasts, which are "intended" for intact consumer use. This is because STEC contamination would be limited to the exterior surfaces of intact beef products and, if these products remain intact, normal consumer cooking will destroy any STEC on the outer surfaces, even if the product is cooked to a rare or medium internal state. STEC is an adulterant in raw non-intact beef products (ground beef) and raw intact beef products intended for raw non-intact use because the same consumer cooking practice will not destroy any STEC that have been internalized by the non-intact processing. STEC is also considered an adulterant in products for which the intended use is not clearly defined or supported.[21]

USDA FSIS documentation in askFSIS states that regulated establishments (beef suppliers) should[22]:

- Identify the intended use of the product as per *9 CFR 417.2(a)(2).*
- Develop decision-making documents based on objective measures which identify the intended use of the product. A hazard analysis must be included with the documents and must be consistent with the establishment's assertion that the product in question is/is not for use in raw non-intact product.
- Have measures in place to restrict products that are for intact use only. Such measures may include letters to the purchasers, website postings, bill of lading communications, and a receipt of acknowledgement that the purchasers understand that this product is intended solely for intact use as described in detail

21 "FSIS Industry Guideline for Minimizing the Risk of Shiga Toxin-Producing Escherichia coli (STEC) in Beef (including Veal) Processing Operations". Available from: https://www.fsis.usda.gov/guidelines/2021-0007

22 "Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts". AskUSDA. https://ask.usda.gov/s/article/Adequate-Support-for-the-Intended-Use-of-Beef-Primal-and-Subprimal-Cuts

by the posted askFSIS answer "Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts".[23]

Some acceptable ways that the establishment can support that primal and subprimal cuts are intended for raw intact product include:

- The establishment communicates the intended use to the receiving establishment or facility by making the letter of intended use available on the producing establishment's company website and references the letter of intended use on bills of lading.
- The establishment receives letters of guarantee showing that all product is used in raw intact product only and maintains on-going communication with the receiving establishment or facility to verify that product is being processed as raw intact product only.
- The establishment has a contractual agreement with the receiving establishment or facility so the producing establishment has knowledge of the receiving establishment or facility's production process.[24]

Intended use should be considered when retailers are grinding primals, subprimals, purchased trim, boxed beef, or other components (e.g., mechanically separated beef or partially defatted beef fatty tissue) that are not accompanied by records of negative *E. coli* O157:H7 or other STEC test results.

Supplier labeling designating the intended use is not required. Therefore, retailers should work with their suppliers to be sure they understand how the supplier will communicate the intended use of beef products. There are various ways a supplier can communicate the intended use of beef to the retailer. Following are some examples:

- Direct communication with the supplier of raw beef products
- Receiving a letter identifying the intended use with each lot of product
- Contractual agreement with the supplying establishment
- Receiving a Certificate of Analysis (COA), testing results, or similar documentation showing the basis for the supplier's designated intended use
- Documentation showing that the product has been tested and found to not contain *E. coli* O157:H7 or other STEC
- Other documents such as Bill of Lading or Letter of Guarantee
- Using a code or labeling to identify the intended use of the product

If the retailer is unclear on the intended use of a product, they should contact their supplier for further clarification.

23 Supporting the supply of raw beef intended for intact use. AskUSDA. Available from: https://ask.usda.gov/s/article/Supporting

24 Adequate Support for the Intended Use of Beef Primal and Subprimal Cuts". AskUSDA. Available from: https://ask.usda.gov/s/article/Adequate-Support-for-the-Intended-Use-of-Beef-Primal-and-Subprimal-Cuts

5. Recordkeeping for Beef Ground at Retail

Existing regulations from FSIS require that all facilities grinding beef (including retail establishments) maintain records regarding the source materials and cleaning and sanitation practices. In a rule published in December 2015, FSIS specified the recordkeeping requirements in *9 CFR 320.1(b).*

Official establishments and retail stores are required to maintain records that fully disclose:

1. The establishment numbers of the establishments supplying the materials used to prepare each lot of raw ground beef product;
2. All supplier lot numbers and production dates;
3. The names of the supplied materials, including beef components and any materials carried over from one production lot to the next;
4. The date and time each lot of raw ground beef product is produced; and
5. The date and time when grinding equipment and other related food-contact surfaces are cleaned and sanitized.

Records can be in any format but should be legible and accessible at all times. Records must be maintained for one year. When feasible, all retailers are encouraged to adopt electronic recordkeeping to collect and maintain this important data in a secure and usable format. Technology will facilitate accurate and timely tracebacks, although smaller retailers may find it challenging due to limited financial and human resources support to move to digital records. Retailers that adopt electronic recordkeeping should develop SOPs to address how to capture key grinding data for system issues or malfunction.

Template: Sample Recordkeeping Template for Grinding Beef

Retail Establishment Name: Store # **Retail Establishment Production Date**

Date and time of grind (required)	Manufacturer name of source material used for product produced (required)	Establishment number(s) of establishment providing source material (required)	Supplier lot #s, product code and/or pack date of source material used (required)	Date and time grinder and related Food Contact Surfaces cleaned and sanitized (required)	Comments	Information linking to the retail package (recommended)

6. Retail Practices, Risk Reduction, and Supplier Communications

Implementing retail practices and strategies for reducing risks in the retail meat department should be part of an Active Managerial Control program. Active Managerial Control is the purposeful incorporation of specific actions or procedures by management into the retail operations to attain control over foodborne illness risk factors. It embodies a preventive rather than reactive approach to food safety through a continuous system of monitoring and verification.

Beef Handling and Grinding Practices at Retail

A producer or supplier of beef cannot verify that all pathogens have been eliminated from raw beef. However, producers have procedures in place for handling, treating, and testing beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of contamination. The risk control steps taken by a supplier are used to designate the intended use of the meat once that meat is in a retail facility.

The risks associated with beef at a retail establishment will depend on several factors including how the supplier intended the beef to be handled, processed, labeled, and sold at retail. When implementing retail practices, the risk should be considered based on product type and intended use.

All the practices in the following examples are permitted. Some of these practices are based on following the supplier's intended use designation for the product. Other retail practices may present additional risk because they are not in accordance with the supplier's intended use and these are designated as non-intended use practices.

1. **Practices/Products Based on Intended Use**

Beef products from a supplier that are intended to be consumed intact.

> Examples: Steaks, roasts, smaller cuts of beef such as stew beef or primals in vacuum packaging. It does not include meat that has been ground, comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded.
>
> Rationale: These products are least likely to have contamination. Contamination, if present, is on the cut surface only. These pieces of beef may have surface contamination, but the outside surfaces will receive sufficient heat treatment when cooked by the consumer to render them safe.

Beef products from a supplier that can be cut at the retail facility provided they retain an intact surface that will be heat-treated when cooked by the consumer.

Examples: Primals, sub-primals, or large roasts that are cut into steaks or smaller pieces. It does not include meat that has been ground, comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded. Nothing has been done at retail to introduce pathogens into the interior of the meat and any contaminants will remain on an exterior surface.

Rationale: Contamination, if present, is on the cut surface only. These pieces of beef may have surface contamination, but the outside surfaces will receive sufficient heat treatment when cooked by the consumer to render them safe.

Beef that has been ground, comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded by the supplier. This is non-intact meat which the supplier intended to be consumed in this form.

Examples: Beef ground by the supplier (may be pre-packed or bulk), cubed steaks, mechanically tenderized steaks. In all these examples, the meat was converted into non-intact beef by the supplier.

Rationale: Although this meat is not intact, the supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

Beef that has been ground or comminuted by the supplier but will be re-ground at the retail establishment. This is non-intact meat which the supplier intended to be consumed in this form.

Examples: Large chubs or containers of ground beef or coarse ground beef that will be re-ground at the retail facility.

Rationale: The supplier has already converted this beef into non-intact product. The supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

Beef trimmings from the supplier that are intended to be ground at retail. This meat will be converted into non-intact beef at retail.

Examples: Combo bins of trimmings, fat, and other small pieces of beef intended by the supplier to be ground at retail.

Rationale: The supplier has taken additional steps for handling, treating, and testing this beef in accordance with a HACCP plan and under FSIS federal inspection oversight to minimize the risk of STEC contamination.

2. Practices Not Based on Intended Use

Non-intended use practices may require additional controls to help mitigate risk of cross contamination if STEC is present on the exterior portion of the beef prior to grinding. Although the controls will help mitigate cross contamination, they will not address the risk of STEC in the product. Examples of non-intended use include the following:

Beef that is intact and which the supplier did not intend to be ground at retail. Intact beef that is not intended by the supplier to be comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded at the retail establishment.

> Examples: Converting store-generated trim (bench trim, market trim, case trim, block trim), re-work, pull-backs, and customer orders into ground beef. Cubing steaks or needle tenderizing beef at the retail facility.
>
> Rationale: Although suppliers have procedures in place for handling, treating, and testing beef in accordance with a HACCP plan and under FSIS federal inspection, this product did not receive any additional treatment or testing to further reduce the risk of STEC contamination. The supplier did not intend for this meat to be converted into non-intact beef at retail.

Controls to Reduce Risk at Retail

There are steps that can be taken at retail to help reduce the risks of contamination of beef. These include developing a written beef grinding protocol that specifies, at a minimum, segregation, separation, grinding practices, lotting, recordkeeping, and labeling.

Retail practices may include:

- Grinding product in small batches to reduce co-mingling of different products
- Labeling products with different source materials to ensure proper identification
- Maintaining complete and accurate production logs and grinding logs
- Segregating products based on designation of intended use
- Establishing consistent grinding sequence (Examples: from intact to non-intact; from most lean to higher fat content)
- Separating production cycles based on type of products or species
- Designating shelf life and/or use by date
- Sourcing meat from approved suppliers following all FSIS regulations

Additional good retail practices include:

- Rotate supply first-in first-out and pay attention to dates.
- Avoid mixing species unless intentional and clearly labeled. Clean and sanitize equipment between species.
- All food contact surfaces should be cleaned and sanitized before use.
- All products should be held at proper temperatures.
- Properly label all products with source, date, time and other required information.
- Avoid mixing multiple products from different suppliers because it makes the recordkeeping and traceback difficult.
- Control other hazards including foreign material.
- Develop a written cleaning and sanitizing program.

The control program should address the cleaning and sanitizing of food contact surfaces, equipment, utensils, implements, and the meat processing areas including frequency of cleaning, cleaning/sanitizing chemicals and tools that will be used. The time of each cleaning and sanitizing should be documented in the recordkeeping system for beef ground at retail. Training is recommended for all employees with responsibilities for cleaning and sanitizing.

Refer to the FDA Food Code and your state, local, tribal or territory requirements for cleaning and sanitation best practices. Section 4-602.11 of the FDA Food Code states that all food contact surfaces shall be cleaned at least every four hours. The food code provides for cleaning less frequently than every four hours if the utensils and equipment are held in a refrigerated room and cleaned according to the frequencies provided in the food code. (See *2017 FDA Food Code* Section 4-602.11)

Temperature	Cleaning Frequency
5.0°C (41°F) or less	24 hours
>5.0°C -7.2°C (>41°F -45°F)	20 hours
>7.2°C -10.0°C (>45°F -50°F)	16 hours
>10.0°C -12.8°C (>50°F -55°F)	10 hours

Breaks in the grinding cycle

When grinding beef, intentional breaks in the grinding cycle are critical and should not be overlooked. A break in the grinding cycle is a combination of a complete cleaning and sanitizing step in conjunction with no carryover of product. Breaks should be used to separate lots, batches, or cycles of product to reduce the risk of cross-contamination. Breaks in the production of ground beef can be the difference between needing to recall product from only part of a day or all product produced over several days. The day and time of all cleaning and sanitizing breaks in the cycle should be documented and included as part of the grinding log.

Employee Training and Personal Health and Hygiene

Proper training of all employees with access to food production, storage, and packaging areas is essential. Only properly trained employees should be allowed in designated areas.

The Food Code and/or state and local regulations have guidelines for employee health and hygiene including illness procedures and policies for hand washing, proper clothing, coverings, hair restraints, gloves, etc. Local, state, and federal regulations should be followed at all times.

Retailers should develop specific training programs for the employees, certified food protection manager (CFPM), and person in charge (PIC) specific to working in the meat department. This includes grinding practices and protocols along with collecting, recording, and maintaining grind log data during their daily job duties.

Lotting at Retail

The package of beef produced at retail must be linked to the lot code(s) of the product from which it was made, i.e., the source product. The retail-ground lot should have a supportable definition and should link the packaged product to the source material.

Official establishments and retail stores are to define a lot of raw ground beef product as the amount of raw ground beef produced during particular dates and times, following clean-up and until the next clean-up, during which the same source materials are used. This ground beef recordkeeping lot definition is distinct from the STEC lot definition used by official establishments; the establishment lot may not be the same as retailer lot.)

The practices above also apply to product that is comminuted, mechanically tenderized (needled), vacuum tumbled, reconstructed, cubed, or pounded at retail.

Communication with Suppliers

It is important that retailers understand how a supplier indicates the intended use of beef products. Suppliers should provide information on the intended use so retailers can assess the risk associated with grinding different types of beef products.

Intended use should be considered when retailers are grinding primals, sub-primals, purchased trim, boxed beef, or other components (e.g., mechanically separated beef or partially defatted beef fatty tissue).

Supplier labeling designating the intended use is not required. Therefore, retailers should work with their suppliers to be sure they understand how the supplier will communicate the intended use of beef products. There are various ways a supplier can communicate the intended use of beef to the retailer. Following are some examples:

- Direct communication with the supplier of raw beef products
- Receiving a letter identifying the intended use with each lot of product
- Contractual agreement with the supplying establishment
- Receiving a Certificate of Analysis (COA), testing results, or similar documentation showing the basis for the supplier's designated intended use
- Documentation showing that the product has been tested and found to not contain *E.coli* O157:H7 or other STEC
- Other documents such as Bill of Lading or Letter of Guarantee
- Using a code or labeling to identify the intended use of the product

7. Regulatory Requirements

Procedures outlined in this document are based on well-established food safety principles and set forth as guidance for planning and conducting safe grinding activities at retail. The use of this guidance is voluntary, and it is not a regulatory document. Retail food establishments that participate in beef grinding should operate in accordance with any applicable federal, state, and local food safety statutes and regulations. For example, retail food establishments conducting grinding activities may also be subject to the FDA Food Safety Modernization Act (FSMA) as well as applicable Current Good Manufacturing Practices (CGMPs) or USDA Food Safety Inspection Service's (FSIS) requirements. It is important that retail food establishments understand all legal and regulatory requirements, as well as industry guidelines, governing the safety of food throughout the grinding process

State, territorial, and local establishments with regulations modeled after the FDA model Food Code should include the following in their operations:

1. Presence of a Certified Food Protection Manager (U. S. Food and Drug Administration, § 2-102.12(A))
2. Compliance with Food Law (Approved Source) (U. S. Food and Drug Administration, §3-201.11(A))
3. Compliance with Food Law (Safe Handling Instructions) (U. S. Food and Drug Administration, §3-201.11(F))
4. Packaged and Unpackaged Food-Separation, Packaging, and Segregation (Food Storage) (U. S. Food and Drug Administration, §3-302.11)
5. Equipment Food-Contact Surfaces and Utensils. (Cleaning Frequency) (U. S. Food and Drug Administration, §4-602.11)
6. Employee Health (U. S. Food and Drug Administration, Subpart 2-201)
7. Hygienic Practices (U. S. Food and Drug Administration, Part 2-4)

It is strongly recommended that establishments focus on the following:

1. Establishing active managerial control, including developing policies, training staff, and maintaining detailed logs/records.
2. Understanding the concerns associated with using beef that is not intended for grinding.
3. Understanding the importance of having a clean break in the production cycle.

9. Appendices

Appendix 1 - Production logs and additional records

A Beef Grinding Log may be used in conjunction with a company's beef production log (or cutting list) log. Production logs are used by retailers to project and produce specific types and amounts of steaks and roasts needed in a production cycle. A fall-out benefit of a production log is that they collect the source material of any bench trim that may have been produced by the retailer while fabricating steaks and roasts for the refrigerated display case. For those retailers grinding bench trim, this becomes the easiest way to collect the necessary data. Production logs or cutting lists will need to contain the supplier establishment number, manufacturer's name of the primal, and pack date and lot or serial number of the primal. (Note: Beef packers will reuse lot and serial numbers. However, documenting *both* the lot or serial number and pack date or use by date for a source material would make the lot or serial number unique.) Retailers will then need to file together both the production log and grind log for record keeping. The *Sample Primal Production Log for Retail Food Establishments below* shows the pertinent information that must be tracked on a production log if an establishment is grinding in-store produced bench trim and/or pull back material.

Completed grinding records must be maintained for a minimum of one year[25]. All such records should be accessible within 24 hours and are required to be maintained at the location where the raw beef was ground.

Production Log for Trim
Sample Primal Production Log for Retail Food Establishments

Examples for use include customer requested grinds and pull backs

Store Location: Store #55			**Production Date**: 08/04/2022	
Primal Product Name as Listed on the Box	**Vendor/Supplier Name**	**Establishment #**	**Lot Number**	**Pack Date**
BEEF KNUCKLE	Swift	3D	7846515	07/24/2022

*Note: This sample production log is being provided as an example to visually provide the pertinent information that must be tracked (in addition to a beef grinding log) if an establishment is grinding in-store produced bench trim and/or pull back material. This

25 9 CFR 320.1(b)4

document must not be misconstrued to prohibit an establishment from keeping this information in a different manner or format.

Appendix 2 - Required and recommended information for records

Required Recordkeeping (9 CFR 320.1(b)	**Recommended data elements for records**
	Retail Establishment Name
	Supplier Name
(A) The establishment numbers of the establishments supplying the materials used to prepare each lot of raw ground beef product;	Establishment Number(s) of Beef Supplier
(B) All supplier lot numbers and production dates;	Lot Number of product ground Pack Date of product ground
(C) The names of the supplied materials, including beef components and any materials carried over from one production lot to the next;	Common Name of Primal
	Common name of product made
(D) The date and time each lot of raw ground beef product is produced; and	Date and time of grind
(E) The date and time when grinding equipment and other related food-contact surfaces are cleaned and sanitized.	Date and time for cleaning and sanitation of grinding equipment
	Link to package label created by retailer

Appendix 3 - Examples of language for intended use from beef suppliers

Suppliers typically provided intended use information in letters of guarantee (LOG) or other information posted on their websites. The following are examples of LOG from beef suppliers:

COMMITTEE NAME Retail Sushi HACCP Standardization Committee Final Report

DATE OF FINAL REPORT: 11/10/2022

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☐ ***Council II*** ☒ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Veronica Bryant, Chair and Rupesh Modi, Vice Chair

COMMITTEE CHARGE(S):

Issue # 2020 III-017 stated that a Retail Sushi HACCP Standardization Committee be formed with the following charges:

1. Review current industry practices, collect available guidance documents, and current state codes pertaining to the production of sushi prepared at retail establishments.
2. Update the current CFP guidance document for production of sushi prepared at retail establishments.
3. Referencing the guidance document in the Food Code Annex, or wherever the committee deems appropriate.
4. Identifying whether the Food Code adequately addresses sushi production at retail as a whole and make suggestions for changes (if necessary) at the next CFP Biennial Conference.
5. Identifying the recommended methods to disseminate the committee's findings.
6. Reporting the committee's findings at the next CFP Biennial Conference

COMMITTEE WORK PLAN AND TIMELINE:

Initial Committee Meeting held November 10, 2021. Regular monthly meetings were held on the second Wednesday of each month

1. Work plan was discussed with full committee, decision was made to work on charges sequentially.
2. First charge was completed between November and December meetings.
3. Charge #2 to update guidance will take most of the time for the committee. Guidance document was discussed during December, January, and February meetings.
4. Committee has agreed to split topics to be covered in the guidance document among members and work in small groups to write sections of the documents and create infographics and decision trees.
5. Guidance document will be assembled with a target date of July 1.
6. Editing and review of the document will be completed with target date of August 1. Actual editing and review were not completed until September 14 meeting. Vote on the final version of the document was completed at the end of October via email vote.
7. Recommendations to the FDA from the committee were discussed and submitted via email vote.
8. The chair and co-chair will monitor attendance of voting and non-voting members and voting members of the full committee will vote to excuse members if unexcused absence of the voting member becomes a pattern.
9. Periodic reports will be submitted by March 1, 2022 and July 1, 2022 to the Council Chair.
10. Final guidance document to be submitted to Council Chairs by November 15, 2022.

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls: 11/10/21, 12/15/21, 1/12/22, 2/9/22, 3/9/22, 5/11/22, 6/8/22, 7/13/22, 8/10/22. 9/14/22, 10/12/22

1. ***Overview of committee activities:***

   Committee completed review of existing sushi guidance. Research was compiled, trends and discrepancies were noted, and a summary of the research will be included in the background of the guidance document.

   Committee has determined content to be discussed in guidance document, and what additional tools may be included.

   Committee has provided feedback on which section of the guidance document they are interested in writing, and groups of committee members were formed to prepare guidance document.

   Committee members wrote draft language for sections of the document, document was then combined.

   Committee members worked to provide edits and prepare a final document with a decision tree and checklist included

   Draft guidance document was submitted to committee at the May 11 meeting. Meetings in June, July, August and September were used to discuss the document and edits to be made.

Additional charges and recommendations to FDA were discussed during the September and October meetings.

Final edits were completed, and vote was taken via email vote. Vote was 20 for, 1 against, 2 abstained. Two abstained votes were committee members who were no longer regularly participating in meetings.

Final votes were taken on additional issues to be submitted by committee. Vote was 19 for, 2 against, 2 abstain for issue on requesting FDA to streamline chain HACCP process and 18 for, 3 against, 2 abstain for issue on adding acidification of rice directly to the Food Code.

Committee work was completed as of 11/7/2022 and committee will request to be disbanded at the 2023 Annual Meeting.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a. Review current industry practices, collect available guidance documents, and current state codes pertaining to the production of sushi prepared at retail establishments.
   Review was completed and document that summarizes findings is attached to this report.
   b. Update the current CFP guidance document for production of sushi prepared at retail establishments.
   Committee determined that guidance needed was not able to be included in the current CFP document. The committee created a separate document that will be submitted. Guidance document is attached to this report.
   c. Referencing the guidance document in the Food Code Annex, or wherever the committee deems appropriate.
   Issue will be submitted by the committee asking for the document to be posted on the website and included in resources provided for acidification of foods, specifically Annex 2 – Supporting Documents or Annex 3 in Section 3-502.11.
   d. Identifying whether the Food Code adequately addresses sushi production at retail as a whole and make suggestions for changes (if necessary) at the next CFP Biennial Conference.
   Two additional issues were voted to be submitted to the 2023 meeting based on discussions of this charge. Committee will ask for letter to be sent to the FDA to review and streamline process for chain HACCP review, and for FDA to include acidification of rice parameters in 3-502.11.
   e. Identifying the recommended methods to disseminate the committee's findings.
   f. Reporting the committee's findings at the next CFP Biennial Conference

3. ***Charges INCOMPLETE and to be continued to next biennium:***

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☒ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.
2.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

a. ***Issue #1:*** **Report – Retail Sushi HACCP Standardization Committee (RSRHSC) 1**

b. **List of content documents submitted with this Issue:** ***Committee Member Roster:***

☐ ***See attached revised roster PDF*** ☒ ***No changes to previously approved roster***

"Committee Members Template" (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

(1) ***Other content documents:***
Guidance Document
Review of National Requirements for HACCP/Variance for Acidification of Rice

c. **List of supporting attachments:** ☐ ***Not applicable***

(1) **Final Roster**

(2) **Roster with attendance**

1. ***Committee Issue #2***: **RSHSC 2– Approval of Guidance Document**
2. **Committee Issue #3**: **RSHSC 3 – Amend Food Code Annex to Reference Approved Document**
3. **Committee Issue #4*:*** **RSHSC 4 – Review and Streamlining of Retail Sushi HACCP Process**
4. **Committee Issue #5**: **RSHSC 5 – Including Rice Acidification Parameters in Food Code**

Introduction

Preface

Council III of the Conference for Food Protection created the Standardization of HACCP Plans for Sushi at Retail Committee in response to Issue 2020-III-017. The committee was charged with:

1. Reviewing current industry practices, collecting available guidance documents, and current state codes pertaining to the production of sushi prepared at retail establishments.
2. Updating the current CFP guidance document for the production of sushi prepared at retail establishments.
3. Referencing the guidance document in the Food Code Annex, or wherever the committee deems appropriate.
4. Identifying whether the Food Code adequately addresses sushi production at retail as a whole

The committee reviewed the current CFP guidance document related to sushi created by the 2016-2018 Special Process Controls Committee titled "Single Hazard Special Process HACCP Template" and it was determined that the information prepared by the committee is not easily integrated into the existing document. This document was created to supplement the templates and guidance provided for acidified rice in that document. This document is intended to provide guidance for food service operators and regulators, is not binding and does not replace regulatory requirements.

Note: This summary was developed around the 2017 FDA Model Food Code. Not all jurisdictions will have adopted this version of the Food Code, however, the references will be similar among versions of the Food Code. Be sure to verify your regulatory authority's requirements.

Sushi Background

The word "sushi" describes the specific preparation of the rice used in formed sushi-making. Sushi rice is a specific variety of rice that has its own unique flavor and ability to stick together to form finished products when combined with vinegar or other acidic products. In its conventional usage, sushi is described as cooked rice that has been acidified with vinegar solutions and formed with raw or cooked fish other seafood, imitation crabmeat, shellfish and fish egg, surimi, fresh chopped vegetables, produce, pickles, tofu, etc.

Sushi products may be formed manually using mats made of bamboo or plastic, specialized tools, or mechanically using sushi forming machines. Popular product forms can include:

- Nigiri, small balls of rice with raw or cooked fish or shellfish, optionally held in place with strips of dried seaweed (nori).
- Maki Rolls, layers of rice and nori sheets rolled with a bamboo or plastic mat to form cylinders that contain various seafood, vegetables, and other ingredients, [i.e., California roll cucumber, avocado and surimi or imitation crab, Philly roll with cream cheese, Tekka maki raw tuna)]; and
- Hand rolls, cone shaped rolls formed by a sheet of nori filled with various ingredients."

Sashimi is a separate food from sushi, even though the two are often used interchangeably. Sashimi, loosely translated, means "pierced body "and it refers to a delicacy of thinly sliced fish or other types of meat. Sashimi is eaten plain, without rice or other foods. Sashimi-grade fish is not a regulatory term but is used as a culinary one. Some of the most popular varieties of sashimi include salmon, fatty tuna, yellowtail, and squid.

An example of a food flow diagram that outlines the entire process of preparing sushi can be found in Appendix A.

Existing Problem

Due to the number and types of local regulatory agencies responsible for food safety across the country, there is inconsistent interpretation and enforcement of existing Food and Drug Administration (FDA) Model Food Code, herein called Food Code, requirements for specialized processes. Establishments that operate in multiple jurisdictions with separate regulatory agencies may be required to provide different documentation for the same food item produced the same way. Examples of these inconsistencies include, but are not limited to:

- When a full HACCP plan and/or variance may be required
- Requirements for variance submittal
- pH value for acidification of rice
- Requirements for submitting sample to lab for pH verification
- Final cooling temperature of rice
- Labeling requirements
- Additional regulatory requirements, such as when seafood HACCP is required

Audience and Benefits of Document

This document provides standardized information for reference and use by both regulatory agencies and retail food establishments that make and sell sushi. Providing standardized guidance for sushi and acidified rice should not only shorten plan review and approval times but would greatly reduce the number of HACCP plans that each retail food establishment or sushi company must create and maintain.

The goal of this guidance is to help jurisdictions achieve a more standardized review of HACCP Plans. Uniform criteria for retail sushi HACCP plans allow for more consistent oversight for regulatory agencies and allows for training of food safety regulators on established critical control points across all facilities. Furthermore, this approach would help ensure that risks associated with the production of sushi at retail and food establishments were properly identified and addressed.

Purpose and Limitations of Guidance Document

This guidance document addresses the specialized process of acidifying rice to make it a non-time/temperature control for safety (TCS) food. This process requires a variance in the current version of the Food Code. This document does not address the requirement of seafood HACCP for fish used as an ingredient in sushi. Seafood HACCP is a requirement for reputable suppliers, and since requirements for approved/reputable suppliers are outlined in the Food Code, adherence to regulation is sufficient for retail HACCP.

Sushi Preparation Food Code References

The application of the Food Code requirements to sushi will vary depending on methods the establishment utilizes to prepare sushi products. Just like all TCS food, the Food Code requirements for parasite destruction, consumer advisory, cold holding, and cooling need to be considered for all sushi operations. Depending on the establishment's operation, time as a public health control or the special process of acidification of rice may also need to be addressed. The establishment's choice of sushi products served, and methods of operation will guide their best approach to meeting the Food Code requirements.

References for all sushi operations:
Parasite Destruction 3-402.11
Cooling 3-501.14
Temperature Control 3-501.16
Consumer Advisory 3-603.11

Additional Considerations for some operations:
Date Marking 3-501.17
Time as a Public Health Control 3-501.19
Special Process (Acidification) 3-502.11
Labeling 3-602.11

References that Apply to all Sushi Operations

Parasite Destruction 3-402.11

Sushi products that include raw or undercooked fish may have naturally occurring parasitic hazards that need to be controlled. The Food Code requires fish that will be served raw or undercooked to be frozen to specific time and temperature parameters found in 3-402.11, unless an exemption is met. Exemptions include molluscan shellfish, shucked scallop adductor muscle, select tuna species [*Thunnus alalunga, Thunnus albacares* (Yellowfin tuna), *Thunnus atlanticus, Thunnus maccoyii* (Bluefin tuna, Southern), *Thunnus obesus* (Bigeye tuna), or *Thunnus thynnus* (Bluefin tuna, Northern)], and fish raised under specified aquaculture practices. Retail establishments commonly rely on suppliers to address parasite controls. Documentation of proper parasite control is required which may include in-house freezing records or letters of guarantee from suppliers.

Cooling 3-501.14

TCS foods held in the Danger Zone have the potential to cause foodborne illnesses. To help control these foodborne illnesses, the Food Code requires rapid cooling of TCS foods, such as cooked rice, cooked fish products, and assembled finished products. TCS food must be rapidly cooled using a two-tiered cooling system that includes cooling TCS from 135°F (57°C) to 70°F (21°C) within 2 hrs., then to 41°F (5°C) within a total of 6 hours.

Sushi usually contains multiple components that include both TCS and non-TCS ingredients. The TCS ingredients and TCS containing finished products must be rapidly cooled to prevent foodborne illness. Sushi rice when acidified below 4.2 is not considered a TCS food. However, the finished, assembled sushi roll containing TCS foods must be rapidly cooled in accordance with 3-501.14.

Temperature Control 3-501.16

Cold holding may occur at several different steps in the production of sushi products. This commonly includes cold holding of fish, some sushi ingredients and sauces, non-acidified cooked rice, and the assembled sushi product if not immediately served. Keeping TCS food at or below 41°F (5°C) reduces opportunity for pathogen growth and/or toxin formation. Keeping TCS foods at 135°F (57°C) or above additionally controls pathogen growth. In sushi operations, hot holding may not be a feasible option due to quality.

Consumer Advisory 3-603.11

The Food Code requires that the consumer be informed about the risks of consuming undercooked or raw animal foods, including raw or undercooked fish often found in sushi. The consumer advisory requires 1) **disclosure** identifying any raw or undercooked animal foods and 2) **reminder** of risks associated with consuming undercooked or raw animal foods such as fish. Consumer advisories are commonly placed on menus, signage at place of order, or on label of packaged product.

References for Some Operations (based on preparation methods)

Date Marking 3-501.17

Date marking in the Food Code applies to ready-to-eat, TCS foods held cold for more than 24 hours within the establishment. Food components that go into finished sushi products, as well as the completed rolls, may require date marking if held over 24 hours. Fish used in sushi products is considered ready-to-eat even if it remains in an undercooked or raw form. Date marking for these ready-to-eat fish components would begin when removed from manufacturers' packaging or removal from in-house freezing for parasite destruction step. When food items are combined, the oldest date needs to be used for the new item. Many sushi products are prepared and sold to consumers the same day, so date marking may not apply.

However, all sushi operations should review use of components that were opened in advance and possible end of day carry-over to determine if the Food Code date marking requirements would apply.

Time as a Public Health Control 3-501.19

Time as a public health control (TPHC) is an option under the Food Code 3-501.19. This can allow use of food products for up to four hours after being cooked without temperature control or control of pH, with any remaining product being discarded. This practice requires written procedures, labeling food when removed from temperature control, and discarding unlabeled products and any remaining at the end of four hours. This option does not allow for saving or restarting once a TPHC procedure is started. This approach works frequently for finished sushi rolls intended for immediate consumption. However, retail establishments packaging sushi for to-go service methods will find TPHC impractical.

Special Process - Acidification of Rice 3-502.11

Acidification of TCS foods with the intent of making them non-TCS is considered a special process in the Food Code. In the case of sushi rice, this process takes a TCS food (cooked rice) and adds acid (typically vinegar) to drop the pH and allow the cooked rice to be held without time or temperature controls. This acid addition needs to adjust the equilibrium pH to less than 4.2 to control the identified hazards.

Addition of vinegar for flavor only, when pH is not monitored, is not considered a special process and rice must be temperature controlled just like any other TCS food. It is also important to remember once the acidified rice is combined with other sushi ingredients the final product would be considered TCS again requiring time and temperature control.

Retail food operations who wish to handle food outside the Food Code parameters can do so by use of a Variance and HACCP Plan. HACCP plan (discussed following sections) specifies the process and how food safety hazards will be controlled. The Food Code 8-103.11 outlines requirements for obtaining a regulatory variance, and 8-201.14 identifies required elements of HACCP plans. The variance issued by the regulatory authority allows the establishment to implement a reviewed HACCP plan which controls food safety hazards in an alternate manner. The Food Code 8-103.10 has additional information about variances.

Labeling 3-602.11

Sushi that is packaged for retail sale, for example clam shell packaged sushi products in a consumer display case, will also require labeling. Package labeling is required to allow the consumer to make informed decisions on food selections and avoid major food allergens. The definition of “packaged” is included in the Food Code and excludes over wraps or carry-out containers facilitating service of food upon consumer request. Basic elements required on label include identity statement, ingredient list, net quantity, major allergens, and name and place of business. In addition to the Food Code, labeling may meet 21 CFR 101.

When a Variance and HACCP Plan is Needed

Based on the food process the establishment has chosen, a variance and HACCP Plan may be required for a retail sushi establishment. As noted above, the Food Code requires a variance and HACCP when acidifying rice to render it non-TCS; however, regulations will vary with jurisdictions. In determining whether a HACCP Plan is needed, the establishment needs to consult with the regulatory authority for specific requirements and procedures for receiving a variance. This document is intended for retail food service establishments and does not cover food processing plants. Example scenarios to help determine whether a food business is a retail food establishment, or a food processing plant can be found in Appendix B. A decision tree is included in Appendix C to assist in determining if a variance and HACCP approval is needed. The sections below provide guidance for creating the HACCP plan for acidified rice only.

Contents of a Sushi Rice HACCP Plan

There are seven principles of HACCP: Hazard Analysis, Determine Critical Control Point, Establish Critical Limit, Establish Monitoring Procedures, Establish Corrective Action, Verification and Record Keeping. A Sushi Rice HACCP Plan should address each of these principles. Additional items are required for a HACCP Plan as stated in 8-201.14, such as general information regarding the operation, recipes, flow diagrams, sample blank log forms, and Standard Operating Procedures.

- **General Information:** General information should be included on the plan to include the owner/operator's name, location of business, Person-In-Charge (PIC), and contact information.
- **Recipe(s)**: Included in your HACCP Plan should be the recipe for your sushi rice. Include each different sushi rice recipe, including alternative grains such as quinoa, brown rice, or similar.
- **Flow Diagram or Chart**: A flow diagram will visually explain the exact process of preparing the sushi rice. Your plan should include a flow diagram or chart. The first step in the flow of food should be receiving ingredients and the last step is consumption or sale of sushi rice. An example food flow can be found in Appendix D.
- **Sample log form**s: A copy of the blank logs should be attached to the HACCP plan. There should be at least one log for each of the critical control points.
- **Standard Operating Procedure**s: Standard operating procedures (SOPs), are written procedures that provide specific instructions on performing food safety tasks related to the HACCP plan.

Hazard Analysis

A hazard analysis identifies the known or reasonably foreseeable hazards associated with a specific food. There are two main biological hazards associated with sushi rice held at room temperature: *Bacillus cereus (B. cereus) and Staphylococcus aureus*. If they are allowed time to grow in the rice, both bacteria can form toxins that cause vomiting and diarrhea. *B. cereus* is a spore forming bacteria often associated with rice. The spores may be present in rice and other grains, and then survive the cooking step. *S. aureus* is associated with food preparation environments and may be introduced to sushi rice due to the amount of handling throughout the sushi preparation process. These bacteria can produce toxins when left for too long in temperature danger zone, of above 41°F- below 135°F (5°F - 57°C). These bacteria are commonly associated with unacidified or improperly acidified sushi rice because it is typically kept in the temperature danger zone. A full hazard analysis for sushi rice process can be found in Appendix D.

Control Measure

Control measures are those processes or procedures put into place to control, reduce, or inactivate pathogens. The main control for the growth of *B. cereus* and *S. aureus*, aside from time/temperature control, is acidification. In the preparation of sushi rice, vinegar is typically mixed thoroughly into cooked sushi rice to reduce the pH of the rice to less than 4.2. This pH threshold meets the definition of a non-TCS food, found in Table B of the FDA Model Food Code (note that water activity of cooked rice is greater than 0.88, and so is not a factor in this determination). This control is effective only when the pH of the rice is correctly monitored by using a pH meter. Colorimetric methods for the determination of pH may be allowed in some instances when the pH is 4.0 or lower.

Critical Control Point (CCP)

The critical control point, or CCP, is the point in the flow of the process at which there is control over the identified hazard, typically the growth of pathogens. If not done correctly, pathogens could grow and/or produce toxins, resulting in consumer illness. The step in which vinegar is added to the rice is the critical control point for sushi rice. This is the step where the two hazards of concern, *Bacillus cereus and Staph aureus*, must be controlled to prevent illness.

Critical Limit(s)

Critical limits are those measurable parameters and values that are based on science that demonstrate a critical control point is effective controlling the identified hazard. In the case of acidified sushi rice the critical limit is a pH of below 4.2to be considered non-TCS. When using FDA Interaction Table B, rice acidified to below 4.2 would not need further evaluation and would be considered non-TCS. Cooked short grain white rice has available water measurement (known as water activity, a_w) of approximately 0.98.

Alternative grains such as brown rice or wild rice, quinoa, couscous, cauliflower rice, are sometimes proposed to be used instead of sushi rice. Any alternate grains are required to meet this same pH critical limit unless alternate science is provided.

Monitoring

A HACCP Plan must include information on how the production of the acidified rice will be monitored. An example monitoring procedure is included in this document. When preparing the sample, 21 CFR 114.90 states that a ratio of 10-20 mL of water to 100 grams of product should be used. Both the acidification of the rice and the final pH of the rice should be monitored. The plan will indicate what is being monitored, how it will be monitored, what is the frequency of monitoring, and who will do the monitoring. With sushi rice, monitoring should be done by a trained individual using a calibrated pH meter.

Corrective Action

Corrective actions are steps taken when a critical limit is not met during the preparation process. It is important that any time a corrective action is needed it must be recorded on a log sheet. If the pH of the measurement is 4.2 or greater; then repeat the measurement with a new sample. If that sample reads 4.2 or greater; add more vinegar to the acidified rice. Mix well and repeat the pH measurement. Repeat this corrective action until the pH is below 4.2. The rice can also be held using time as a public health control, cooled, and held cold, or discarded as a corrective action. Additional long term corrective actions should be applied, including reviewing the process, adjusting recipe, or substituting vinegar type. Note all corrective actions applied in a corrective action log.

Verification vs Validation

Verification and Validation are not the same thing. **Verification** is making sure the HACCP Plan is working as written. **Validation** is making sure the HACCP Plan will work to control the hazards identified based on science. Most sushi rice HACCP plans are written based on already validated science (i.e., pH below 4.2), because of this, scientific validation is not required. If a method is used that is not already recognized in the scientific literature as controlling the identified hazard, a validation (other science or challenge studies) may be required.

Verification

The Person-in-Charge (PIC) is responsible for reviewing and signing the sushi rice acidification log and making sure the HACCP plan is being followed as written. This is considered a verification of the HACCP plan. The HACCP plan should indicate who will do the verification, the frequency of the verification and what verification activities are taking place. The PIC should also observe employees performing the pH measurement and recording required data periodically. All verification activities should be noted in the appropriate log notes along with the signature of the PIC performing the verification activities. An example checklist can be found in Appendix E that can help with verification activities.

Record Keeping

Records (logs or log forms) are an integral part of the HACCP Plan and should be kept for all monitoring of critical control points. Required records include pH meter calibration logs, sushi rice pH measurement logs, corrective action logs, PIC verification logs, and training logs.

Note: Once records are created, they must be kept for at least six months or as otherwise specified by the jurisdiction based on inspection frequency and made available to the Regulatory Authority upon inspection request.

Training

Any employee involved in the acidification of rice is required to receive training to show that they understand the hazards and controls associated with making acidified rice. The training plan must address any food safety issues of concern as stated in 8-201.14(F) (1) and should include training on all facility standard operating procedures. The PIC must review sections relating to the flow diagram, hazards, control measures, CCPs, critical limits, verification and record keeping. Hands-on training is essential. A blank training log form should be attached to the HACCP Plan. The training sessions must be recorded in the log, and must include date, employees present, and instructor.

Standard Operating Procedures

Standard operating procedures, or SOPs, are an important part of a HACCP Plan. These are specific written instructions that give details on how to perform tasks associated with food safety and the sushi rice HACCP Plan. SOPs should already align with the regulation unless a variance is in place. SOPs should include pH meter calibration, cleaning and sanitizing food contact surfaces, personal hygiene and employee health policies, hand washing, eliminating bare hand contact, and proper chemical storage. Many of the SOPs needed for sushi rice acidification are contained within the Food Code, but should include the following (these are examples only, additional SOPs may be needed):

- **Bare hand contact:** Clarify that bare hand contact with ready to eat (RTE) food is not permitted at any time and what is done with RTE food touched with bare hands
- **Employee health policy:** Address the symptoms of foodborne illness, pathogens associated with illness, symptom and illness reporting requirements, exclusion/restriction plan, return to work criteria, etc.
- **Personal hygiene:** Address wounds/sores, jewelry, fingernails, hair restraints, clothing (i.e., uniform, apron), tasting food, eating/drinking, what is done when employees do not follow the personal hygiene information
- **Hand washing:** Clarify when, how, and where to wash hands, and any corrective actions
- **Labeling:** Include details of all applicable dates (packaging, expiration), consumer advisory (if applicable), and what is done with food that is not labeled or is incorrectly labeled
- **Cleaning and sanitizing food contact surfaces:** Specify how to properly clean and sanitize food contact surfaces, and what to do with food contact surfaces that have not been properly cleaned and sanitized
- **Thermometer use and calibration:** Address the method and frequency of thermometer calibration and what is done with thermometers that cannot be calibrated, and provide details of documenting thermometer calibration
- **pH meter use and calibration:** Address the method and frequency of pH meter use; calibration, verification of accuracy of calibration and what is done with pH meters that cannot be calibrated and provide information on calibration and use logs.
- **Cold holding:** Address proper cold holding temperatures and corrective actions if food is found to be out of temperature, including allowances for cooling or discarding food
- **Transporting:** Address proper cold holding temperatures and applicable corrective actions if food is found to be out of temperature, including allowances for cooling or discarding food

Example Standard Operating Procedures

The following are examples of standard operating procedures that can be used for thermometer calibration, pH meter calibration, and pH monitoring. Be sure to follow any manufacturer's instructions related to specific equipment. *****These are only examples; sushi operations may choose another SOP to align with business needs. *****

Standard Operating Procedure for Thermometer Calibration

- Thermometers used for specialized processes should meet the same requirements as outlined in the Food Code Sections 4-201.12, 4-203.11 and 4-302.12.
- All thermometers must be accurate to +/-2 degrees Fahrenheit.
- Thermometers must be calibrated according to the Food Code Section 4.502.11(B). Thermometers should be calibrated at least once per day and whenever they are exposed to extreme temperatures or dropped.
- The ice water calibration method is the most common and reliable, and is outlined below:
- Fill a cup with ice, preferably crushed, with enough ice so the thermometer remains upright.
- Add cold water to the cup and stir, allowing the temperature to equilibrate.
- Place the thermometer probe in the cup. Temperature should read at 32°F, if it does not, adjust the thermometer according to manufacturer's instructions.
- When taking product temperature, the probe should be placed in the thickest portion of the food. For rice and other grains, it is recommended to stir first before taking temperature.

Standard Operating Procedure for pH meter Calibration

- The pH meters used for sushi rice should be designed for food and not designed simply for water or liquids. Appropriate meters will be portable, able to be calibrated and read to at least two decimal points
- pH should be calibrated daily and according to the manufacturer's instructions. Typically, pH meters come with 2-3 buffer solutions which are typically pH 4, pH 7 and pH 10. These solutions may be in aqueous or powder form and will come with any applicable mixing and handling instructions.
- The following outlines a basic calibration procedure, but always follow specific manufacturer's guidance.
    1. Prepare buffer solutions according to the package instructions.
    2. Remove the electrode from the storage solution, rinse thoroughly with distilled water and carefully blot (do not wipe) dry with a lint-free wipe.
    3. Turn the pH meter on and submerge the probe in the pH 7 solution, gently moving the probe around until the pH reading stabilizes. Select the calibrate button and then rinse the probe with distilled water and blot dry.
    4. Repeat step 3 with the pH 4 buffer solution.
- After calibration is complete, check the pH in the 4.0 buffer solution to make sure it reads correctly. The reading should be within 0.1 pH units of its true value (for example, the 4.0 buffer should read between 3.9 and 4.1).
- If results aren't within 0.1 pH unit of the true value for the buffer, the meter must be recalibrated.
- Record the calibration in your pH meter calibration log. You are now ready to test product samples.
- A second pH meter will ensure acidification operation can continue if there is failure of the pH meter. Having an additional pH meter for use as a backup is recommended.

Standard Operating Procedure for pH monitoring

- Each batch of acidified rice must be measured for pH as follows.
- Prepare rice and acidify according to the approved recipe. Allow rice to sit so vinegar can uniformly penetrate the rice. The pH is typically measured within 30 minutes or within timeframe specified in HACCP plan
- Prepare and calibrate the pH meter according to the manufacturer's directions. Record the calibration of the pH meter in the log. Calibration should be done daily or as required to maintain calibration.
- One quarter cup of rice should be collected from various locations in the batch of sushi rice. Press the rice down during sampling in the measuring cup so that it is flat and level. Repeat the procedure so there are two different samples.
- Add ¾ cup of distilled water to the ¼ cup of sushi rice for each sample. Mix the rice and water until a consistent slurry develops. The cooked and acidified grains will need to be crushed, mashed or blended with distilled water to reach a semi-liquid consistency.
- Insert the pH electrode into the first rice slurry and press the button to measure the pH. The electrode should be fully submerged in the sample and should be gently and slowly stirred until the probe reading is complete.
- Record your measurement on in your log, including the signature of the person who performed the acidification/monitoring. Take the pH of the second sample. Record it.
- **If either sample has a pH of 4.2 or above, corrective action is required**.

Prerequisite Programs

PARASITE DESTRUCTION

- Raw, ready-to-eat seafood, except for those exempt under 3-402.11(B), require freezing utilizing one of the following options: frozen and stored at a temperature of -20 ˚C (-4 ˚F) or below for a minimum of 168 hours (7 days) in a freezer, frozen at -35 ˚C (-31 ˚F) or below until solid and stored at -35 ˚C (-31 ˚F) or below for a minimum of 15 hours; or frozen at -35 ˚C (-31 ˚F) or below until solid and stored at -20 ˚C (-4 ˚F) or below for a minimum of 24 hours.
- In addition to exempt tuna species, some aquacultured fish products that have met specific requirements in 3-402.11(B) are exempt from freezing.
- The Food Code requires that "If the fish are frozen by a supplier, a written agreement or statement from the supplier stipulating that the fish supplied are frozen to a temperature and for a time specified under § 3-402.11" be provided. A similar written agreement is required to verify aquacultured fish products have met exemption requirements.
- Either purchase specifications or a letter of guarantee would be an acceptable way to verify the parasite destruction requirement.
- A document containing the following information would meet the requirement for verifying parasite destruction.
- Name of processing facility, or other entity, that has documented and carried out the freezing process.
- Draft date (within one year of purchase)
- Seafood item name
- Clear description of master cartons, or packaging, logo/brand reference to aid in cross referencing the letter to the item.

- One of the following specifications, depending on whether fish has been frozen or is exempt from parasite destruction
    - For fish that has been frozen: specific freezing process (one of the above) used to destroy parasites
    - For exempt/aquacultured fish: specifics on feed type and farm type (open water, net-pens, ponds, tanks, etc.)

- Where freezing is not applied for raw ready-to-eat seafood, and a parasite destruction exemption exists, documentation shall be secured from the supplier/processor to include, at a minimum, the following:
- Additionally, fish served raw in sushi products should be labeled as "ready-to-eat." Retail sushi operations should read packaging and labels as all fish and fish products are not intended for raw consumption. If the label or package does not state information about whether it is intended for raw consumption, the sushi operator should verify the intended use with the supplier.

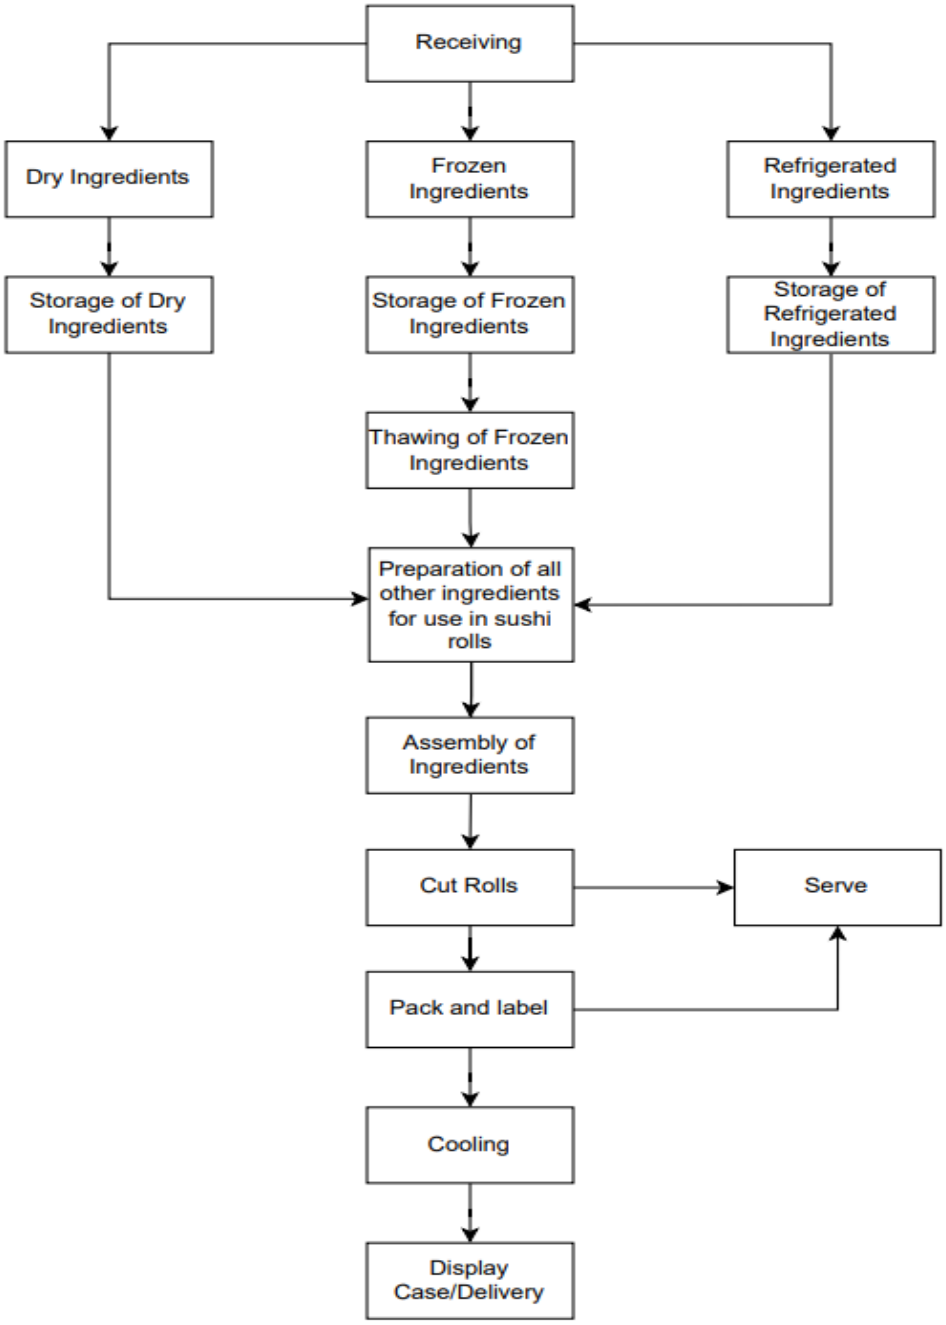
Appendix

A – Food Flow Diagram for Sushi Process
B – Example Permitting Scenarios
C – Decision Tree
D – Food Flow Diagram and Hazard Analysis for Sushi Rice
E – Sample Validation and Verification Checklist

Appendix A: Food Flow Diagram for Sushi Process

This food flow diagram is designed to illustrate the entire process for preparing sushi products and is not intended to be submitted with the HACCP Plan. **This food flow includes many steps that do not need to appear in the food flow diagram for the sushi rice HACCP plan. The only components of this food flow diagram that are required in a HACCP Plan are receiving, storing, preparation, and service.** An example of the food flow diagram that should be submitted with a HACCP plan can be found in Appendix D.



Appendix B: Examples permitting scenarios and how to interpret

Definitions:

I. ***Retail Food Establishments*** are sushi producers that prepare sushi products for direct distribution to the end consumer. The distribution methods may include but are not limited to dine in restaurant, to-go distribution, delivery, mobile food establishments, and vending machines, and can be fixed or temporary facilities or locations. Additional specifics of the retail food establishment definition can be found in FDA Food Code 1-201.10.

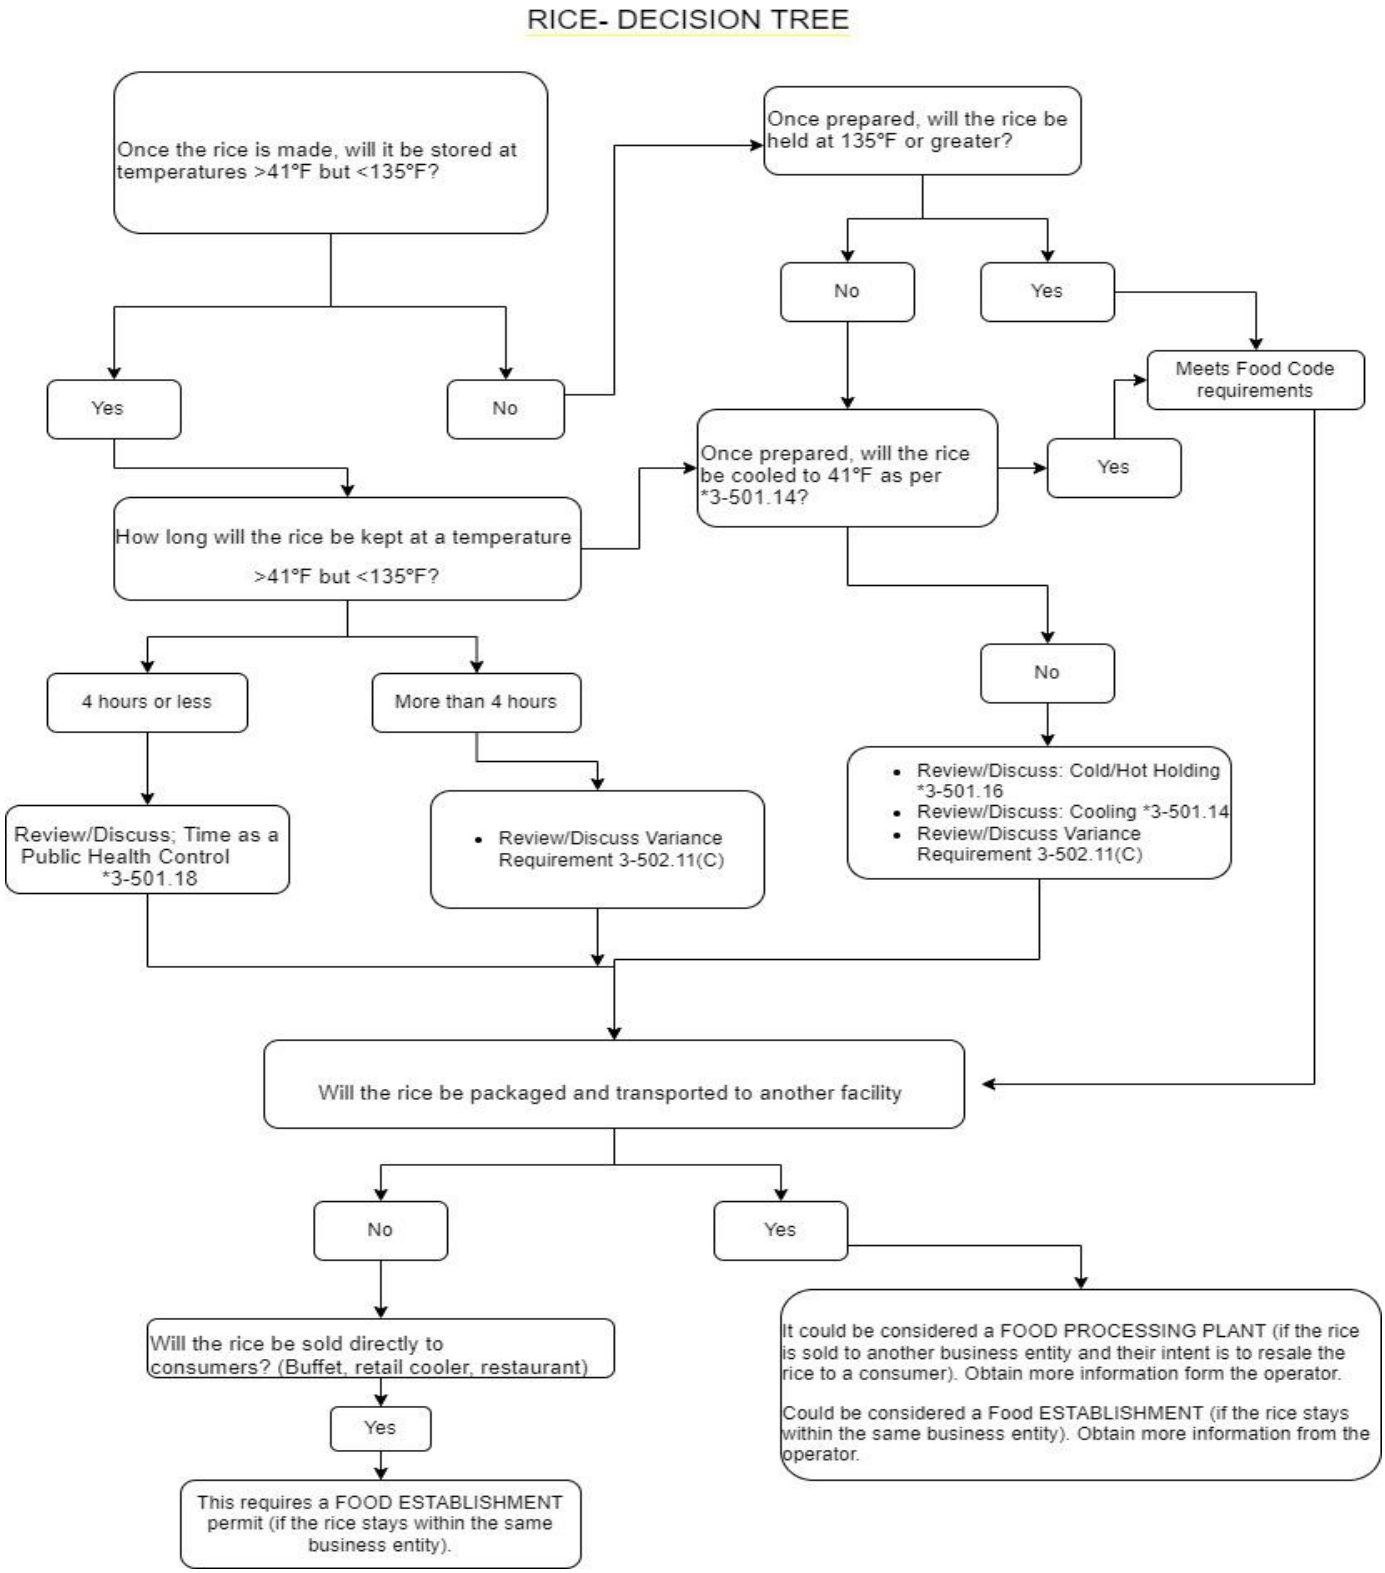
II. ***Food Processing Plants*** are commercial sushi operations that manufacture, package, label, or stores sushi and provides it for sale or distribution to other business entities. These sushi operations are generally offsite from a retail food establishment and sell or distribute to a business (Food Establishment) prior to distribution to the end consumer.

Examples:

1. Sushi is prepared in a restaurant and offered for sale to the consumer either for dine in, take out, or other third-party delivery service. These operations would be **Retail Food Establishments**.
2. Sushi is prepared in retail grocery store by a third-party vendor and the grocery store does not take ownership of the product. The vendor is leasing space, the sushi producer provides finished sushi to the end consumer, and the grocery store takes payment. These operations would be **Retail Food Establishments**.
    - Distribution often includes stocked refrigerators, 3rd party delivery services, and/or vending machines. The sushi establishment does not need to collect money directly for sale of its products.
3. Sushi is prepared at an off-site commissary and delivered to other retail stores or businesses that do not produce onsite. These operations are **Food Processing Plants**.
    - Sushi products made at a food processing plant may be produced at a central commissary location and distributed to other Food Establishments not operated by the company. In this instance, there is a business that receives the products as an intermediary before the final consumer receives the sushi or sushi product.
4. Sushi is produced by a chain operation at a grocery store and distributes it to another kiosk owned by the same operation. These operations would be **Retail Food Establishments**.
    - Sushi products may be prepared or produced at a central commissary location and delivered to other operations owned by the same company. Ownership of the product cannot change, but the product may be made in a different location than where it is offered for sale to the consumer.
5. Sushi is prepared at a preparation site/kitchen/commissary and ends up in university campus/hospital/airport. These operations are **Food Processing Plants**.
    - This would apply to sushi provided to locations such as universities, airports, etc. where the sushi company does not retain ownership of the product. These end locations may have a retail establishment component, but the sushi prepared for service within these locations is considered from a food processing plant, unless the distribution is via vending machine or other direct to consumer Food Establishment criteria.

Appendix C: Decision Tree

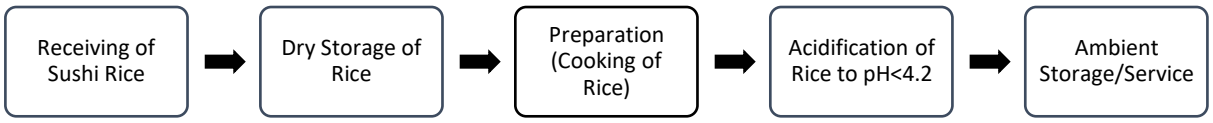
The decision tree is based off the 2017 FDA Model Food Code is intended to provide operators with specific food safety guidance based on the process used by an operator for holding rice. It also includes information about permitting/licensing based on how it will be served/sold.



Appendix D: Food Flow and Hazard Analysis for Sushi Rice

Food Flow Diagram for Sushi Rice

This is an example of a food flow diagram that should be submitted with a sushi rice HACCP Plan. All steps related to the preparation and acidification of rice are included. Please note that food flow diagrams do not have to follow this format, they just must contain the appropriate information.



Hazard Analysis for Sushi Rice

This chart outlines the steps in sushi rice preparation and the hazards associated with them. The CCP has also been identified. This information can be used in assembling the HACCP Plan.

PROCESS	**RECOMMENDATIONS/POLICIES**	**HAZARDS**	**CCP? IF YES, CRITICAL LIMITS**
Receiving	●All food products received from approved suppliers/distributors	●B: Microbial pathogens ●C: Chemical contamination of products ●P: Pest contamination	●No; have prerequisite receiving program Rejection process/segregation of rejected products SOP
Food storage	●Any dry storage foods will be stored away from any chemicals and in a dry, clean, 6" off floor location that is not exposed to other contamination.	●B: Potential growth or survival of pathogens	●No; Food Code parameters met for cold storage and dry storage
Preparation	●Rinse/soak rice to remove any foreign debris ●Cook rice to desired temperature, 135°F for rice that will be hot held	●B: Potential growth of *B. cereus, S. aureus, C. perfringens*	●Follow Food Code parameters for proper cooking and holding of rice.
Acidification	●Acidify rice after cooking, prepare sample for pH measurement and take pH ●Calibrate pH meter according to manufacturer's specs	●B: Potential growth of *B. cereus, S. aureus* and *C. perfringens* if held at room temp	●CCP pH<4.2
Display/Serve	● Display and serve sushi using no bare hand contact with ready-to-eat foods. ● Food should be stored according to time/temperature requirements during display	●B: Potential growth or survival of pathogens	●Follow Food Code parameters for employee health, no bare hand contact, and holding temperatures for TCS ingredients

Appendix E: Checklist HACCP Plan Review and Verification

HACCP Plan Content Requirements	**Observed**
List of all ingredients, equipment, and packaging to be used including recipes and/or formulations	
Food flow diagram (page 15 Appendix D of guidance document)	
Hazard Analysis (*B. cereus, S. aureus* is pathogen of concern)	
Critical control points labeled (acidification step as CCP)	
Critical limit given (pH of rice below 4.2)	
Monitoring procedures (pg. 9-10)	
Corrective actions provided (pg. 7)	
Record keeping procedures (pg. 8)	
Employee training program	
Written prerequisite programs and SOPs	
Notes:	

Verification Activities	**Observed**
Approved equipment used	
Proper ingredients and formulation used	
Identification of employees involved in process	
Proper pH meter calibration observed	
Observation of pH sample preparation and pH meter use	
Corrective actions observed or discussed with trained employees	
Review of pH logs and corrective actions log	
Review and verification of adequate training program	
Observation of prerequisite programs/SOPs	
Notes:	

State	County	Acidified Rice	Variance Required	HACCP plan available	Lab test required for PH	Labelling	Are NIST Calibrated Thermometer required	Is 24 hours continuou monitoring required for Seafood items	Is the temp of the Seafood needs to be 38°F or 40°F or 41°F	Comment	Link

Colorado		4.2 or below	Yes for acidified rice	Yes	Yes, if using the statewide variance option.					Can either obtain their own variance that may need a HACCP plan or can follow the statewide variance criteria (one sample, three different batches or onsite pH testing). Inspectors should be doing field verification for acidified rice.	https://conferenceforfoodprotection.sharepoint.com/sites/ConferenceforFoodProtection/Shared%20Documents/Forms/AllItems.aspx?FolderCTID=0x012000ZE08D3C88C78D24B9F6412D97F4C1B05&id=%2Fsites%2FConferenceforFoodProtection%2FShared%20Documents%2FCouncil%20Committees%2FCouncil%20III%2FRetail%20Sushi%20HACCP%20Committee%2FShared%20Documents%2FColorado%2FRF199%2D24%5FSushi%20Rice%5FApproval%20Letter%5FO40319%5Fmbrandt%2Epdf&parent=%2Fsites%2FConferenceforFoodProtection%2FShared%20Documents%2FCouncil%20Committees%2FCouncil%20III%2FRetail%20Sushi%20HACCP%20Committee%2FShared%20Documents%2FColorado
Delaware		4.1 or below	Yes for acidified rice	Yes							https://conferenceforfoodprotection.sharepoint.com/:b:/r/sites/ConferenceforFoodProtection/Shared%20Documents/Council%20Committees/Council%20III/Retail%20Sushi%20HACCP%20Committee/Shared%20Documents/Delaware/HACCP%20and%20Variance%20Template%20for%20Sushi%20Rice%20Acidification.pdf?csf=1&web=1&e=xLImBB
Michigan		4.2 below	Yes for acidified rice	Yes						Only if special process (Acidification of rice)	https://conferenceforfoodprotection.sharepoint.com/:b:/r/sites/ConferenceforFoodProtection/Shared%20Documents/Council%20Committees/Council%20III/Retail%20Sushi%20HACCP%20Committee/Shared%20Documents/Michigan/Sushi_Rice_Acidification_Application_715003_7.pdf?csf=1&web=1&e=vv1gJv
Wiconsin		4.3 or below (MN also)	Yes for acidified rice	Yes							https://conferenceforfoodprotection.sharepoint.com/:f:/r/sites/ConferenceforFoodProtection/Shared%20Documents/Council%20Committees/Council%20III/Retail%20Sushi%20HACCP%20Committee/Shared%20Documents/WI_DATCP?csf=1&web=1&e=feihqq
South Carolina DHEC		4.1	Yes for acidified rice	No	one-time product assessment from process authority or accredited food lab required to approve variance	For prepackaged "grab and go" foods only	No. Only pH meter and calibration required (sushi rice)	No.	41F	Variance based on approved SOP only if special process (Acidification of rice); Program offers options to use either temperature control or TPHC without control of pH. (SOP required for TPHC)	https://conferenceforfoodprotection.sharepoint.com/:b:/r/sites/ConferenceforFoodProtection/Shared%20Documents/Council%20Committees/Council%20III/Retail%20Sushi%20HACCP%20Committee/Shared%20Documents/SC%20DHEC%20Sushi%20Rice.pdf?csf=1&web=1&e=NdRSLL
Nevada	Washoe County	4.2 or below	Yes for acidified rice	Yes	Yes	For prepackage/manufactured foods only	No. Only pH meter and calibration required.	No.	41F	For sushi rice, TPHC or an approved HACCP plan and variance is required by all food establishments in Washoe County. Washoe County also has restrict SOP requirements such as training, employee health, and cleaning/sanitization for all HACCP plans. This often creates a lot of back and forth to get a plan approved from nationwide corp entities.	

With the exception of material that is copyrighted and/or has registration marks, committee generated documents submitted to the Executive Board and via the Issue process (including Issues, reports, and content documents) become the property of the Conference.

COMMITTEE NAME: **Safe Use of Reusable Containers Committee (SURCC)**

DATE OF FINAL REPORT: *11/22/22*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☐ ***Council II*** ***X*** ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: **Carrie Pohjola (co-chair) and Dagny Tucker (co-chair)**

COMMITTEE CHARGE(S):

- Clarify the scenarios related to reusable containers within the scope of regulation
- Identify and analyze the scientific and other literature related to consumer-owned containers at retail
- Draft recommended guidance around those scenarios and create a definition of reusable container
- Provide recommended code language changes, if necessary, to FDA
- Report progress and report findings and recommendations at Biennial Meeting in 2023

Issue# 2020 I-024 (combined with 2020 I-022 and 2020 I-023)

1. Clarify the scenarios related to reusable containers within the scope of regulation.
2. Identify and analyze the scientific and other literature related to consumer-owned containers at retail.
3. Draft recommended guidance around those scenarios and create a definition of reusable container
4. Provide recommended Code language changes, if necessary, to FDA
5. Report progress back to the next Biennial Meeting in 2023 and the committee findings and recommendations may be presented at the subsequent Biennial Meeting if necessary.

COMMITTEE WORK PLAN AND TIMELINE:

COMMITTEE ACTIVITIES: **Dates of committee meetings or conference calls:** *11/16/2021, 11/30/2021, 12/14/2021, 1/11/2022, 2/8/2022, 2/22/2022, 3/22/2022, 4/5/2022, 4/19/2022, 5/3/2022, 6/14/2022, 7/12/2022, 10/04/2022, 10/28/2022, 11/01/2022, 11/15/2022, 11/22/2022, 11/29/2022*

1. ***Overview of committee activities:***

   The committee determined that subcommittee work would be best to accomplish the charges. The first subcommittee was the Regulatory Foundation Subcommittee that developed a flow chart of what is currently allowed in the Food Code for the safe use of re-usable containers. This will be used to address scenarios that were then addressed by sub-committees. Subcommittees then determined all types of scenarios that could possibly occur at the retail level based on types of sales of foods and finally a sub-committee is working on flows based on the packaging (consumer owned, business owned, third party owned) and when finalized will be used to determine which of the identified scenarios could be safely done with food code language changes. Once this is determined, guidance will be drafted based on identified literature and best practices to safely allow for the re-use of containers.

   The committee continues to work on a guidance document. A sub-committee is working on making the sections within the document more cohesive for review by the full committee on

September 20th, updated to 10/04/2022 due to FDA regional seminar. The final document is to be completed by the end of October for submission in November.

The committee will complete the final guidance document to be submitted to CFP by December 5th. It is currently in the formatting stage of completion.

Food code language and a definition of reuse was drafted based on jurisdictions that have adopted the reuse of containers and literature and documentation that was reviewed by the committee when drafting the guidance document.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***

A.a. Clarify the scenarios related to reusable containers within the scope of regulation. Scenario matrix developed demonstrating reusable/returnable containers currently being utilized in numerous scenarios where current regulatory code does not align with practice.

A.b. Identify and analyze the scientific and other literature related to consumer-owned containers at retail. Current scientific literature specific to consumer-owned containers is limited. Available relevant scientific literature, a precedents overview and other relevant examples and literature was reviewed and is compiled and referenced in the committee's guidance document.

A.c. Draft recommended guidance around those scenarios and create a definition of reusable container. Scenarios and opportunities for safe implementation of reusables/returnables were critically evaluated and a guidance document was drafted. Additionally food code was cross referenced for definitions of reuse, returnable, refillable along with allowable container types in current code and based on those examinations and current scenarios of use, a definition of reusable/refillable container was created.

A.d. Provide recommended code language changes, if necessary, to FDA. Based on the above work as well as current food code precedents at the state level, food code language changes are being recommended.

A.e. Both committee co-chairs plan to attend the Biennial meeting to report progress and report findings and recommendations at Biennial Meeting in 2023.

3. ***Charges INCOMPLETE and to be continued to next biennium:***

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

X ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***

☐ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1.

2.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

a. ***Issue #1:*** Report – Safe Use of Reusable Containers Committee Acknowledge the 2021-2023 Safe Use of Reusable Containers Committee final report, thanks the committee members for their work and disband the committee

b. **List of content documents submitted with this Issue:**

Committee Member Roster:

☐ ***See attached revised roster PDF*** x ***No changes to previously approved roster***

"Committee Members Template" (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

DEFINITIONS & ABBREVIATIONS

Terms not defined in the Food Code and shortened abbreviations used in this document.

TABLE 1: DEFINITION OF TERMS USED IN THIS GUIDANCE

Term	*Definition*
Contamination-free	A procedure for filling a consumer's container with food or beverage without directly or indirectly contaminating the source container of food or a food-contact surface.
Intermediate Utensil	A utensil used to prevent contamination from refillable containers to food or food-contact surfaces.
Origin	Source of the refillable container, such as the consumer, the food establishment, or a third-party provider.
Reusable Container	A product or primary packaging, to hold food, that is used repeatedly, refilled, or returned for multiple uses and conforms to characteristics of sanitary construction as defined in Chapter 4-1 and 4-2 of the Food Code.
Return Receptacles	Empty containers such as a bin, crate, or cart used to collect reusable containers returned to a food establishment for cleaning prior to refilling with food.
Secondary Reusable Container	Cooler, delivery bag or other container that is returned to a food establishment for reuse but is not a food-contact surface for ready-to-eat foods
Third-Party Providers	Person that provides warewashing services and/or refillable containers cleaned as specified under Parts 4-6 & 4-7 to the food establishment.
Verification	The cleaning, monitoring, or check procedure should be done by a food employee capable of affirming the cleaning process was completed properly.

TABLE 2: TABLE OF ABBREVIATIONS USED IN THIS GUIDANCE

Abbreviation	*Substituted Phrase*
CPG	Consumer Packaged Good
NON-TCS	Non-Time/Temperature Control for Safety Food
RTE	Ready-To-Eat
TCS	Time/Temperature Control for Safety Food
W/R/S	Wash/Rinse/Sanitize
LCA	Life Cycle Assessment
PR3	Partnership to Reuse, Refill, Replace Single-Use Packaging

II–DISCLAIMER

The guidance in this document does not create or confer any rights for, or on, any person and does not operate to bind public health officials or the public. This guide does not have the force and effect of law and thus is not subject to enforcement. This guide encourages food establishments to use the guidance herein to tailor food safety practices appropriate to their operations.

III–PREAMBLE

At the 2021 Conference for Food Protection (CFP) Biennial Meeting, Council III voted and approved the creation of the Safe Use of Reusable Containers Committee. This was in response to Issue #2020 I-024 (combined with 2022 I-022 and 2022 I-023), as presented at the CFP Biennial Meeting.

The following charges were given to the Committee:

1. *Clarify the scenarios related to reusable containers within the scope of regulation.*
2. *Identify and analyze the scientific and other literature related to consumer-owned containers at retail.*
3. *Draft recommended guidance around scenarios identified in the issue and create a definition of reusable container.*
4. *Provide recommended code language changes, if necessary, to the FDA.*

IV–SCOPE

This committee found there are numerous instances where current regulatory code does not align with practice in the field. To address this issue for CFP, the committee created this document around a scenario matrix, which offers an overview of how reusable/refillable/returnable containers are currently being used by the business community.

This document does not include: binding requirements unless adopted by the regulatory authority; nor does it describe W/R/S procedures for containers that are washed by food employees prior to refilling (which is spelled out in the Food Code).

This document will help clarify:

1. *Scenarios for refilling reusable containers in retail food establishments as listed in the 2017 FDA Model Food Code.*
2. *Best practice recommendations for filling reusable containers including those under a variance of the Food Code.*
3. *Reusable containers washed outside of the retail food establishment such as by a third-party provider.*
4. *Literature and local legislation related to refilling reusable containers.*

Photo courtesy of Dispatch Goods

V

INTRODUCTION

There are few pathways available in the 2017 FDA Food Code for refilling consumer-owned or third-party provided containers unless W/R/S in the food establishment or filled by the consumer at a water vending station (see Figure 1).

The CFP convened the 2020 Biennial Meeting using a virtual format in 2021 due to the ongoing coronavirus pandemic. Three issues related to refillable containers submitted to CFP Council I were transferred to Council III at the 2021 meeting. Issue 2020 I-024 Creation of a Committee to Address Reusable Scenarios in Food Retail was combined with 2020 I-022 Amend Food Code to Harmonize the Definition of Reusable Container and 2020 I-023 Amend Food Code to Address New Reusable Scenarios in Food Retail. Council III voted, and subsequently approved, to create the Safe Use of Reusable Containers Committee. The following charges were given to the new Committee:

1. *Clarify the scenarios related to reusable containers within the scope of regulation.*
2. *Identify and analyze the scientific and other literature related to consumer-owned containers at retail.*
3. *Draft recommended guidance around scenarios identified in the issue and create a definition of reusable container.*
4. *Provide recommended code language changes, if necessary, to the FDA.*

The committee was composed of representatives from academia, the food industry, and local, state, and federal regulatory agencies. Consultants from FDA and academic partners advised the committee throughout the entire process of guidance document preparation. The committee met biweekly with additional subcommittee meetings for approximately 12 months to fulfill its charges, including the completion of this guidance document.
Following a review of state and local codes, waste reduction bills, and the variety of current scenarios with reusable food containers in use, the committee identified several themes:

- *An increase in regulatory emphasis on the reduction of single-use articles to reduce solid waste.*
- *An increasing number of local ordinances that require (specifically for onsite dining) or expressly allow the use of reusable containers.*
- *An increase in the number of businesses that offer services to implement turnkey reusable container solutions for retail food establishments.*
- *The use of reusable containers in retail food establishments is common despite limited allowance in the food code.*
- *There is limited data on disease transmission related to the use of reusable containers.*
- *States recently modifying their food codes to increase the allowance of consumer-owned containers (see Appendix Table 1).*
- *Lack of understanding among industry, consumer, and regulatory partners for the existing allowances for reusable containers, such as those provided by the business for return*

The committee agreed the filling of customer-owned containers and third-party supplied reusable containers in retail food establishments was common despite limited allowance in the food code. The committee also agreed that local, national, and global legislation and movements to reduce solid waste from disposable food containers would increase reuse requirements and the demand for reusable container options from consumers, businesses, and environmental groups. In addition, legislative bodies will likely look toward reusable container options for food service packaging to help address issues of waste, human health, and climate change.

This document is designed to guide the safe use of reusable containers for retail food establishment operators intending to use these types of containers and to provide guidance to regulatory authorities evaluating or approving retail refilling operations. This document addresses scenarios where reusable containers are currently used, was informed by an analysis of literature and best practices related to consumer-owned containers at retail, identifies limitations in the 2017 FDA Food Code related to refilling operations, and highlights recommended guidance for potential food safety controls to help protect consumers, employees, and food if expanded reusable container and refilling operations are approved.

The document includes parameters for reducing potential contamination from direct and indirect contact when filling consumer-owned or third-party provided containers, options for a variety of foods and risk levels, and suggested equipment modifications to reduce risk. It also includes guidance for third-party providers that manage all or a portion of the circular movement of reusable containers for food retailers, such as nationally-distributed CPGs or locally-prepared food items. The committee members encourage regulatory and industry partners to refer to CFP-issued plan review guidance as future reduction of disposable food containers will potentially increase the warewashing and storage considerations for reusable serving containers.

VI

CONTAINER CONSTRUCTION & CONDITION

CONTAINER CONSTRUCTION

Containers reused in a food service establishment need to meet the characteristics of sanitary construction as defined in Chapter 4-1 and 4-2 of the Food Code. They should be used as intended and temperature appropriate.

Regulators and retailers may allow for a broader array of refillable containers for raw agricultural commodities such as whole, unwashed fruits and vegetables that are intended to be washed before consumption. For example, a cloth bag may be an acceptable refillable container for produce provided it is clean and in good repair.

Consumers may fill containers such as insulated type vessels or other containers that do not support a reduced oxygen atmosphere with hot foods. Containers, such as lidded jars or heat-sealed bags, supporting a reduced oxygen atmosphere should not be refilled with hot foods. A reduced oxygen atmosphere may be created inside the container as the product cools, allowing pathogenic bacteria such as Clostridium botulinum to potentially grow in the container, presenting a significant hazard to the consumer.

Similarly, containers designed for use with cold foods should not be filled with hot foods. However, foods held at cold or ambient temperatures may be refilled into containers as the corresponding reduced oxygen environment is unlikely to occur.

CONTAINER CONDITION

In addition to multiuse construction, containers presented for reuse in a food service establishment must also be in good repair and condition as defined by Chapter 4 and 3-304.17(4)(c) of the Food Code.

Single-use articles are designed for a single, and often specific, use. Unless the food establishment has a variance of 4-502.13 to ensure damaged, cracked, or unsuitable single-use containers are not refilled, food employees may not refill a single-use container with food. However, the code does not explicitly prohibit a customer from refilling a clean container with their individual food using a contamination-free process. For example, a cleaned yogurt container might be used by a customer to fill with dry grains from a gravity-flow dispenser.

Due to the wide array of containers that may be presented for reuse, food establishments should have clear procedures to evaluate which customer owned refillable containers may be refilled in the food establishment and that single-use containers should not be refilled by a food employee without additional preventive controls as directed by the variance. Peer-reviewed scientific studies show that hazardous chemicals can migrate from plastic food packaging into food[1].

After an initial release of unbound chemicals, some refillable/reusable plastics have also been measured to migrate hazardous chemicals into food following multiple uses[2]. Current safety assessment approaches focus on a specific set of toxic endpoints (e.g. genotoxicity) and are not yet able to fully account for additional sensitive endpoints or for mixture toxicity[3]. Guidelines are therefore needed to ensure the safe reuse of plastic food packaging articles.

VII

CONTAMINATION-FREE FILLING METHODS

Five methods for filling of reusable containers are included for either consumer or employee filling. Some of these methods are already common practice. These methods are examples and are not an exhaustive list of safe filling methods for reusable containers. Processes may vary and food establishments should consult with their regulatory authority to identify approval mechanisms.

METHOD 1

GRAVITY-FED DISPENSERS (SELF SERVICE, BULK GRAVITY FLOW)

Type of Equipment

Dispensers that protect bulk, unpackaged food using a baffle, chute, or other barrier to prevent access to the food. A handle or other mechanism allows the product to flow into the receiving container with no additional utensil needed.

Control Needed

Posted instructions for customer education to ensure proper use and clarity of which products may be refilled to a customer container.

Example

Continuous or portion-controlled flow dispensers used for free-flowing products like cereals, grains, nuts, ice cream and beverages. The customer would fill their refillable container by actuating a lever to allow food to flow. This would need to occur without contact between the refillable container and the dispenser.

METHOD 2

SELF SERVICE, NON-GRAVITY FED

Type of Equipment

Self-service scoop bins, spice containers, and non-TCS bulk foods that need utensils for food transfer.

Single-use articles

Such as a paper liners or utensils such as tray, scoop, or spoon may be used to ensure that customer-provided containers are not brought into food preparation areas, and that unpackaged foods do not come into contact with a contaminated utensil. Receptacles must be provided for both clean and dirty transfer utensils.

Control Needed

Displayed products shall be protected from contamination using packaging, guards, covered display containers or other effective means. Individual utensils must be provided for each bulk food storage bin and or container. Space to hold clean and dirty utensils. Staffing to wash utensils. Posted instructions for customer education to ensure proper use and clarity of which products may be refilled to a customer container.

Example

A customer provided container is filled from a bulk bin or other bulk storage container of non-TCS food. The customer would use a single-use article or transfer utensil to fill the consumer-owned container.

METHOD 3

INTERMEDIARY LINERS (FULL SERVICE, EMPLOYEE REFILLING)

Type of Equipment

Transfer liners such as a wax paper liner may be used to ensure that customer provided containers are not brought into kitchens or service areas, and that work spaces do not come into contact with containers that have not been sanitized according to FDA recommendations. Transfer liners are used on scales and to collect requested food for customers before being placed in the customer-provided container. Adhesive stickers can be provided for customer provided containers.

Control Needed

Intermediary liners shall be protected from contamination using proper storage or other effective means. Food service staff must be educated about proper handwashing procedures in the event of inadvertent hand contact with the customer provided container.

Example

A customer provided container is brought in for refill at a deli, seafood, meat counter, or similar full-service station. The employee would utilize a single-use liner to serve the food. The liner is then transferred to the customer owned container. This method limits waste significantly, while still maintaining existing food safety requirements.

METHOD 4

W/R/S FOR THE CUSTOMER (BEVERAGES & ALTERNATIVE METHOD FOR FULL SERVICE)

The customer presents a container to the food establishment for use, after any approved method for W/R/S service, or approved sanitization method, is completed prior to filling.

Control Needed

Staff must be educated on the defined acceptable condition/criteria of the customer returned container. Staff must be educated on proper cleaning, sanitizing and proper handwashing procedures associated with the handling of the customer returned containers. Intermediary container shall be protected from contamination using proper storage or other effective means.

Example A

Customer brings a container to the food establishment. The container is visually inspected to determine if they will W/R/S the container or use another approved sanitization method. The container is filled and returned to the customer.

Example B

Customer brings a beverage container in for beverages. The container is visually inspected to determine if they will W/R/S the container or use another approved sanitization method. The employee can fill an intermediary container (disposable or washable) with the beverage which is then transferred to their container.

METHOD 5

REUSABLE CONTAINER EXCHANGE — TRADE DIRTY FOR CLEAN, SANITIZED CONTAINERS

The business provides a pre-approved, exchangeable container program. Containers are provided either directly by the establishment, or by a contracted third-party vendor. Receptacles are provided for collection of used containers, and the customer is provided with (by the employee) a verified, sanitized container for use using the food establishment's process.

Control Needed

Staff must be educated about the defined acceptable condition/criteria of the customer returned container. Staff must be educated in proper W/R/S and proper handwashing procedures associated with the handling and cleaning of the customer returned container. Clean, sanitized containers shall be protected from contamination using proper storage or other effective means.

Example A

Customer returns a container provided by the food establishment in exchange for one that has been a W/R/S container. The customer will fill the clean container. The food establishment will W/R/S the returned container for a future exchange. Examples include multiuse to go boxes at a salad bar, beverage containers, lidded containers for bulk foods.

Example B

Customer brings a beverage container in for beverages. The container is visually inspected to determine if they will W/R/S the container or use another approved sanitization method. The employee can fill an intermediary container (disposable or washable) with the beverage which is then transferred to their container.

VIII

THIRD PARTY REUSE PROVIDER

Reusing food contact packaging requires quality control measures that ensure safe and sanitary implementation.

Many food service providers do not have onsite facilities and/or capacity to adequately W/R/S reusable foodware, third party businesses have come to market providing these services as well as forward and reverse logistics services for the containers.

The following section addresses the emergence of third-party reusable foodware service providers beginning with an outline of the types of services provided and followed by considerations for ensuring safe and sanitary implementation of reusables with third-party providers.

Third-party reusables service providers are businesses that engage in any combination of the following activities:

- *Provide reusable food containers and complete circular management between sites (distribution of clean containers and collection of dirty containers);*
- *Clean and sanitize reusable containers at their site before returning to distribution inventory;*
- *Ensure sanitary handling transport for reusable containers between businesses; and*
- *Monitor reusable container condition and manage inventory accordingly.*

While there are many reusable food containers available, there are several critical differentiators between consumer provided reusable packaging, refillable packaging and reusable packaging designed for reuse service systems[4].

Reuse service systems are intentionally designed to incorporate:

- *The existence of infrastructure and reverse logistics for actual take-back, cleaning, refill and redistribution of the packaging (operated by the producers and/or a third party).*
- *A suitable incentive to return the packaging (usually a deposit, but can also be a system in which the consumer pays a fine when the packaging is not returned).*
- *A certain amount of minimum rotations (at least between 10-15 cycles with upwards of 1000+ the ideal[5])*
- *A collection rate of at least 90% of the packaging.*

THIRD-PARTY REUSE SERVICE PROVIDERS: EVALUATION AND CONSIDERATIONS

The rapidly changing third party reuse provider industry has seen exponential growth over the last several years in the number and type of reuse providers coming to market[6]. With any emerging industry it takes time for regulatory and other agencies to evaluate and implement regulations to ensure safe operations.

Currently, the degree of oversight into the reusable service provider space varies significantly across geographies. As such the following guidance offers an outline of considerations retailer's, food service providers and others contracting with a third-party reuse vendor may want to take into account.

REGULATORY OVERSIGHT (PERMIT/LICENSE/ INSPECTION)

It is critical third-party service providers follow state, county and local regulatory agency requirements. While service providers that do not handle food may not be considered a food preparation operation, they may be licensed by some agencies.

CUSTOMER OVERSIGHT (CONTRACTING BUSINESS CONSIDERATIONS)

As with any supplier consider a contract/agreement that ensures second or third-party assessments with onsite facility and/or procedural reviews including clear reporting/communication expectations and processes.

CONTAINER SELECTION

See guidance in VI of this document to evaluate the selection of reusable containers and conduct and/or use current life cycle assessments to ensure the number of reuse cycles provide the intended benefits. Setting individual minimum rotations for each packaging type would cause a very high administrative burden. According to a comparison of 32 LCA studies 10-15 rotations for all packaging materials already brings more benefits compared to single-use packaging.

4. Adopted from "Packaging Reuse vs. Packaging Prevention" Henriette Schneider, Senior Expert Circular Economy, Environmental Action Germany (DUH) Larissa Copello. Production and Consumption Campaigner, Zero Waste Europe. June 2022.2. Tisler and Christensen 2022
5. Reusable vs.Single-use Packaging. A review of environmental impacts. Downloadable at https://zerowasteeurope.eu/wp-content/uploads/2020/12/zwe_reloop_report_reusable-vs-single-use-packaging-a-review-of-environm ental-impact_en.pdf.pdf_v2.pdf

6. www.reuselandscape.org

STANDARD OPERATING PROCEDURES (SOPS)

All third-party service providers must have SOPs in place for the safe and sanitary handling of foodware throughout the container's entire journey. While SOPs for W/R/S are well known and have strong regulatory oversight and guidance, reuse service providers face a unique set of circumstances whereby many of their operations fall outside the normal bounds of regulated space yet still have implications for food safety. In particular, the reverse logistics of collecting dirty containers for transport to a facility for W/R/S, possibly in conjunction with the distribution of clean containers, requires specific attention and the development of SOPs in order to ensure minimal risk of cross-contamination and/or other health and hygiene concerns.

GENERAL CONSIDERATIONS

Well known industry standards exist for the following but we highlight them here so they are not overlooked simply because many of the third-party service providers operate outside of food handling facilities.

- *Employee health & hygiene*
- *Employee illness policy*
- *Hand washing and sinks*
- *Glove usage where appropriate (see example SOPs in appendix)*

WASHING, SANITIZING & HANDLING OF CONTAINERS

Clear guidance and regulations exist for the W/R/S and handling of containers. Please refer to local and federal food safety guidelines with particular attention to ensuring adequate space for stacking reusables after drying and storage of the reusables in secondary containers with lids for protection.

RECORD KEEPING, PROCEDURES AND PROTOCOLS

Third-party contractors and all food service operators must keep and retain adequate records related to their operation including SOP's, hazard control, audit/inspection reports, operational checklists, and if necessary for CPGs, market withdrawal and recall protocols.

REVERSE (COLLECTION) / FORWARD (DISTRIBUTION) LOGISTICS

In the appendix of this document, we offer guidance that addresses the expanded boundaries of food safety considerations required in open-network/offsite reusable foodware systems. This is an excerpt from the PR3 Washing, Sanitization & Handling of Foodware standard[7] which was designed to integrate and support diverse reuse initiatives. Below are some of the key takeaways from that extensive list.

For context it is important to note that several models have emerged for the collection of dirty containers including:

- *Staffed Returns Stations*
- *Automated/Machines*
- *Passive/Unstaffed Return Bins*

Each of these collection models will necessarily have a slightly different set of protocols but all need consistency in safe handling procedures.

All secondary and primary containers must be clearly labeled as clean or dirty. If any of the models being evaluated use the same bin for collection, storage and/or distribution, it is critical the bins and foodware are W/R/S between uses. The containers and bins should have the same level of W/R/S/ to ensure consumer safety and minimize cross contamination.

It is important to also take into account the following considerations:

- *Clean container handling procedures*
- *Storage of the foodware containers while in wash facility, during transportation, and onsite at the food service/restaurant location*

7. Partnership to Reuse, Refill, Replace Single-Use Packaging PR3 standards available for review online: PR3 Standards - RESOLVE

IX
CONCLUSION

The above points of consideration and guidance are intended as a starting point for regulatory agencies, businesses, and other parties interested in the safe and sanitary implementation of reusable foodware systems.

While not designed to be comprehensive, this guidance offers key points of consideration when contracting with a third-party reuse provider.

As this new industry continues to mature, we encourage maintaining close contact with regulatory and industry peers on this topic, as well as monitoring for any updated food code and PR3 Reuse Industry Standards to stay abreast of and share emerging best practices.

X

RESOURCES

The following legislative activities, current reuse examples, scientific rationale, and existing guidance resources were evaluated when creating this document.

EXAMPLE MUNICIPALITY AND LEGISLATIVE REQUIREMENTS AFFECTING THE USE OF REUSABLES

California Assembly. (2019, July 12). Assembly Bill No. 619, CHAPTER 93, An Act to AMEND Sections 114121 and 114353 of the Health and Safety Code, relating to retail food facilities. California Legislative Information.

APPENDIX

Filling Methods

Photos courtesy of Oren Kariri

Method 1

GRAVITY FLOW

Liquids/oils/honey/peanut butter

Method 2

SCOOPS / UTENSILS

Traditional bulk foods with scoop

Method 3

TRANSFER SHEETS (EMPLOYEE / DELI COUNTER)

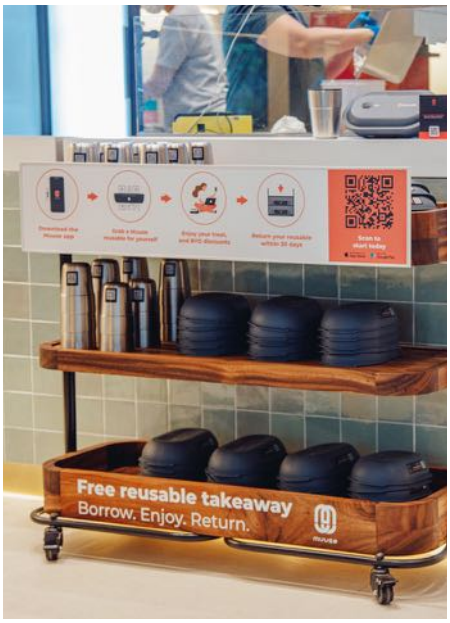
Use of a paper to prevent exposure of the equipment/packaging deli meat

Method 4

CONTAINER WASHED BY FOOD ESTABLISHMENT

Visual inspection/potential refusal of container

Method 5



CONTAINER WASHED BY A THIRD PARTY

Collection stations or transport of dirty containers/delivery of clean containers

CONSUMER OWNED CONTAINERS

WHAT CAN BE USED

Mason jar
Yogurt container
Canvas bag (produce)
Plastic bag
Metal foodware container
Plastic food storage container
Glass food storage container

WHAT CANNOT BE USED

Paper cup
Kitty litter bucket
Tin can
Styrofoam container
Pizza box

SAMPLE BEST PRACTICES FOR **SAFE HANDLING OF FOODWARE DURING REVERSE AND FORWARD LOGISTICS**

EXCERPT FROM PR3's "Washing, Sanitization & Handling of Foodware Standard."*

FOODWARE HANDLING DURING DISTRIBUTION AND COLLECTION

- Third-party employees should have food-handler certificates and receive additional training for safe container handling during collection and distribution.
- Handling procedures should be printed and kept in all vehicles, sorting, storage and washing facilities for reference.
- Distribution vehicles (trucks, vans, pedicabs, bikes, etc.) should have separated and designated dirty and clean areas or be used solely for distribution of clean containers or solely for collection of dirty containers.
- Vehicle operators that switch between collecting used foodware and distributing clean foodware should wash and sanitize vehicle storage areas between uses.
- Vehicle operators should seek further advice from local authorities on local requirements.
- Boxes of clean, food service gloves must be available in vehicles, at or near each collection point, and at the sorting, washing and warehousing facilities where employees drop off used foodware or pick up clean foodware.
- Handwashing should be provided at the receiving facility.
- Employees should use gloves to handle any used foodware or collection bins.
- Employees should wash hands and replace gloves if switching between collection and distribution roles, as detailed below.
- If a glove rips while handling dirty foodware, employee SHALL immediately wash hands and clean and sanitize any surfaces touched on the way to washing hands.
- If any clean foodware comes in contact with a dirty glove, ripped glove, or is dropped, or placed on an unsanitary surface, it SHALL be returned to a washing facility for re-washing and sanitization.

FOODWARE HANDLING DURING DISTRIBUTION

- Clean foodware must be stored and transported in FDA, EPA, NSF and/or other governing body agency approved, sealed storage/distribution containers.
- In the case that collections bins and storage/distribution containers are interchangeable, they SHALL be washed and sanitized between each use and clearly labeled as "clean" or "used.

PICKING UP CLEAN FOODWARE FOR DISTRIBUTION

Employees must follow the below steps in order.

- Employee must wash hands.
- Employee must wear gloves.
- Employee will collect cleaned, sanitized foodware that is packed and sealed in a distribution/storage container(s) from the warewashing provider.
- Employee will place distribution/storage container(s) into the designated clean section of the distribution vehicle(s).

DISTRIBUTING CLEAN FOODWARE

Employees must follow the below steps in order.

- Employee will distribute clean containers in sealed distribution/storage containers to vendors back of house.
- Employee will give storage/distribution container(s) directly to vendor employees or place it in designated areas in the back of house or behind the counter, away from customers and potential contamination until used.

** Partnership to Reuse, Refill, Replace Single-Use Packaging (PR3) standards are in the process of being accredited through the American National Standards Institute (ANSI) and are available for review online: https://www.resolve.ngo/site-pr3standards.htm*

FOODWARE HANDLING DURING COLLECTION

- Collection bins will be cleaned and sanitized with an FDA or other local governing body-approved sanitizing solution for nonfood-contact surface each time it is emptied by an employee.
- Collection bins will be cleaned and sanitized each time before being reused at a collection point.
- Collection bins will be fitted with a lid that seals the bin during collection.

NOTE: Nonfood-contact surfaces of equipment must be kept free of an accumulation of dust, dirt, food residue, and other debris. Timely cleaning and sanitizing prevent the growth of microorganisms on both food-contact surfaces of equipment and non-food contact surfaces. Additionally, proper cleaning frequency prevents the development of slime, mold, or other soil and related microorganisms on food-contact surfaces and equipment.

- Collection bins will be maintained by third-party employees, even if they are located within the vendor's space.

COLLECTING DIRTY BINS FROM COLLECTION POINTS

Employees must follow the below steps in order.

- When directly in front of the collection point, employee will wear gloves
- Employee will open the collection point housing unit and seal collection bin with lid.
- Employee will place the sealed collection bin into the designated dirty section of the collection/distribution vehicle.
- Employee will sanitize the collection point housing.
- Employee will repeat steps if multiple collection point housing units are in the same location.
- Employee will remove gloves and properly dispose of gloves in a nearby trash can and wash hands.

INSERTING CLEAN COLLECTION BINS INTO COLLECTION POINTS

- Employees will follow the below steps in order.
- o Employee will wear a new pair of clean
- o Employee will place sanitized collection bin from collection/distribution vehicle into collection point housing unit.
- o Employee will repeat steps above if multiple additional collection point housing units are in the same location.
- o Employee will remove gloves and properly dispose of gloves in a nearby trash can and wash hands.

RETURNING DIRTY FOODWARE TO SORTING OR WASHING FACILITY

- Employees will follow the below steps in order.
- o Employee will put on new gloves.
- o Employee will unload dirty reusable containers and receptacles for sorting and/or washing/sanitizing.

Photo courtesy of Muuse

SUMMARY OF RECENT FOOD CODE **ACTIVITY RELATED TO CONSUMER-OWNED FOOD CONTAINERS IN THE UNITED STATES**

After reviewing state and local codes, waste reduction bills, and a wide variety of reusable food containers commonly in use, the committee identified several themes:

Lack of awareness or enforcement of existing regulatory restrictions on reusable containers

- *The use of consumer-owned reusable containers, especially for beverages and bulk foods, is considered common practice.*
- *Lack of understanding among industry, consumer, and regulatory partners for the existing allowances for reusable containers, such as those provided by the business for return*

Increase in solid waste regulatory activities encourages consumer-owned reusable containers

- *Restrictions on single-use items are putting pressure on food establishments.*
- *Municipalities are passing regulations expressly allowing reusable food containers.*

Increase in the number businesses that support reusables in retail food services

- *Several businesses already offer services to implement turnkey reusable containers.*
- *Some jurisdictions do not consider these businesses to meet the definition of a "food establishment" and therefore do not provide regulatory oversight.*

Limited data on disease transmission related to the use of reusable containers

- *The existing requirement for filling reusable containers using contamination free process addresses any potential concerns with potential fomite transmission.*
- *Several states recently modified regulations, or are in the progress, to increase the allowance of consumer-owned containers (see Table 1).*

Table 1

Comparison of 2017 FDA Food Code, Recent State Code Modifications, and new CFP Guidance Document Related to Filling Consumer-Provided Reusable Food Containers Using a Contamination-free Procedure.

Allowances for Filling Consumer-Provided Reusable Containers

Shading indicates allowable filling options

	Method 1	***Method 2***	***Method 3***	***Method 4***	***Method 5***
	Bulk foods from protective dispensers	Bulk food using a utensil for transfer	Employee filling using intermediary liners	Employee filing washed or visually inspected container	Reusable container program washed by food establishment or third party
2017 FDA Food Code Section 3-304.17	Only non TCS beverages				No specific guidance for third party
California (2019) Section 114121(b)					Same as FDA Food Code
Illinois (2019) HB3440t					Same as FDA Food Code

SURCC Meeting Summations

CFP COMMITTEE CONFERENCE CALL DOCUMENTATION FORM

Date _11/16/2021_____

Recording on: Yes __X___ No____

Reminder of Anti-Trust Statement: Yes_X___ No ____

Roll Call: Dagny Tucker, Frank Cuarto, Eric Puente, Alison Hurysz, Jordan Ingle, Carrie Pohjola, Christina Springer, Kristina Bonatakis, Rayna Oliker, Steph Teclaw, Oren Kariri, Christina Applewhite, Susan Shelton, Gregory Lux, Jeff Clark, Kat Olson, Rayna Oliker, Sarah Kantrowitz, Steph Teclaw, Tom Arbizu, Sabrina Salinas, Traci Michelson

Quorum: Yes_X__ No___

Vote on previous conference call's Roll Call and Summation: APPROVE ____ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes_X___ No____

Summation of call proceedings

Clarifying Scenarios in which Reusable Containers may be used

- **Reusing personal containers for bulk**
- **Personal containers for take out**
- **A grocery might provide containers that are reusable**
- **Third party might be provide container**

Potential Platforms to be used during meetings (Tabled)

- Google Docs
- Food Shield Group
- Teams

Sub Committees to be created per Category

- **Before subcommittees are created per Category the Regulatory Committee will conduct foundation work to determine:**
    - What we want the recommendation to be
    - Proposed framework
    - Understanding where we are and wanting to go

- Review Food Code
    - **Regulatory Committee**
        - Susan Shelton
        - Kristina Bonatakis
        - Rayna Oliker
        - Gregory Lux

Categories to be reviewed:

- Bulk
- Delivery
    - Restaurant
    - Direct to consumer
    - Grocery (i.e. Instacart)
- Grocery
    - Ready to eat
        - TCS vs. Non TCS
    - Not ready to eat
        - TCS vs. Non TCS
- Institutional

    - Self Service Markets & Vending
- Events
    - Temporary & Mobile
    - Trade Shows
- Tabled- CPG (Consumer Product Goods)?

Meeting will be changed to 2:30 pm based on common consensus from group

ACTION ITEMS

Poll to be sent out in reference to Committee interest

- Christina Springer & Oren Kariri(expressed interest in Grocery)

Regulatory Committee will start work for next meeting

Safe Use of Reusable Containers

CFP COMMITTEE CONFERENCE CALL DOCUMENTATION FORM

Date _____December 14th, 2021_____

Recording on: Yes __x___ No____

Reminder of Anti-Trust Statement: Yes_x___ No ____

Roll Call: ____Jeff Clark, Jessica Otto, Stephanie Teclaw, Jordan Ingle, Kat Olson, Traci Michelson, Oren Kariri, Susan Shelton, Dan Redditt, Mike Goscinski, Christina Springer, Steve Oswald, Ali Hurysz, Christine Applewhite, Kaycee Strewler, Dagny Tucker, Carrie Pohjola, Eric Puente, Sabrina Salinas, Gregory Lux, Abeid Fells, Rayna Oliker, Sarah Kantrowitz, Don Schnaffer

Quorum: Yes__x_ No___

Vote on previous conference call's Roll Call and Summation:

APPROVE _x___ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes_x___ No____

Summation of call proceedings__

1. Summation/notes are uploaded to TEAMS channel for review

2. Review of draft decision tree per current food code - Jessica Otto would like to take this back to the FDA team to validate it
3. Review of subcommittee meetings and actions
4. Discussion on how we should go about developing reusable container definitions/approvals - look for current definitions, use FDA Food Code definition - add to TEAMS any that the group comes across

(B) A take-home FOOD container returned to a FOOD ESTABLISHMENT may be refilled at a FOOD ESTABLISHMENT with FOOD if the FOOD container is:

(1) Designed and constructed for reuse and in accordance with the requirements specified under Part 4-1 and 4-2; P

5. Discussion on 12/28 meeting - cancel due to holidays - next meeting is 1/11/22

Action Items:

Jessica/FDA to review draft decision tree

Carrie/Dagny to look for reusable container definition - anyone else can upload as well

Subcommittees to continue to work and report out on the 1/11/22 meeting

---

Summation of call proceedings_____

FDA participant discussed the flow chart: Refilling Returnables 3-304.17. Container – (Food) Code doesn't care who owns the container but how it is used. Contextualize our work - needs to be food contact. Not talking about reusable bags. Filling a container with food. Q. Direct FC v. ?

Scope of diagram. Does the diagram take into account T/T in delivery

world? ___This is a great first step in helping to contextualize what this committee is trying to address. Direct to Consumer Guidance - will share for reference. Final version as a tool - may want to highlight what the rule is v the provision. Non TCS language? Annex 3. Food for thought (from FDA) scenario… can always apply for a variance for a use that is not allowed. _____Q. from committee membe Regarding the asterisk. Separate paragraphs are treated separately. They are distinct. Notes will be shared with the group who developed the diagram.

Subcommittee 1 Discussion:

Discussion around container definition. What's allowed v not allowed - decided to wait to address that. Grocery -identified departments, takeout v delivery, who would be filling a container with what - TCS v non TCS. Direct to consumer and ecommerce - compostable trays, insulation materials - want less packaging or reuse the materials. Suggestion to designate insulation materials as active or passive. Restaurants - same process of identifying who provides, who fills, etc… suggestion to use same terminology as DTC guidance._

Difficult to clean container - growlers, kombucha, etc. Salad food bars - self-service: olives, fruit, etc.

Subcommittee 2 has a bulleted list that will be added to the table that was shared by subcommittee 1. Literature review in process. Added scenarios from other countries (raw meat!) options available some grocery stores are already allowing refilling. Science articles - Norovirus outbreak traced back to reusable canvas bag that was in restroom during a vomiting (?) event.

Documents will be shared (Teams) suggestions for using other methods of sharing as well (in chat). Some subjects that didn't get a lot of interest - institution, mobile/temporary - is anyone interested in taking on those concepts. Sub committee 2 did talk about temp and mobile foods in their subcommittee meeting. _____Suggestion to change "Restaurant" to "Food Service" to incorporate more types of facilities. Let Co-chairs know if there are existing definitions in various state laws (legislated). _____Next meeting scheduled for Jan. 25 - ACTION ITEMS _____No additional action items identified.

CFP COMMITTEE CONFERENCE CALL DOCUMENTATION FORM

Date : 2/8/22

Recording on: Yes ___X__ No____

Reminder of Anti-Trust Statement: Yes_X_ No ____

In Attendance:

Dagny Tucker

Carrie Pohjola

Jessica Otto

Oren Kariri

Traci Michelson

Don Schaffner

Ali Hursyz

Rayna Oliker

Susan Shelton

Jeffrey Clark

Debbie Crabtree

Abeid Fells

Gregory Lux

Christina Springer

Frank Curto

Kat Olson

Sabrina Salinas

Sarah Kantrowitz

Kristina Bonatakis

Quorum: Yes_X_ No___

Vote on previous conference call's Roll Call and Summation:

APPROVE _X__ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes____ No_X__

Summation of call proceedings

- Dagny reiterated Committee member obligations - attendance etc.
- Approval of 1/11/22 summation
- Regulatory Sub-committee - Confirmed updates made to code visualization based on FDA comments. Will await further approval upon sharing.
- Discussion of shared scenario matrix for integration of sub-committee findings. Records sector, origin, collection, etc.
    - Traci elucidated intent for similar rows and desire to differentiate
    - Dagny explained Grocery/Manufacturer
    - Sarah K. - Raised issue of committee scope in e-commerce or grocery delivery. Does it include secondary packaging used in delivery (ex. dunnage).
    - Discussion of how to capture emerging scenarios, desire to document even if we will not make recommendations.
    - Expect some recent e-commerce, hospital, events/mobile, and "other" scenarios not yet documented
    - Noted call to add additional examples to "Literature Review"

- Reusable Container definition - first review
    - FDA code currently highlighted, but additional content is desired to accommodate other possibilities

- Governance and planning discussion
    - Assignment of small groups raised as a potential next step
    - Full group to decide scenarios for committee focus and recommendations

ACTION ITEMS

- Subcommittee members to contribute any undocumented scenarios to matrix
- Sarah K. to schedule a small-group session to visualize the documented scenarios, overlaps and patterns

Vote on previous conference call's Roll Call and Summation: APPROVE ___x_ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes _X_ No__

Summation of call proceedings

Note taking asssignment-

Antitrust statement – all accepted

Roll call- attendance discussion

Approval of meeting summation 2.8.2022 - Dagny Tucker 1st Rayna Oliker second approved.

Subcommittee 1 Discussion:

- Reusable refillable chart – discussion for needing revision or update.
    - Are there are FDA edits for this in teams folders
    - There is a version 3 for this chart

- FDA good with the version 3 which is most current in teams
- Used to how to use the decisions for reusables

- Scenarios – Primary Packaging
  - Based on packaging used. Consumer own, retail own, third party owned
  - Types of food (non TCS, TCS, TCS RTE); who fills (employeee, consumer)
  - Might direct fill if consumer to avoid contamination
  - Container uses (wax paper, etc) contact free manner
  - Labeling
  - Life cycle of the container -risk map
    - Moments where there are points of CCP
    - Weights and measures – more bet practices and other one for dirty and handling the clean containers.

Is there an opportunity maybe to align the language in the provision

decision tree and this scenario map? Just so we're using the same language where possible (and it's ok if there are places where it isn't possible/is different).

USDA did not supply a consultant for this committee.

ACTION ITEMS ____no additional action items identified.

Run through the scenrios with this scenario map to match of the language and see where they fall out. Which would work and ones that don't.

Align to clean up language for this scenarios and the decision tree.

1. 4 options in the "Type of Food" line... TCS -RTE (and nonRTE) and nonTCS-RTE (and nonRTE) – Susan Shelton.
2. Definition of reusable – or other definitions that need to be added for this type of setup. Example wash areas, cleaning areas.
3. Example salad, produce about literature on resusables, for deliverables
4. Draft report for committee

Summation of call proceedings

Dagny and Bessie introduced a new member of the committee who is Beth Glenn from Starbucks.

Review of Guidance document work was discussed:

Section III-Susan and Abeid provided work done on the Introduction section which is in the Teams folder. They are relying on further sections to update the draft intro provided.

Section IV-Steph and Sabrina worked on the Definitions section based

on what was already worked on from committee work. They also included abbreviations. Steph requested if we wanted to continue to use returnable or reusable as definitions. Jessica did state the returnable was not defined in the food code. Dagny asked if there strong feelings from the group. Don Schaffner did state that we are not using a term, we don't need to define it. Dagny suggested that we continue with the term reusable.

Section V-Susan reviewed the draft language. Dagny suggested that we include containers not washed onsite what are provided by 3rd party providers.

Section VI-Frank reviewed Container construction and validation and the flow chart was developed and 3 scenarios that could present itself and the first discussed were the counter type scenario. The construction definition was also reviewed and it included some additions of complexity of the equipment. Rayna did suggest we may re-allocate the locations of decision trees and flow charts. Rayna suggested a decision tree for each of the methods provided.

Section VII-Eric reviewed the work on methods of contamination free process and discussed multiple scenarios. They were broken out into A, B, C.

Section VIII-Dagny reviewed the third party reusable containers and a document that was already developed which provided a distribution and collection. Beth did feel that this will provide some guidance for this type of activity. Dagny did review the outline for the Third party and asked if they needed to draft definitions in this section as well. The sub-committee did not come up with who would come up with the oversight of the 3rd party providers.

ACTION ITEMS:

Review the section assignments:

Group 3 no review

Group 4 review Group 5

Group 5 review Group 4

Group 6-no review

Group 7 review by Group 6

Group 8 no review

Next conference call-May 31st will be tentatively a working meeting and we will provide breakouts for the group.

Meeting was adjourned at 3:31 pm by Dagny.

Agenda review: Yes_x___ No____

Summation of call proceedings

- Reviewed guidance document and timeline. Each subcommittee chair or vice chair on call reported on status and updates.
- *Definition subcommittee*: edits were made as outlined from last meeting. Few questions remain and will be worked on by the group before the next call. After a discussion, some definitions

were kept in the section, such as “return receptacles,” and will be visited at a later date.

- *Methods of contamination subcommittee* (chapter 7): currently reviewing comments and outlining next steps now chapter. Requesting more feedback from Group 6 and will reach out for additional comments.

- *Container construction and condition subcommittee*: leveraged a lot of the existing code language but needed additional help with additional consumer-facing materials such as bags and non-ridged containers. In addition, needed to review: 1) the back-of-house decision tree when filling containers as well as a verification review; and 2) self-service for consumer product filling. Planning to coordinate with other teams for reviewing chapter.

- *Introduction subcommittee* (Group 3): a draft of the introduction is completed and will is available for review by the other groups.

- *Scope subcommittee* (Group 5): similar to the introduction subcommittee (Group 3), the scope is outlined and is requesting

review from other individuals/groups.

- Other comments/issues? None.

ACTION ITEMS

- Individuals to review other groups' language and suggest edits/changes before the next meeting.

Agenda review: Yes____ No__x__ (agenda not provided)

Summation of proceedings:

Definitions section reviewed-Sabrina had a question regarding return receptacle definition. Dagny did state in the 3rd party section 8 that it become "collection bin" instead of "return receptacle". Sabrina also suggested "origin" be changed to "source". She requested any other suggestions regarding the definitions section.

Carrie and Dagny will put the document together into one cohesive document on August 1st, which means any additions need to happen by July 31st. Please make comments so the groups know what is being asked.

Carrie did request that any reference to W/R/S in the construction

section be removed as it will be covered in the contamination free section.

Rayna asked for a review of the contamination free section and Dagny suggested a regulator review. Susan, Carrie and Christina will take a look from the regulator point. There are some concerns and conversations regarding the consumer self-serve area (buffets,etc.). Rayna did state that they did want to include more than less to put it out there.

Dagny covered the 3rd party section and made a suggestion for a pop out box on best practices and provide something more substantial. Dagny did request that folks go through the section to read through. Traci did ask Jessica for some language/verbiage protocol on recall of the container.

Dagny did acknowledge the Intro and Scope so they can read through the entire document to update the sections.

Provide illustrations, photos, precedence, etc. in you section folder and include where you would like them in the document with brackets or

highlights by August 9th. If this is provided, there will be no meeting on the 9th. Susan did suggest Kristina B.

Jessica did state that the new food code will be complete by the end of 2022. Anything that comes out of the 2023 CFP and approved will make it into the supplement.

Carrie did ask about proposing the charge of language change and asked if it is was ok to just request to align the food code language with the guidance document.

ACTION ITEMS:

- Comments for all sections are due **JULY 31st**
- Illustrations, pictures, etc. are due by **AUGUST 9th**

Next conference call: August 9th, unless the documents are provided by the committee members.

Meeting was adjourned by Dagny at 3:19 PM CT and seconded by Beth.

Summation of call proceedings__

Guidance document was reviewed and provided in the Teams folder. It was suggested to include the scenario matrix spreadsheet as an

appendix. Susan provided some background on the introduction changes for the group. Jessica suggested to circle back around to the charges in the introduction. The group thought it best to reference Figure 1.

Jessica did state some concerns with the number of uses or reclamation rate. But jurisdictions could include number of uses if they see fit. Origin was discussed and it was decided to swap supplier with source___

The FAQs were discussed in the container construction section VI. Jessica also suggested to not reference the food code language but perhaps cross reference to the appendix. There was some discussion on the yogurt reuse FAQ and Jessica will give it some thought. The committee left off at methods of filling.

ACTION ITEMS: Review guidance document for discussion at the next meeting.

Agenda review: Yes__X__ No____

SUMMATION OF CALL:

Review of FDA Comments:

Science Based Documentation

- Any places where we can make linkages to food safety will assist in strengthening the document
- Washington State may be the best resource for documentation
- Susan S. can provide code references to jurisdictions that allow these practices

3rd Party Delivered & Retail

- 3rd party delivered services are detailed, may need to include more on the retail side and how they handle containers/utensils, specific to collection of containers

- General consensus is that this is a routine concept for most retailers but there should be clarification on this in the document

Food Code Language Cited

- Reference of the language in the document is helpful, but not verbatim- vote determined to use references

Method 2

- Need to add control method. Greg will be adding language to account for the method to address this

FAQ's

- Lacks the safety literature back up, need full analysis for strong source citations, science behind why the recommendations we're making

- Move the FAQ's into the guidance

ACTION ITEMS:

- Put together a paragraph for retailers' collection and sanitation

document – Susan S will reach out to Starbucks Team for any pre established text they have on this

- Literature review from WA that can be placed in the document from Susan

NEXT CALL:

- Interim meeting may occur, Dagny & Carrie will meet prior and send out a note

---

Quorum: Yes___ No_X__

Vote on previous conference call's Roll Call and Summation: APPROVE ____ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes__X__ No____

Summation of call proceedings:

Dagny requested that folks who aware of code language for jurisdictions that currently allow for the reuse provide that reference within the document. CA does have language and other municipalities that have added it. It does not need to be at state level. Susan and Christina will provide an opening comment in the Contamination Free Filling Methods.

Jeff will review the guidance document and clean it up (removing comments, track changes, grammar, etc.)

The definition for reusable container definition was discussed and reviewed to replace refillable. Carrie will send out an email for comments for final vote on November 29th.

Code language was reviewed and an email will be sent out for comment for final vote on November 29th.

Actions Items:

-Carrie will send out an email for comments before final vote on the definition and proposed code language.

-Dagny will work with a designer on formatting final guidance document.

-Jeff will review the guidance document and make any needed edits.

Quorum: Yes_X__ No___

Vote on previous conference call's Roll Call and Summation, November 22nd, 2022:

APPROVE __x__ DISAPPROVE ____ (document date and results of email vote, if applicable) APPROVE AS AMENDED ____

Agenda review: Yes_X__ No____

Summation of call proceedings:

-Guidance document reviewed with Jeff's editing. All edits were

reviewed and accepted.

-discussion regarding refillable v. reusable.

-Susan reviewed her language change regarding the jurisdictions that are currently or in the process of including language to allow for reusable containers. This was included in the introduction of the guidance document. Juhi suggested a table that listed each Method and what jurisdiction allows.

-Susan will work on a chart/table showing what jurisdictions allow reusables to support the food code language changes and Beth will provide background in the guidance document as well. Carrie and Dagny will include all changes in the final document.

-Rayna suggested a vote on the language and definition.

-Food code language was reviewed and approved by the committee.

ACTION ITEMS:

-Final Guidance document completion

-Beth-(1) Condense the language in the guidance document.

-Susan-(2) Add a table as an attachment to the issue OR add the table into the Public Health significance of the issue paper.

Next conference call: None, Committee has come to an end

COUNCIL III SAFE USE OF REUSEABLES COMMITTEE - REUSE SCENARIO MATRIX SAMPLE

The Council III "Safe Use of Reusables Committee" compiled an extensive matrix of scenarios in which reuseable conatiners are currently being utilized.
The following is intended as a representative sample and not an exhaustive list of all reusable container scenarios currently in practice.

COMMITTEE NAME *Disinfectant committee*

DATE OF FINAL REPORT: *12/26/2022*

COMMITTEE ASSIGNMENT: ☐ ***Council I*** ☐ ***Council II*** ☒ ***Council III*** ☐ ***Executive Board***

REPORT SUBMITTED BY: Dale A. Grinstead, Anna Starobin

COMMITTEE CHARGE(S):

Issue # _2020 III-035_____

1. Review current regulations related to disinfectant use
2. Develop a guidance document for posting on the CFP website for use by retail food facility operators (chain and independent operators), food safety trainers, and regulators to explain the appropriate use of disinfectants on food-contact surfaces in a retail food facility. Suggested topics include, but are not limited to:
    a. Why to use, including an explanation of the difference between sanitization and disinfection.
    b. When to use to treat a surface exposed to viruses (e.g., vomiting and diarrheal events, foodborne illness outbreaks, COVID-19 illness(es)).
    c. What to use (e.g., EPA-registered products).
    d. How to use (e.g., in accordance with EPA-registered label use instructions).
    e. Recommended protocols for clean-up of vomiting and diarrheal events as specified in FDA Food Code section 2-501.11.
    f. List of existing resources, such as federal agency guidance documents, federal regulations (referencing specific, applicable sections), and other publicly available resources to prevent information duplication or contradiction
3. Consider recommending changes to the FDA Food Code to clarify the use of disinfectants in retail food facilities on food-contact surfaces.
4. Report progress back to the next Biennial Meeting in 2023 and the committee findings and recommendations may be presented at subsequent Biennial Meetings if necessary.

COMMITTEE WORK PLAN AND TIMELINE:

1. Review current regulations on use of disinfectants and engage with EPA to understand any upcoming changes to those regulations
2. Review literature available to inform the guidance document
3. Draft a guidance document based on the best available information
4. Draft suitable language changes for the code to include appropriate use of disinfectants in food facilities and on food contact surfaces.

TIMELINE:

1. First Draft of Guidance to be completed by July 2022
    a. Content of Guidance finalized by August 2022
    b. Guidance document finalized by October 2022
2. First draft of recommended changes to the Code by September 2022
    a. Recommended changes to the Code completed by October 2022
3. First draft of issues from the committee by end of October 2022
    a. Issues finalized by mid December 2022
    b. Issues submitted by first week of January 2023

COMMITTEE ACTIVITIES: Dates of committee meetings or conference calls:

1. ***Overview of committee activities:***

   The committee held by Bi-weekly calls through July 2022 and then changed to weekly calls until mid-November 2020 when the guidance and issue drafts were completed.

2. ***Charges COMPLETED and the rationale for each specific recommendation:***
   a. Review current regulations related to disinfectant use. Completed and no recommendation for this charge. Work was completed to provide information for the guidance.
   b. Develop a guidance document for posting on the CFP website for use by retail food facility operators (chain and independent operators), food safety trainers, and regulators to explain the appropriate use of disinfectants on food-contact surfaces in a retail food facility. Work completed and recommendation to accept and post the guidance is included in Issue 2 from this committee
   c. Consider recommending changes to the FDA Food Code to clarify the use of disinfectants in retail food facilities on food-contact surfaces. Work completed and recommended changes to address the use of disinfectants and to suggest changes to the vomiting and diarrheal language in the code are in Issues 3, 4, and 5.
   d. Report progress back to the next Biennial Meeting in 2023 and the committee findings and recommendations may be presented at subsequent Biennial Meetings if necessary. Work is completed and Issue one recommends disbanding the committee as all charges have been met.

3. ***Charges INCOMPLETE and to be continued to next biennium:***

   None

COMMITTEE REQUESTED ACTION FOR EXECUTIVE BOARD:

☐ ***No requested Executive Board action at this time; all committee requests and recommendations are included as an Issue submittal.***
☒ **Board Action is required for some provision(s) of this report and therefore a verbal report needs to be presented at the Board Meeting.**

1. The participation of EPA in this committee was very valuable. CFP should consider that EPA be present as a consultant to Council III deliberations at the biennial meetings.

LISTING OF CFP ISSUES TO BE SUBMITTED BY COMMITTEE:

a. ***Issue #1: Report – Disinfectant committee:*** **List of content documents submitted with this Issue:** ***Disinfectant committee final report and Committee member roster.***

b. ***Committee Member Roster:***

☐ ***See attached revised roster PDF*** ☒ ***No changes to previously approved roster***
"Committee Members Template" (Excel) available at: www.foodprotect.org/work/ (Committee roster to be submitted as a PDF attachment to this report.)

(1) ***Other content documents:***

c. **List of supporting attachments:** ☐ ***Not applicable***

(1) ***Guidance for the safe and proper use of sanitizers and disinfectants in food establishments***

1. ***Committee Issue #2: Use of Disinfectants in a Food Establishment Guidance.*** **List of content documents submitted with this Issue*: Guidance for the safe and proper use of sanitizers and disinfectants in food establishment.* Supporting documents: *Disinfectant committee final report and Committee member roster.***

2. ***Committee Issue #3: Recommended Food Code Changes to Address Use of Disinfectants in Food Establishments.*** **List of content documents submitted with this Issue*: None.* Supporting documents*: Guidance for the safe and proper use of sanitizers and disinfectants in food establishment***

3. ***Committee Issue #4: Recommended Food Code Changes to correct unclear language in the annex on hand antiseptics.*** **List of content documents submitted with this Issue*: None.* Supporting documents*: Guidance for the safe and proper use of sanitizers and disinfectants in food establishment***

4. ***Committee Issue #5: Updates to the code to address the use of disinfectants during body fluid clean-up.*** **List of content documents submitted with this Issue*: None.* Supporting documents*: Guidance for the safe and proper use of sanitizers and disinfectants in food establishment***

Committee Name: Disinfection of Food Contact Surfaces

CONFERENCE FOR FOOD PROTECTION

GUIDANCE FOR THE SAFE AND PROPER USE OF SANITIZERS AND DISINFECTANTS IN FOOD ESTABLISHMENTS

Executive summary

NOTE: The guidance in this document does not create or confer any rights for, or on, any person and does not operate to bind public health officials or the public. This guidance does not have the force and effect of law and thus is not subject to enforcement. EPA, FDA and CDC served as advisors participating in committee discussions as the guidelines were developed. Further, this guidance does not establish regulatory requirements and the recommendations contained herein are not intended to supplant, or otherwise serve as, the rules and regulations applicable to food establishments in a given Federal, State, local, or tribal jurisdiction. The contents of this document are solely the responsibility of the authors and does not necessarily represent the views of their employers.

The Conference for Food Protection (CFP) convened the 2020 Biennial Meeting using a virtual format in August 2021; the meeting was originally scheduled for April 2020 but was delayed due to the COVID-19 pandemic.

Throughout the COVID-19 pandemic, the use of disinfectants significantly increased in food establishments; however, available guidance for safe and proper use of disinfectants at retail was limited and occasionally conflicting. It was not always clear to food industry and regulatory sectors which products were appropriate for use in order to reduce or inactivate microorganisms of concern.

This ongoing confusion resulted in the submission of late-breaking Issue 2020-III-035 pertaining to the use of disinfectants in retail food establishments and the concern that disinfection is not addressed in the 2017 FDA Food Code (Food Code). As a result of Council III deliberation in August 2021, a “Disinfection of Food-Contact Surfaces Committee” was formed with charges including charge 1) propose disinfection language for the Food Code, and charge 2) develop a guidance document for food establishments on when and how to safely apply disinfectants on food contact surfaces as needed to reduce or eliminate disease-causing microorganisms (e.g., bacteria, fungi, and viruses) during the clean-up of bodily fluid events, foodborne illness outbreaks, and the COVID-19 pandemic.

The committee was comprised of representatives from academia, local/state/federal regulatory agencies, and the food industry. Consultants from FDA, EPA and CDC were advising the committee throughout the entire process of guidance document preparation. The committee met weekly for approximately 9 months to fulfill its charges, including the completion of this guidance document.

The committee agreed it was critical to provide guidance on the use of sanitizers and disinfectants, to clarify differences between these categories of products, when and how it is appropriate to use them to control disease-causing pathogens. A review of important regulatory requirements and safeguards, such as EPA registration and product label information, is also provided in this document.

The purpose of this guidance document is to increase knowledge and awareness about the proper use of sanitizers and disinfectants in retail food establishments. When used

properly, sanitizers and disinfectants are powerful and complimentary tools that can keep consumers safe from pathogens that cause infectious disease.

INTRODUCTION

The COVID-19 pandemic heightened attention to the importance of cleaning, sanitizing, and disinfecting of surfaces in food establishments. In response, many governmental agencies governmental agencies, such as the Centers for Disease Control and Prevention (CDC), U.S. Food and Drug Administration (FDA), and United States Department of Agriculture (USDA) began emphasizing the need to frequently disinfect high-touch surfaces.[1] In many instances, high-touch surfaces are classified as nonfood-contact surfaces, which according to the US FDA Food Code 2017 must be cleaned. Although the 2017 Food Code does not recommend disinfecting or sanitizing non-food contact surfaces, there are occasions when it is appropriate to use an antimicrobial treatment on those surfaces. Disinfectants are used less frequently in food establishments which has led to some observations of misunderstanding and misuse of these antimicrobials.

In addition to disinfectant use during unusual circumstances such as outbreaks and pandemics, there are other occasions when disinfectant use is appropriate in the retail food and food service industry (hereafter referred to as food establishments). Disinfectants should be used during clean-up of bodily fluid spills as well as during foodborne outbreaks. Other occasions when disinfectant use is appropriate in food establishments is when the organism to be controlled is not controlled by available sanitizers or when a higher level of microbial control is desired.

Clearly, there are a number of occasions, some of them quite common, when disinfectant use is appropriate in food establishments. Although sanitization is a routine, common

practice defined in the U.S. Food and Drug Administration (FDA) Food Code, disinfection is not addressed in the Food Code. Sanitizers and disinfectants may both be present in food establishments, but sanitizers are more frequently used in those environments. It is important to emphasize that sanitizers and disinfectants are **not** interchangeable products and care must be taken to ensure they are not inadvertently misused. Consequently, end users need to understand the differences between sanitizers and disinfectants as well as when, why, and how both can be used in food establishments. The aim of this guidance is to increase knowledge about proper use of sanitizers and disinfectants in food establishments to facilitate proper use. When used properly, sanitizers and disinfectants are powerful and complementary tools that can keep food establishments safe from pathogens that cause infectious disease.[1]

DEFINITIONS

Note: These definitions are intended for use only in this guidance document. They are not exact references of U.S. Environmental Protection Agency (EPA) or US Food and Drug Administration (FDA) definitions and are included here solely to aid the reader of this guidance document.

ACTIVE INGREDIENT: chemicals in a pesticide product (e.g., surface sanitizer or disinfectant) that act to control the pests.[1]

ANTIMICROBIALS: substances or mixtures of substances used to destroy or suppress the growth of pathogens (e.g., bacteria, viruses, or fungi) on inanimate objects and surfaces. While hot water and steam can be used to treat surfaces, they are not legally defined as antimicrobials.

BACK OF THE HOUSE: any place that the customers cannot go within a FOOD ESTABLISHMENT, such as kitchens, food preparation areas and storage areas.

DETERGENT-SANITIZER: surface sanitizer that can also be used as a cleaner

DISINFECTANT: substance, or mixture of substances that destroys or irreversibly inactivates bacteria, fungi and viruses, but not necessarily bacterial spores, in the inanimate environment.[3]

EPA ESTABLISHMENT NUMBER: the EPA assigns a unique number to each establishment that produces any pesticide, active ingredient, or pesticide device. The Federal Insecticide, Fungicide, and Rodenticide Act (FIFRA) requires that each producing establishment must place its EPA ESTABLISHMENT NUMBER on the label or immediate container of each pesticide, active ingredient or device produced.[4]

EPA REGISTRATION NUMBER: all EPA-registered DISINFECTANT and SANITIZERS must have an EPA REGISTRATION NUMBER (EPA Reg. No.). The EPA Reg. No. of a product can be more useful than its brand name for identifying the EPA-registered product. Alternative brand names have the same EPA Reg. No.

FOOD-CONTACT SURFACE: a surface of equipment or a utensil with which food normally comes into contact or a surface of equipment or a utensil from which food may drain, drip or splash into a food, or onto a surface normally in contact with food.[5] Term is abbreviated as FCS in this document.

FOOD-CONTACT SURFACE SANITIZER: substance, or mixture of substances, that reduces the microbial population in the inanimate environment by significant numbers but does not destroy or eliminate all microorganisms.[3]

Note: *The FDA defines the process of sanitization but does not provide a definition for SANITIZER. The EPA, however, does define a surface sanitizer. The abbreviated version of EPA definition (above) will be used in the context of this guidance document.*

FOOD ESTABLISHMENT**:** operation that stores, prepares, packages, serves, vends food directly to the consumer, or otherwise provides food for human consumption.[5]

FRONT OF THE HOUSE: any place where customers can go within a FOOD ESTABLISHMENT, such as the dining room, bar, patio, areas open to shoppers, checkout counters and bathrooms.

INERT INGREDIENT: substances in addition to the ACTIVE INGREDIENT(s) referred to as “inert ingredients” or sometimes as “other ingredients.” An INERT INGREDIENT generally is any substance (or group of similar substances) other than an ACTIVE INGREDIENT intentionally included in a pesticide product. Examples include emulsifiers, solvents, carriers, aerosol propellants, fragrances, and dyes.[3]

MASTER LABEL: contains claims and directions for all approved uses for a given product and all associated required labeling. All other labeling for a given product must not contain any text beyond that which is approved in the master label. This label goes on file with the EPA once it is stamped “accepted.”

NONFOOD-CONTACT SURFACE: surfaces that typically do not come in contact with food. Term is abbreviated as NFCS in this document.

NONFOOD-CONTACT SURFACE SANITIZER: substance, or mixture of substances that when evaluated for efficacy by the EPA, is sufficient to yield a reduction of 3 logs within 5 minutes on a NONFOOD-CONTACT SURFACE, which is equal to a 99.9% reduction.

PRODUCT LABEL: written, printed, or graphic matter on, or attached to, the pesticide container or device or any of its wrappers.[4]

PESTICIDE: any substance or mixture of substances intended for preventing, destroying, repelling, or mitigating any pest.

DIFFERENCES BETWEEN DISINFECTANTS, FOOD-CONTACT SURFACE (FCS) SANITIZER, AND NON-FOOD-CONTACT SURFACE (NFCS) SANITIZERS

DISINFECTANTS, FCS and NFCS SANITIZERS are different classifications of ANTIMICROBIALS used for different purposes. Understanding those differences is important when selecting the correct antimicrobial product to achieve the desired outcome.

Contact Time

One common difference between surface SANITIZERS and DISINFECTANTS is contact time. Most FCS SANITIZERS are tested at 30- and 60- seconds contact time, but a 1-minute contact time is listed on the PRODUCT LABEL, whereas contact times for NFCS SANITIZERS are 5 minutes or less. DISINFECTANTS have a wider range of contact times – from less than 60 seconds up to 10 minutes. Moreover, some DISINFECTANTS have different contact times for different microorganisms and product use concentrations. For example, a DISINFECTANT may have one contact time against human norovirus, a different contact time when used against coronaviruses, and a third contact time when used against *E. coli.* The contact times can also vary depending on use concentrations as some DISINFECTANTS can be used at more than one concentration. DISINFECTANT manufacturers can assist in selecting the correct DISINFECTANT to ensure microorganisms of concern are controlled and the DISINFECTANT is properly used. It is important to review the PRODUCT LABEL to verify that the correct contact time and DISINFECTANT concentration are used to control microorganisms of concern.

Chemical Concentration

Another common difference between SANITIZERS and DISINFECTANTS is the ACTIVE INGREDIENT concentration which is often higher and sometimes different in DISINFECTANTS than in most surface SANITIZERS. This higher concentration is one of the reasons DISINFECTANTS can achieve a higher level of ANTIMICROBIAL efficacy compared

to surface SANITIZERS. In most cases this higher level of ACTIVE INGREDIENT exceeds the level that can be safely applied to a FCS without a follow-up rinse. Furthermore, some INERT INGREDIENTS that do **not** meet the statutory limit outlined in 40 CFR 180 might be used in a DISINFECTANT, making the DISINFECTANT inappropriate for a no-rinse FCS application.[6] Therefore, **it is critical to carefully review PRODUCT LABELS for all registered surface SANITIZERS and DISINFECTANTS to ensure their safe and proper use.**

Cleaner-Disinfectants and Detergent-Sanitizers

Some DISINFECTANTS are designed to be used on surfaces without prior cleaning. These products are referred to as "cleaner- DISINFECTANTS" or "one-step DISINFECTANTS." They contain ingredients that enhance product's ability to remove soil from surfaces, often in a single cleaning and disinfection step. To ensure an additional soil load does not interfere with the DISINFECTANT'S antimicrobial performance, efficacy testing is done with 5% soil added to the test solutions.[7]

FCS SANITIZERS are designed to be used on a clean surface. When using DETERGENT-SANITIZERS, often called cleaner-SANITIZERS, that can also be used as a cleaner, it is important to ensure the product is first used for cleaning, followed by a repeat application on the precleaned surface. FCS sanitization is always a multi-step procedure. The Food Code states that if a DETERGENT-SANITIZER is used to clean a FCS and the same DETERGENT-SANITIZER is used to SANITIZE the surface, then no rinse is required between cleaning and sanitizing that FCS (Food Code 4-501.115).[5] However, it is important to remove soil during the cleaning process. Carefully review PRODUCT LABELS for all registered surface SANITIZERS and DISINFECTANTS to ensure safe and proper use.

Surface DISINFECTANT/ Surface SANITIZER Combination Products

Some products can be used as both a surface SANITIZER and a DISINFECTANT. These ANTIMICROBIALS come in two broad categories.

Those with different concentrations and/or contact times for disinfection and sanitizing

Many surface SANITIZER products have DISINFECTANT claims on the EPA-registered PRODUCT LABEL. Surface SANITIZERS and DISINFECTANTS may have different contact times and concentrations. For example, a quaternary ammonium-based product may be used at 200 PPM with a 60 second contact time and be an effective FCS SANITIZER. That same product, however, may be used at 600 PPM with the same or different contact time and be registered as a DISINFECTANT. While FCS SANITIZERS are meant to be used on FCS without a follow-up rinse, that is not always the case for DISINFECTANTS. Some DISINFECTANTS require a rinse step following application. Check the PRODUCT LABEL and consult with the chemical manufacturer to verify correct use of the chemical.

Those with the same concentration and contact time for disinfection and sanitizing

In recent years, a handful of DISINFECTANTS known as no-rinse DISINFECTANTS have been introduced to the market. These DISINFECTANTS have passed EPA Product Performance Test Guidelines as a DISINFECTANT and are designed within the limits outlined in 40 CFR 180, which permits them to be used on FCS without a follow-up rinse.[6] These products may also have FCS SANITIZERS claims. Specific claims vary for these products and so do their contact times. Refer to the PRODUCT LABEL to ensure these products are used correctly. Manufacturers of these chemicals can provide guidance on appropriate use of these no-rinse DISINFECTANT products.

Products with biofilm claims

Biofilm kill claims are primarily allowed for DISINFECTANTS. Because these claims were only recently allowed, only a few DISINFECTANTS have that claim. A limited number of surface SANITIZERS have biofilm claims, some of which were granted prior to current, more strict requirements.

Pesticidal (antimicrobial) devices

Sometimes a device is used to sanitize or disinfect surfaces. In some cases, the device may generate sufficient chemical to kill microorganisms on a surface. In other cases, the device may inactivate microorganisms via a physical process. EPA refers to these devices as pesticide devices. Examples of generated chemical antimicrobial agents include hypochlorous acid, ozone and ozonated water, and chlorine dioxide. Devices that inactivate microorganisms via non-chemical means include UV light and high temperature. The EPA does not require registration of pesticide devices. However, these devices must be produced in EPA-registered establishments and some states do require registration of pesticide devices, and a few require efficacy data for submission.

The data plate on the device must list the establishment number. ***"***Because there is no EPA registration of solutions generated and used on-site, the user of the equipment should look to the equipment manufacturer for data to validate the efficacy of the solution that is generated by the device as well as the conditions for use of the solution" (Food Code Annex 3 7.204-11 Sanitizers, Criteria).[5] There are several companies which choose to register end use solution, following EPA required efficacy test protocols.

Maintaining and cleaning devices used for on-site generation of sanitizing solutions in accordance with manufacturer specifications help ensure SANITIZERS are generated in the form and concentration for which their efficacy was assessed.

WHICH SURFACE SANITIZERS OR DISINFECTANTS TO USE?

The U.S. EPA is the regulatory authority for ANTIMICROBIALS like surface SANITIZERS and DISINFECTANTS used in FOOD ESTABLISHMENTS. Therefore, **only** EPA-registered surface SANITIZERS and DISINFECTANTS can be used in FOOD ESTABLISHMENTS.

Considerations for choosing to use a surface SANITIZER or DISINFECTANT:

When choosing a surface SANITIZER or DISINFECTANT multiple factors should be considered, such as:

- Microorganisms against which the surface SANITIZER or DISINFECTANT are effective against
- Contact time required for surface SANITIZER or DISINFECTANT to be effective
- Compatibility of surface SANITIZER or DISINFECTANT with surfaces being treated
- Safety
- Cost
- Tolerance to hard water
- Stability/shelf life
- Effectiveness in presence of soil

Table 1. Attributes of common SANITIZER and DISINFECTANT ACTIVE INGREDIENTS[1]

ACTIVE INGREDIENT	SPECTRUM OF ACTIVITY[A]	ADVANTAGES	DISADVANTAGES
Free available chlorine, hypochlorous acid, sodium hypochlorite	Vegetative bacteria and enveloped and nonenveloped viruses	• Broad spectrum of activity • Good hard water tolerance	• May be incompatible with some soft metals • Rapidly inactivated by soil • Limited shelf life that varies with pH • Can generate chlorine gas if mixed with acid or ammonia
Quaternary ammonium compounds (QAC)	Vegetative bacteria and enveloped and nonenveloped viruses	• Broad spectrum of activity • Compatible with most surfaces • Very stable with	• Can be inactivated by hard water • Can be inactivated by some surfactants used in cleaners • May bind to cleaning cloths,

ACTIVE INGREDIENT	SPECTRUM OF ACTIVITY[A]	ADVANTAGES	DISADVANTAGES
		long shelf lives • Less reactive with soil	reducing active levels in a solution • Food Code requires use above 24°C (75°F)
Peroxides	Vegetative bacteria and enveloped and nonenveloped viruses	• Minimal residue • Formulated for hard water tolerance	• May require elevated levels to be effective against catalase-positive organisms. • May be incompatible with some soft metals
Peracids	Vegetative bacteria and enveloped and nonenveloped viruses	• Broad spectrum of activity (note that antifungal activity may require a mixture of peracid) • Compatible with most surfaces • Minimal residue	• Pungent odor • Limited shelf life • Inactivated by some types of soil • May be incompatible with some metals
Acid anionics	Vegetative bacteria and enveloped and nonenveloped viruses	• Compatible with residual cleaners if rinsing is incomplete • Good cleaning performance • Good material compatibility • Good hard water tolerance	• May be incompatible with some soft metals and some plastic surfaces • Can generate chlorine gas if mixed with chlorine products
Alcohol	Vegetative	• Can be used in	• High flammability

ACTIVE INGREDIENT	SPECTRUM OF ACTIVITY[A]	ADVANTAGES	DISADVANTAGES
	bacteria and enveloped viruses	environments where aqueous SANITIZERS or DISINFECTANTS are undesirable • No residue • Limited impact on organic matter	• Some alcohols display poor compatibility with certain plastic materials • RTU format only

Chlorine and quaternary ammonium compound-based (QAC) SANITIZERS are the most commonly used on FCS in FOOD ESTABLISHMENTS. The EPA-registered PRODUCT LABEL will include critical information (e.g., kill claims and contact times) for various use concentrations of the product.

Material Compatibility

Material compatibility profiles for SANITIZERS and DISINFECTANTS are important to consider when selecting a product. The material compatibility profile is highly dependent on not only the product's ACTIVE INGREDIENT, but also the total formulation, as well as an application method for the SANITIZERS and DISINFECTANTS. Over time, surfaces can become damaged if exposed to repeated use of a surface SANITIZER or DISINFECTANT incompatible with the surface. Repeated use of incompatible surface SANITIZERS or DISINFECTANTS can lead to micro-abrasions, cracks, and pitting that can make cleaning, sanitizing, and disinfecting more difficult to accomplish as microorganisms can "hide" in these imperfections and eventually form biofilms.[8]

While every FOOD ESTABLISHMENT is unique, some generalizations can be made. Stainless steel, a common material used, is usually resistant to a variety of chemicals. However, repeated use of strong oxidizers (e.g., chlorine-based), may cause pitting to occur over time. Soft metals (e.g., aluminum, brass, bronze, copper) are highly sensitive

to pH extremes. Surface SANITIZERS and DISINFECTANTS with alkaline or acidic formulations may accelerate oxidation of these soft metals. Plastic materials found in FOOD ESTABLISHMENTS vary widely in their chemical composition and construction. Some solvents used in surface SANITIZER and DISINFECTANT formulations may be incompatible with various plastic materials. The chemical manufacturer is an excellent resource for determining the material compatibility profile of a surface SANITIZER or DISINFECTANT. Often, the material compatibility profile is listed on the PRODUCT LABEL.

Dispensing Considerations

DISINFECTANTS and surface SANITIZERS can be dispensed using three different dispensing platforms. The goal of the dispensing platform is to safely deliver the product in its registered use concentration.

Automatic dilution of concentrates. The most frequently dispensed solutions in FOOD ESTABLISHMENTS are concentrates. Concentrates are diluted at the point of use via automatic dispensers. These concentrates have a variety of advantages. Minimal packaging size provides cost savings during shipping to the FOOD ESTABLISHMENT and products are often less expensive when diluted at the point of use (versus ready-to-use products). It is extremely important that automated dosing and dispensing systems are set up and installed appropriately to consistently deliver an accurate chemical dose. Poor dosing control can lead to a variety of challenges, such as increased risk of health hazards related to exposure by employees, use of an ineffective product, and regulatory concerns (potentially even fines). Because these systems can degrade over time, periodic checks and/or servicing by a chemical provider are recommended.

Manual dilution of concentrates. Manual dosing systems are rarely used due to issues with under- and over-dosing. These systems are more prone to human error and typically used in unique situations, such as tight spaces and boil water advisories.

Ready-to-Use. Ready-to-use (RTU) surface SANITIZERS and DISINFECTANTS do not require dilution prior to use. Advantages of RTU products include ease of use, since they do not require mixing, and limited/reduced risk related to under- or overdosing of the

product. The main disadvantage of RTU products is cost - usually they are more expensive.

WHEN TO USE A SURFACE DISINFECTANT VS. A FCS SANITIZER?

When is use of a disinfectant the right choice?

Given the differences between surface SANITIZERS and DISINFECTANTS, it is reasonable to ask when use of a DISINFECTANT is the right choice for a FOOD ESTABLISHMENT.

There are several situations when a DISINFECTANT as opposed to a surface SANITIZER should be used:

Product user suspects surfaces are contaminated with a virus or fungus

As mentioned above, a key difference between surface SANITIZERS and DISINFECTANTS is that SANITIZERS are generally not approved for use against spores, mycobacteria, viruses and fungi, such as mold or mildew. Currently with few exceptions, the EPA does not allow these claims for surface SANITIZERS, which compels the user to control these types of microorganisms with a DISINFECTANT. The PRODUCT LABEL lists microorganisms and conditions of use (concentration, contact times, application methods, etc.) under which surface SANITIZERS and DISINFECTANTS are effective.

Note: the EPA is reviewing its policy, and, in the future, more SANITIZERS may have virucidal claims.

To achieve a higher level of antimicrobial efficacy

Another scenario when a DISINFECTANT may be used instead of a surface SANITIZER is when a higher level of efficacy is desired. Cleaning up bodily fluids is a common example of such situation. Many microorganisms of concern are viruses (e.g., HIV, norovirus, hepatitis, etc.) so a DISINFECTANT is likely to be a better choice than a surface SANITIZER. Use of a DISINFECTANT may be appropriate when cleaning restrooms due to the potential presence of high levels of human pathogens, such as viruses. Another

situation when DISINFECTANTS may be a better option is when cleaning high-touch surfaces, such as door handles, touch screens for credit card readers, push buttons for dispensers, chairs, light switches, etc.

When a surface SANITIZER effective against the microorganism(s) of concern is not available.

In addition to efficacy against viruses and fungi, there may be bacteria that need to be controlled that surface SANITIZERS are not commonly tested or effective against. Examples include *Pseudomonas* spp. or *Mycobacterium* spp*.* Many DISINFECTANTS are effective against a broad range of bacteria. Similarly, when biofilm control is a priority, a DISINFECTANT (with few exceptions) is likely the correct choice. Check the PRODUCT LABEL for the complete list of organisms against which a DISINFECTANT is effective to verify correct product selection. Chemical manufacturers can assist with product selection.

Another instance when DISINFECTANTS should be used is when required by a regulatory authority. It is important to make sure the required use is in compliance with the EPA-registered PRODUCT LABEL.

When is use of a surface SANITIZER the right choice?

A FOOD-CONTACT SURFACE SANITIZER is recommended for use by the Food Code.[5] A surface SANITIZER is the default option for most applications in FOOD ESTABLISHMENTS. Use a surface SANITIZER if (1) it is effective against the microorganisms of concern and listed on the EPA-registered label, and (2) it is required by a regulatory authority. Ensure product used is in compliance with the EPA-registered label. Select an FCS SANITIZER or NFCS SANITIZER depending on the nature of the surface being sanitized.

Other considerations:

Several other factors can impact whether to use a DISINFECTANT or a SANITIZER:

- DISINFECTANTS tend to be more expensive than surface SANITIZERS because they are often used at higher concentrations than surface SANITIZERS and may

have more complex formulations. They typically have more microorganisms on the label, which are costly to test.

- Most DISINFECTANTS have a relatively complicated process for use on FCS. After DISINFECTANT application on an FCS, the surface must be rinsed if required by a PRODUCT LABEL. Surfaces must remain wet with SANITIZERS or DISINFECTANTS for the required contact time specified on the PRODUCT LABEL. Many DISINFECTANTS have longer contact times than surface SANITIZERS. Because of the long contact time during which the surface must remain wet with DISINFECTANT, multiple applications of DISINFECTANT to the surface may be needed.
- Most DISINFECTANTS and surface SANITIZERS are not interchangeable. Use patterns highlighted above create challenges regarding proper use of a product. When both surface SANITIZERS and surface DISINFECTANTS are available in a FOOD ESTABLISHMENT, it is easy to misuse them. This could result in an unintentional contamination or adverse health effects for the user or public. Therefore, employee training on proper use of SANITIZERS and DISINFECTANTS is important.
- The relatively high concentration of ACTIVE INGREDIENTS found in many DISINFECTANTS as well as other ingredients can present a safety profile different from FCS SANITIZERS. Proper Personal Protective Equipment (PPE) should be worn if required on the product Safety Data Sheet or the PRODUCT LABEL. For guidance on PPE requirements, contact the chemical manufacturer and provide training for employees as needed.

HOW TO USE DISINFECTANTS IN FOOD ESTABLISHMENTS

When using an EPA-registered DISINFECTANT, read the PRODUCT LABEL and follow the directions, including the application method.

The EPA regulatory process requires that all registered DISINFECTANTS legally sold in the United States include directions for use to ensure efficacy without resulting in adverse effects on the environment.[9]

DISINFECTANT procedures and application types can vary based on the purpose of the procedure implementation, which is why it is important to read and follow the instructions on the PRODUCT LABEL. Deviating from the PRODUCT LABEL use instructions, including application methods, is illegal and could be unsafe.

Reading EPA-registered product labels

PRODUCT LABELS display the most relevant and useful information for the end user. It is important to note that a product can be sold under a different name than the one that appears on the MASTER LABEL. Key parts of the PRODUCT LABEL include:

EPA registration number

On the PRODUCT LABEL, the registration number is displayed as “EPA Reg. No.” followed by two or sometimes three sets of numbers. Because products may be marketed and sold under different brand names, they might have the same EPA REGISTRATION NUMBER. Products made by a supplier or distributor (i.e., not a manufacturer) have three sets of numbers. The last set of numbers identifies the supplier, who is not the same as the manufacturer. If the first two sets of numbers match a registration number that is on EPA lists (e.g., List G or List N), the product is equivalent to the listed product. For example, if “EPA Reg. No. 12345-12” is on List N, then all products labeled EPA Reg. No. 12345-12-#### are an equivalent product, because the last set of numbers identifies the supplier or distributor.

Format

The PRODUCT LABEL specifies if the product is RTU (i.e., does not require any dilutions) or if it is a concentrate (i.e., liquid or powder requiring dilution as specified by the label before use).

Directions for use

Use instructions present valuable information on dilution, contact time (see below), and whether the product can be sprayed, wiped, mopped and so on. They also list cleaning steps and whether a potable-water rinse is required.

Dilution

A concentrated product will have precise instructions for use, listing ounces per gallon and parts per million (ppm) to help the end user achieve the correct concentration. The efficacy of some antimicrobial products, such as SANITIZERS and DISINFECTANTS, may be affected by the water hardness used to prepare diluted product. Because of this, which is why manufacturers test efficacy of the product in hard water. The label will indicate the water hardness level at which efficacy testing was done, indicating the highest water hardness to be used when the product is diluted. Water hardness varies throughout the United States. For information about a specific location, contact the local health agency or local water utility.

Contact time

The contact time indicates how long the surface must be in contact with a surface SANITIZER or DISINFECTANT. Similarly, to an FCS SANITIZER, for a DISINFECTANT to be effective, the surface must be wet with the product for the entire contact time. Importantly, some DISINFECTANTS with longer contact times may need to be applied more than once to achieve the full required contact time.

Contact times can vary based on product type, target microorganism, or specific use/application. Required contact time for FCS SANITIZERS is typically one minute, apart from sanitizing in a dish machine[5]; required contact time for NFC surface SANITIZERS can be up to 5 minutes. DISINFECTANTS can have various contact times for different bacteria, viruses, or fungi but generally do not exceed 10 minutes. If a PRODUCT LABEL lists multiple contact times for the same application, it is recommended to use the longest contact time and the strongest dilution noted. When a specific microorganism is targeted, the contact time for that microorganism listed on the label must be used.

Claims

A claim is an EPA-approved statement about a product supported by data that has been approved by the EPA. Claims can range from simply naming a product as a surface SANITIZER or DISINFECTANT to specifics about its ability to kill a particular virus or bacterium or claims it will SANITIZE a particular surface type.

Efficacy claims are specific to the intended use as a surface SANITIZER or DISINFECTANT, and they are also specific to the concentration and contact time. Product marketing materials or associated literature are regarded as “labeling” by the EPA.[10] Therefore, claims listed in these materials are subject to the same rules as claims on product packaging and physical labels. An emerging viral pathogen claim is another type of claim, such as one used during a COVID-19 pandemic. This type of claim will appear on a MASTER LABEL and can be used on marketing materials during an active outbreak, such as during the COVID-19 pandemic.

Surface type and compatibility

Some products may have information about surfaces for which the product is intended (e.g., stainless steel, glazed tile, cabinets, or floors). PRODUCT LABELS may also mention surfaces that could become damaged through use of the product. For example, peracid products should not be used on soft metals like copper and highly acidic or highly alkaline chemicals may damage aluminum.

Shelf life

The EPA requires shelf life (expiration date) to be listed on the PRODUCT LABEL only when the shelf life is less than one year. Shelf life is determined for an unopened container by the product manufacturer. For products that are in use (e.g., wiping cloth solution), the concentration must be checked according to in the FDA Food Code (Section 4-302.14).

Storage and disposal

Any specific instructions regarding storage or disposal are listed on the EPA-registered PRODUCT LABEL.

Statutory precautionary statements

These statements alert the user to hazards associated with misuse of the product and first aid procedures should injury occur.

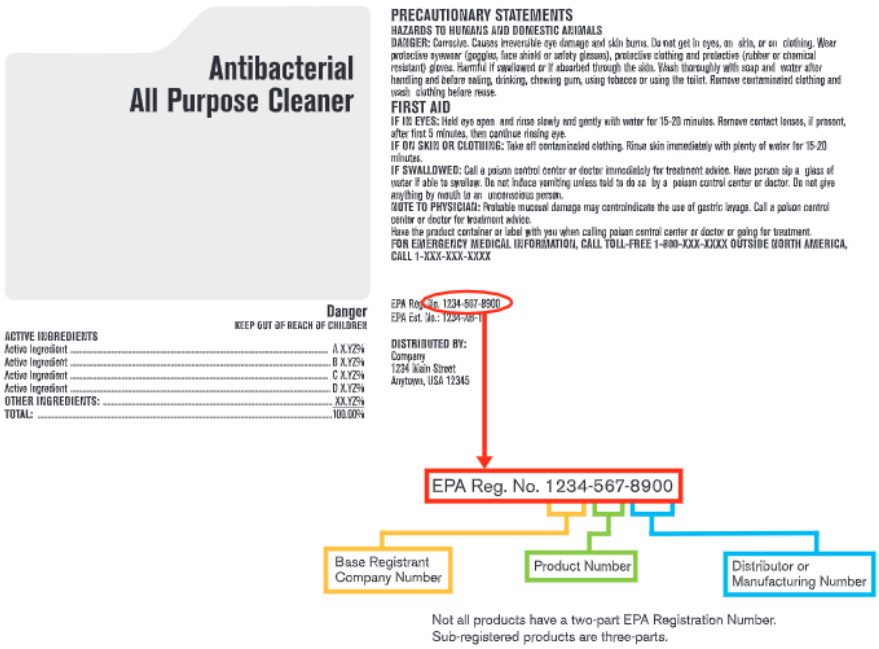
Phone number

A phone number must be listed for the user to access additional information or file a complaint about the product as well as an emergency phone number in case of exposure.

An example of a PRODUCT LABEL is in

Figure 1.

Figure 1. Example of a Product Label.[1]



Frequency of surface SANITIZER and DISINFECTANT use.

Section 4-702.11 of the Food Code states FOOD-CONTACT SURFACES shall be sanitized before use and after cleaning. Therefore, frequency of sanitizing is dependent on frequency of cleaning. Cleaning frequency for FOOD-CONTACT SURFACES is presented in section 4-602 and summarized below:

- When changing between types of food, such as fish, beef, chicken, pork
- When changing between raw and ready-to-eat foods
- Any time FCS and utensils may be contaminated
- Every 4 hours unless the equipment is held below room temperatures

The following table is provided in the Food Code to determine cleaning frequency at temperatures below room temperature:

Table 2. Food Code recommended FOOD-CONTACT SURFACE cleaning frequency[5]

Temperature	Cleaning frequency
5.0°C (41°F) or less	24 hours
>5.0°C -7.2°C (>41°F -45°F)	20 hours
>7.2°C -10.0°C (>45°F -50°F)	16 hours
>10.0°C -12.8°C (>50°F -55°F)	10 hours

While the 2017 Food Code provides guidance for frequency of sanitizing, it does **not** address disinfection.

Frequency of disinfection varies depending on circumstances at the time of disinfection. During normal, routine conditions, surfaces should be disinfected at least daily. High-touch surfaces (e.g., door handles, dispensers, restroom surfaces) should be disinfected at least daily when the facility is open. During outbreaks surfaces should be disinfected at the frequency recommended by public health officials. Surfaces should also be disinfected immediately after a bodily fluid event.

Application methods for surface SANITIZERS and DISINFECTANTS:

- **Coarse Spray Application**
    - Coarse spray is the most common application method where relatively large droplets are generated. Large droplets are not suspended in the air for very long and typically do not spread very far from the sprayer. According to the American Society of Agricultural and Biological Engineers, the volume median diameter (VMD) of a coarse spray is >325 µm. Examples of coarse sprays include trigger sprayers, most hose-end sprayers, and wall-mounted dispensing systems with dispensing hoses. Unless otherwise specified on a label, if surface SANITIZER or DISINFECTANT use instructions say to "spray" the surface SANITIZER or DISINFECTANT, it is a coarse spray. Many dispensing systems can give somewhat inaccurate dosing if a very small amount of surface SANITIZER or DISINFECTANT is dispensed. For this reason, it is better to fill small containers from a larger volume. A good practice for surface SANITIZERS is to dispense a surface SANITIZER into the surface SANITIZER compartment of a sink **then** fill spray bottles from that compartment. A container used to dispense DISINFECTANT or surface SANITIZER must be clean and should never be used to hold any other chemical such as a cleaner. Residual cleaners may inactivate a DISINFECTANT or surface SANITIZER added to that container.
- **Wipe Applications**
    - Cloth Immersed in surface SANITIZER
        - Surface SANITIZERS can be prepared in a bucket and a wiping cloth immersed into the solution, which can then be used to clean surfaces. However, as indicated in the Food Code, while wiping a surface with a surface SANITIZER-soaked cloth may be adequate for cleaning purposes, it does not constitute sanitizing the surface. "Soiled wiping cloths, especially when moist, can become breeding grounds for pathogens that could be transferred to food. Wiping cloths that are

not dry (except those used once then laundered) must be stored in a surface SANITIZER solution of adequate concentration between uses. Wiping cloths soiled with organic material can overcome the effectiveness of, and neutralize, the surface SANITIZER. The sanitizing solution must be changed as needed to minimize the accumulation of organic material and sustain proper concentration. Proper surface SANITIZER concentration should be verified by monitoring the solution periodically with an appropriate chemical test kit. The sanitizing solution must stay on the surface for a specific contact time in accordance with the manufacturer's EPA-registered label (Food Code Annex 3-304.14 Wiping Cloths, Use Limitation).[5] Surface SANITIZER concentration should be checked at least every 4 hours and whenever a fresh solution is dispensed into the container. The PRODUCT LABEL includes instructions of this use application. The manufacturer can also provide guidance on product use.

- Cloth Immersed in DISINFECTANT
  - DISINFECTANT can be prepared in a bucket with a cloth immersed in the solution, which can then be used to disinfect surfaces. Ensure DISINFECTANT solution in the bucket is at the correct concentration. Soil can build up in buckets, inactivating the DISINFECTANT and reducing its concentration. Both dirty and clean cloths may inactivate DISINFECTANT solution, therefore the concentration in such containers must be verified at least every 4 hours. A surface being disinfected must remain wet with DISINFECTANT for the duration of the registered contact time. The PRODUCT LABEL includes instructions for this use application. The manufacturer can also provide guidance on product use.
- Disposable SANITIZER wipes
  - Disposable wipes, single use wiping cloths or towelettes are popular application methods. Typically, they are pre-moistened with surface

SANITIZER in a container with a surface SANITIZER. These wipes are intended to be single use, then discarded. Wiping a surface with a disposable wet sanitizing cloth is an acceptable practice for wiping food spills and equipment surfaces. However, this practice does not constitute cleaning and sanitizing of FCS to satisfy the methods and frequency requirements in parts 4-6 and 4-7 of the Food Code. The sanitizing solution must stay on the surface for a specific contact time in accordance with the manufacturer's EPA-registered label.[5] It should also be noted that the EPA does not currently allow wipes to be used on items that could be immersed in SANITIZER, e.g., utensils, cutting boards, glasses, etc. Wipes should be used on immobile surfaces or those that cannot be immersed in SANITIZER.

- It is important to make sure at least two wipes are used for an EPA-registered cleaner/surface SANITIZER wipe. The first wipe is used for a cleaning step, the second for a sanitizing step. If the wipes are not registered as a cleaner/surface SANITIZER, a three-step process should be followed (wash, rinse, sanitize), using at least one wipe for each step.
- Disposable wipes may hold less solution than other wipes, therefore, make certain surfaces remain wet for the entire contact time listed on the PRODUCT LABEL.

- <u>Disposable DISINFECTANT wipes.</u>
  - Disposable DISINFECTANT wipes, single use wiping cloths or towelettes have become popular in recent years. They are pre-moistened with DISINFECTANT at the correct concentration. These wipes are meant to be used once, then discarded. If FCS are wiped with a DISINFECTANT wipe, a rinse step may be required. The PRODUCT LABEL will provide use instructions and specify if rinse step is required.

        - Disposable DISINFECTANT wipes may hold a limited amount of a product solution; therefore, make certain surfaces remain wet for the entire contact time listed on the PRODUCT LABEL.
    - Mopping
        - This application method is always used on NFCS. The soil level in the mop bucket tends to be very high, therefore, the concentration of surface SANITIZER or DISINFECTANT in the bucket must be closely monitored to ensure its effectiveness.
- **Immersion**
    - In this application, items being treated are completely immersed in surface SANITIZER or DISINFECTANT for the required contact time. They may be immersed in a sink, bucket, specialized tank or other equipment containing surface SANITIZER or DISINFECTANT. Some equipment or utensils must be disassembled prior to immersion to ensure all treated surfaces have contact with a surface SANITIZER or DISINFECTANT. After items are sanitized or disinfected, care must be taken to prevent recontamination during reassembly. It may be necessary to disinfect or sanitize any tools used to reassemble the equipment or utensils. Chemical and equipment manufacturers can provide guidance on proper procedures for sanitizing or disinfecting equipment.
- **Clean In Place (CIP)**
    - CIP involves circulating cleaning, rinsing and sanitizing solutions through piping and flushing interior surfaces of equipment. The CIP process is specific to a piece of equipment. Equipment and chemical manufacturers can provide guidance on how to conduct the CIP process along with recommendations for selecting the best surface SANITIZER for CIP equipment. CIP processes can have some unique requirements for surface SANITIZER, such as low foam or a high-temperature tolerance.

- **Misting/Fogging**

  Application of surface SANITIZERS or DISINFECTANTS via fogging or misting should be approved by the EPA and must be specified on the PRODUCT LABEL along with use instructions and safety requirements. In these applications the surface SANITIZER or DISINFECTANT is dispensed via a device that delivers the liquid surface SANITIZER or DISINFECTANT via very small droplets. Fogging typically generates droplets with <50 µm VMD, whereas misting generates slightly larger droplets with a 50 to 100 µm VMD. The purpose of this application is to increase a treated surface coverage. The very small droplet size in mists and fogs compared to coarse spray application droplet size can significantly impact the safety of the surface SANITIZER or DISINFECTANT because small droplets are more easily inhaled deeply into lung tissue. When surface SANITIZERS or DISINFECTANTS are applied as a mist or fog, employees should vacate the area or wear respirators if their presence is required. In addition, for DISINFECTANTS which are registered for misting or fogging, PRODUCT LABELS are required to state that foods must be removed from the area of treatment or be covered up. Small droplets stay suspended in the air much longer than those applied using a coarse spray and may remain in the treated area for hours. Restricted access to the treated area may be required for entire application time as well as several hours after treatment.

  - **ElectroStatic Spray (ESS)**

    ESS is different from misting and fogging, even though it might seem to be similar. The primary difference is the device used for dispensing the surface SANITIZER or DISINFECTANT generates and applies a very small electrical charge to the products' droplets. The intent of this charge is to attract droplets to the surface being treated to ensure the surface SANITIZER or DISINFECTANT covers all treated surface areas. Mists and

fogs applied with ESS systems do not remain in the air for a long time, but due to the small droplet size, the use of respirators may be required in the areas being treated. Most ESS systems dispense small volumes of surface SANITIZER or DISINFECTANT; therefore, it is important to ensure enough product is dispensed to cover surfaces for the entire contact time specified on the PRODUCT LABEL. When surface SANITIZER or DISINFECTANT is registered for application via ESS, directions and safety precautions are provided on the PRODUCT LABEL.

- **Gaseous/Vaporized**

  This application is similar to fogged or misted surface SANITIZER or DISINFECTANT except in this case the surface SANITIZER or DISINFECTANT is applied as a gas form, not in small droplets. PPE is required and employees or other personnel should vacate the area because many gaseous or vaporized surface SANITIZERS or DISINFECTANTS are highly toxic when inhaled. When a surface SANITIZER or DISINFECTANT is registered for this type of application, directions and safety precautions can be found on the PRODUCT LABEL and SDS.

Surface SANITIZER and DISINFECTANT Concentration Verification

Section 4-302.14 of the Food Code states, “A test kit or other device that accurately measures the concentration in MG/L of SANITIZING solutions shall be provided”, and section 4-501.116 states, “Concentration of the SANITIZING solution shall be accurately determined by using a test kit or other device.” A surface SANITIZER concentration needs to be measured to ensure it meets minimum concentration requirements for proper sanitization and does not exceed appropriate use levels.[5]

Test strips are the most common test kits used in FOOD ESTABLISHMENTS. Acceptable test strips are usually specified by chemical manufacturers and are different for various surface SANITIZER and DISINFECTANT actives. Although some chemistries have similar actives, they may require different test strips.

It is important to read directions for each type of test strip or other measuring device. Accuracy of results may depend on the tested solution temperature, time required for the strip immersion in the solution, and time needed before comparing the color of the strip and the chart.

Test strips will change color in response to certain levels of the active chemical being measured and will cover a range of concentrations typical to the DISINFECTANTS or surface SANITIZERS the test strips are intended to measure. When using test strips, it is important to choose a test strip with a measurement range that brackets the expected active concentration. For example, if measuring an active concentration of 600 ppm, select a test strip with a range that is both above and below the target level, with the smallest increments possible.[11]

Usually, surface SANITIZER concentrations are measured in three-compartment sinks, towel buckets, spray bottles, and warewash machines. Surface SANITIZER concentrations are measured immediately after dispensing surface SANITIZER and during use. It is customary to check the surface SANITIZER concentration at least every four hours, or more often if necessary. Frequency for measuring concentration could vary and depends on multiple factors, such as:

- Chemistry used
- Soil levels in the solution
- SANITIZER solution temperature
- Towels/surface SANITIZER ratio
- Type of towels used

Some wiping cloths when placed in quaternary ammonium chloride (QAC) surface SANITIZER solutions for storage, may bind the active to the wiping cloth material, leading to a quick drop of the ACTIVE INGREDIENT in the solution. QACs are known for this but other ACTIVE INGREDIENTS are also susceptible to binding of the active.

Residual cleaning chemical, soil or other materials in surface SANITIZER or DISINFECTANT solution containers can also inactivate the surface SANITIZER or DISINFECTANT. It is critical that any container that will be used to hold the surface SANITIZER or DISINFECTANT is clean and is never used to hold any other chemical.

For accurate measurement, test strips must be used correctly by following the directions on the strip dispenser. An example of a common error is measuring concentration of a surface SANITIZER solution that is too warm or too cold. Most test strips are designed for use at ambient temperature (approximately 75˚F). Temperatures above 10˚F or below 75°F can lead to inaccurate readings. Another source of an error when measuring detergent-based SANITIZERS, such as QAC is presence of a foam in the sample tested. It is important to ensure a sample tested has no foam on it. Many dosing systems can be slightly inaccurate if a small amount of surface SANITIZER is dispensed for concentration verification. If a small amount of surface SANITIZER (one quart or less) is needed, it is best to dispense a larger volume (one gallon or more) into a container such as a three-compartment sink and test that solution. Smaller containers can then be filled from the larger volume.

Test trips are calibrated for room temperature use and may provide inaccurate results if the surface SANITIZER solution is tested above or below that temperature. It may be necessary to take a smaller portion of surface SANITIZER from a larger volume and allow it to come to room temperature before it is tested. It is important to use test strips before their expiration date.

Other more complicated techniques can be used for measuring concentrations, such as titration kits, but they are seldom used in FOOD ESTABLISHMENTS. Chemical manufacturers may use them to calibrate dispensing equipment.

The FDA Food Code 2017 does not address the use of DISINFECTANTS (only mentioned in Annex 3), therefore, there are no Food Code recommendations for measuring their concentrations. Because all DISINFECTANTS are EPA-registered products, concentration of dilutable products should be tested. Measuring techniques discussed above can be used to verify DISINFECTANT concentration.

DISINFECTION of FOOD-CONTACT SURFACES

Review the PRODUCT LABEL to determine appropriate use as directions can vary. Determine disinfection needs within the FOOD ESTABLISHMENT, then follow the PRODUCT LABEL instructions for specific use(s) of the chemical.

DISINFECTANTS can be used on an FCS; however, most DISINFECTANTS require rinsing after being applied to an FCS. Regular food preparation and cooking would follow the rinse step (if required) after a DISINFECTION step.

The procedure to clean and disinfect an FCS with a DISINFECTANT requiring rinsing after application is as follows:

- Clean the FCS using a cleaning product, or cleaner- DISINFECTANT.
- Rinse cleaner and soil from the FCS.
- Apply DISINFECTANT and allow FCS to remain wet for the required contact time of DISINFECTANT.
- Rinse off DISINFECTANT.

The procedure to clean and disinfect FCS with a no-rinse DISINFECTANT (i.e., one that does not require a rinse step after use) on an FCS is as follows:

- Clean the FCS using a cleaning product, or cleaner- DISINFECTANT.
- Rinse cleaner and soil from the FCS.
- Apply the DISINFECTANT according to use instructions making sure the FCS remains wet for the required contact time of the DISINFECTANT.

Note the following details on the PRODUCT LABEL:

- **Warning statements:**

  Without proper precautions in place, exposure to many cleaning, SANITIZING, or DISINFECTING products can be risky to your health. The Occupational Safety and Health Administration (OSHA) requires any hazards associated with product use be clearly stated on the PRODUCT LABEL. Labels highlight required PPE, first aid procedures in case of a spill or other exposure, and disposal precautions (if necessary). The EPA categorizes products from I (highly toxic) to IV (very low toxicity). If possible, select products rated as category IV to reduce risk of harm.

- **Dilution/refilling and testing of chemical containers:**

  The PRODUCT LABEL indicates if the product is in a ready-to-use (RTU) form (i.e., does not require any dilutions) or if it is a concentrate, such as liquid or powder. If the product is in a concentrated form, it will need to be diluted per label instructions before use. A concentrated product has precise instructions for use, listing ounces per gallon and final concentration of a use solution (ppm) to help the end user achieve the correct concentration. The efficacy of some diluted products may be affected by the hardness of the water used to prepare the product. For this reason, manufacturers commonly test product efficacy in hard water. The LABEL may indicate the water hardness level at which efficacy testing was done. Product efficacy may be negatively impacted if the product is diluted in water above the hardness stated on the PRODUCT LABEL. Water hardness varies throughout the United States. For information about a specific location, users should contact the local water utility.

  Personal Protective Equipment (PPE):

  - To determine PPE requirements, refer to the PRODUCT LABEL and the Safety Data Sheet (SDS), paying attention to how the product will be used. Once a surface SANITIZER or DISINFECTANT is diluted to use concentration,

PPE may not be required. SDS will sometimes recommend two sets of PPE, one for the concentrate and one for the use solution.

- PPE is designed to protect an individual from chemical exposures. Adequate PPE should address exposure risks to skin, eyes, lungs, face, hands, feet, and other parts of the body. Examples of PPE include safety glasses, goggles or eye shields to reduce eye damage resulting from splashing, chemical resistant gloves, long-sleeved garments (e.g., uniforms, closed-toe shoes, and respirators) to prevent accidental inhalation.

- **Contact time**

Contact times can vary based on product type, target organism, or specific use.

- The required contact time for food-contact hard surface SANITIZERS is typically 1 minute, with the exception of contact time for sanitizing in a dish machine.[5]
- Contact time for nonfood-contact SANITIZERS can be up to 5 minutes.
- DISINFECTANTS can have various contact times which depend on the type of bacteria, viruses, or fungi but do not exceed 10 minutes.

If a product has multiple contact times for the same application, it is recommended to use the longest contact time **and** highest concentration. For additional guidance consult your local health department or the product manufacturer. In cases when a specific organism is targeted, the contact time for that organism listed on the PRODUCT LABEL should be used. For a DISINFECTANT to be effective, the surface must be wet with DISINFECTANT for the full duration of the contact time. Some DISINFECTANTS with longer contact times might need to be applied more than once to achieve the full required contact time.

Safety

Mixing:

Never mix multiple products! Mixing will not only negatively impact performance, but it is an extremely dangerous practice that could result in serious injury or death from the formation of toxic fumes. For example, mixing bleach-based solutions with vinegar or ammonia can generate chlorine and chloramine gases that could result in severe lung tissue damage if inhaled. In a recent CDC survey of chemical end users and consumers, a large percentage of people were unaware of the dangers of mixing chemicals, with only 35% of responders understanding that mixing bleach with vinegar is dangerous.[12] This knowledge gap highlights the need to educate end-users on the potential dangers of mixing chemicals.

Directions for use on different surfaces:

The use instruction section of a PRODUCT LABEL provides information on use concentration, contact time (see below) and the product application type (product can be sprayed, fogged, misted, electrostatically sprayed, wiped, immersed or mopped). The instructions will also indicate if a pre-cleaning step or a potable water rinse is required. It is important to always adhere to product use instructions on LABEL instructions. Use of surface cleaner, surface SANITIZERS or DISINFECTANTS for tasks they are not designed for could result in damaged equipment or surfaces and lead to employee and/or guest exposure.

Storage and Disposal:

Always refer to the PRODUCT LABEL to determine chemical storage and disposal requirements. Store all products together by chemical type and hazard class code (if applicable). Do not store products together that could cause reactions if mixed. Follow PRODUCT LABEL instruction for ambient temperature storage requirements and do not expose to direct heat. Never store products on the floor and do not store higher than eye level. Storing products on top shelves is a dangerous practice and increases risk of a chemical spill. Be sure all products are properly LABELED so that all handlers are aware of instructions, risks, and safety precautions. Only store products in original packaging or

appropriate containers with correct labels. Re-using empty containers to store other products or chemicals is a risky practice and could result in accidental mixing or exposure as well as violations during safety inspections and is a violation of the Food Code.[5]

WHERE TO USE DISINFECTANTS IN A FOOD ESTABLISHMENT

Most DISINFECTANTS used in FOOD ESTABLISHMENTS are intended for targeted interventions or specific areas. Typically, they are reserved for restrooms, high touch points, blood and bodily fluid clean up, pathogen remediation, outbreak control, or biofilm control. It is important to use DISINFECTANTS only when needed and **not** as a substitute for a surface SANITIZER.

The following are examples of when it is appropriate to use DISINFECTANTS:

- When the user is concerned about surfaces contaminated with a virus or fungus
- When a surface SANITIZER effective against the organism(s) of concern is not available.
- When required by a regulatory authority

If needed for bodily fluid clean up or pathogen remediation, DISINFECTANTS can be used on most surfaces within FOOD ESTABLISHMENTS, such as food equipment surfaces (food-contact and nonfood-contact), dining tables and chairs, counter tops, food display cases, mop sinks and cleaning tools, restrooms and other customer service areas. To ensure efficacy and safety of DISINFECTANTS, it is critical to use EPA-registered DISINFECTANTS and follow LABEL instructions. Post-rinsing may be required after a DISINFECTANT is used on FOOD-CONTACT SURFACES (this requirement is listed on the EPA-registered label).

DISINFECTANTS can be used on all surfaces listed on the EPA registered PRODUCT LABEL. Currently, there is a limited number of products with EPA registered claims for soft surface disinfection with virucidal claims.

BODILY FLUID CLEAN-UP PROCEDURE

In Section 2-501.11 Clean-up of Vomiting and Diarrheal Events states of Food Code 2017 "*A* FOOD ESTABLISHMENT shall have written procedures for EMPLOYEES to follow when responding to vomiting or diarrheal events that involve the discharge of vomitus or fecal matter onto surfaces in the FOOD ESTABLISHMENT. The procedures shall address the specific actions EMPLOYEES must take to minimize the spread of contamination and the exposure of EMPLOYEES, consumers, FOOD, and surfaces to vomitus or fecal matter. *Pf."* Guidelines for implementation of this regulatory provision are in Annex 3 Public Health Reasons/Administrative Guidelines for Section 2-501.11 Clean-up of Vomiting and Diarrheal Events[5], which identifies what components need to be included in a written plan for clean-up of vomitus and fecal matter in FOOD ESTABLISHMENTS.

Based on these recommendations the following plan should include, but is not limited to:

- Contents of clean-up kit
    - Cleaning agent(s) and effective DISINFECTANT(S)
        - DISINFECTANTS should be an EPA-registered product with a stated claim against norovirus. Consult with your chemical provider to address the questions on product registration if not listed on the PRODUCT LABEL.
    - PPE
    - Cleaning tools
- Procedure for:
    - Preparing contaminated area(s) before clean-up which include:
        - Removing food (packaged and unpackaged), and all items that might have been contaminated (e.g., tablecloth, condiments, flatware, etc.). ***Note:*** *Do not disinfect packaged food as currently there are no EPA-registered DISINFECTANTS approved for this application.*
    - Identifying and isolating areas that will be cleaned
    - Cleaning and disinfecting contaminated area(s)
    - Containing and removing vomit/diarrheal waste
    - Disinfecting pre-cleaned surfaces

- Instructions for post clean-up procedure, which include:
    - Handling PPE and tools used to clean-up vomitus or fecal matter (discarding or cleaning/disinfecting)
    - Discarding open food items which may have been contaminated
    - Cleaning and disinfecting cleaning equipment and tools which may have been contaminated
- Training program for workers on implementation of procedures
    - Training is highly recommended for all new and current employees at least once per year.

Who performs clean-up?

Ideally, nonfood workers should be responsible for cleaning-up vomit/diarrheal waste to prevent cross-contamination. (*This might not be feasible for FOOD ESTABLISHMENTS with limited staff*). Regardless, all workers tasked with clean up should be trained. Professional cleaning services can also be used.

Clean-up kit and other supplies needed for clean-up

Having a clean-up kit readily available ensures all tools needed to properly clean contaminated areas are readily available. Clean-up kits can be purchased or self-assembled.

<u>At a minimum</u> all clean-up kits must include:

- Personal protective equipment – PPE to be worn during cleaning.
    - Follow use directions and PPE requirements listed on a PRODUCT LABEL and SDS.
    - Provide a list of the PPE that must be worn when using the chemicals specified in the FOOD ESTABLISHMENT'S clean-up procedure.
    - At a minimum, anyone cleaning-up vomit/diarrheal waste should wear durable, single-use gloves, disposable eye protection and a disposable apron. Other PPE items may be required for the chemical used. PPE should protect an individual from the chemical used for disinfection as well as from pathogens that may be present in the bodily spill being cleaned and disinfected.

- Cleaning/disinfecting chemicals
    - EPA-registered SANITIZER or DISINFECTANT effective against norovirus.
    - Detergents if used in the clean-up procedure.
- Cleaning tools
    - Absorbent powder/solidifier (e.g., kitty litter or product provided by your kit supplier)
    - Disposable paper towels. Do not use cloth towels as they could be a source of cross-contamination.
    - Mop head if vomit/diarrheal waste are on the floor. If a mop is used, it must be thoroughly disinfected or discarded after use.
    - Bucket, if preparing DISINFECTANT solution.
- **Waste removal**
    - 1 disposable scoop/scraper
    - 2 plastic bags with 2 twist ties
- **Tools to mark area to be cleaned, such as cones, tape, placard, among others.**

Clean-up procedures

- Before cleaning begins:
    - Direct everyone (i.e., employees and patrons) to vacate the area where the event occurred.
    - Block off the affected area.
    - Put on PPE.
        - At a minimum, personnel assigned to clean should wear, durable, single-use gloves and a disposal apron. Refer to the SDS to determine if additional PPE needs to be worn.
- Cleaning Hard Surfaces
    - Place sufficient absorbent powder/solidifier to completely cover the body fluid waste.
    - Completely cover solidified waste with disposable paper towels.
    - Apply DISINFECTANT (i.e., spray, pour over) so paper towels are saturated.

- Remove the covered waste, which includes solidified matter and paper towels, using a scoop or a scraper. Place covered waste and the scoop/scraper into the first trash bag.
- Spray DISINFECTANT over the area from which the waste was removed.
- Make sure all treated surfaces are wet for the entire contact time listed on the PRODUCT LABEL. Use the contact time for norovirus listed on the PRODUCT LABEL, if the cause of body fluid contamination is unknown.
- Wipe or rinse off the disinfected area with clean paper towel(s).
- Put paper towels and disposable cleaning tools into the first trash bag and tie with a twist tie, then place into second trash bag. Secure the second trash bag with a second twist tie.
    - If non-disposable cleaning tools are used (e.g., mops, buckets), disinfect them after clean-up is complete, before returning them to storage area.
- Remove PPE and place it into the second trash bag tying with the second twist tie.
- Discard the double-bagged waste into a dumpster.
    - Never place contaminated waste in a regular trash receptacle located inside the establishment.
- Wash hands and forearms with soap and warm water for 20 seconds[5]
    - Wipe hands with a paper towel and turn off the faucet using this paper towel

- Cleaning soft surfaces, such as upholstered furniture, and draperies.
    - Place sufficient absorbent powder/solidifier to completely cover the body fluid waste.
    - Completely cover solidified waste with disposable paper towels.
    - Remove the covered waste, which includes solidified matter and paper towels, using a scoop or a scraper. Put into the trash bag, along with the scoop/scraper used in to the first trash bag.
    - Use DISINFECTANTS with claims against norovirus designed to be used on soft surfaces.
    - Apply (i.e., spray, pour over) so paper towels are saturated.

A. Spray DISINFECTANT over the area from which the waste was removed.
    - *Make sure that the DISINFECTANT used is registered for use on soft surfaces.*
    - *Make sure all treated surfaces are wet for the entire contact time listed on the PRODUCT LABEL*.

Use steaming for disinfection if EPA registered DISINFECTANTS are not available for the soft surface of interest, such as carpet.

B. "Steam clean (heat inactivation) at 158°F for 5 minutes or 212°F for 1 minute for complete inactivation. Disinfecting with bleach may discolor carpets and/or upholstered furniture"

- Wipe or rinse off the disinfected area with clean paper towel(s).
- Put paper towels and disposable cleaning tools into the first trash bag and tie with a twist tie then place into the second trash bag. If non-disposable cleaning tools are used, disinfect them after clean-up is complete.
- Remove PPE and place it into the second trash bag tying with the second twist tie.
- Discard the trash bag into a dumpster.
- Never place it in a regular trash receptacle located inside the establishment. If non-disposable cleaning tools are used, disinfect them after clean-up is complete and before returning them to a storage area.

- Wash hands and forearms with soap and warm water.
    - Wash the faucets along with washing hands.
    - Wipe hands with a paper towel and turn off the faucet using the same paper towel.

Cleaning Launderable items

Wash laundry thoroughly

If possible, remove and wash clothes or linens that may be contaminated with vomit/diarrheal waste as soon as possible.

- Handle soiled items carefully without agitating (shaking) them.
- Wear rubber or disposable gloves while handling soiled items.

- Wash the items with detergent (cleaning agent) and hot water at the maximum available cycle length and then machine dry them at the highest heat setting.
- Wash hands and forearms with soap and warm water for at least 20 seconds.[5]
    - Wipe hands with a paper towel and turn off the faucet using the same paper towel.

ANNEX:

REGULATIONS ON DISINFECTANT AND SURFACE SANITIZER USE IN FOOD SERVICE ESTABLISHMENTS

Oversight and registration of DISINFECTANTS and surface SANITIZERS in the USA

The EPA is the primary regulatory authority for environmental surface SANITIZERS and DISINFECTANTS used in FOOD ESTABLISHMENTS (i.e., retail and foodservice operations). Surface SANITIZERS and DISINFECTANTS are identified as ANTIMICROBIAL PESTICIDES by the EPA, as they fit the statutory definition of products intended to reduce or eliminate microorganisms.[1] The FIFRA gives the EPA the authority to regulate the distribution, sale, and use surface SANITIZERS and DISINFECTANTS.

The EPA requires laboratory testing to verify manufacturers' antimicrobial activity claims for their surface SANITIZERS and DISINFECTANTS. In addition, the EPA requires extensive data on the potential health and environmental effects of all these products, before granting a registration, which is a license to market a product in the United States.

Regulatory process, testing, review, and approval

The EPA has developed criteria to substantiate acceptable levels of microbial kill or "efficacy" for a product to be registered as a surface SANITIZER or DISINFECTANT. Minimum testing requirements mandate efficacy against specific bacterial strains. Additional microorganisms can be added to the registration if the manufacturer of the DISINFECTANT or surface SANITIZER submits additional lab testing for these microorganisms. Based on data provided by the manufacturer, the EPA determines the human and ecological risks from exposure to products reviewed. Based on this review, precautionary language such as "Caution", "Warning", or "Danger" as well as PPE and first aid labelling. Scientific experts at the EPA analyze the data submitted and make decisions on whether proposed marketing language from the manufacturer is truthful and not "false and misleading." Once data have been evaluated and deemed

acceptable, the EPA approves a product MASTER LABEL and assigns an EPA REGISTRATION NUMBER.

A MASTER LABEL includes all approved uses for a surface SANITIZER or DISINFECTANT, use directions, safety information and an approved marketing language. The PRODUCT LABEL is the label attached or associated with the product as it is distributed and sold. Note the following differences between the two labels:

- PRODUCT LABEL
    - May only contain a subset of the information provided on the MASTER LABEL
    - Is not required to include all information from the MASTER LABEL
    - Cannot contain information not included on the MASTER LABEL
    - Users must comply with this label
- MASTER LABEL
    - Contains all claims approved for use on a registered product
    - Contains all claims approved for use on a registered product for multiple settings, such as household, food service, hospitals, etc.
    - multiple settings such as household, food service, hospitals, etc.

The Occupational Safety and Health Administration (OSHA) has direct authority over Safety Data Sheets (SDS), formerly called Material Safety Data Sheets (MSDS) for surface SANITIZERS and DISINFECTANTS. When an SDS is distributed with a product, it becomes a part of its labeling because it is accompanying the product (FIFRA 2(p)(2)(A)). Therefore, if an SDS includes warnings, precautions or any other information that conflict with the FIFRA-approved label, it could be misleading to end users, resulting in the product to be considered misbranded and unlawful for sale or distribution. For example, in 2012 OSHA adopted a revised Hazard Communication Rule for SDSs which utilizes the criteria for signal words, (e.g., Danger or Warning) adopted by multiple countries under the Globally Harmonized System (GHS) for hazard

communication language and symbols. The EPA has not adopted the GHS criteria; thus, an OSHA SDS may have a signal word that differs from the one the EPA requires for a surface SANITIZER or DISINFECTANT PRODUCT LABEL. PR Notice 2012-1 explains how a company can explain and justify such a difference if it occurs in order to prevent users from being misled by the inconsistencies. If there is a conflict that prevents compliance with both, the chemical manufacturer should be contacted to clarify the conflict.

The data package submitted to the EPA to register surface SANITIZERS and DISINFECTANTS must include:

- Microbiological data (i.e., efficacy data)
- Chemistry data (ingredients and their concentration)
- Stability (or shelf life) data
- Toxicology data (to help determine precautions and recommendations for PPE)
- Food-contact tolerances for each ingredient (FOOD-CONTACT SURFACE SANITIZERS and DISINFECTANTS)

The submission must also include a detailed MASTER LABEL containing:

- First aid statements
- Precautionary language
- Directions for use
- Efficacy claims (often a list of microorganisms and the contact times and product concentrations)
- Approved marketing language

Antimicrobial chemical efficacy testing

DISINFECTANTS, FCS and NFCS SANITIZERS can be tested for antimicrobial efficacy in various ways. The methods are standardized, and some have been validated through multi-lab collaboration.

Although the test methods vary, most of the performance standards show a reduction of test microorganisms. Test methods vary, for example in some test methods test culture is added to the antimicrobial product's use solution (suspension method) or to a test surface (carrier test).

FCS SANITIZERS are generally tested using a 30-second contact time, but the shortest contact time that can be claimed on the PRODUCT LABEL is 60 seconds. Note that FCS SANITIZERS for use in dish machines could claim shorter contact times if the data submitted to the EPA supports that claim. NFCS SANITIZERS and DISINFECTANTS have multiple contact times which could vary for different microorganisms.

Label, labeling and antimicrobial claims

Companies selling or distributing EPA-registered surface SANITIZERS and DISINFECTANTS may not make ANTIMICROBIAL efficacy claims on PRODUCT LABELS or any other written or graphic material, including literature, marketing materials and websites, unless the data supporting the claims were reviewed and approved by the EPA. Surface SANITIZER and DISINFECTANT LABELS provide critical information about how to safely and legally handle and use these products.

EPA-registered MASTER and PRODUCT LABELS are legally enforceable, and all include the statement, *"It is a violation of Federal law to use this product in a manner inconsistent with its LABELING."* **In other words, the LABEL is the law.**

If the intended users of a product are in FOOD ESTABLISHMENTS, companies manufacturing surface SANITIZERS and DISINFECTANTS typically develop data and claims that are most relevant for the product's intended use (e.g., norovirus, *Listeria monocytogenes*, *Salmonella* spp., *Shigella* spp., *E. coli* O157:H7 control, etc.). Many products have proven efficacy as FCS and NFCS SANITIZERS, as well as DISINFECTANTS. It is common for these product categories to be used at different concentrations and contact times.

PRODUCT LABELS generally contain a subset of the claims and use instructions that appear on the MASTER LABEL. A PRODUCT LABEL will often only contain those claims and use instructions appropriate for a specific use setting, such as FOOD ESTABLISHMENTS, health care or other settings. As a result, a product might have a long list of efficacy claims on its MASTER LABEL, but a much shorter list on a PRODUCT LABEL. The user of any surface SANITIZER or DISINFECTANT is required to comply with the PRODUCT LABEL and use the chemical as instructed on that label.

MASTER LABELS of all EPA-registered surface SANITIZERS and DISINFECTANTS are listed in a searchable database available in the EPA PPLS[13] and in the National Pesticide Retrieval Information System (NPRIS).[14] To help users select an appropriate surface SANITIZER or DISINFECTANT to control microorganisms of interest, the EPA maintains multiple specialized lists of ANTIMICROBIAL products registered by the EPA.[15] Examples include List G, the EPA's Registered ANTIMICROBIAL Products Effective Against norovirus, and List N, DISINFECTANTS for Use against SARS-CoV-2 (COVID-19). The EPA's newest lists include searchable tables for ease of use. Lists may not be updated regularly therefore; it is important to follow the PRODUCT LABEL use instruction to ensure that the proper surface SANITIZER or DISINFECTANT is used correctly.

Enforcement

The EPA enforces requirements under FIFRA, which governs the distribution, sale and use of surface SANITIZERS and DISINFECTANTS. The EPA is authorized to take enforcement action under the following circumstances:

- Distribution or sale of unregistered surface SANITIZERS and DISINFECTANTS
- Composition of registered surface SANITIZERS and DISINFECTANTS that differ from the formulation submitted at registration

- Registered surface SANITIZERS and DISINFECTANTS that are misbranded or adulterated
- Registered surface SANITIZERS and DISINFECTANTS that are applied using an unapproved method (e.g., fogging)

Enforcement can include fines, stop sale orders, and/or seizure of products not meeting EPA requirements. Additionally, EPA's enforcement program aims to ensure surface SANITIZERS and DISINFECTANTS entering the United States meet EPA requirements.

End users can report suspicious products or individual surface SANITIZER and DISINFECTANT incidents by contacting pesticidequestions@epa.gov. Efficacy of registered products is occasionally confirmed by regulators or manufacturers. Manufacturers are required to review reports of adverse effects or efficacy issues for their registered products and comply with the EPA incident reporting requirements.[16]

The role of state and local authorities in registration and lawful use of DISINFECTANTS and surface SANITIZERS

Surface SANITIZERS and DISINFECTANTS that are sold, distributed, or used must be registered by each state. States have a variety of requirements for registration which can include all or a subset of the information submitted to EPA and in the case of some states can include additional data requirements. Refer any additional questions to your chemical supplier.

FDA oversight of Food Code and connection to EPA/CDC

The FDA Center for Food Safety and Applied Nutrition, Retail Food Protection Staff, Retail Food Police Team (CFSAN/RFPS/RFPT) produces the model FDA Food Code. It represents the FDA's recommendations for a uniform system of regulation to ensure food at retail is safe for consumers. The Food Code is offered for adoption by local, state and federal governmental jurisdictions for administration by various health agencies with delegated compliance responsibilities for FOOD ESTABLISHMENTS.

FDA partners with federal internal and external agencies who have a stake in food safety (CDC, USDA/FSIS, EPA, FDA-Office of Food Additive Safety, FDA-Office of Food Safety/Division of Seafood Safety and Division of Milk/Dairy Products, etc.) and work together to harmonize regulatory provisions and recommendations where applicable.

The federal government is committed to enhanced coordination of food safety efforts with state, local, and tribal agencies, and the food industry to protect the food supply. Establishing uniform and enforceable standards of food safety in FOOD ESTABLISHMENTS is an important part of strengthening the U.S. food protection system. The FDA, EPA, and USDA partner with food safety stakeholders and are committed to reducing the incidence of foodborne illness in the United States.

Key sections of FDA FOOD CODE addressing surface SANITIZERS and DISINFECTANTS

The use of surface SANITIZERS is addressed in the Food Code in several places. The Food Code states in part 1-2, Definitions, that “sanitization” means the application of cumulative heat or chemicals on cleaned FOOD-CONTACT SURFACES that, when evaluated for efficacy, is sufficient to yield a reduction of 5 logs, equal to a 99.999% reduction of representative disease microorganisms of public health importance. Part 4-7 specifies the frequency and methods for sanitizing FOOD-CONTACT SURFACES, the final step prior to reuse of a FOOD-CONTACT SURFACE. It includes two options for sanitizing cleaned and rinsed surfaces (i.e., use of hot water or chemical surface SANITIZERS). Important criteria for using chemical surface SANITIZERS, along with examples of commonly used chemicals, are in Food Code Section 4-501.114, 4-703.11(C), 7-204.11.[5] All surface SANITIZERS must be used in accordance with the EPA-registered label use instructions.

DETERGENT-SANITIZERS are addressed in FDA Food Code Section 4-501.115.[5] These combination products can be used for both cleaning and sanitizing steps and do

not require a rinse between the two steps. Apply to clean the surface, which may include wiping if needed to remove soil, then apply again with the same product to sanitize. Refer to the PRODUCT LABEL for use pattern information. Contact your chemical manufacturer to answer any questions.

NFCS SANITIZERS are not directly addressed in the Food Code. The Code recommends only cleaning these NFCS as needed. However, operators often use surface SANITIZERS and/or DISINFECTANTS on NFCS SANITIZERS to minimize the possible risk of cross-contamination.

DISINFECTANTS are not defined in the 2017 Food Code, but their use is referenced in Annex 3 Section 2-501.11, “Clean-up of Vomiting and Diarrheal Events.” The Food Code specifically states that procedures to clean up after a vomiting or diarrheal event should involve a more stringent process than routine sanitization: “It is therefore important that FOOD ESTABLISHMENTS have procedures for the cleaning and disinfection of vomitus and/or diarrheal contamination events that address, among other items, the use of proper DISINFECTANTS at the proper concentration.”[5] As stated above, disinfection is currently not a regulatory requirement in FOOD ESTABLISHMENTS. However, when a DISINFECTANT is used on a FOOD-CONTACT SURFACE, special attention must be paid to the EPA-registered label use instructions (i.e., concentration, contact time, and application method and requirement for post-disinfection rinse).

The Food Code addresses surface SANITIZER use concentration verification. In Section 4-302.14, the code specifies that “a test kit or other device that accurately measures the concentration in mg/L [ppm] of sanitizing solutions shall be provided.”
The code further goes on to say in section 4-501.116 that the “Concentration of the SANITIZING solution shall be accurately determined by using a test kit or other device”.[5]

Development of disinfection guidance for the public by Centers for Disease Control and Prevention (CDC)

The CDC is the nation's leading science-based, data-driven, service organization that protects the public's health. The CDC is one of the government agencies where recommendations during a public health crisis could be found. In tandem with government agencies, including the FDA and EPA, the CDC makes evidence-based recommendations to the public on the control of pathogens that pose a public health concern. These recommendations often come in the form of guidance documents, such as those released during the COVID-19 pandemic. The CDC takes into consideration the risk factors related to transmission of disease-causing microorganisms as well as the availability of EPA registered products effective against the target microorganism. The CDC provides guidance documents to assist manufacturers or distributors of DISINFECTANTS and surface SANITIZERS in their communication with end users on suitability of products for control of the target pathogen.

During outbreaks caused by a new emerging pathogen, for which effective antimicrobial products might not be registered with the EPA, the CDC can provide recommendations for surface SANITIZER or DISINFECTANT use. In anticipation of such situations, the EPA has published a guideline which helps to register products against new emerging viral pathogens.[17]

Sustainability considerations when selecting DISINFECTANTS and surface SANITIZERS

In recent years, consumer demand for more sustainable and environmentally friendly products and processes has increased. This demand for more "eco-friendly" and/or "green" products has also carried over to both cleaning and ANTIMICROBIAL products.

The US EPA has programs to help consumers make informed purchases for environmentally friendly products. The EPA's Safer Choice program[18] helps

consumers, businesses, and purchasers find products that perform and contain ingredients that are safer for human health and the environment. ANTIMICROBIAL products are not within the scope of the EPA Safer Choice program. Instead, EPA maintains a program called Design for the Environment (DfE).[19] Similar to the Safer Choice program, the DfE program helps purchasers make informed decisions when selecting environmentally friendly ANTIMICROBIAL products, such as surface SANITIZERS and DISINFECTANTS.

The DfE program is optional and there is no regulatory requirement that any surface SANITIZER or DISINFECTANT be certified under this or any other sustainability program. Products approved under the DfE program have been certified by EPA and are ones that:

- minimize any possible risks to human health by excluding ingredients that might have the potential to negatively impact young children, cause cancer, or have other negative effects
- further protect fish and other aquatic life
- minimize pollution of air or waterways and prevent harmful chemicals from being added to the land
- ensure products have no unresolved compliance, enforcement, or efficacy issues

Importantly, the EPA does not consider the DfE logo to be a product endorsement. The DfE logo indicates the product has been certified by the EPA, but these products do not meet the Safer Choice Standards.

Although DfE provides a certification for sustainability of certain attributes of ANTIMICROBIALS, many other products, particularly some concentrates do not meet the DfE certification criteria. However, concentrated ANTIMICROBIALS products have additional sustainability benefits, utilizing less packaging and less carbon associated with transportation, and have the same efficacy and hazard profile as products that are sold as ready to use, when diluted as directed. When choosing a SANITIZER or

DISINFECTANT, it is important to understand the full picture of sustainability of the product and which sustainability attributes matter to you, rather than looking for a certification or seal as this may not be aligned with you/your companies' goals for sustainability.

It should also be noted there are other sustainability programs such as Greenseal and EcoLogo, which offer certifications for cleaning products as well as guidelines for sustainable disinfection. These programs are independent of the EPA DfE and Safer Choice certification but are intended to achieve a similar purpose, i.e., allow users of chemicals to better understand the sustainability and environmental impact of those chemicals. However, it is critical to note that DfE is the only on label certification allowed by the EPA for SANITIZERS and DISINFECTANT. It is also important to understand that all of these programs are completely optional and that a FOOD ESTABLISHMENT is not required to use surface SANITIZERS or DISINFECTANTS that have been certified in any sustainability program, and that sustainable sanitizing and disinfection can be achieved by selecting products with key sustainability attributes in alignment with company goals, independently and regardless of third-party certification.

Supplemental Labeling

Supplemental labeling contains modifications to the pesticide label since the last MASTER LABEL approval (e.g., new use, change application timing). Supplemental labels must be submitted for EPA and state approval, stamped "ACCEPTED" and placed in the official record. Supplemental labels are partial labels distributed with the product by the registrant or distributors in addition to the complete PRODUCT LABEL. Because these are partial labels, they must bear a statement referring the user to the PRODUCT LABEL for complete directions, precautions, and a statement that both the PRODUCT LABEL and supplemental labeling must be in the possession of the user. Compliance with both the PRODUCT LABEL and supplemental labeling is required to safely and effectively use the product.

Supplemental labeling must include the following:

- Product Name
- EPA REGISTRATION NUMBER
- Restricted use classification statement (if applicable)
- “It is a violation of Federal law to use this product in a manner inconsistent with its labeling.”
- “This labeling must be in possession of the user at the time of application.”
- “Read the label affixed to the container for [product name] before applying.”
- “Use of [product name] according to this labeling is subject to the use precautions and limitations imposed by the label affixed to the container for [product name].”

Typically, supplemental labeling will be incorporated into the MASTER LABEL at the next printing of the PRODUCT LABEL (final printed label) or within 18 months, whichever comes first. There are circumstances when these updates may not be completed. For example, if directions for use on the supplemental labeling are subject to continual, frequent change (e.g., California aerial application county restrictions can change every six months). Supplemental labeling must be approved prior to distribution. Supplemental labeling also includes state registration of special local need (SLN) under FIFRA 24(c).

Distributor label

A distributor label is used when a product is registered to one company but is distributed or sold (known as “supplemental distribution”) by another company (known as the “distributor” or “sub-registrant”). (40 CFR 152.132). Distributor labels are not submitted for approval, but a Notice of Supplemental Distribution must be submitted to EPA and states before supplemental distribution of the product.

The registrant is responsible for the contents of both the distributor product and the distributor label.

A distributor label must be the same as the registered PRODUCT LABEL except for:

- Product name
- Distributor name and address
- EPA ESTABLISHMENT NUMBER
- EPA REGISTRATION NUMBER (a third set of numbers is added at the end denoting the distributor's company number, e.g., EPA Reg. No. 1234-56-7890)
- Product claims (specific claims may be deleted as long as no other changes are necessary, but new claims cannot be added)
- Warranty statements (if allowed by contract between the registrant and the distributor and such change is not false or misleading)

The term "supplemental distributor labeling" is sometimes used but is not proper EPA terminology and is often confused with the term "supplemental labeling." The correct term is "distributor label." A supplemental label is used to add new uses or directions for a product, while a distributor label cannot include any uses or directions that differ from the registered product's labeling.

WHAT IS A RADIUS OF THE AREA TO BE CLEANED AND DISINFECTED?

Introduction

Vomiting is a hallmark symptom of a norovirus infection. Infectious norovirus particles can spread in the environment via droplets or aerosol formed during vomiting episodes. Hence, proper environmental disinfection is critical to disrupt its spread. At present, no conclusive evidence is available to support a cleaning radius for vomitus because the extent of contamination and quantity of aerosol formed during vomitus emission and cleanup is still unknown. In fact, most cleanup procedures rarely include a cleaning radius, leaving this to the discretion of the cleaner.

A pattern of viral particles spread is influenced by an array of factors (i.e., viscosity and volume of vomitus, air flow in the room, height of vomiter and type of vomit and establishment layout among others). Given the complexity of each individual factor and

their interaction, it is very difficult to recommend a single radius for clean-up of vomitus. A brief summary of the state of the science regarding norovirus spread in vomitus is below. Multiple studies showed different results regarding the radius of vomit clean-up. This summary is intended to help individual FOOD ESTABLISHMENTS to make a decision on the clean-up radius to be used after a vomiting episode.

Laboratory-Based Studies in Chronological Order

Few laboratory-based studies aim to investigate norovirus spread induced by vomiting. In 2013, U.S. researchers investigated droplet spread during vomiting by conducting a "tipping bucket" experiment.[20] In these experiments, various volumes of artificial vomit (either artificial saliva or oatmeal) were dropped from a height of 3.5 ft and the amount of splatter across the room was evaluated. The maximum travelling distance of the droplets was 14.5 ft, leading to recommendation for this distance to be a minimum radius for vomit clean-up procedures. Airborne particles may spread further than 14.5 ft.

In a 2014 study, researchers created "vomiting Larry" a vomiting machine designed to replicate realistic vomiting episodes so the droplet spread could be studied.[21] In this study, water with a fluorescent dye was used to track spread of droplets during vomiting episodes. In a conclusion of this study an area of approximately 84 ft^2 was recommended to be decontaminated after a vomiting episode. It was emphasized that this area does not take into consideration airborne particles, since they could not be visualized in the experiments.

In 2015, these same researchers published results from aerosolization experiments using a "vomiting machine" which anatomically mimicked a scaled down version of a vomiting episode.[22] In this study, simulated vomitus and MS2 bacteriophage, a surrogate virus for human norovirus were used. Less than 0.03%. of total virus was aerosolized in all experiments, which corresponds to >13,000 norovirus particles aerosolized during a typical vomitus event. This study did not assess total particle spread.

Select Outbreak Case Studies

There are many outbreak investigations where environmental spread of norovirus was documented. In 1998, 58 out of 129 dinner guests became ill at a hotel after a guest

vomited on the wooden floor of the restaurant.[23] Analysis of attack rates by dining table showed an inverse relationship with the distance from the person who vomited, providing strong evidence for norovirus spread by aerosolization during the vomiting incident. The authors also noted the presence of ceiling fans near the incident, which likely promoted norovirus particle spread throughout the restaurant. No distances between tables were given in the research article, although every table in the restaurant had guests who later became ill from the incident.

In 1999, more than 300 people became sick over a five-day period after a concert attendee vomited multiple times during the concert.[24] Many of the individuals sickened did not sit in the same section as the index case. This study resulted in the widespread use of 25 feet as a recommended radius for cleaning up suspected norovirus incidents, since there were cases within a 25-foot radius of the index case who became ill.

Conclusions

In summary, there is convincing evidence that vomiting can spread norovirus particles through droplets as well as aerosols. While a facility will need to determine the appropriate practical clean-up radius for their own establishment, there are several best practices that should always be used. Any surface with visible vomitus or diarrhea needs to be cleaned and disinfected during the clean-up procedure. EPA-registered DISINFECTANTS with norovirus claims must be used in these procedures. Since EPA DISINFECTANTS are not registered for decontaminate inanimate packaging materials, packaged foods suspected to be impacted by the norovirus incident should be discarded not disinfected. Airflow should be considered when determining the appropriate area for clean-up. For example, an indoor environment with multiple ceiling fans will likely spread virus further than an environment without fans.[23] The establishment should consider all affected areas besides the floors such as table legs, table surfaces, shelves, display cases, etc. during cleanup as norovirus particles can spread in all directions during an incident. Consider cleaning other areas which sick individual may have touched.

SpaceX’s Inspiration4 update: Cold pizza, zero-gravity flips and a ukulele solo

Hawthorne-based SpaceX's crew of amateur astronauts will return to Earth on Saturday evening

-

This photo provided by SpaceX shows Hayley Arceneaux, one of the passengers of Inspiration4 in the Dragon capsuleon Friday, Sept. 17. (SpaceX)

Two days into Hawthorne-based SpaceX's Inspiration4 mission, the Earth-orbiting crew of amateur astronauts provided a lively livecast update on its journey on Friday, Sept. 17, 24 hours before they're due to splash down off the Florida coast.

The event included zero-gravity tumbles, lots of high spirits, displays of artwork created in space and an interstellar ukulele solo.

During the livestream, the crew announced that the quartet was scheduled to return to Earth at 4:06 p.m. PDT Saturday, splashing down into the Atlantic Ocean off the coast of Florida.

SpaceX's Dragon capsule was scheduled to perform two burns Friday night to reduce the spacecraft's altitude to 365 kilometers, SpaceX tweeted Friday, to align the craft with its landing site.

Dragon reached as high as 590 kilometers, or 367 miles, above earth's surface before the astronauts took off their space suits, said Andy Tran, quality engineer at SpaceX, during the update.

Dragon lifted off Wednesday at NASA's Kennedy Space Center in Florida.

Aboard the history-making, fund-raising flight are the four amateur astronauts: mission commander Jared Isaacman, billionaire CEO of payment processing company Shift4 Payments, who funded the trip; mission pilot Sian Proctor, a geoscientist and community college professor in Arizona; mission medical officer Hayley Arceneaux, a physician's assistant at St. Jude Children's Research Center in Memphis, TN; and mission specialist Chris Sembroski, an aerospace data engineer.

Their first meal in space was cold pizza, which the crew said, Tran relayed. And it was extraordinary, he added.

On Friday, Proctor turned the camera to the Dragon's cupola window, trying to share a view the stars and an aurora around Earth amid the dark atmosphere.

"We've been spending so much time in this cupola, the largest window flown into space," Arceneaux said. "We could see the entire perimeter of the Earth, which gives such incredible perspective; the views, I have to say, are out of this world."

Well, they literally are just that.

- **SpaceX launches 49 satellites in a Falcon 9 rocket above Southern California**

The crew floated above Europe during the update, Proctor said, as Proctor showed her marker illustration of the Dragon being carried by an actual dragon off of Earth, Sembroski played his ukulele and Arceneaux turned flips in the zero-gravity environment.

The crew only had 10 minutes of connectivity to Earth on Friday, Tran said, as SpaceX can only communicate with a spacecraft travelling 17,500 mph when it is flying over a designated ground station.

They've been taking swabs of different body parts to evaluate the microbiome and how that changes in those three days in space, Arceneaux said. The crew has also been taking blood samples for research teams back on Earth to study, as well as cognitive tests.

Aside from scientific research, the mission's biggest goal is to raise $200 million for St. Jude Children's Research Hospital. Isaacman looks to the greater community to match the $100 million he's pledging to the hospital.

Axiom Article

4 days in, Axiom Space's crew makes history for private space flight at ISS

Axiom-1 is the first all-private mission to the International Space Station.

*BY***DORIS ELÍN URRUTIA**

APRIL 12, 2022

SpaceX/Axiom

Over the weekend, the Axiom-1 mission carried four rich guys and philanthropists, a celebrity-chef menu, and biomedical experiments to the International Space Station (ISS).

On Friday (April 8) at 11:17 a.m. Eastern, Axiom-1 launched atop a reused SpaceX Falcon 9 rocket from NASA's Kennedy Space Center in Cape Canaveral, Florida. This flight began the 10-day mission for the first all-private mission for Axiom Space, a company based in Houston near NASA's Johnson Space Center that seeks to place the first commercial space station into low-Earth orbit sometime this decade.

Everything leading up to the flight went smoothly for the most part. Personnel noticed a slight loss of pressure after the hatch was first sealed, so a ground crew reopened and resealed it about two hours prior to takeoff.

Two minutes and 45 seconds after launch, the pre-flown first stage — the bottom two-thirds of the rocket — separated from the upper stage and successfully navigated back to Earth's surface, landing on a SpaceX drone ship floating in the Atlantic Ocean.

A SpaceX Falcon 9 rocket launched on Friday (April 8) shortly before noon local time with the four crewmembers of the Axiom-1 mission.

ANADOLU AGENCY/ANADOLU AGENCY/GETTY IMAGES

Axiom-1's crew were meanwhile "hooting and hollering" during the ride, Axiom-1 pilot and American real-estate investor Larry Connor said during a video message to SpaceX headquarters the following day. Commander and former NASA Space Shuttle astronaut Michael López-Alegría remained "diplomatic" during the cheers, Connor added.

They rode within a SpaceX Dragon Endeavour crew capsule, which is now on its third mission to the ISS. Once this robotic cocoon reached its targeted orbit about 12 minutes after launch, the crew got comfortable and had their first meals for the mission. The Axiom-1 mission menu includes Iberian ham and chicken paella, according to a video segment that SpaceX aired during its pre-launch broadcast. The food was prepared by the non-profit organization World Central Kitchen, helmed by celebrity chef José Andrés.

A "Caramel the Dog" stuffed animal traveled to space with Axiom-1. This is the mascot for the Montreal Children's Hospital in Canada.

AXIOM SPACE

Caramel the Dog, the mascot for the Montreal Children's Hospital Foundation, made an appearance after launch. Astronauts typically use stuffed animals as zero-G indicators, which lets them see whether or not weightlessness has kicked in while remaining safely strapped into their seats. A camera inside Endeavour aired the first microgravity flight of Axiom-1's zero-G indicator. The toy was selected because Mission Specialist and Canadian entrepreneur Mark Pathy collaborates with Canadian health centers as part of his philanthropic work.

The 21-hour trip to the space station suffered a snag at the end. When Endeavor reached the ISS and attempted to dock, the astronauts on the space station couldn't see the feed from an Endeavour camera that was necessary for the docking procedure. Docking was delayed about 45 minutes as teams figured out a solution, which was eventually reached through support from SpaceX Headquarters and NASA.

The SpaceX Dragon Endeavour carrying the Axiom-1 astronauts approaches the International Space Station on April 9, 2022.

NASA/FLICKR

At 10:13 a.m. on Saturday (April 9), the Axiom-1 crew successfully docked to the ISS, bringing the orbiting laboratory's population up to 11. The space station was already housing Expedition 67, a mission made up of three NASA astronauts, one European astronaut, and three Roscosmos cosmonauts.

A NASA blog post published on Monday (April 11) details the science work they will be assisting during their eight days on the space station. The experiments will tackle questions about genetic markers in cellular aging, changes to brain activity in microgravity, and a DNA editing system.

Monday marked Flight Day 4 of Axiom-1.

2-million-dollar bacon sando Article

Heston Blumenthal's Canned Bacon Sandwich Cost $2.8 Million

1

Is it the priciest sandwich in the galaxy?

by Dana Hatic@DanaHatic Mar 15, 2016, 4:30pm EDT

Via TV chef Heston Blumenthal creates bacon sandwich costing 'a couple of million pounds' [The Mirror], Heston, we have a problem... the top chef cooks for Tim Peake [The Guardian], and All Heston Blumenthal Coverage [E]

Stuart C. Wilson/Getty Images

British chef, TV personality, and proprietor of the many-starred Fat Duck in Bray, England, Heston Blumenthal is known for innovative and elaborate cooking styles, but his latest production takes the cake. Blumenthal designed a canned bacon

sandwich for Major Tim Peake, a British astronaut stationed at the International Space Station, and transport of the expensive sandwich cost "a couple million pounds," according to *The Mirror*. That's over $2.8 million.

The chef, who often makes use of molecular gastronomy techniques in his kitchens, curated a handful of meals for Peake, all of which were was designed to hold up under zero-gravity situations. The meal also had to abide by the strict regulations of the world's space agencies which had to approve the meal. Heston spent two years working on the sandwich, eventually landing on canning as the best method of preservation. Though canning cut the risks, it still left Blumenthal in of fear of giving Peake food poisoning, *The Guardian* reported.

In addition to the bacon sandwich, Blumenthal created a red Thai curry, beef stew with truffles, Alaskan salmon, and apple crumble, among other items. These dishes were sent to the International Space Station on a rocket from Cape Canaveral and were waiting for Peake when he arrived in December. Back then we didn't know Blumenthal was the chef, though we did know Peake was excited about having a bacon sandwich in space.

Most expensive bacon sandwich ever? Probably. Worth it? Peake will be the judge, and the world will find out in a TV special called, "Dinner in Space," featuring a video-chat dinner with Peake and Blumenthal, which airs on March 20.

Kimchi Article New York Times

Kimchi goes to space, along with first Korean astronaut

- Give this article

-
-
-

By [Choe Sang-Hun]

- Feb. 22, 2008

SEOUL — Koreans say they must eat kimchi wherever they are. When South Korea dispatched troops to the Vietnam War in the 1960s, tearful mothers sent off their sons with clay pots containing homemade kimchi. Soon troopships were filled with the pungent smell of the fermenting cabbage slathered with pepper and garlic.

So it was only natural for Koreans to think that their first astronaut must have the beloved national dish when he goes on his historic space mission in April. Three top government research institutes went to work. Their mission: to create "space kimchi."

"If a Korean goes to space, kimchi must go there, too," said Kim Sung Soo, a Korea Food Research Institute scientist. "Without kimchi, Koreans feel flabby. Kimchi first came to our mind when we began discussing what Korean food should go into space."

Ko San, a 30-year-old computer science engineer who beat 36,000 contestants to become the first South Korean space traveler, will blast off April 8 on board a Russian-made Soyuz rocket, together with two Russian cosmonauts. He will stay in the International Space Station for 10 days conducting scientific experiments.

ADVERTISEMENT

Continue reading the main story

Ko's trip will be an occasion for national celebration. Since 1961, 34 countries, including Vietnam, Mongolia and Afghanistan, have sent more than 470 astronauts into space, but none of them was Korean - something South Koreans have found humiliating, given their country's economic stature. So when their government finally decided to finance Ko's trip, they wanted him well prepared for his momentous journey. Which means he must take kimchi with him.

After millions of dollars and years of research, South Korean scientists successfully engineered kimchi and nine other Korean recipes fit for space travel. When the Russian space authorities this month approved them for Ko's trip, the South Korean food companies that participated in the research took out full-page newspaper ads.

- **Dig deeper into the moment.**

Special offer: Subscribe for $1 a week for the first year.

The other space food Koreans created include the national instant noodle called ramyeon, hot pepper paste, fermented soybean soup and sticky rice.

But kimchi - a must-have side dish at every Korean meal - was the toughest to turn into space food.

"The key was how to make a bacteria-free kimchi while retaining its unique taste, color and texture," said Lee Ju Woon at the Korean Atomic Energy Research Institute, who began working on the newfangled kimchi in 2003 with samples provided by his mother.

Ordinary kimchi is teeming with microbes, like lactic acid bacteria, which help fermentation. On Earth they are harmless, but scientists fear they could turn dangerous in space if cosmic rays cause them to mutate. Another problem is that kimchi has a short shelf life, especially when temperatures fluctuate rapidly, as they do in space.

ADVERTISEMENT

Continue reading the main story

"Imagine if a bag of kimchi starts fermenting and bubbling out of control and bursts all over the sensitive equipment of the spaceship," Lee said.

Lee's team found a way to kill the bacteria with radiation while retaining 90 percent of the original taste. Lee's space kimchi comes in cans, whereas the Korea Food Research Institute's version, developed by Kim's team using a different technology to control the fermentation process, comes in a plastic package.

"This will greatly help my mission. When you're working in space-like conditions and aren't feeling too well, you miss Korean food," Ko, who is training in Russia, said in a statement transmitted through the Korea Aerospace Research Institute, which is overseeing his mission. "Since I am taking kimchi with me, this will help cultural exchanges in space."

Ko plans to be host of a Korean dinner in the space station on April 12 to celebrate the 47th anniversary of the day the Soviet cosmonaut Yuri Gagarin became the first human in space. The dinner will conclude with Korean ginseng and green tea.

What about kimchi's strong aroma, which often keeps non-Koreans from trying it?

"We managed to reduce the smell by one-third or by half," Kim said. "So the other astronauts will feel comfortable trying our space kimchi."

Sea moss has recently seen increasing popularity for use in “healthy” smoothie beverages, with some products formulated with sea moss appearing to be a major ingredient. Despite the unpermitted vendors selling in various local venues, there are several safety concerns associated with sea moss (*Chondrus crispus*) that require specific controls to ensure the safety of consumers. The production process requires regulatory approval, and the producer must operate from a commercial kitchen under a Retail Food Establishment permit.

Here are the safety concerns:

1. The spores of *Clostridium botulinum* are present in the marine environment and may be present on the product. These bacteria, often referred to as “**C. bot**.”, produce the toxin that causes botulism poisoning. In producing the sea moss gel, growth and toxin formation by C. bot. must be controlled by one of two methods:
    a. Use of a scientifically backed cooking process to destroy the spores and bacteria, or
    b. Acidification of the product to a pH of 4.6 or lower to prevent growth and toxin formation by any C. bot that may be present.

    A written procedure must be submitted to the regulatory authority for approval of the production process using one of the two options above as the safety control. The “Fish and Fishery Products Hazards and Controls Guidance,” March 2020 includes validated guidance on cooking processes for destruction of the spores of C. bot. If the product will be acidified, an initial product assessment for pH must be obtained from a recognized Process Authority. That report must be provided to the regulatory authority as one requirement for approval of the production process. The retail producer will be required to do their own pH testing of each process batch, and must maintain batch production records that include the pH test results for each batch.
2. The supplier of raw sea moss must harvest from an area free from contaminants such as heavy metals, agricultural or industrial chemicals and microorganisms associated with septic waste, which are commonly associated with runoff water from populated and industrial areas. An approved harvester/producer of the sea moss must be able to provide a letter to the retail establishment attesting that their harvesting practices meet this requirement. This letter must be made available to retail food inspectors, and a copy of the letter must be supplied to the regulatory authority as another requirement for approval of the production process.
3. Sea moss and seaweed are natural sources of iodine. Maximum serving sizes must consider the maximum daily allowance of dietary iodine. The concentration of iodine in the sea moss gel will depend on factors such as the local source of the raw material as well as the processing of the gel. The National Institutes of Health (NIH) have published a study of various seaweed products showing, anecdotally, that sea moss had the lowest concentration of iodine of all types of seaweed in the study (see Table 4 of the study). For the sample tested, an 8 gram serving of sea moss would provide 85% of the NIH recommended 150 micrograms daily intake of iodine. NIH recommended a tolerable upper limit of 650 micrograms of daily iodine intake, corresponding to approximately 40 grams of sea moss. NIH further reports that iodine toxicity can occur with more than 1100 micrograms iodine intake per day, resulting in a variety of thyroid health problems. The best guidance is to maintain a balanced diet and moderate consumption of sea moss products.

4. Sea moss is the natural source from which the thickener/emulsifier carrageenan is refined. Use of carrageenan is regulated as a food additive under 21 CFR 172.620. Additional information on allowed use is found at 21 CFR 172.623. The FDA Food Additive Status List provides maximum allowed concentrations of food additives in food.

The above requested documentation should be submitted to foodvariances@dhec.sc.gov for review and approval.

Be aware that if the sea moss gel will be processed using the acidification option, you will need a pH meter with which to test each production batch to be sure the critical pH value is met.

The topic of health claims is one that requires specific FDA guidance to navigate the fine details of what is allowed or not allowed. No health claims can be approved by local agencies such as SC DHEC, and the use of health claims renders the associated product as a dietary supplement, and not a food. As such, the product would be regulated by FDA, not by any local regulatory agency. Here are resources to assist you:

Consumer Advisory: MDARD Urges Consumers to Dispose of Royalty Sea Moss Lemonade and Gel Products Because of Possible Health Risk

Michigan Dept of Agriculture & Rural Development sent this bulletin at 10/17/2022 10:30 AM EDT

For immediate release: October 17, 2022
MDARD Program Contact: Tom Tederington, 517-749-5849
MDARD Media Contact: Jennifer Holton, 517-284-5724

Consumer Advisory: MDARD Urges Consumers to Dispose of Royalty Sea Moss Lemonade and Gel Products Because of Possible Health Risk

LANSING - The Michigan Department of Agriculture and Rural Development (MDARD) is advising consumers not to eat, drink, or consume any sea moss lemonade or gel products produced by Royalty Sea Moss of Mt. Pleasant, MI.

MDARD initiated the investigation after receiving a complaint from the Maryland Department of Health, Office of Food Protection. During the investigation, MDARD identified the firm produced these products with inadequate processing controls required to stop the growth of deadly foodborne pathogens including botulism. In addition to inadequate process controls the firm does not hold a license to manufacture, hold, or sell food products, which is a violation of the Michigan Food Law of 2000, P.A. 92, MCL 289.5101(1).

Improperly processed beverages and food products may have the potential to be contaminated with Clostridium botulinum, a tasteless and odorless bacterium which can cause life-threatening illness or death.

Botulism, a potentially fatal form of food poisoning, can cause the following symptoms: general weakness, dizziness, double-vision and trouble with speaking or swallowing. Difficulty in breathing, weakness of other muscles, abdominal distension and constipation may also be common symptoms. People experiencing these problems should seek immediate medical attention.

No illnesses have been reported at this time. Consumers are warned not to use the product even if it does not look or smell spoiled.

Products were primarily distributed across the U.S. through the firm's website, and social media platforms. Products advertised on their website lack adequate and consistent labeling including but not limited to ingredient statements, lot codes, and sell by dates.

- Regular Sea Moss Gel
- Fruit Flavored Sea Moss Gel:
  - Mixed Berry with Blueberry Strawberry Raspberry
  - Pineapple Cherry Strawberry
  - Peach Strawberry Flavor
  - Strawberry Dragon fruit
  - Mango Pineapple
  - Strawberry Banana
- Sea Moss Lemonade:
  - Blue Raspberry

- Mango
- Lemonade
- Watermelon
- Strawberry Peach
- Green Apple
- Pink Strawberry
- Strawberry Lemonade
- Grape
- Pineapple
- Strawberry Kiwi
- Cherry
- Fruit Punch

If consumers have additional questions or concerns, they may contact MDARD at 800-292-3939, Monday through Friday between 8 am and 5 pm.

The identification of potential food safety hazards in seaweed

Words by Clare Winkel

The consumption of seaweed has many health and nutritional benefits and Australia currently imports a significant amount of seaweed for human consumption.

Between 2017-2018, seaweed imports were worth $40 million and 85% of that was for human consumption. Every year there are at least 36 recalls or import alerts worldwide for seaweed-based foods. In 2019, Australia instigated at least 50% of these recalls or rejections.

There are currently only a small number of domestic harvesters, growers and processors producing and selling seaweed for human consumption, but given the food safety concerns with imported seaweed, how does the local product compare?

AgriFutures

To assist this small industry, AgriFutures has funded Integrity Compliance Solutions (ICS) to undertake a project to identify potential food safety hazards and develop HACCP Plans (Hazard Analysis Critical Control Point) for two seaweed case studies. These documents will provide the basis of a readily adaptable program for seaweed processors and guidance for regulators in terms of minimising risks in the processing of seaweed for human consumption.

The project is focused on two seaweed species: one grown and one wild harvested. The first case study is *Phyco Health & Venus Shell Systems,* run by Dr Pia Weinberg. This business grows sea lettuce in large 'swimming pools' which is then heat dried and processed. The second case study is *Sea Health Products,* run by Jo Lane. This business harvests kelp from the beach which it then sun dries and processes.

The end-products from both businesses in the case studies are similar dried flaked products that can then be further processed into almost any type of processed foods including pasta, seasonings, chips, cheese, chocolate and coated snacks such as roasted nuts.

To start the hazard identification process, a literature review was undertaken. One study by the European Union Rapid Alert System[1] identified 22 food safety hazards in European seaweed - four were considered major, five moderate and thirteen minor.

The four major hazards identified were: arsenic, cadmium, iodine and Salmonella. Some of the minor hazards included pesticide residues, dioxins, polychlorinated biphenyls, brominated flame retardants, polycyclic aromatic hydrocarbons, pharmaceuticals, marine bio toxins, allergens, nano plastics, pathogenic bacteria and viruses. The pathogenic bacteria include Salmonella and viruses include norovirus and hepatitis B.

These minor hazards are organisms or chemicals that are found within the European environment. Some are naturally occurring, such as marine biotoxins, and some are clearly a result of human activities such as nano plastics, pesticides, dioxins and flame retardants. There are safety concerns related to adverse events associated with seaweed consumption, particularly the variable and potentially dangerously high concentrations of iodine and heavy metals (including inorganic arsenic) in certain seaweeds.[2,3]

Only one publication by the University of Connecticut[4] focused on seaweed sold to the consumer (including raw and chilled), whether in restaurants or as a processed product. The food safety hazards identified

[Picture of person collecting seaweed removed due to file size constraints]

Jo Lane collecting Golden Kelp (Ecklonia radiata) at dawn from case study 2. Photo taken by Honey Atkinson and supplied by Jo Lane.

were pathogens from the harvest area, which were potentially significant because the seaweed may be consumed as a raw product, without any additional processing kill step.

Pathogens of concern include *Vibrio, Salmonella, E.coli* O157:H7, *Shigella, Norovirus* and Hepatitis. Environmental chemical contaminants were considered potentially significant as certain species of seaweeds exhibit a high affinity for accumulating heavy metals and other contaminants in their tissues. Natural toxins from the harvest area including outbreaks related to the consumption of several *Gracilaria* species. These toxins are often heat-stable and even if seaweed is cooked before consumption, the toxin will remain in the final product.

The spores of *Clostridium botulinum,* that form botulinum toxin, are naturally occurring in the marine and estuarine environment. It could be considered for seaweed products that are raw or blanched and then packaged in a modified/reduced atmosphere package (e.g. vacuum packed). Almost all papers reviewed were based on Northern hemisphere seaweed species and environments.

In addition to the literature review, the project reviewed 20 years of worldwide recall notices and border rejections using the Horizon Scan database.[5] This process identified the following food safety hazards:

- Iodine: 262 incidents between 2000 – 2022
- Inorganic arsenic: 64 incidents between 2000 – 2022
- USA Import refusals: 35 incidents between 2002 – 2021 including labelling failure, processing failure, 'filth' and unauthorised colours
- Cadmium: 13 incidents between 2005 – 2020
- Salmonella: 11 incidents between 2011 – 2018
- E. coli O7:H4: 3,000 school students and staff in Japan in 2020 (red seaweed salad)
- Chemical hazards: Nitrofurans, sulphites, benzopyrene and aluminium
- Unauthorised colours
- Unauthorised irradiation
- Microbiological organisms: Listeria, mould and coliforms
- Allergens: soy, gluten and sesame
- Fraud: documentation (labelled as organic from Nth Korea in 2020) and species substitution (Vietnam 2021).

The process steps undertaken in the case studies were reviewed for actual food safety hazards, control measures and critical control points (CCP). The hazards identified were quite different to those identified in most of the publications. These were:

- Allergens: crustaceans and molluscs - controlled by washing in fresh water
- Physical contamination: sand and marine debris - controlled by washing in fresh water
- Micro contamination: Salmonella - controlled by the drying process resulting in a final product of Aw below 0.83 and salt content
- Chemical contamination: iodine – possibly controlled by blanching of raw material
- Almost all hazards were controlled or eliminated by growing seaweed in controlled tank conditions.

Variables that need to be considered to identify further controls for the identified food safety hazards include:

- Species specific hazards in local seaweed species
- Seaweed plant age and which parts of the plants are used
- Local harvest environmental conditions
- Rainfall levels in the local harvest area and harvest water temperature
- Blanching process.

NATIONAL COFFEE ASSOCIATION USA EST. 1911

January 23, 2023

Dr. David McSwane, REHS, CP-FS
Executive Director
Conference for Food Protection
30 Elliott Court
Martinsville, IN 46151-1331
Dmcswane.cfp@gmail.com

Cc: Sharon Farrell, MS, RD,
Indiana Department of Health

Dear Dr. McSwane:

The NCA appreciates the opportunity to comment and submit an Issue to the Conference for Food Protection on retail cold brew coffee to consider for recommendation to the Food Code. We provide this supporting document to summarily describe justification, current enforcement practices, and a comprehensive challenge study currently underway, to help inform the creation of a standard on retail cold brew coffee for the Food Code.

The National Coffee Association (NCA), established in 1911, is the nation's leading coffee trade organization, representing more than 200 member organizations across all segments of the U.S. coffee industry, including growers, importers, traders, roasters, retailers, and allied organizations. Coffee plays a key role in the U.S. economy, supporting more than 1.6 million jobs and contributing more than $225 billion to the economy annually. Most Americans (66% of those over 18) drink coffee each day, more than any other beverage, including water[1].

While "traditional" coffee is recognized as a safe food, cold brew coffee involves a different preparation method, one that exchanges a heat-based extraction method for one that takes place over a longer period of time at ambient or cooler temperature, and results in a beverage that tastes less acidic and is smoother than traditionally prepared coffee. Given a lack of consistent and clear regulations regarding safe preparation, storage, and dispensing of cold brew coffee, coupled with its rapidly growing popularity, state and local health departments as well as coffee retailers (such as coffee shops) are in need of guidance in the form of regulations that provide clarity for food safety enforcement and compliance, as well as consumer safety.

As a result, there is a pressing need for the creation of a Food Code standard on cold brew coffee prepared for retail sale to help provide uniformity of food safety enforcement and compliance across the many enforcement agencies across the country.

[1] National Coffee Data Trends Report Fall 2022, National Coffee Association USA, Inc. https://www.ncausa.org/Portals/56/PDFs/Communication/Fall-2022-media-highlights.pdf

Outlined below is a summary of some safety concerns and enforcement considerations that have been brought to our attention via prominent health departments and businesses. In addition, we have summarized the objectives, outcomes and timing for a comprehensive cold brew challenge study that the NCA has commissioned with a leading national third-party accredited laboratory, currently underway, intended to result in empirical data to support the creation of safety standards.

Summary of Justification, Enforcement, and Challenge Study Research Objectives

Safety concerns in retail cold brew coffee, existing food code enforcement, and research objectives for a cold brew coffee challenge study designed to resolve regulators' concerns and inform the Food Code.

Safety concerns for retail cold brew coffee:

1. Temperature abuse or ambient brewing allowing for increased microbial growth.
2. Extended shelf-life increases risk of microbial growth
3. Sanitation concerns
4. Reduced oxygen packaging (ROP)

Health inspector enforcement of existing food code:

Health inspector enforcement of existing food code standards on retail cold brew has varied significantly across state and local jurisdictions. Some of the most rigorous and prominent enforcement has included (excerpted from Maricopa County Environmental Services Department):

1. Cold brew coffee has been regarded by various jurisdictions as a time/temperature control for safety (TCS) food unless evidence has been provided to health departments to indicate it is a non-TCS food.
    a. A food that because of its pH or a_w (water activity) value, or interaction of a_w and pH values, is designated as a non-TCS food.
    b. If the interaction of the product's pH and a_w indicates a product assessment is required, then a challenge study will need to be conducted in accordance with National Advisory Committee on Microbiological Criteria for Foods (NACMCF) standards and provided to departments of health for consideration.
2. HACCP plans and variances are not required if cold brew coffee is handled in accordance with all applicable parameters of the food code:
    a. Brew, hold, and dispense at 41°F or below.
    b. Date marked for no more than 7 days from the date of production.
3. Kegging cold brew coffee, or using a similar packaging method, such as bottling, is a reduced oxygen packaging (ROP) process. With the exceptions identified below, a HACCP plan and a variance may be required.
4. HACCP plans and variances are NOT required for non-TCS food.
5. HACCP plans and variances are NOT required if sealing the product using ROP methods and holding the product in package for less than 48 hours (after 48 hours product must be discarded, removed from package or unsealed) in accordance with §3-502.12 (F) and if handled in accordance with all other applicable parameters of the food code.

6. When packaging (packaged at 41°F or below) is conducted in accordance with §3-502.12, only a HACCP plan will be required. If processes deviate from §3-502.12, a variance will also be required.

Research Objectives:

1. NCA has commissioned a nationally accredited third-party laboratory to determine the ability of proteolytic and non-proteolytic *Clostridium botulinum* (*C. bot.*) and non-*C. bot.* pathogens (*Bacillus cereus* spores, *Escherichia coli* O157:H7, *Listeria monocytogenes*, *Salmonella*, and *Staphylococcus aureus*) to grow in cold brew coffee concentrate prepared by the bucket method (4-6° Brix) at ambient temperature for 12-18 hours and single-strength cold brew (1.5-2° Brix) packaged into bag-in-box (BIB) and stored at 85°F for up to 11 days of storage.

Outcomes & Timing:

The NCA anticipates that the research study will be completed in the Spring with completion of a white paper by June 2023. The results can be used to inform creation of a standard for the Food Code.

Conclusion:

On behalf of the coffee sector, we are interested in participating and supporting a process to create science-based, practical guidance to support creation and enforcement of cold brew coffee related food safety regulations to protect consumers.

Sincerely,

William (Bill) Murray, CAE

Comprehensive Reviews in Food Science and Food Safety

Chapter VIII
Framework Developed to Determine Whether Foods Need Time/ Temperature Control for Safety

1. Description of framework

The variety and novelty of the foods currently available to consumers has resulted in a complex situation when determining whether a food needs time/temperature control for safety. Although there are many foods that need time/temperature control for safety (TCS), other foods require specific evaluation in order to determine their status as TCS or non-TCS foods. To facilitate the decision as to whether a food needs time/temperature control for safety, the panel developed a framework based on: in-depth evaluation of criteria used by industry, government, and trade organizations; survey data collected by the panel (see Appendix B); available scientific literature; and the panelists' own experience on this subject. The framework provides a stepwise process that considers holding time and temperature, product description, pH and a_w interaction, product assessment, challenge testing, and mathematical models. Decisions as to whether or not a food should be designated as TCS can be made at various steps of the framework. Performing the initial steps requires only limited experience and/or minimum training, while subsequent steps require knowledge of the product's pH and a_w. More technical expertise is needed for the analysis step which is based on product assessment, challenge studies, and predictive modeling. If it is determined that the product needs (or may need) time/temperature control for safety, a number of alternatives are presented in the framework that might be considered. For example, a decision might be made that a challenge study is so costly that the best alternative is to reformulate the product or control the time or temperature.

The following is a description of the proposed framework that the panel has developed to determine whether a food needs time/temperature control for safety (see section 2 of this chapter).

Before proceeding with Step 1 of the evaluation process, the evaluator needs to make a succinct review of the food product in question, including intrinsic and extrinsic factors that may affect microbial growth and potential hazards. (Detailed descriptions of factors and potential hazards that will help with this review are presented in Chapters 3 and 4.) The food may already be held hot or cold for safety reasons. In this case, and if there is no desire to store the food at ambient temperature, the trained decision-maker need not proceed any further. Product history, in combination with a robust scientific rationale that justifies such safe history of use, may also be used as criteria to designate a food as a non-TCS food not requiring further evaluation (see also Chapter 3, section 4.2.).

Step 1. The panel concluded that the appropriate scientific evidence exists to allow for the evaluation of a food according to its pH, water activity, and pH/a_w interaction. The panel also agreed that a product that is processed to eliminate vegetative cells needs to be addressed differently than an unprocessed product that received no treatment or a less robust treatment. The concern of possible post-process contamination also needs to be addressed. If a food is processed to inactivate bacteria and packaged so that there is no post-process contamination, the tolerable range conditions of a_w and pH are more permissive, since spores would become the only microbial hazard. For these reasons, the panel designed two pH/a_w tables: one for the control of spores (Table A), and one for the control of spores and vegetative cells (Table B). The rationale for the ranges of pH and a_w in determining whether a food is non-TCS versus TCS is based on minimum pH and a_w requirements for the pathogens of concern; that is, *Bacillus cereus* and *Clostridium botulinum* toxin production when controlling spores, and *Listeria monocytogenes*, *Staphylococcus aureus, Salmonella* spp*, C. botulinum*, and *B. cereus* when controlling both vegetative cells and spores (see Chapter 3, sections 2.1. and 2.2. and Appendix C). If process technologies other than heat are applied, then the effectiveness of the process needs to be validated. For this decision, the evaluator needs to have an understanding of both the process and the validation of its effectiveness in reducing pathogens of concern. It should be noted that for some products, the analysis of pH and a_w may be inaccurate, especially in the case of combination products (see Chapter 4, section 10). Consequently, for these products the pH and a_w would not be considered as controlling factors without supporting data from challenge studies.

Step 2. After the product's assignment to a box inside one of the tables, if the product is designated as non-TCS, it may be safely stored at room temperature. If the product is placed in a box indicating with a question mark (?) that it may require temperature control for safety, an analysis may be performed to assess the microbial risk of holding the product at ambient temperature. The evaluator may also decide not to perform the analysis, in which case the time and temperature of the product should be controlled for safety.

Product assessment. A comprehensive description of the product is the first task in this product assessment. This entails a detailed description of such factors as (1) potential pathogens, (2) intrinsic factors (for example, preservatives, antimicrobials, humectants, acidulants, and nutrients), (3) extrinsic factors (for example, packaging, atmosphere (MAP), use/shelf life, and temperature range of storage and use), (4) effectiveness of the processing for control of pathogens, and (5) possible post-process recontamination opportunities that may be present. If any of the factors precludes the growth of pathogens (for example, acetic acid as an acidulant at a reasonably low pH), the product may be designated non-TCS. Historical information regarding product safety should be considered by determining whether the food in question, or

any of its ingredients, has been previously implicated as a common vehicle of foodborne disease after temperature abuse. Of particular importance are the microbiological agents that are responsible for illnesses associated with the food and the reported contributing factors that have led to documented illnesses. Has adequate temperature control been clearly documented as a factor that can prevent or reduce the risk of illness associated with the food? Lastly, product history alone should not be used as the sole factor in determining whether or not a food needs time/temperature control for safety, unless a scientific basis for such safe use could be rationalized. As intrinsic or extrinsic factors change (for example, MAP or greatly extended shelf life), historical evidence alone is not appropriate in determining potential risk. Therefore, for a product to be identified as non-TCS based on history, the intrinsic and extrinsic factors affecting microbial growth need to have remained constant, and a scientific rationale needs to have been provided for the product's safe use (see also Chapter 3, section 4.2.).

Microbial growth models and challenge studies. In addition to the usual considerations, time of expected storage and display might also play a significant role in determining the classification of the food. Foods that have combinations of pH, a_w, preservatives, or other factors that are restrictive (but not prohibitive) to microbial growth and/or toxin production may not require refrigeration to protect public health. For example, if the duration of storage and/or display is less than that needed for microbial growth and/or toxin production, adequate control may be achieved through a variety of time and temperature combinations. Under certain circumstances, time alone at ambient temperatures can be used to control product safety. These factors can be considered in light of the product assessment and the microbial hazards of concern. The following is an example of how storage or holding time alone at ambient temperatures could be used to control product safety. If the microbiological concern for a specific food is the growth of *S. aureus*, the USDA Pathogen Modeling Program v. 5.1 could be used to estimate the time of storage where pathogen growth could occur. Using Table 8-1 with data generated from the model, a product with an $a_w = 0.88$ and pH = 5.5 could be safely stored at ambient temperature for weeks, assuming *S. aureus* would be the only microbial concern.

Table 8-1—Time estimates required for 3-log growth of *Staphylococcus aureus* at various pH and water activities (a_w) based on the USDA Pathogen Modeling Program v. 5.1

	PH			
a_w	6.0	5.5	5.0	4.6
0.94	Hours	Hours	Hours	Hours
0.92	Hours	Hours	Days	Days
0.90	Hours	Days	Days	Weeks
0.88	Days	Weeks	Months	Months
0.86	Weeks	Months	Months	Months

Days = 2–13 days
Weeks = 13–60 days
Months = > 60 days

It must be emphasized, however, that general growth models such as the USDA Pathogen Modeling Program must be restricted in use because of limitations of the model parameters, microorganisms of concern, or other factors. Consequently, unless used conservatively, it is often more appropriate to use them in combination with challenge testing. Nevertheless, a general model can assist, for example, in selecting pathogens of concern for a challenge test. In the absence of an appropriate model, a challenge test alone could be used to determine whether pathogens of concern could grow under specified storage conditions (see Chapter 6 for guidelines on challenge testing). On the other hand, if an in-house model has been developed and validated for a particular food, it could be used to make such an assessment by itself or with challenge testing. At this point, a final decision needs to be made about the product's need to be time/temperature controlled. If the hazard analysis indicates that the product should be designated as non-TCS, the product can be stored at room temperature. If, on the contrary, the product is identified as TCS, the evaluator can either decide to modify the product, change the processing and handling it undergoes, control pathogen growth with time/temperature, or revisit the commercial feasibility of the product.

(See "2. Framework for determining if time/temperature control is required for safety" on next page)

2. Framework for determining if time/temperature conrol is required for safety

The food in question may already be held hot or cold for safety reasons. In this case, and if there is no desire for ambient temperature storage, an analysis using this framework is not needed. If the need to control the temperature of the product for safety reasons is unknown, a review of the food, its ingredients, and general methods of preparation should precede the evaluation of the food. If the food, as described, has a substantial and extensive history of safe use without time/temperature control, and there is enough scientific rationale that supports such safe history of use, then the food may continue to be classified as not requiring temperature control for safety, or non-TCS (see also Chapter 3, section 4.2.).

If there is no known history of safe use, proceed with Step 1.

Step 1—Was the food treated to destroy vegetative cells of potential pathogens and packaged to avoid recontamination? If yes, position your product in Table A according to its pH and water activity (a_w). If not, position your product in Table B according to its pH and a_w.

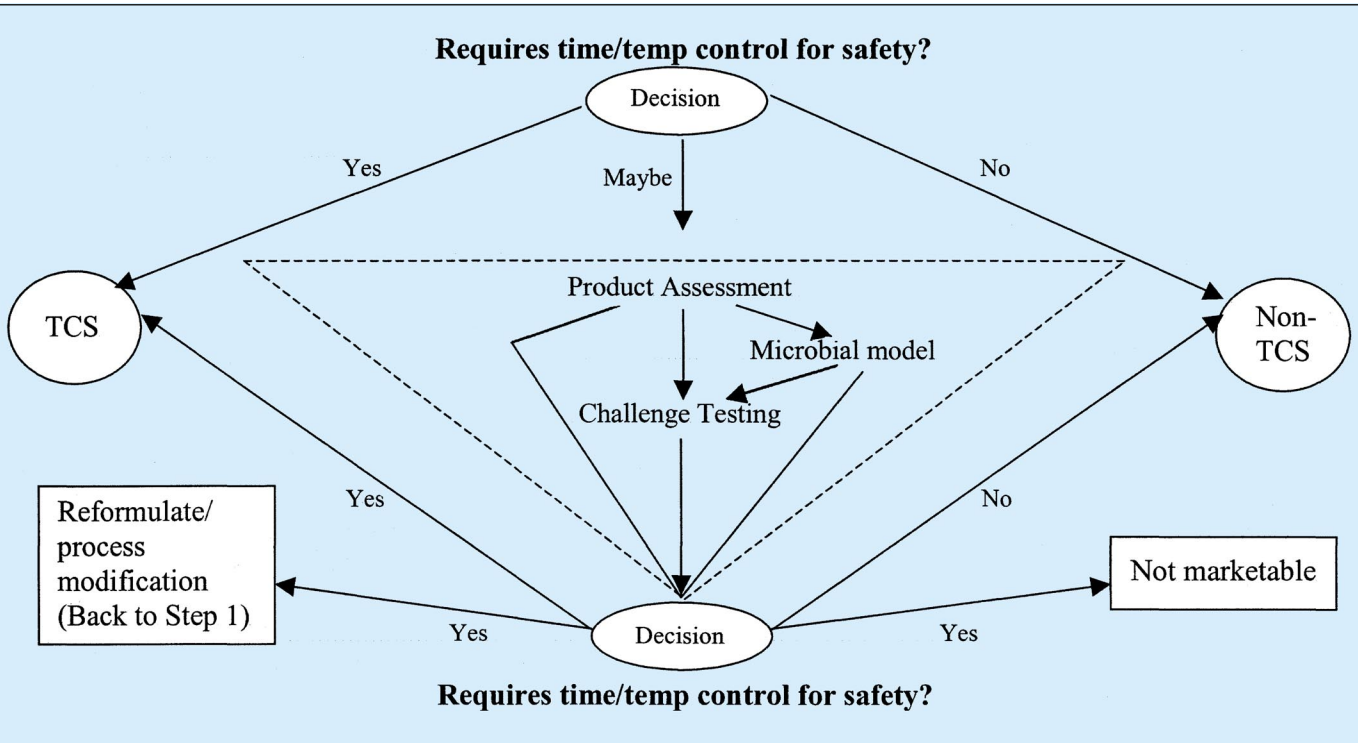
Table A—Control of spores: Product treated to control vegetative cells and protected from recontamination.

Critical a_w values	Critical pH values		
	4.6 or less	> 4.6 to 5.6	> 5.6
0.92 or less	Non-TCS	Non-TCS	Non-TCS
> 0.92 to .95	Non-TCS	Non-TCS	?
> 0.95	Non-TCS	?	?

Table B—Control of vegetative cells and spores: Product not treated or treated but not protected from recontamination

Critical a_w values	Critical pH values			
	< 4.2	4.2 to 4.6	> 4.6 to 5.0	> 5.0
< 0.88	Non-TCS	Non-TCS	Non-TCS	Non-TCS
0.88 to 0.90	Non-TCS	Non-TCS	Non-TCS	?
> 0.90 to .92	Non-TCS	Non-TCS	?	?
> 0.92	Non-TCS	?	?	?

Step 2—If the food is classified as a non-TCS food according to Step 1 above, it may be stored and held safely without regard to time or temperature. If the need for time/temperature control is questionable, the food should be held either hot or cold for safety, or subjected to a product assessment as the next step in determining the appropriate classification.



3. Critique of framework. Application of framework to foods.

The panel's framework on time/temperature control of foods for safety was applied to the following foods as examples. Each step of the framework has been described as it applies to the food under consideration. Most of the data presented were from industry studies submitted to the panel in response to a survey of industry practices to determine whether a food needs time/temperature control (see Appendix B).

3.1. Salad dressings

Product: Viscous, non-particulate[1] pourable salad dressing.

The product is not held hot or cold. The ingredients of the product are eggs, soybean oil, buttermilk, tomato paste, onion, garlic, spices, lemon juice, vinegar (2.5 – 5.4% salt), and potassium sorbate. Microbial hazards: *Clostridium botulinum*. The product is intended to be distributed and stored at ambient temperature for 7 to 9 mo. New product, so there is no history of use.

Step 1. Processing: Cold blended and filled in plastic or glass bottle. No heat applied.

Go to Table B.

Table: pH maximum of 4.2 and "high" (not specified) a_w.

Step 2. Decision: Product may be a temperature controlled for safety (TCS) food.

Product Assessment: Salad dressing is acidified with acetic acid. No microbiological hazard at pH 4.2.

Decision: Product is a Non-TCS.

[1]If salad dressing had particulate matter, then this product would need to be reevaluated.

3.2. Condiments: Mustard

Product: Viscous, non-particulate[1] mustard.

The product is not held hot or cold. The ingredients of the product are mustard seeds and vinegar (acetic acid). The product is intended to be distributed and stored at ambient temperature for extended shelf life. Microbial hazards: *Listeria monocytogenes, Salmonella* spp.*, Escherichia coli* O157:H7, *C. botulinum.* There is history of safe use without time/temperature control[2].

Step 1. Processing: Ground and blended. Go to Table B.

Table: pH maximum of 4.0 and "high" (not specified) a_w.

Decision: Product is a Non-TCS.

[1] If mustard had particulate matter, then this product needs to be reevaluated.

[2] If pH of mustard was above 4.2 or if acidulant was not acetic acid, then this product would need to be reevaluated.

3.3. Butter

Example 1

Product: Salted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution product is held at low temperatures for quality reasons. The ingredients of the product are cream and salt. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There is no history of safety problems when the consumer does not control time/temperature of commercial salted butter.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 5.41 and a_w 0.897.

Step 2. Decision: Product may be a TCS food.

Product Assessment: Product characteristics prevent *L. monocytogenes* growth. Predictive model (p 8-3) suggests that holding the product for hours at ambient temperature is safe.

Decision: Challenge testing, predictive microbial model, reformulation to decrease a_w, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or product is not marketable.

Example 2

Product: Salted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution product is held at low temperatures for quality reasons. The ingredients of the product are cream and salt. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There is no history of safety problems when the consumer does not control time/temperature of commercial salted butter.

Step 1. Processing: Pasteurization of cream. Acidified by fermentation. No heat applied after butter is churned. Go to Table B.

Table: pH 4.25 and a_w 0.897.

Step 2. Decision: Product is a Non-TCS food.

Example 3

Product: Salted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution product is held at low temperatures for quality reasons. The ingredients of the product are cream and salt. The product is intended to be stored at ambient temperature. Microbiological hazard: *S. aureus, L. monocytogenes*. There is no history of safety problems when the consumer does not control time/temperature of commercial salted butter.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 5.94 and a_w 0.847.

Step 2. Decision: Product is a Non-TCS food.

Example 4

Product: Salted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution product is held at low temperatures for quality reasons. The ingredients of the product are cream, lactic acid bacteria, and salt. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There is no history of safety problems when the consumer does not control time/temperature of commercial salted butter.

Step 1. Processing: Pasteurization of cream. Acidified by fermentation. No heat applied after butter is churned. Go to Table B.

Table: pH 4.78 and a_w 0.863.

Step 2. Decision: Product is a Non-TCS.

Example 5

Product: Unsalted whipped butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution, the product is held at low temperatures for quality reasons. The ingredients of the product are cream and acidified natural flavoring. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There has been a report of unsafe handling of a whipped butter product.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 4.91 and a_w 0.921.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision: Challenge testing, predictive microbial model, reformulation to decrease a_w, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or product is not marketable.

Example 6

Product: Unsalted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution , the product is held at low temperatures for quality

reasons. The ingredients of the product are cream and natural flavoring. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There is no history of unsafe use without time/temperature control.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 5.98 and a_w 0.941.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision: Challenge testing, predictive microbial model, reformulation to decrease a_w, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or product is not marketable.

Example 7

Product: Unsalted butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution , the product is held at low temperatures for quality reasons. The ingredients of the product are cream and natural flavoring. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There is no history of unsafe use without time/temperature control.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned. Go to Table B.

Table: pH 5.42 and a_w 0.907.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision: Challenge testing, predictive microbial model, reformulation to decrease a_w, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or product is not marketable.

Example 8

Product: Salted light whipped butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution, the product is held at low temperatures for quality reasons. The ingredients of the product are cream, salt, water, tapioca, modified food starch, beta carotene, vitamin A, natural flavoring, lactic acid, vegetable mono and diglycerides, potasium sorbate, sodium benzoate. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There has been a report of unsafe handling of a whipped butter product.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 4.48 and a_w 0.985.

Step 2. Product may be a TCS food.

Product Assessment: Sodium benzoate and potassium sorbate may prevent pathogen growth.

Decision: Challenge testing, predictive microbial model, reformulation to decrease a_w, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or product is not marketable.

Example 9

Product: Salted whipped butter. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution, the product is held at low temperatures for quality reasons. The ingredients of the product are cream and acidified natural flavoring. The product is intended to be stored at ambient temperature. Microbiological hazards: *S. aureus, L. monocytogenes*. There has been a report of unsafe handling of a whipped butter product.

Step 1. Processing: Pasteurization of cream. No heat applied after butter is churned.

Go to Table B.

Table: pH 4.14 and a_w 0.822.

Step 2. Decision: Product is a Non-TCS food.

3.4. Margarine

Product: Margarine. The product is not held hot or cold for safety. However, during commercial handling, storage, and distribution, the product is held at low temperatures for quality reasons. The ingredients of the product are soybean oil (80%), water and milk protein (19%), salt (0.9%), and potassium sorbate (.1%). The product is intended to be distributed and stored at ambient temperature for 3 mo. Microbiological hazards: *S. aureus, L. monocytogenes*. There is history of safe use without time/temperature control.

Step 1. Processing: Emulsification of oil blend/water preservative mixture. No heat applied. Go to Table B.

Table: pH 4.8 and a_w unknown.

Step 2. Product may be a TCS food.

Product Assessment: Sorbic acid in formulation prevents pathogen growth. Historically product is safe and stable.

Decision: Product is a Non-TCS.

3.5. Garlic-in-oil[1]

Product: Garlic-in-oil. The product is not held hot or cold. The ingredients of the product are chopped fresh garlic and oil. The product is intended to be distributed and stored at ambient temperature for extended shelf life. Outbreaks have been associated with *C. botulinum* toxin in garlic-in-oil. Microbiological hazards: *C. botulinum* toxin production.

Step 1. Processing: Oil poured into chopped garlic in a bottle. Although no heat is applied, vegetative pathogens are not associated with this food. Go to Table A.

Table: pH > 4.6 and high a_w (not specified).

Step 2. Decision: Product may be a TCS food.

Product Assessment: No identified product characteristic that prevents spore-forming pathogen growth. Antimicrobial properties of garlic will prevent the growth of vegetative pathogens.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic or phosphoric acid to < 4.6, refrigerate (TCS food), store hot (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

[1]Flavored oil will present negligible hazard due to lack of *C. botulinum* survival or growth in 100% oil.

3.6. Cheeses

Example 1

Product: Cream cheese. The product is not held hot or cold during use. The ingredients of the product are milk, cream, salt, gums. The product is intended to be distributed and stored

at ≤ 7 °C (45 °F) for a maximum of 120 d. When in use, the tempered unopened product can be kept up to 48 h at ambient temperature. There is no history of botulism associated with cream-cheese products. Microbiological hazard: *C. botulinum.*

Step 1. Processing: Full fat, plain cream cheese, bulk packed and hot-filled > 68 °C (155 °F) in 3 lb/30 lb/ 50 lb tubs/blocks. Ready-to-eat after opening or baked. Go to Table A

Table: pH 4.7 to 5.1, $a_w > 0.97$.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic acid or phosphoric acid to < 4.6, keep refrigerated—that is, eliminate tempering at ambient (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: Separate products were inoculated with 100 – 500 spores/g of either proteolytic A & B or non-proteolytic B cocktails of *C. botulinum* and held at 30 °C (86 °F) for 10 d. No toxin was detected throughout the study. Conclusion is that the unopened product can be stored safely at ambient temperature for up to 7 d based on a safety factor of 1.3 times shelf life of the product. However, loss of product quality dictates storage at ambient temperature for no longer than 48 h. Without additional challenge studies on vegetative pathogens, opened product requires time/temperature control.

Example 2

Product: Process cheese sauce packed in 40 lb bag-in-box containers. The product is not held hot or cold during use. The ingredients of the product are cheddar cheese, milk, whey, milk fat, water, salt, sodium phosphate, sorbic acid, artificial color. The product is intended to be distributed and stored at ≤ 7 °C (45 °F) for a maximum of 9 mo. The tempered unopened product can be kept 24 h at ambient temperature in foodservice establishments prior to use. New product, so there is no history of use. Microbiological hazards: C*. botulinum.*

Step 1. Processing: Heated to 85 °C (185 °F) for 1 to 2 min and hot-filled at 68 to 69 °C (155 to 165 °F) into bag-in-box containers. Ready-to-eat or heated prior to consumption. Go to Table A.

Table: pH 5.7 (target) and $a_w > 0.95$.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No apparent product characteristic that prevents spore outgrowth. Possibly certain ingredients such as sodium phosphate and sorbic acid may inhibit pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic, lactic or phosphoric acid, refrigerate (that is, eliminate tempering at ambient temperature [TCS food]), or store at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Run formulation through a validated microbial model.

Predictive microbial modeling: Microbial model showed that the product would support the growth and toxigenesis of *C. botulinum.* A decision was made to reformulate by optimizing the controlling factors and their interactions. In this case, sorbic acid levels were adjusted from 0.08 % to 0.15 %. The reformulated product was run through the microbial model which gave a prediction of safety. Conclusion is that the reformulated unopened product may be tempered at room temperature for 24 h maximum. Without additional challenge studies on vegetative pathogens, opened product requires time/temperature control.

Example 3

Product: Pasteurized process cheese slices, bulk packaged. The product is not held hot or cold during use. The ingredients of the product are milk, whey, cheese, milk fat, water, salt, sodium citrate, sorbic acid, artificial color. The product is intended to be distributed and stored at ≤ 7 °C (45 °F) for a maximum of 8 mo. The tempered 96-slice pack can be kept for an 8 h shift at ambient temperature prior to use near to the grill in foodservice establishments to facilitate peeling of slices and melting on sandwiches. No history of pathogenic growth associated with commercial pasteurized process cheese slices. Product is subject to recontamination after opening. Microbial hazards: *L. monocytogenes, S. aureus, Salmonella* spp*., E. coli* O157:H7, *C. botulinum* (product does not receive a proteolytic botulinal cook).

Step 1. Processing: Heated to ≥ 66 °C (150 °F) for ≥ 30 s and cooled over a chill roll. Slices are then bulk packed in units of 96 slices. Ready-to-eat directly out of package or used in melt applications. Go to Table B.

Table: pH 5.7 to 5.8 and $a_w > 0.92$.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No apparent product characteristic that prevents spore outgrowth. Possibly sorbic acid may inhibit pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic, lactic, or phosphoric acid, refrigerate (that is, eliminate tempering at ambient temperature [TCS food]), or store at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: Product was inoculated with 10^3 CFU/g *L. monocytogenes, S. aureus, E. coli* O157:H7, *Salmonella* spp*.,* and *C. botulinum* (proteolytic strains only). Cocktails of each challenge organism were inoculated into separate samples. Inoculated product was incubated at 30°C (86°F) for 96 h. Results showed that *Salmonella* spp*, E. coli* O157:H7, and *L. monocytogenes* decreased in populations over the challenge period. *Staphylococcus aureus* levels remained constant during the challenge period, but were below levels that supported detectable enterotoxin production. No botulinal toxin was detected over the challenge period. From a safety perspective the opened product could be stored for 67 h at room temperature, based on a safety factor of 1.3 times shelf life of the product. Loss of product quality dictates that slices be tempered for no longer than 8 h.

Example 4

Product: Cheese blend for pizza topping. The product is not held hot or cold during use. The ingredients of the product are cheese, sodium chloride 1.81%, nitrite level < 1ppm. The product is intended to be stored at ambient temperature for a maximum of 10 h before being baked. This is a new intended use, so there is no history of safe use. The microbiological hazards are the heat-stable toxins of *S. aureus* and *B. cereus.*

Step 1. Processing: Baked, but heat-stable toxins may remain. Go to Table B.

Table: pH 5.56 and a_w 0.978.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic, lactic, or phosphoric acid, refrigerate (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: 1,000 CFU/g of product inoculated with *S. aureus* and *B. cereus* and incubated at 27 °C (80 °F) for various lengths of time: No toxin was detected at 10 h. Product can be stored safely at room temperature for 7 h, based on a safety factor of 1.3 shelf life of the product.

Example 5

Description: Cheese-filled bread. The product is not held hot or cold during use. The ingredients of the product are process cheese, pastry covering, salt, glycerol. The product is intended to be distributed and stored at 4.4 to 7.3 °C (40 to 45 °F) for a maximum of 90 d, and then stored at ambient temperature for sale. New product, so there is no history of use. Microbiological hazard: *Bacillus cereus* and *Clostridium botulinum* toxin production.

Step 1. Processing: Baked to internal temperature of 88 °C (190 °F) and MAP packed with 100% N_2. Go to Table B.

Table: pH 5.6 to 5.7 and a_w 0.93.

Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic acid or phosphoric acid, refrigerate (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: Separated inocula of 500 spores of *C. botulinum* and 500 spores of *B. cereus* incubated at 13, 18.5, 30 °C (55, 65, 86 °F) for various lengths of time. No toxin production or *B. cereus* growth at 30°C (86 °F) for 14 d. Product can be stored safely at room temperature for at least 10 d, based on a safety factor of 1.3 times shelf life of the product.

Example 6

Product : Monterey cheese slices. The product is not held hot or cold during use. The ingredients of the product are Monterey Jack cheese, milk fat, water, citrate and phosphate emulsifiers, salt (1.9 to 2.5%), sorbic acid (2000 ppm max), color. The product is intended to be distributed and stored refrigerated for 180 to 210 d, but used at room temperature in food service. New product, so there is no history of use. Microbiological hazards: *L. monocytogenes, S. aureus, Salmonella* spp.*, E. coli* O157:H7.

Step 1. Processing: 71 °C (160 °F) for 30 s, hot filled, and sliced, but recontamination is possible. Go to Table B.

Table: pH 5.7 to 6.0, and a_w 0.94 to 0.95.

Step 2. Decision: Product may be a TCS food.

Product Assessment: Sorbic acid as a preservative may prevent pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic acid or phosphoric acid, refrigerate (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: Inoculum with 1,000 CFU/g of *L. monocytogenes, S. aureus, Salmonella* spp.*, E. coli* O157:H7 incubated at 30 °C (86 °F) for various lengths of time: No growth of any pathogen tested at 24 h, no *S. aureus* toxin, *E. coli*, *L. monocytogenes* and *Salmonella* spp. were detected at 48 h. Although *E. coli*, *L. monocytogenes* and *Salmonella* spp. levels remain the same up to 72 h, *S. aureus* toxin was detected at 72 h. Product can be stored safely at room temperature for no more than 33 h, based on a safety factor of 1.3 times shelf life of the product.

3.7. Filled bakery product

Product: Cream-filled éclairs. The product is not held hot or cold during use. The ingredients of the product are pastry shell (water, eggs, flour, hydrogenated vegetable oil, baking powder, sodium acid pyrophosphate, baking soda, corn starch, monocalcium phosphate, salt, malted barley); filling (water, sugar, modified corn starch, dextrose, vegetable oil, cottonseed, mono and diglycerides, salt, carrageenan, glucono delta lactone, sodium benzoate and potassium sorbate (0.02%), polysorbate 60, soy lecithin, natural and artificial flavors colored w/Yellow). The product is intended to be distributed at = 0 °C (32 °F) or refrigerated for a maximum of 180 d or 3 d, respectively, and stored at room temperature for a maximum of 4 h. This is a new product, so there is no history of use. Microbiological hazards: *L. monocytogenes, S. aureus, Salmonella* spp.

Step 1. Processing: Filling 88 °C (190 °F), cooled to 5 °C (41 °F) in 4 h; shell > 93 °C (200 °F), cooled to ambient but recontamination is possible. Go to Table B.

Table: pH 7.2 (shell), 5.1 to 5.8 (filling), a_w 0.87 (shell), 0.96 to 0.98 (filling).

Step 2. Decision: Product may be a TCS food.

Product Assessment: Benzoate, sorbate, and glucono delta lactone as preservatives may prevent pathogen growth.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic acid or phosphoric acid, refrigerate (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

Decision: Challenge test.

Microbial Challenge Testing: Filling inoculated (and placed in shell) with 100 to 1,000 CFU/g with *L. monocytogenes, S. aureus, Salmonella* spp. incubated at 7, 12 and 26 °C (44.6, 53.6 and 78.8 °F) for various lengths of time. There was pathogen growth at 1 d. Product as processed and formulated cannot be stored safely at room temperature.

3.8. Breads

Example 1

Product: Pepper focaccia. The product is not held hot or cold during use. The ingredients of the product are bread, roasted sliced red peppers, oil, Romano cheese, garlic powder, oregano. This is a new product, so there is no history of use. The microbiological hazards are: *S. aureus, Salmonella* spp, and *C. botulinum*.

Step 1. Processing: Baked, but recontamination is possible. Go to Table B.

Table: pH (pepper and bread) 3.9 to 4.1[1] and a_w 0.99.

Step 2. Decision: Product is a non-TCS food.

[1]If only the bread or the peppers have low pH, then a challenge study should be performed.

Example 2

Product: Plain focaccia. The product is not held hot or cold during use. The ingredients of the product are bread, oil, Romano cheese, garlic powder, oregano. This is a new product, so there is no history of use. The microbiological hazards are: *S. aureus, Salmonella* spp.

Step 1. Processing: Baked, but recontamination is possible. Go to Table B.

Table: pH 5.5 to 5.3, and a_w 0.95 to 0.97.

Step 2. Decision: Product may be a TCS food.

Product Assessment: No product characteristic that prevents pathogen growth. Although product has properties similar to white bread, with a long history of safe use, some ingredients would not be in the formulation of white bread; therefore, the product may be a TCS food and should be further analyzed.

Decision options: Challenge testing, predictive microbial model, reformulation to lower pH with acetic acid or phosphoric acid, refrigerate (TCS food), or at ambient temperature for a limited time less than the estimated lag phase for the pathogens of concern, or not marketable.

FDA U.S. FOOD & DRUG ADMINISTRATION
CENTER FOR FOOD SAFETY & APPLIED NUTRITION

Reference Document: 2013 FDA Food Code

Provision: 1-201.10

Document Name: Heat sealing without a vacuum v03

Date: January 4, 2017, Editorial change September 12, 2017, December 20, 2019

Question: When packaging food in a retail food establishment, does the 2013 Food Code definition of reduced oxygen packaging apply to the use of plastic bags or plastic films that have been heat sealed without drawing a vacuum?

Response:

No. The process of heat sealing a time temperature control for safety (TCS) food in packaging (a plastic bag or a plastic film on trays) without drawing a vacuum or otherwise modifying the atmosphere inside the package would not meet the 2013 Food Code definition of reduced oxygen packaging (ROP), provided the food being packaged has NOT been heated, just prior to packaging.

The 2013 FDA Food Code defines "Reduced Oxygen Packaging" (ROP) as:

- "The reduction of the amount of oxygen in a package by removing oxygen; displacing oxygen and replacing it with another gas or combination of gases; or otherwise controlling the oxygen content to a level below that normally found in the atmosphere (approximately 21% at sea level); and . . . .."

A reduced oxygen environment occurs in a package when less oxygen is present in the package relative to the amount of oxygen expected to be present in the atmosphere (typically 21% at sea level). The Food Code definition of reduced oxygen packaging is limited to the intentional or purposeful methods used by food establishments to create a reduced oxygen environment within a packaged TCS food product at the time of packaging.

The packaging and sealing, without drawing a vacuum, of a TCS food that has not been heated, just prior to packaging, is not considered to be removing oxygen to the degree that you are: 1) reducing the amount of oxygen in a package at the time of packaging, or 2) using an intentional or purposeful method to create a reduced oxygen environment within a packaged TCS food product at the time of packaging.

The information on this page is part of the Food and Drug Administration's (FDA's) Food Code Reference System (FCRS), a database which is available at https://accessdata.fda.gov/scripts/fcrs/. Any reference to a commercial product, process, service, or company is not an endorsement or recommendation by the U.S. government, the Department of Health and Human Services, FDA or any of its components. FDA is not responsible for the content of the individual organization Web pages found at these links. FDA is also not responsible for any subsequent changes to the Web addresses for these links after December 20, 2019.

Heat sealing a hot TCS food (which includes TCS foods cooked as specified in relevant Sections of Part 3-401 of the Food Code and TCS foods heated to hot holding temperatures) without modifying the atmosphere or drawing a vacuum raises a concern of *C. botulinum* growth in the packaged TCS food. This is because the process of cooking food drives off oxygen from the food thereby lowering the oxygen level in that food. After the bag is sealed, the oxygen level in the headspace and the oxygen level in the hot TCS food will begin to equilibrate. This results in a package with an oxygen level below what is normally found in the atmosphere, thereby creating a process that aligns with the Food Code definition of ROP.

The model Food Code is neither federal law nor federal regulation and is not preemptive. It represents FDA's best advice for a uniform system of regulation to ensure that food at retail is safe and properly protected and presented. The model Food Code provisions are designed to be consistent with federal food laws and regulations and are written for ease of legal adoption at all levels of government.

OFFICE OF FOOD SAFETY

CHAPTER 13: **Clostridium botulinum Toxin Formation**

This guidance represents the Food and Drug Administration's (FDA's) current thinking on this topic. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. You can use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations. If you want to discuss an alternative approach, contact the FDA staff responsible for implementing this guidance. If you cannot identify the appropriate FDA staff, call the telephone number listed on the title page of this guidance.

UNDERSTAND THE POTENTIAL HAZARD.

Clostridium botulinum (*C. botulinum*) toxin formation can result in consumer illness and death. It is the toxin responsible for botulism. About 10 outbreaks of foodborne botulism occur annually in the United States, from all sources. Symptoms include: weakness, vertigo, double vision, difficulty in speaking, swallowing and breathing, abdominal swelling, constipation, paralysis, and death. Symptoms start from 18 hours to 36 hours after consumption. Everyone is susceptible to intoxication by *C. botulinum* toxin; only a few micrograms of the toxin can cause illness in a healthy adult. Mortality is high; without the antitoxin and respiratory support, death is likely.

This chapter covers the hazard of *C. botulinum* growth and toxin formation as a result of time and temperature abuse during processing, storage, and distribution.

- **Strategies for controlling pathogen growth**

There are a number of strategies for the control of pathogens in fish and fishery products. They include:

- Controlling the level of acidity (pH) in the product (covered by the Acidified Foods regulation, 21 CFR 114, for shelf-stable acidified products, and by this chapter for refrigerated acidified products);
- Controlling the amount of salt or preservatives, such as sodium nitrite, in the product (covered in this chapter);
- Controlling the amount of moisture that is available for pathogenic bacteria growth (water activity) in the product by formulation (covered in this chapter);
- Controlling the amount of moisture that is available for pathogenic bacteria growth (water activity) in the product by drying (covered in Chapter 14);
- Controlling the introduction of pathogenic bacteria after the pasteurization process and after the cooking process performed immediately before reduced oxygen packaging (covered in Chapter 18);
- Controlling the source of molluscan shellfish and the time from exposure to air (e.g., by harvest or receding tide) to refrigeration to control pathogens from the harvest area (covered in Chapter 4);
- Managing the amount of time that food is exposed to temperatures that are favorable for pathogenic bacteria growth and toxin production (covered generally in Chapter 12; for *C. botulinum*, in this chapter; and for *Staphylococcus aureus (S. aureus)* in hydrated batter mixes, in Chapter 15);
- Killing pathogenic bacteria by cooking or pasteurization (covered in Chapter 16), or retorting (covered by the Thermally Processed Low-Acid Foods Packaged in Hermetically Sealed Containers regulation, 21 CFR 113 (hereinafter, the Low-Acid Canned Foods (LACF) Regulation));
- Killing pathogenic bacteria by processes that retain the raw product characteristics (covered in Chapter 17).

- **Formation of *C. botulinum* toxin**

When *C. botulinum* grows, it can produce a potent toxin, one of the most poisonous naturally occurring substances known. The toxin can be destroyed by heat (e.g., boiling for 10 minutes), but, because of its potency, you should not rely on this as a means of control.

The strains of *C. botulinum* can be divided into two groups, the proteolytic group (i.e., those that break down proteins) and the non-proteolytic group (i.e., those that do not break down proteins). The proteolytic group includes *C. botulinum* type A and some of types B and F. The non-proteolytic group includes *C. botulinum* type E and some of types B and F.

The vegetative cells of all types of *C. botulinum* are easily killed by heat. However, *C. botulinum* is able to produce spores. In this state, the pathogen is very resistant to heat. The spores of the proteolytic group are much more resistant to heat than are those of the non-proteolytic group (i.e., they require a canning process to be destroyed). Table A-4 (Appendix 4) provides guidance about the conditions under which the spores of the most heat-resistant form of non-proteolytic *C. botulinum*, type B, are killed. However, there are some indications that substances that may be naturally present in some products (e.g., dungeness crabmeat), such as lysozyme, may enable non-proteolytic *C. botulinum* to more easily recover after heat damage, resulting in the need for a considerably more stringent process to ensure destruction.

C. botulinum is able to produce toxin when a product in which it is present is exposed to temperatures favorable for growth for sufficient time. Table A-1 (Appendix 4) provides guidance about the conditions under which *C. botulinum* and other pathogenic bacteria are able to grow. Table A-2 (Appendix 4) provides guidance about the time necessary at various temperatures for toxin formation to occur.

Packaging conditions that reduce the amount of oxygen present in the package (e.g., vacuum packaging and modified atmosphere packaging) extend the shelf life of a product by inhibiting the growth of aerobic spoilage bacteria. There is a safety concern with these products because there is an increased potential for the formation of *C. botulinum* toxin before spoilage makes the product unacceptable to consumers.

C. botulinum forms toxin more rapidly at higher temperatures than at lower temperatures. The minimum temperature for growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F is 38°F (3.3°C). For type A and proteolytic types B and F, the minimum temperature for growth is 50°F (10°C). As the shelf life of refrigerated foods is increased, more time is available for *C. botulinum* growth and toxin formation. As storage temperatures increase, the time required for toxin formation is significantly shortened. You should expect that at some point during storage, distribution, display, or consumer handling of refrigerated foods, safe refrigeration temperatures will not be maintained (especially for the non-proteolytic group). Surveys of retail display cases indicate that temperatures of 45 to 50°F (7 to 10°C) are not uncommon. Surveys of home refrigerators indicate that temperatures can exceed 50°F (10°C).

In reduced oxygen packaged products in which the spores of non-proteolytic *C. botulinum* are inhibited or destroyed (e.g., smoked fish, pasteurized crabmeat, and pasteurized surimi), a normal refrigeration temperature of 40°F (4.4°C) is appropriate because it will limit the growth of proteolytic *C. botulinum* and other pathogens that may be present. Even in pasteurized products where non-proteolytic *C. botulinum* is the target organism for the pasteurization process, and vegetative pathogens, such as *Listeria monocytogenes*, are not likely to be present (e.g., pasteurized crabmeat and pasteurized surimi), a storage temperature of 40°F (4.4°C) is still appropriate because of the potential for survival through the pasteurization process and recovery of spores of non-proteolytic *C. botulinum*, aided by naturally occurring

substances, such as lysozyme. In this case, refrigeration serves as a prudent second barrier.

However, in reduced oxygen packaged products in which refrigeration is the sole barrier to outgrowth of non-proteolytic *C. botulinum* and the spores have not been destroyed (e.g., vacuum-packaged refrigerated raw fish, vacuum-packaged refrigerated unpasteurized crayfish meat, and reduced oxygen packaged unpasteurized dungeness crabmeat), the temperature should be maintained below 38°F (3.3°C) from packing to consumption. Ordinarily you, as a processor, can ensure that temperatures are maintained below 38°F (3.3°C) while the product is in your control. However, the current U.S. food distribution system does not ensure the maintenance of these temperatures after the product leaves your control.

The use of a Time-Temperature Indicator (TTI) on each consumer package may be an appropriate means of overcoming these problems in the distribution system for reduced oxygen packaged products in which refrigeration is the sole barrier to outgrowth of non-proteolytic *C. botulinum* and in which the spores have not been destroyed. A TTI is a device that monitors the time and temperature of exposure of the package and alerts the consumer or end user if a safe exposure limit has been exceeded. If a TTI is used, it should be validated to ensure that it is fit for its intended purpose and verified that it is functional at the time of use. It should be designed to alert the consumer (e.g., a color change) that an unsafe time and temperature exposure has occurred that may result in *C. botulinum* toxin formation. Additionally, the alert should remain perpetually visible after it has been triggered, regardless of environmental conditions that could reasonably be expected to occur thereafter. Skinner, G. E., and J. W. Larkin in "Conservative prediction of time to *Clostridium botulinum* toxin formation for use with time-temperature indicators to ensure the safety of foods," Journal of Food Protection, 61:1154-1160 (1998), describe a safe time and temperature exposure curve ("Skinner-Larkin curve") that may be useful in evaluating the suitability of a TTI for control of *C. botulinum* toxin formation in reduced oxygen packaged fish and fishery products.

Alternatively, products of this type may be safely marketed frozen, with appropriate labeling to ensure that it is held frozen throughout distribution. For some reduced oxygen packaged products, control of *C. botulinum* can be achieved by breaking the vacuum seal before the product leaves the processor's control.

The guidance in this chapter emphasizes preventive measures for the control of non-proteolytic strains of *C. botulinum* in products that are contained in reduced oxygen packaging. As was previously described, this emphasis is because such an environment extends the shelf life of a refrigerated product in a way that, under moderate temperature abuse, favors *C. botulinum* growth and toxin formation over aerobic spoilage. It is also possible for both non-proteolytic and proteolytic *C. botulinum* to grow and produce toxin in a product that is not reduced oxygen packaged and is subjected to severe temperature abuse. This is the case because of the development within the product of microenvironments that support its growth. However, this type of severe temperature abuse of refrigerated products is not reasonably likely to occur in the processing environment of most fish or fishery products and the Current Good Manufacturing Practice in Manufacturing, Packing, or Holding Human Food regulation, 21 CFR 110, requires refrigeration of foods that support the growth of pathogenic microorganisms.

- **Sources of *C. botulinum***

C. botulinum can enter the process on raw materials. The spores of *C. botulinum* are very common. They have been found in the gills and viscera of finfish, crabs, and shellfish. *C. botulinum* type E is the most common form found in freshwater and marine environments. Types A and B are generally found on land but may also be occasionally found in water. It should be assumed that *C. botulinum* will be present in any raw fishery product, particularly in the viscera.

Because spores are known to be present in the viscera, any product that will be preserved by salting, drying, pickling, or fermentation should be eviscerated prior to processing (see the "Compliance Policy Guide," Sec. 540.650). Without evisceration, toxin formation is possible during the process, even with strict control of temperature. Evisceration of fish is the careful and complete removal of all internal organs in the body cavity without puncturing or cutting them, including gonads. If even a portion of the viscera or its contents is left behind, the risk of toxin formation by *C. botulinum* remains. Uneviscerated small fish, less than 5 inches in length (e.g., anchovies and herring sprats), for which processing eliminates preformed toxin, prevents toxin formation during processing and that reach a water phase salt content of 10% in refrigerated finished products, or a water activity of below 0.85 in shelf-stable finished products, or a pH of 4.6 or less in shelf-stable finished products, are not subject to the evisceration recommendation.

Note: The water phase salt content of 10% is based on the control of *C. botulinum* type A and proteolytic types B and F.

Note: The water activity value of below 0.85 is based on the minimum water activity for toxin production of *S. aureus*.

- **Reduced oxygen packaging**

A number of conditions can result in the creation of a reduced oxygen environment in packaged fish and fishery products. They include:

- Vacuum, modified, or controlled atmosphere packaging. These packaging methods generally directly reduce the amount of oxygen in the package;
- Packaging in hermetically sealed containers (e.g., double-seamed cans, glass jars with sealed lids, and heat-sealed plastic containers), or packing in deep containers from which the air is expressed (e.g., caviar in large containers), or packing in oil. These and similar processing and packaging techniques prevent the entry of oxygen into the container. Any oxygen present at the time of packaging (including oxygen that may be added during modified atmosphere packaging) may be rapidly depleted by the activity of spoilage bacteria, resulting in the formation of a reduced oxygen environment.

Packaging that provides an oxygen transmission rate (in the final package) of at least 10,000 cc/m^2/24 hours at 24ºC can be regarded as an oxygen-permeable packaging material for fishery products. The oxygen transmission rate of packaging material is listed in the packaging specifications that can be obtained from the packaging manufacturer.

An oxygen-permeable package should provide sufficient exchange of oxygen to allow aerobic spoilage organisms to grow and spoil the product before toxin is produced under moderate abuse temperatures. Particular care should be taken in determining the safety of a packaging material for a product in which the spoilage organisms have been eliminated or significantly reduced by processes such as high pressure processing. The generally recommended 10,000 cc/m^2/24 hours at 24ºC transmission rate may not be suitable in this case.

Use of an oxygen-permeable package may not compensate for the restriction to oxygen exchange created by practices such as packing in oil or in deep containers from which the air is expressed or the use of oxygen scavengers in the packaging.

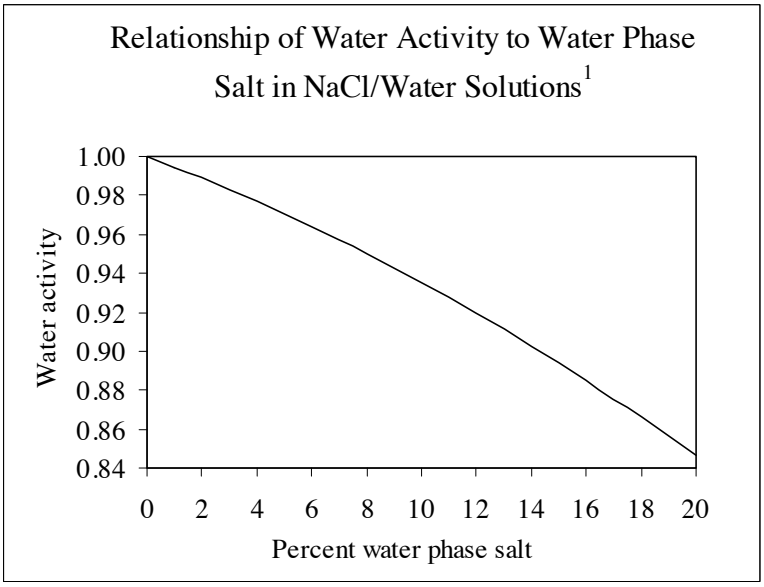
- **Control of *C. botulinum***

There are a number of strategies to prevent *C. botulinum* growth and toxin formation during processing, storage, and distribution of finished fish and fishery products. They include:

For products that do not require refrigeration (i.e., shelf-stable products):

- Heating the finished product in its final container sufficiently by retorting to destroy the spores of *C. botulinum* types A B, E, and F (e.g., canned fish). This strategy is covered by the LACF Regulation, 21 CFR 113, and these controls are not required to be included in your Hazard Analysis Critical Control Point (HACCP) plan;

- Controlling the level of acidity (pH) in the finished product to 4.6 or below, to prevent growth and toxin formation by *C. botulinum* types A, B, E, and F (e.g., shelf-stable acidified products). This strategy is covered by the Acidified Foods regulation, 21 CFR 114, and these controls are not required to be included in your HACCP plan;
- Controlling the amount of moisture that is available in the product (water activity) to 0.85 or below by drying, to prevent growth and toxin formation by *C. botulinum* types A, B, E, and F and other pathogens that may be present in the product (e.g., shelf-stable dried products). This strategy is covered by Chapter 14;
- Controlling the amount of salt in the product to 20% water phase salt (wps) or more, to prevent the growth of *C. botulinum* types A, B, E, and F and other pathogens that may be present in the product (e.g., shelf-stable salted products). This strategy is covered in this chapter. Water phase salt is the concentration of salt in the water-portion of the fish flesh and calculated as follows: (% NaCl X 100)/(% NaCl + % moisture) = % NaCl in water phase. The relationship between percent water phase salt and water activity in fish is described in the following graph.



1. This relationship is generally valid for fish products when salt (sodium chloride) is the primary means of binding water. The specific food matrix and the use of other salts or water binding agents could affect the exact relationship. If you intend to use this relationship in your control strategy, you should determine the exact relationship in your product by conducting a study.

For products that require refrigeration:

- Heating the finished product in its final container sufficiently by pasteurization to destroy the spores of *C. botulinum* type E and non-proteolytic types B and F, and then minimizing the risk of recontamination by controlling seam closures and cooling water, and next controlling the growth of the surviving *C. botulinum* type A and proteolytic types B and F in the finished product with refrigerated storage (e.g.. pasteurized crabmeat and some pasteurized surimi-based products). Pasteurization is covered in Chapter 16, controlling recontamination after pasteurization is covered in Chapter 18, and controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter;
- Heating the product sufficiently to destroy the spores of *C. botulinum* type E and non-proteolytic types B and F, and then minimizing the risk of recontamination by hot filling the product into the final container in a sanitary, continuous, closed filling system and controlling seam closures and cooling water, and next controlling the growth of the surviving *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in the finished product with refrigerated storage (e.g., vacuum packed soups, chowders, and sauces). Specialized cooking processes are covered in Chapter 16, prevention of recontamination after specialized cooking processes is covered in Chapter 18, controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12;
- Controlling the amount of moisture that is available in the product (water activity) to 0.97 or below to inhibit the growth of *C. botulinum* type E and non-proteolytic types B and F by drying, and then controlling the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in the finished product through refrigerated storage (e.g., refrigerated dried fish). Drying is covered in Chapter 14, controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12;
- Controlling the level of pH to 5 or below, salt to 5% wps or more, moisture (water activity) to 0.97 or below, or some combination of these barriers, in the finished product sufficiently to prevent the growth of *C. botulinum* type E and non-proteolytic types B and F by formulation, and then controlling the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in the finished product with refrigerated storage (e.g., refrigerated acidified (pickled) products). Controlling the growth of non-proteolytic *C. botulinum* through formulation is covered in this chapter, controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12;
- Controlling the amount of salt and preservatives, such as sodium nitrite, in the finished product, in combination with other barriers, such as smoke, heat damage, and competitive bacteria, sufficiently to prevent the growth of *C. botulinum* type E and non-proteolytic types B and F, and then controlling the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in the finished product with refrigerated storage (e.g., salted, smoked, or smoke-flavored fish). Controlling the growth of non-proteolytic *C. botulinum* through salting and smoking is covered in this chapter, controlling the growth of proteolytic *C. botulinum* through

refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12;

- Controlling the amount of salt in the finished product, in combination with heat damage from pasteurization in the finished product container, sufficiently to prevent the growth of *C. botulinum* type E and nonproteolytic types B and F, and then controlling the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in the finished product with refrigerated storage (e.g., some pasteurized surimi-based products). Controlling the growth of non-proteolytic *C. botulinum* through a combination of salt and heat damage is covered in this chapter, controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12.

Examples of *C. botulinum* control in specific products:

- **Refrigerated (not frozen), reduced oxygen packaged smoked and smoke-flavored fish**

  Achieving the proper concentration of salt and nitrite in the flesh of refrigerated, reduced oxygen packaged smoked and smoke-flavored fish is necessary to prevent the formation of toxin by *C. botulinum* type E and non-proteolytic types B and F during storage and distribution. Salt works along with smoke and any nitrites that are added to prevent growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F. Note that nitrites should be used only in salmon, sable, shad, chubs, and tuna, according to 21 CFR 172.175 and 21 CFR 172.177 , and should not exceed a level of 200 ppm in salmon, sable, shad, chubs and 10 ppm in tuna.

  In hot-smoked products, heat damage to the spores of *C. botulinum* type E and non-proteolytic types B and F also helps prevent toxin formation. In these products, control of the heating process is critical to the safety of the finished product. It is important to note, however, that this same heating process also reduces the numbers of naturally occurring spoilage organisms. The spoilage organisms would otherwise have competed with, and inhibited the growth of, *C. botulinum*.

  In cold-smoked fish, it is important that the product does not receive so much heat that the numbers of spoilage organisms are significantly reduced. This is important because spoilage organisms must be present to inhibit the growth and toxin formation of *C. botulinum* type E and non-proteolytic types B and F. This inhibition is important in cold-smoked fish because the heat applied during this process is not adequate to weaken the *C. botulinum* spores. Control of the temperature during the cold-smoking process to ensure survival of the spoilage organisms is, therefore, critical to the safety of the finished product.

  The interplay of these inhibitory effects (i.e., salt, temperature, smoke, and nitrite) is complex. Control of the brining or dry salting process is clearly critical to ensure that there is sufficient salt in the finished product. However, preventing toxin formation by *C. botulinum* type E and non-proteolytic types B and F is made even more complex by the fact that adequate salt levels are not usually achieved during brining. Proper drying during smoking is also critical in order to achieve the finished product water phase salt level (i.e., the concentration of salt in the water portion of the fish flesh) needed to inhibit growth and toxin formation by *C. botulinum*.

  This chapter covers the control procedures described above.

You should ordinarily restrict brining, dry salting, and smoking loads to single species and to fish portions of approximately uniform size. This restriction minimizes the complexity of controlling the operation. You should treat brine to minimize microbial contamination or periodically replace it as a good manufacturing practice control.

The combination of inhibitory effects that are present in smoked and smoke-flavored fish are not adequate to prevent toxin formation by *C. botulinum* type A and proteolytic types B and F. Strict refrigeration control (i.e., at or below 40°F (4.4°C)) during storage and distribution should be maintained to prevent growth and toxin formation by *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in these products. Controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the growth of other pathogenic bacteria through refrigeration is covered in Chapter 12.

- **Refrigerated (not frozen), reduced oxygen packaged, pasteurized fishery products**

  Refrigerated, reduced oxygen packaged, pasteurized fishery products fall into two categories: (1) those which are pasteurized in the final container; and (2) those which are cooked in a kettle and then hot filled into the final container in a continuous, closed filling system (e.g., heat-and-fill soups, chowders, and sauces). In both cases, ordinarily the heating process should be sufficient to destroy the spores of *C. botulinum* type E and non-proteolytic types B and F. In neither case is it likely that the heating process will be sufficient to destroy the spores of *C. botulinum* type A and proteolytic types B and F. Therefore, strict refrigeration control (i.e., at or below 40°F (4.4°C)) should be maintained during storage and distribution to prevent growth and toxin formation by *C. botulinum* type A and proteolytic types B and F. Refrigeration also serves as a prudent second barrier because of the potential survival through the pasteurization process and recovery of spores of non-proteolytic *C. botulinum*, aided by naturally occurring substances, such as lysozyme. Cooking and pasteurization are covered in Chapter 16, and controlling the growth of *C. botulinum* through refrigeration is covered in this chapter.

  In the second category of products, filling the product into the final container while it is still hot in a continuous, closed filling system (i.e., hot filling) is also critical to the safety of the finished product because it minimizes the risk of recontamination of the product with pathogens, including *C. botulinum* type E and non-proteolytic types B and F. This control strategy applies to products such as soups, chowders, and sauces that are filled directly from the cooking kettle, where the risk of recontamination is minimized. It may not apply to products such as crabmeat, lobster meat, or crayfish meat or to other products that are handled between cooking and filling. Control of hot filling is covered in Chapter 18.

  Chapter 18 also covers other controls that may be necessary to prevent recontamination, including controlling container sealing and controlling contamination of container cooling water. These controls may be critical to the safety of both categories of products.

  Examples of properly pasteurized products follow: fish and fishery products generally (e.g., surimi-based products, soups, or sauces) pasteurized to a minimum cumulative total lethality of $F_{194°F}$ ($F_{90°C}$) = 10 minutes, where z = 12.6°F (7°C) for temperatures less than 194°F (90°C), and z = 18°F (10°C) for temperatures above 194°F (90°C); blue crabmeat pasteurized to a minimum cumulative total lethality of $F_{185°F}$ ($F_{85°C}$) = 31 minutes, where z = 16°F (9°C); and dungeness crabmeat pasteurized to a minimum cumulative total lethality of $F_{194°F}$ ($F_{90°C}$) = 57 minutes, where z = 15.5°F

(8.6°C). Equivalent processes at different temperatures can be calculated using the z values provided.

EXAMPLES OF PROPERLY PASTEURIZED PRODUCTS

PRODUCT	MINIMUM CUMULATIVE TOTAL LETHALITY	Z VALUE
Fish and fishery products generally (e.g., surimi-based products, soups, or sauces)	$F_{194°F}$ ($F_{90°C}$) = 10 minutes	12.6°F (7°C), for temperatures less than 194°F (90°C) 18°F (10°C) for temperatures above 194°F (90°C)
Blue crabmeat	$F_{185°F}$ ($F_{85°C}$) = 31 minutes	16°F (9°C)
Dungeness crabmeat	$F_{194°F}$ ($F_{90°C}$) = 57 minutes	15.5°F (8.6°C)

In some pasteurized surimi-based products, salt, in combination with a milder pasteurization process, in the finished product container works to prevent growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F. An example of a properly pasteurized surimi-based product in which 2.4% wps is present is one that has been pasteurized at an internal temperature of 185°F (85°C) for at least 15 minutes. This process may not be suitable for other types of products because of the unique formulation and processing involved in the manufacture of surimi-based products.

- **Refrigerated (not frozen), reduced oxygen packaged pickled fish, salted fish, caviar, and similar products**

  In pickled fish, salted fish, caviar, and similar products that have not been preserved sufficiently for them to be shelf stable, growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F is controlled by one of the following:

  - Adding sufficient salt to produce a water phase salt level (i.e., the concentration of salt in the water portion of the fish flesh) of at least 5%;
  - Adding sufficient acid to reduce the acidity (pH) to 5.0 or below;
  - Reducing the amount of moisture that is available for growth (water activity) to below 0.97 (e.g., by adding salt or other substances that "bind" the available water); or
  - Making a combination of salt, pH, and/or water activity adjustments that, when combined, prevents the growth of *C. botulinum* type E and non-proteolytic types B and F (to be established by a scientific study).

  Much like smoked products, in some of these products the interplay of these inhibitory effects (i.e., salt, water activity, and pH) can be complex. Control of the brining, pickling, or formulation steps is, therefore, critical to ensure that there are sufficient barriers in the finished product to prevent the growth and toxin formation of *C. botulinum* type E and non-proteolytic types B and F during storage and distribution. These control procedures are covered in this chapter.

  You should ordinarily restrict brining and pickling loads to single species and to fish portions of approximately uniform size. This restriction minimizes the complexity of controlling the operation. You should treat brine to minimize microbial contamination or periodically replace it as a good manufacturing practice control.

  The controls discussed above are not sufficient to prevent toxin formation by *C. botulinum* type A and proteolytic types B and F. Strict refrigeration control (i.e., at or below 40°F (4.4°C)) during storage and distribution should, therefore, be maintained to prevent growth and toxin formation by *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present in these products. Controlling the growth of proteolytic *C. botulinum* through refrigeration is covered in this chapter, and controlling the

growth of other pathogenic bacteria through refrigeration is covered in Chapter 12.

- **Refrigerated (not frozen), reduced oxygen packaged raw, unpreserved fish and unpasteurized, cooked fishery products**

  For refrigerated, reduced oxygen packaged raw, unpreserved fish (e.g., refrigerated, vacuum-packaged fish fillets) and refrigerated, reduced oxygen packaged, unpasteurized, cooked fishery products (e.g., refrigerated, vacuum-packaged, unpasteurized crabmeat, lobster meat, or crayfish meat), the sole barrier to toxin formation by *C. botulinum* type E and non-proteolytic types B and F during finished product storage and distribution is refrigeration. These types of *C. botulinum* will grow at temperatures as low as 38°F (3.3°C). As was previously noted, maintenance of temperatures below 38°F (3.3°C) after the product leaves your control and enters the distribution system cannot normally be ensured. The use of a TTI on the smallest unit of packaging (i.e., the unit of packaging that will not be distributed any further, usually consumer or end-user package) may be an appropriate means of overcoming these problems in the distribution system. This chapter provides controls for the application of TTIs for packaging.

  If you intend to package these products in a reduced oxygen package and you do not intend to apply a TTI on each consumer package, you should evaluate the effectiveness of other preventive measures, either singularly, or in combination, that may be effective in preventing growth and toxin formation by *C. botulinum*. Such evaluation is customarily accomplished by conducting an inoculated pack study under moderate abuse conditions. A suitable protocol for the performance of such studies is contained in a 1992 publication by the National Advisory Committee on Microbiological Criteria for Foods, "Vacuum or modified atmosphere packaging for refrigerated, raw fishery products."

- **Frozen, reduced oxygen packaged raw, unpreserved fish and unpasteurized, cooked fishery products**

  For frozen, reduced oxygen packaged raw, unpreserved fish (e.g., frozen, vacuum-packaged fish fillets) and frozen, reduced oxygen packaged, unpasteurized, cooked fishery products (e.g., frozen, vacuum-packaged, unpasteurized crabmeat, lobster meat, or crayfish meat), the sole barrier to toxin formation by *C. botulinum* type E and non-proteolytic types B and F during finished product storage and distribution is freezing. Because these products may appear to the retailer, consumer, or end user to be intended to be refrigerated, rather than frozen, labeling to ensure that they are held frozen throughout distribution is critical to their safety.

  Controls should be in place to ensure that such products are immediately frozen after processing, maintained frozen throughout storage in your facility, and labeled to be held frozen and to be thawed under refrigeration immediately before use (e.g., "Important, keep frozen until used, thaw under refrigeration immediately before use"). Frozen, reduced oxygen packaged products that are customarily cooked by the consumer or end user in the frozen state (e.g., boil-in-bag products and frozen fish sticks) need not be labeled to be thawed under refrigeration. For purposes of hazard analysis, other frozen products that do not contain the "keep frozen" statement should be evaluated as if they will be stored refrigerated because the consumer or end user would not have been warned to keep them frozen.

  Control procedures to ensure that product is properly labeled with "keep frozen" instructions are covered in this chapter.

- **Control in unrefrigerated (shelf-stable), reduced oxygen packaged fishery products**

  Examples of shelf-stable, reduced oxygen packaged fishery products are dried fish, acidified fish, canned fish, and salted fish. Because these products are marketed without refrigeration, either (1) the spores of *C. botulinum* types A, B, E, and F should be destroyed after the product is placed in the finished product container (covered by the LACF Regulation, 21 CFR 113) or (2) a barrier, or combination of barriers, should be in place that will prevent growth and toxin formation by *C. botulinum* types A, B, E, and F, and other pathogens that may be present in the product. Suitable barriers include:

  - Adding sufficient salt to produce a water phase salt level (i.e., the concentration of salt in the water portion of the fish flesh) of at least 20%. Note that this value is based on the maximum salt level for growth of *S. aureus*, covered in this chapter;
  - Reducing the amount of moisture that is available for growth (water activity) to below 0.85 (e.g., by adding salt or other substances that bind the available water). Note that this value is based on the minimum water activity for growth and toxin formation of *S. aureus*, covered in this chapter;
  - Adding sufficient acid to reduce the pH to 4.6 or below. This barrier is covered by the Acidified Foods regulation, 21 CFR 114, and these controls are not required to be included in your HACCP plan;
  - Drying the product sufficiently to reduce the water activity to 0.85 or below. Note that this value is based on the minimum water activity for growth and toxin formation of *S. aureus*, covered in Chapter 14.

  Note: A heat treatment, addition of chemical additives, or other treatment may be necessary to inhibit or eliminate spoilage organisms (e.g., mold) in shelf-stable products.

DETERMINE WHETHER THE POTENTIAL HAZARD IS SIGNIFICANT.

The following guidance will assist you in determining whether *C. botulinum* toxin formation is a significant hazard at a processing step:

1. Is it reasonably likely that *C. botulinum* will grow and produce toxin during finished product storage and distribution?

   The factors that make *C. botulinum* toxin formation during finished product storage and distribution reasonably likely to occur are those that may result in the formation of a reduced oxygen packaging environment. These are discussed in the section "Understand the potential hazard," under the heading, "Reduced oxygen packaging."

2. Can growth and toxin formation by *C. botulinum* that is reasonably likely to occur be eliminated or reduced to an acceptable level at this processing step?

   C. botulinum toxin formation should also be considered a significant hazard at any processing step where a preventive measure is, or can be, used to eliminate the hazard (or reduce the likelihood of its occurrence to an acceptable level) if it is reasonably likely to occur.

   Preventive measures for *C. botulinum* toxin formation during finished product distribution and storage are discussed in the section, "Understand the potential hazard," under the heading, "Control of *C. botulinum*."

- **Intended use**

Because of the extremely toxic nature of *C. botulinum* toxin, it is unlikely that the significance of the hazard will be affected by the intended use of your product.

IDENTIFY CRITICAL CONTROL POINTS.

The following guidance will assist you in determining whether a processing step is a critical control point (CCP) for *C. botulinum* toxin formation:

1. Is there an acidification step (equilibrium pH of 4.6 or below), a drying step, an in-package pasteurization step, a combination of cook and hot-fill steps, or a retorting step (commercial sterility) in the process?

    a. If there is, you should in most cases identify the acidification step, drying step, pasteurization step, cook and hot-fill steps, or retorting step as the CCP(s) for this hazard. Other processing steps where you have identified *C. botulinum* toxin formation as a significant hazard will then not require control and will not need to be identified as CCPs for the hazard. However, control should be provided for time and temperature exposure during finished product storage and distribution of the following products:

    - Products pasteurized in the final container to kill *C. botulinum* type E and non-proteolytic types B and F and refrigerated to control the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present (e.g., pasteurized crabmeat and pasteurized surimi);
    - Products cooked to kill *C. botulinum* type E and non-proteolytic types B and F, and then hot filled into the final container, and next refrigerated to control the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present;
    - Products dried to control the growth of *C. botulinum* type E and non-proteolytic types B and F and refrigerated to control the growth of *C. botulinum* type A and proteolytic types B and F and other pathogens that may be present.

In these cases, you should also identify the finished product storage step as a CCP for the hazard. Control of refrigeration is covered in this chapter for *C. botulinum* and in Chapter 12 for other pathogenic bacteria.

Additionally, some pasteurized surimi-based products rely on a combination of salt and a relatively mild pasteurization process in the finished product container for the control of *C. botulinum* type E and non-proteolytic types B and F. In these products, you should also identify the formulation step as a CCP for the hazard. Guidance provided in "Control Strategy Example 4 - Pickling and Salting" may be useful in developing controls at this step.

Guidance for the *C. botulinum* control strategies listed above is contained in the following locations:

- Control of cooking and hot-filling is covered in Chapters 16 and 18;
- Control of pasteurization is covered in Chapters 16 and 18;
- Control of drying is covered in Chapter 14;
- Control of acidification is covered in the Acidified Foods regulation, 21 CFR 114;
- Control of retorting is covered in the LACF Regulation, 21 CFR 113.

Note: Acidification and retorting controls for *C. botulinum* required by 21 CFRs 113 and 114 need not be included in your HACCP plan.

b. If there is no acidification step (equilibrium pH of 4.6 or below), drying step, pasteurization step, cooking and hot-filling, or retorting (commercial sterility) step in the process, then decide which of the following categories best describes your product and refer to the guidance below:

- Smoked and smoke-flavored fish;
- Fishery products in which refrigeration is the sole barrier to prevent toxin formation;
- Fishery products in which freezing is the sole barrier to toxin formation;
- Pickled fish and similar products.

- **Smoked and smoke-flavored fish**

1. Is the water phase salt level and, when permitted, the nitrite level, important to the safety of the product?

   For all products in this category, the water phase salt level is critical to the safety of the product, and the brining, dry salting and, where applicable, drying steps should be identified as CCPs. Nitrite, when permitted, allows a lower level of salt to be used. Salt and nitrite are the principal inhibitors to *C. botulinum* type E and non-proteolytic types B and F toxin formation in these products. The water phase salt level needed to inhibit toxin formation is partially achieved during brining or dry salting and is partially achieved during drying. Control should be exercised over both operations.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 1 - Smoking (1a - Brining, Dry Salting, and Drying)."

2. Is the temperature of the heating or smoking process important to the safety of the product?

   For both cold-smoked and hot-smoked fish products, the temperature of smoking is critical, and the smoking step should be identified as a CCP for this hazard. The smoking step for hot-smoked fish should be sufficient to damage the spores and make them more susceptible to inhibition by salt. The smoking step for cold-smoked fish should not be so severe that it kills the natural spoilage bacteria. These bacteria are necessary so that the product will spoil before toxin production occurs. It is likely that they will also produce acid, which will further inhibit *C. botulinum* growth and toxin formation.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 1 - Smoking (1b - Cold Smoking and 1c - Hot Smoking)."

3. Is the storage temperature important to the safety of the product?

   Refrigerated (not frozen) finished product storage is critical to the safety of all products in this category and should be identified as a CCP. Toxin formation by *C. botulinum* type A and proteolytic types B and F is not inhibited by water phase salt levels below 10%, nor by the combination of inhibitors present in most smoked or smoke-flavored fish. *Bacillus cereus* can grow and form toxin at water phase salt concentrations as high as 18%.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 1 - Smoking (1d - Refrigerated Finished Product Storage)."

   In some cases, salted, smoked, or smoke-flavored fish are received as ingredients for assembly into another product, such as a salmon paté. In other cases, they are received simply for storage and further distribution (e.g., by a warehouse). In either case, the refrigerated (not frozen) storage step is critical to the safety of the product and should be identified as a CCP. Control is the same as that provided under "Control Strategy Example 1 - Smoking (1d - Refrigerated

Finished Product Storage)." Additionally, receiving of these products should be identified as a CCP, where control can be exercised over the time and temperature during transit.

This control approach is a control strategy referred to in this chapter as "Control Strategy Example 1 - Smoking (1e - Receipt of Products by Secondary Processor)."

- **Fishery products in which refrigeration is the sole barrier to prevent toxin formation**

1. Is the storage temperature important to the safety of the product?

Refrigerated finished product storage is critical to the safety of all products in this category and should be identified as a CCP. These products contain no barriers (other than refrigeration) to toxin formation by *C. botulinum* type E and non-proteolytic types B and F during finished product storage and distribution. These types of *C. botulinum* will grow at temperatures as low as 38°F (3.3°C), necessitating particularly stringent temperature control.

This control approach is a control strategy referred to in this chapter as "Control Strategy Example 2 - Refrigeration With TTI (2d - Refrigerated Finished Product Storage)."

In some cases, these products are received as ingredients for assembly into another product. In other cases, they are received simply for storage and further distribution (e.g., by a warehouse). In either case, the refrigerated storage step is critical to the safety of the product and should be identified as a CCP. Control is the same as that provided under "Control Strategy Example 2 - Refrigeration With a TTI (2d - Refrigerated Finished Product Storage)." Additionally, receiving of these products should be identified as a CCP, where control can be exercised over the time and temperature during transit.

This control approach is a control strategy referred to in this chapter as "Control Strategy Example 2 - Refrigeration With a TTI (2e - Receipt of Product by Secondary Processor)."

As previously noted, maintenance of temperatures below 38°F (3.3°C) after the product leaves your control and enters the distribution system cannot normally be ensured. The use of a TTI on the smallest unit of packaging (i.e., the unit of packaging that will not be distributed any further, usually consumer or end-user package) may be an appropriate means of overcoming these problems in the distribution system. When TTIs are used in this manner, their receipt, storage, and application and activation should be identified as CCPs.

This control approach is a control strategy referred to as "Control Strategy Example 2 - Refrigeration With TTI (2a - Unactivated TTI Receipt, 2b - Unactivated TTI Storage, and 2c - Application and Activation of TTI)."

- **Fishery products in which freezing is the sole barrier to toxin formation**

1. Is the storage temperature important to the safety of the product?

Frozen finished product storage is critical to the safety of all products in this category. These products contain no barriers (other than freezing) to toxin formation by *C. botulinum* type E and non-proteolytic types B and F during finished product storage and distribution. As previously noted, because these products may appear to the retailer, consumer, or end user to be intended to be refrigerated, rather than frozen, labeling to ensure that they are held frozen throughout distribution is critical to their safety and should be identified as a CCP.

This control approach is a control strategy referred to in this chapter as "Control Strategy Example 3 - Frozen With Labeling."

- **Pickled and salted fish and similar products**

1. Is the water phase salt level, water activity, and/or pH level important to the safety of the product?

   For all products in this category, the water phase salt level, water activity, and/or pH level are critical to the safety of the product because they are the principal inhibitors to growth and toxin formation by *C. botulinum* type E and non-proteolytic type B and F. The levels of these inhibitors needed to inhibit toxin formation are achieved during the pickling, brining, or formulation step. Control should be exercised over the relevant step.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 4 - Pickling and Salting (4a - Brining, Pickling, Salting, and Formulation)."

2. Is the storage temperature important to the safety of the product?

   Unless pickling, brining, or formulation results in a water phase salt level of at least 20% (note that this value is based on the maximum salt concentration for growth of *S. aureus*), a pH of 4.6 or below, or a water activity of 0.85 or below (note that this value is based on the minimum water activity for growth of *S. aureus*), refrigerated finished product storage is critical to ensure the safety of the product and should be identified as a CCP.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 4 - Pickling and Salting (4b - Refrigerated Finished Product Storage)."

   In some cases, pickled fish or similar products are received as ingredients for assembly into another product. In other cases, they are received simply for storage and further distribution (e.g., by a warehouse). In either case, the refrigerated storage step is critical to the safety of the product and should be identified as a CCP. Control is the same as that provided under "Control Strategy Example 4 - Pickling and Salting (4b - Refrigerated Finished Product Storage)." Additionally, receiving of these products should be identified as a CCP, where control can be exercised over time and temperature during transit.

   This control approach is a control strategy referred to in this chapter as "Control Strategy Example 4 - Pickling and Salting (4c - Receipt of Product by Secondary Processor)."

DEVELOP A CONTROL STRATEGY.

The following guidance provides four control strategies for *C. botulinum* toxin formation. You may select a control strategy that is different from those which are suggested, provided it complies with the requirements of the applicable food safety laws and regulations. Control strategies contain several elements that may need to be used in combination to result in an effective control program.

The following are examples of control strategies included in this chapter:

CONTROL STRATEGY	MAY APPLY TO PRIMARY PROCESSOR	MAY APPLY TO SECONDARY PROCESSOR
Smoking	✓	✓
Refrigeration with TTI	✓	✓
Frozen with labeling	✓	✓
Pickling and salting	✓	✓

- **CONTROL STRATEGY EXAMPLE 1 - SMOKING**

This control strategy should include the following elements, as appropriate:

a. Brining, dry salting, and drying;

b. Cold smoking;

c. Hot smoking;

d. Refrigerated finished product storage;

e. Receipt of products by secondary processor.

1A. BRINING, DRY SALTING, AND DRYING

Set Critical Limits.

- The minimum or maximum values for the critical factors of the brining, dry salting, and/or drying processes established by a scientific study. The critical factors are those that are necessary to ensure that the finished product has not less than 3.5% wps or, where permitted, the combination of 3% wps and not less than 100 ppm nitrite. The critical factors may include: brine strength; brine to fish ratio; brining time; brining temperature; thickness, texture, fat content, quality, and species of fish; drying time; input/output air temperature, humidity, and velocity; smoke density; and drier loading.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- The critical factors of the established brining, dry salting, and/or drying processes. These may include: brine strength; brine to fish ratio; brining time; brining temperature; thickness, texture, fat content, quality, and species of fish; drying time; input/output air temperature, humidity, and velocity; smoke density; and drier loading;

  OR

- The water phase salt and, where appropriate, nitrite level of the finished product.

» **How Will Monitoring Be Done?**

- For monitoring critical factors:
  - Monitor brine strength with a salinometer;

    AND

  - Monitor brine time with a clock;

    AND

  - Monitor brine temperature using:
    - A temperature-indicating device (e.g., a thermometer);

      OR

    - Monitor brine temperature at the start of the brining process with a temperature- indicating device (e.g., a thermometer), and then monitor ambient air temperature using a continuous temperature-recording device (e.g., a recording thermometer);

      AND

  - Monitor the drying time and the input/output air temperature (as specified by the study) using a continuous temperature-recording device (e.g., a recording thermometer);

    AND

  - Monitor all other critical factors specified by the study with equipment appropriate for the measurement;

  OR

- Collect a representative sample of the finished product and conduct water phase salt analysis and, when appropriate, nitrite analysis.

» **How Often Will Monitoring Be Done (Frequency)?**

- For brine strength:
  - At least at the start of the brining process;

  AND

- For brine time:
  - Once per batch;

  AND

- For manual brine temperature monitoring:
  - At the start of the brining process and at least every 2 hours thereafter;

  AND

- For continuous temperature-recording devices:
  - Continuous monitoring by the device itself, with a visual check of the recorded data at least once per batch;

AND

- For brine to fish ratio:
  - At the start of the brining process;

AND

- For time requirements of the drying process:
  - Each batch;

AND

- For all other critical factors specified by the study:
  - As often as necessary to maintain control;

OR

- For water phase salt and, when appropriate, nitrite:
  - Each lot or batch of finished product.

» **Who Will Do the Monitoring?**

- For continuous temperature-recording devices:
  - Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls;

OR

- For other checks:
  - Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the product until its safety can be evaluated;

OR

- Reprocess the product;

OR

- Divert the product to a use in which the critical limit is not applicable (e.g., packaging that is not hermetically sealed, or an LACF, or a frozen product);

OR

- Destroy the product;

OR

- Divert the product to a non-food use.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Adjust the salt and/or nitrite concentration in the brine;

OR

- Adjust the air velocity or input air temperature to the drying chamber;

OR

- Extend the drying process to compensate for a reduced air velocity or temperature or elevated humidity;

OR

- Adjust the brine strength or brine to fish ratio;

OR

- Cool the brine;

OR

- Move some or all of the product to another drying chamber;

OR

- Make repairs or adjustments to the drying chamber as necessary.

Establish a Recordkeeping System.

- Printouts, charts, or readings from continuous temperature-recording devices;

AND

- Record of visual checks of recorded data;

AND

- Appropriate records (e.g., processing record showing the results of the brine strength and temperature, brine to fish ratio, size

and species of fish, and time of brining) as necessary to document the monitoring of the critical factors of the brining, dry salting, and/or drying process, as established by a study;

OR

- Results of the finished product water phase salt determination and, when appropriate, nitrite determination.

Establish Verification Procedures.

- Process validation study (except where water phase salt analysis and, where appropriate, nitrite analysis of the finished product are the monitoring procedure):
    - The adequacy of the brining, dry salting, and drying processes should be established by a scientific study. It should be designed to consistently achieve a water phase salt level of 3.5% or 3% with not less than 100 ppm nitrite. Expert knowledge of salting and/or drying processes may be required to establish such a process. Such knowledge can be obtained by education or experience, or both. Process validation study for establishment of brining, dry salting, and drying processes may require access to adequate facilities and the application of recognized methods. The drying equipment should be designed, operated, and maintained to deliver the established drying process to every unit of product. In some instances, brining, dry salting, and/or drying studies may be required to establish minimum processes. In other instances, existing literature, which establishes minimum processes or adequacy of equipment, is available. Characteristics of the process, product, and/or equipment that affect the ability of the established minimum salting, dry salting, and drying process to deliver the desired finished product water phase salt and, where applicable, nitrite levels should be taken into consideration in the process establishment. A record of the process establishment should be maintained;

AND

- Before a temperature-indicating device (e.g., a thermometer) or temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
    - Immersing the sensor in an ice slurry (32°F (0°C)), if the device will be used at or near refrigeration temperature;

      OR
    - Immersing the sensor in boiling water (212°F (100°C)) if the device will be used at or near the boiling point. Note that the temperature should be adjusted to compensate for altitude, when necessary;

      OR
    - Doing a combination of the above if the device will be used at or near room temperature;

      OR
    - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a thermometer traceable to National Institute of Standards and Technology (NIST) standards) under conditions that are similar to how it will be used (e.g., air temperature, brine temperature, product internal temperature) within the temperature range at which it will be used;

AND

- Once in service, check the temperature-indicating device or temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended

by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

AND

- Calibrate the temperature-indicating device or temperature recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Devices subjected to high temperatures for extended periods of time may require more frequent calibration. Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- Perform other calibration procedures as necessary to ensure the accuracy of the monitoring instruments;

AND

- Do finished product sampling and analysis to determine water phase salt and, where appropriate, nitrite analysis at least once every 3 months (except where such testing is performed as part of monitoring);

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

1B. COLD SMOKING

Set Critical Limits.

- The smoker temperature must not exceed 90°F (32.2°C).

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- The smoker temperature.

» **How Will Monitoring Be Done?**

- Measure ambient smoker chamber temperature using a continuous temperature-recording device (e.g., a recording thermometer).

» **How Often Will Monitoring Be Done (Frequency)?**

- Continuous monitoring by the device itself, with a visual check of the recorded data at least once per batch.

» **Who Will Do the Monitoring?**

- Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the product until its safety can be evaluated;

OR

- Divert the product to a use in which the critical limit is not applicable (e.g., packaging that is not hermetically sealed, or an LACF, or a frozen product);

OR

- Destroy the product;

  OR

- Divert the product to a non-food use.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Make repairs or adjustments to the smoking chamber;

  AND/OR

- Move some or all of the product to another smoking chamber.

Establish a Recordkeeping System.

- Printouts, charts, or readings from continuous temperature-recording devices;

  AND

- Record of visual checks of recorded data.

Establish Verification Procedures.

- Before a temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
  - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

    OR

  - Immersing the sensor in boiling water (212°F (100°C)) if the device will be used at or near the boiling point. Note that the temperature should be adjusted to compensate for altitude, when necessary;

    OR

  - Doing a combination of the above if the device will be used at or near room temperature;

    OR

  - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

  AND

- Once in service, check the temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

  AND

- Calibrate the temperature-recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

  AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

1C. HOT SMOKING

Set Critical Limits.

- The internal temperature of the fish must be maintained at or above 145°F (62.8°C) throughout the fish for at least 30 minutes.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- The internal temperature at the thickest portion of three of the largest fish in the smoking chamber.

» **How Will Monitoring Be Done?**

- Use a continuous temperature-recording device (e.g., a recording thermometer) equipped with three temperature-sensing probes.

» **How Often Will Monitoring Be Done (Frequency)?**

- Continuous monitoring by the device itself, with visual check of the recorded data at least once per batch.

» **Who Will Do the Monitoring?**

- Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the product until its safety can be evaluated;

  OR

- Reprocess the product;

  OR

- Divert the product to a use in which the critical limit is not applicable (e.g., packaging that is not hermetically sealed, or a LACF, or a frozen product);

  OR

- Destroy the product;

  OR

- Divert the product to a non-food use.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Make repairs or adjustments to the heating chamber;

  OR

- Move some or all of the product to another heating chamber.

Establish a Recordkeeping System.

- Printouts, charts, or readings from continuous temperature-recording devices;

  AND

- Record of visual checks of recorded data.

Establish Verification Procedures.

- Before a temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
  - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

    OR

  - Immersing the sensor in boiling water (212°F (100°C)) if the device will be used at or near the boiling point. Note that the temperature should be adjusted to compensate for altitude, when necessary;

    OR

  - Doing a combination of the above if the device will be used at or near room temperature;

    OR

- Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., product internal temperature) within the temperature range at which it will be used;

AND

- Once in service, check the temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

AND

- Calibrate the temperature-recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

1D. REFRIGERATED FINISHED PRODUCT STORAGE

Set Critical Limits.

- For refrigerated (not frozen) finished product storage:
  - The product is held at a cooler temperature of 40°F (4.4°C) or below. Note that allowance for routine refrigeration defrost cycles may be necessary. Also note that you may choose to set a critical limit that specifies a time and temperature of exposure to temperatures above 40°F (4.4°C);

OR

- For finished product stored under ice:
  - The product is completely and continuously surrounded by ice throughout the storage time.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- For refrigerated finished product storage:
  - The temperature of the cooler;

OR

- For finished product storage under ice:
  - The adequacy of ice surrounding the product.

» **How Will Monitoring Be Done?**

- For refrigerated finished product storage:
  - Use a continuous temperature-recording device (e.g., a recording thermometer);

OR

- For finished product storage under ice:
  - Make visual observations of the adequacy of ice in a representative number of containers (e.g., cartons and totes) from throughout the cooler.

» **How Often Will Monitoring Be Done (Frequency)?**

- For continuous temperature-recording devices:
  - Continuous monitoring by the device itself, with a visual check of the recorded data at least once per day;

  OR
- For finished product storage under ice:
  - Sufficient frequency to ensure control.

» **Who Will Do the Monitoring?**

- For continuous temperature-recording devices:
  - Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls;

  OR
- For other checks:
  - Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the affected product until an evaluation of the total time and temperature exposure is performed;

  OR
- Destroy the product;

  OR
- Divert the product to a non-food use.

AND

Take the following corrective actions to regain control over the operation after a critical limit deviation:

- Prevent further deterioration:
  - Add ice to the product;

    OR
  - Move some or all of the product in the malfunctioning cooler to another cooler;

    OR
  - Freeze the product;

  AND
- Address the root cause:
  - Make repairs or adjustments to the malfunctioning cooler;

    OR
  - Make adjustments to the ice application operations.

Establish a Recordkeeping System.

- For refrigerated finished product storage:
  - Printouts, charts, or readings from continuous temperature-recording devices;

    AND
  - Record of visual checks of recorded data;

  OR
- For finished product storage under ice:
  - Results of ice checks:
    - The number of containers examined and the sufficiency of ice for each;

      AND
    - The approximate number of containers in the cooler.

Establish Verification Procedures.

- Before a temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
  - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

    OR

- Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

AND

- Once in service, check the temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

AND

- Calibrate the temperature-recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- When visual checks of ice are used, periodically measure internal temperatures of fish to ensure that the ice is sufficient to maintain product temperatures at 40°F (4.4°C) or less;

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

1E. RECEIPT OF PRODUCTS BY SECONDARY PROCESSOR

Set Critical Limits.

- For fish or fishery products delivered refrigerated (not frozen):
  - All lots received are accompanied by transportation records that show that the product was held at or below 40°F (4.4°C) throughout transit. Note that allowance for routine refrigeration defrost cycles may be necessary;

OR

- For products delivered under ice:
  - Product is completely surrounded by ice at the time of delivery;

OR

- For products delivered under chemical cooling media, such as gel packs:
  - There is an adequate quantity of cooling media that remain frozen to have maintained product at 40°F (4.4°C) or below throughout transit;

AND

  - The internal temperature of the product at the time of delivery is 40°F (4.4°C) or below;

OR

- For products delivered refrigerated (not frozen) with a transit time (including all time outside a controlled temperature environment) of 4 hours or less (optional control strategy):

- Time of transit does not exceed 4 hours;

  AND

- Temperature of the product at the time of delivery does not exceed 40°F (4.4°C).

Note: Processors receiving product with transit times of 4 hours or less may elect to use one of the controls described for longer transit times.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- For products delivered refrigerated (not frozen):
  - The internal temperature of the product throughout transportation;

    OR

  - The temperature within the truck or other carrier throughout transportation;

  OR
- For products delivered under ice:
  - The adequacy of ice surrounding the product at the time of delivery;

  OR
- For products held under chemical cooling media, such as gel packs:
  - The quantity and frozen status of cooling media at the time of delivery;

    AND

  - The internal temperature of a representative number of product containers (e.g., cartons and totes) at time of delivery;

  OR
- For products delivered refrigerated (not frozen) with a transit time of 4 hours or less:
  - The date and time fish were removed from a controlled temperature environment before shipment and the date and time delivered;

    AND

  - The internal temperature of a representative number of product containers (e.g., cartons and totes) at the time of delivery.

» **How Will Monitoring Be Done?**

- For products delivered refrigerated (not frozen):
  - Use a continuous temperature-recording device (e.g., a recording thermometer) for internal product temperature or ambient air temperature monitoring during transit;

  OR
- For products delivered under ice:
  - Make visual observations of the adequacy of ice in a representative number of containers (e.g., cartons and totes) from throughout the shipment, at delivery;

  OR
- For products delivered under chemical cooling media, such as gel packs:
  - Make visual observations of the adequacy and frozen state of the cooling media in a representative number of containers (e.g., cartons and totes) from throughout the shipment, at delivery;

    AND

  - Use a temperature-indicating device (e.g., a thermometer) to determine internal product temperatures in a representative number of product containers from throughout the shipment, at delivery;

  OR
- For products delivered refrigerated (not frozen) with a transit time of 4 hours or less:
  - Review carrier records to determine the date and time the product was removed from a controlled temperature environment before shipment and the date and time delivered;

    AND

- Use a temperature-indicating device (e.g., a thermometer) to determine internal product temperatures in a representative number of product containers (e.g., cartons and totes) randomly selected from throughout the shipment, at delivery. Measure a minimum of 12 product containers, unless there are fewer than 12 product containers in a lot, in which case measure all of the containers. Lots that show a high level of temperature variability may require a larger sample size.

» **How Often Will Monitoring Be Done (Frequency)?**

- Each lot received.

» **Who Will Do the Monitoring?**

- For continuous temperature-recording devices:
  - Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls;

  OR
- For other checks:
  - Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the affected product until an evaluation of the total time and temperature exposure is performed;

  OR
- Reject the lot.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Discontinue use of the supplier or carrier until evidence is obtained that the identified transportation-handling practices have been improved.

Establish a Recordkeeping System.

- Receiving records showing:
  - Results of continuous temperature monitoring:
    - Printouts, charts, or readings from continuous temperature-recording devices;

      AND
    - Visual check of recorded data;

    OR
  - Results of ice checks, including:
    - The number of containers examined and the sufficiency of ice for each;

      AND
    - The number of containers in the lot;

    OR
  - Results of the chemical media checks, including:
    - The number of containers examined and the frozen status of the media for each;

      AND
    - The number of containers in the lot;

    AND/OR
  - Results of internal product temperature monitoring, including:
    - The number of containers examined and the internal temperatures observed for each;

      AND
    - The number of containers in the lot;

      AND
    - Date and time fish were initially removed from a controlled

temperature environment and date and time fish were delivered, when applicable.

Establish Verification Procedures.

- Before a temperature-indicating device (e.g., a thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
    - Immersing the sensor in an ice slurry (32°F (0°C)), if the device will be used at or near refrigeration temperature;

      OR
    - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., product internal temperature) within the temperature range at which it will be used;

  AND
- Once in service, check the temperature-indicating device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational;

  AND
- Calibrate the temperature-indicating device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

  AND
- Check the accuracy of temperature-recording devices that are used for monitoring transit conditions, for all new suppliers and at least quarterly for each supplier thereafter. Additional checks may be warranted based on observations at receipt (e.g., refrigeration units appear to be in poor repair or readings appear to be erroneous). The accuracy of the device can be checked by comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

  AND
- When visual checks of ice are used, periodically measure internal temperatures of fish to ensure that the ice or is sufficient to maintain product temperatures at 40°F (4.4°C) or less;

  AND
- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

TABLE 13-1

CONTROL STRATEGY EXAMPLE 1 - SMOKING

This table is an example of a portion of a HACCP plan using "Control Strategy Example 1 - Smoking." This example illustrates how a processor of vacuum-packaged hot-smoked salmon can control C. botulinum toxin formation. It is provided for illustrative purposes only.

C. botulinum toxin formation may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., aquaculture drugs, environmental chemical contaminants and pesticides, parasites, growth of other pathogenic bacteria, survival of other pathogenic bacteria through the cook step, and metal fragments).

Example Only
See Text for Full Recommendations

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
CRITICAL CONTROL POINT	SIGNIFICANT HAZARD(S)	CRITICAL LIMITS FOR EACH PREVENTIVE MEASURE*	MONITORING				CORRECTIVE ACTION(S)	RECORDS	VERIFICATION
			WHAT	HOW	FREQUENCY	WHO			
Brining	C. botulinum toxin formation in the finished product	Minimum brining time: 6 hours Maximum brine temperature: 40°F	Start time and end time of the brining process Brine temperature	Clock Dial thermometer	Every batch Every 2 hours	Brine room employee	Extend the brining process Hold and evaluate the product Cool the brine	Production record	Establish a brining and drying process Check the dial thermometer for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Monthly calibration of the scale Quarterly water phase salt analysis of the finished product Review monitoring, corrective action, and verification records within 1 week of preparation
		Minimum salt concentration of brine at the start of brining: 60° salinometer	Salt concentration of brine	Salinometer	Start of each brining process	Brine room employee	Add salt	Production record	
		Minimum ratio of brine to fish: 2:1	Weight of brine (as determined by volume)	Visual, to mark on the tank	Start of each brining process	Brine room employee	Add brine	Production record	
			Weight of fish	Scale	Each batch		Remove some fish and reweigh		
		Maximum fish thickness 1½ in. Note: To produce a minimum water phase salt level in the loin muscle of 3.5%	Fish thickness	Caliper	Each batch (10 largest fish)	Brine room employee	Hold and evaluate based on finished product water phase salt analysis	Production record

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
CRITICAL CONTROL POINT	SIGNIFICANT HAZARD(S)	CRITICAL LIMITS FOR EACH PREVENTIVE MEASURE*	MONITORING				CORRECTIVE ACTION(S)	RECORDS	VERIFICATION
			WHAT	HOW	FREQUENCY	WHO			
Smoking and drying	C. botulinum toxin formation in finished product	Minimum time open vent: 2 hours	Time of open vent	Clock	Each batch	Smoker employee	Extend the drying process Hold and evaluate based on finished product water phase salt analysis	Production record	Establish a brining and drying process Quarterly water phase salt analysis of the finished product Review monitoring, corrective action, and verification records within 1 week of preparation
Heating	C. botulinum toxin formation in the finished product	Internal temperature of fish held at or above 145°F for at least 30 minutes	Internal temperature of fish and time at that temperature	Digital data logger with three probes in thickest fish in cold spot of smoking chamber	Continuous, with visual check of recorded data at the end of the batch	Smoker employee	Extend the heating process Make repairs or adjustments to the smoking chamber Hold and evaluate the product	Data logger printout	Check the data logger for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Review monitoring, corrective action, and verification records within 1 week of preparation
Finished product storage	C. botulinum toxin formation during finished product storage	Maximum cooler temperature: 40°F (based on growth of vegetative pathogens)	Cooler air temperature	Digital data logger	Continuous, with visual check of recorded data once per day	Production employee	Adjust or repair the cooler Hold and evaluate the product based on time and temperature of exposure	Digital data logger printout	Check the data logger for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Review monitoring, corrective action, and verification records within 1 week of preparation

*Note: The critical limits in this example are for illustrative purposes only and are not related to any recommended process.

- **CONTROL STRATEGY EXAMPLE 2 - REFRIGERATION WITH TTI**

This control strategy should include the following elements, as appropriate:

a. Unactivated TTI receipt;

b. Unactivated TTI storage;

c. Application and activation of TTI;

d. Refrigerated finished product storage;

e. Receipt of product by secondary processor.

2A. UNACTIVATED TTI RECEIPT

Set Critical Limits.

- The TTI is suitable for use. It should be designed to perform properly under the conditions that it will be used. It should also be designed to produce an alert indicator (e.g., a color change of the device) at a combination of time and temperature exposures that will prevent the formation of non-proteolytic *C. botulinum* toxin formation (e.g., consistent with the "Skinner-Larkin curve");

  AND

- Where transportation conditions (e.g., temperature) could affect the functionality of the TTI, all lots of TTIs are accompanied by transportation records that show that they were held at conditions that do not result in loss of functionality throughout transit;

  AND

- The TTI functions (i.e., produces an alert indicator, such as a color change of the device, when exposed to time and temperature abuse) at time of receipt.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- For suitability of use:
  - Performance data from the manufacturer;

  AND
- For transportation conditions:
  - The temperature within the truck or other carrier throughout transportation;

    OR
  - Other conditions that affect the functionality of the TTI, where applicable;

  AND
- For functionality at receipt:
  - The ability of the TTI to produce an alert indicator, such as a color change of the device, when exposed to time and temperature abuse at time of receipt.

» **How Will Monitoring Be Done?**

- For suitability of use:
  - Review performance data;

  AND
- For transportation conditions:
  - Use a continuous temperature-recording device (e.g., a recording thermometer) for ambient air temperature monitoring during transit;

  AND
- For functionality at receipt:
  - Activate and then expose a TTI from the lot to ambient air temperature for sufficient time to determine whether it is functional (i.e., produces an alert indicator, such as a color change of the device).

» **How Often Will Monitoring Be Done (Frequency)?**

- For suitability of use:
  - The first shipment of a TTI model;

  AND
- For transportation conditions and functionality at receipt:
  - Every shipment.

» **Who Will Do the Monitoring?**

- For suitability of use:
  - Anyone with an understanding of TTI validation studies and of the intended conditions of use;

  AND
- For transportation conditions and functionality at receipt:
  - Anyone with an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Reject or return the shipment.

AND

Take the following corrective actions to regain control over the operation after a critical limit deviation:

- For suitability of use:
  - Discontinue use of the supplier until documentation of validation has been provided;

  AND
- For transportation conditions and functionality at receipt:
  - Discontinue use of the supplier or carrier until evidence is obtained that the identified production or transportation practices have been improved.

Establish a Recordkeeping System.

- For suitability of use:
  - Manufacturer's performance data;

  AND
- For transportation conditions:
  - Printouts, charts, or readings from continuous temperature-recording devices;

    AND
  - Records of visual checks of recorded data;

  AND
- For functionality at receipt:
  - Results of a TTI challenge test (i.e., whether the TTI produces an alert indicator, such as a color change of the device, when exposed to time and temperature abuse).

Establish Verification Procedures.

- Check the accuracy of temperature-recording devices that are used for monitoring transit conditions, for all new suppliers and at least quarterly for each supplier thereafter. Additional checks may be warranted based on observations at receipt (e.g., refrigeration units appear to be in poor repair or readings appear to be erroneous). The accuracy of the device can be checked by comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

  AND
- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

2B. UNACTIVATED TTI STORAGE

Set Critical Limits.

- The combination of storage conditions (e.g., temperature) that prevent loss of functionality throughout storage (based on manufacturer's specifications).

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- Storage air temperature, where temperature affects functionality of the TTI;

  AND/OR

- Other storage conditions that affect functionality of the TTI.

» **How Will Monitoring Be Done?**

- For temperature:
  - Use a continuous temperature-recording device (e.g., a recording thermometer);

  AND/OR

- For other conditions:
  - Use instruments appropriate for the purpose.

» **How Often Will Monitoring Be Done (Frequency)?**

- For temperature:
  - Continuous monitoring by the device itself, with a visual check of the recorded data at least once per day;

  AND/OR

- For other conditions:
  - With sufficient frequency to ensure control.

» **Who Will Do the Monitoring?**

- With continuous temperature-recording devices:
  - Monitoring is performed by the device itself. The visual check of the data generated by the device, to ensure that the critical limits have been met consistently, may be performed by any person who has an understanding of the nature of the controls;

  AND

- For other checks:
  - Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a TTI involved in a critical limit deviation:

- Destroy the lot of TTIs.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Make repairs or adjustments to the malfunctioning cooler;

  AND/OR

- Make other repairs or adjustment appropriate for the condition.

Establish a Recordkeeping System.

- For refrigerated storage:
  - Printouts, charts, or readings from continuous temperature-recording devices;

    AND
  - Record of visual checks of recorded data;

  AND/OR

- Storage record showing the results of monitoring of other conditions.

Establish Verification Procedures.

- Before a temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
  - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

    OR
  - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

AND

- Once in service, check the temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

AND

- Calibrate the temperature-recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- Perform other instrument calibration, as appropriate;

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

2C. APPLICATION AND ACTIVATION OF TTI

Set Critical Limits.

- Each consumer package has an activated TTI.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- Packages for the presence of an activated TTI.

» **How Will Monitoring Be Done?**

- Visual examination.

» **How Often Will Monitoring Be Done (Frequency)?**

- Representative number of packages from each lot of product.

» **Who Will Do the Monitoring?**

- Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Hold the lot below 38°F (3.3°C) until TTIs are applied and activated.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Identify and correct the cause of the TTI application or activation deficiency.

Establish a Recordkeeping System.

- Packaging control record that shows the results of the TTI checks.

Establish Verification Procedures.

- Review monitoring and corrective action records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

2D. REFRIGERATED FINISHED PRODUCT STORAGE

Follow the guidance for "Control Strategy Example 1 - Smoking (1d - Refrigerated Finished Product Storage)," except that the where the critical limits list 40°F (4.4°C), they should list 38°F (3.3°C).

2E. RECEIPT OF PRODUCTS BY SECONDARY PROCESSOR

Follow the guidance for "Control Strategy Example 1 - Smoking (1e - Receipt of Products by Secondary Processor)," except that the where the critical limits list 40°F (4.4°C), they should list 38°F (3.3°C).

TABLE 13-2

CONTROL STRATEGY EXAMPLE 2 - REFRIGERATION WITH TTI

This table is an example of a portion of a HACCP plan using "Control Strategy Example 2 - Refrigeration With TTI." This example illustrates how a processor of refrigerated, vacuum-packaged, raw fish fillets can control C. botulinum toxin formation. It is provided for illustrative purposes only.

C. Botulinum toxin formation may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., aquaculture drugs, environmental chemical contaminants and pesticides, parasites, growth of other pathogenic bacteria, and metal fragments).

Example Only
See Text for Full Recommendations

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
CRITICAL CONTROL POINT	SIGNIFICANT HAZARD(S)	CRITICAL LIMITS FOR EACH PREVENTIVE MEASURE	MONITORING				CORRECTIVE ACTION(S)	RECORDS	VERIFICATION
			WHAT	HOW	FREQUENCY	WHO			
Receipt of TTI	C. botulinum toxin formation in the finished product	TTI is suitable for use	Performance data from the manufacturer	Review of performance data	First shipment of a TTI model	Quality assurance supervisor	Reject the shipment Discontinue use of the supplier until appropriate validation documentation is provided	Manufacturer's performance data	Review monitoring, corrective action records within 1 week of preparation
		All lots received are accompanied by truck records that show temperature was maintained at or below 40°F	Truck temperature	Digital time and temperature data logger	Continuous, with visual review and evaluation of temperature-monitoring records for each shipment	Receiving employee	Discontinue use of the supplier or carrier until evidence is obtained that the identified transportation- handling practices have been improved Reject the shipment	Receiving record	Check the data logger for all new suppliers and for all suppliers at least quarterly thereafter Review monitoring, corrective action records within 1 week of preparation
		The TTI functions at receipt	The ability of the TTI to change color when exposed to room air temperature	Expose a TTI from the lot to room air temperature for sufficient time to determine whether it changes color	Every shipment	Quality assurance staff	Discontinue use of the supplier or carrier until evidence is obtained that the identified production or transportation-handling practices have been improved	TTI challenge record	Review monitoring, corrective action records within 1 week of preparation

TABLE 13-2

CONTROL STRATEGY EXAMPLE 2 - REFRIGERATION WITH TTI

This table is an example of a portion of a HACCP plan using "Control Strategy Example 2 - Refrigeration With TTI." This example illustrates how a processor of refrigerated, vacuum-packaged, raw fish fillets can control C. botulinum toxin formation. It is provided for illustrative purposes only.

C. Botulinum toxin formation may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., aquaculture drugs, environmental chemical contaminants and pesticides, parasites, growth of other pathogenic bacteria, and metal fragments).

CRITICAL CONTROL POINT	SIGNIFICANT HAZARD(S)	CRITICAL LIMITS FOR EACH PREVENTIVE MEASURE	MONITORING				CORRECTIVE ACTION(S)	RECORDS	VERIFICATION
			WHAT	HOW	FREQUENCY	WHO			
Finished product storage	C. botulinum toxin formation during finished product storage	Maximum cooler temperature 38°F	Cooler air temperature	Digital data logger	Continuous, with visual check of recorded data once per day	Production employee	Adjust or repair cooler Hold and evaluate the product based on time and temperature of exposure	Digital logger printout	Check the data logger for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Review monitoring, corrective action, and verification records within 1 week of preparation

*Note: The critical limits in this example are for illustrative purposes only and are not related to any recommended process.

- **CONTROL STRATEGY EXAMPLE 3 - FROZEN WITH LABELING**

Set Critical Limits.

- All finished product labels must contain a "keep frozen" statement (e.g., "Important, keep frozen until used, thaw under refrigeration immediately before use").

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- Finished product labels for the presence of a "keep frozen" statement.

» **How Will Monitoring Be Done?**

- Visual examination.

» **How Often Will Monitoring Be Done (Frequency)?**

- Representative number of packages from each lot of product.

» **Who Will Do the Monitoring?**

- Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Segregate and relabel any improperly labeled product.

AND

Take the following corrective actions to regain control over the operation after a critical limit deviation:

- Segregate and return or destroy any label stock or pre-labeled packaging stock that does not contain the proper statement;

  AND

- Determine and correct the cause of improper labels.

Establish a Recordkeeping System.

- Record of labeling checks.

Establish Verification Procedures.

- Review monitoring and corrective action records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

TABLE 13-3

CONTROL STRATEGY EXAMPLE 3 - FROZEN WITH LABELING

- **CONTROL STRATEGY EXAMPLE 4 - PICKLING AND SALTING**

This control strategy should include the following elements, as appropriate:

a. Brining, pickling, salting, and formulation;

b. Refrigerated finished product storage;

c. Receipt of Product by secondary processor.

4A. BRINING, PICKLING, SALTING, AND FORMULATION

Set Critical Limits.

- The minimum or maximum values for the critical factors of the brining, pickling, or formulation process established by a scientific study. The critical factors are those that are necessary to ensure that the finished product has:

For refrigerated, reduced oxygen-packaged fishery products:

- A water phase salt level of at least 5%;

  OR

- A pH of 5.0 or below;

  OR

- A water activity of below 0.97;

  OR

- A water phase salt level of at least 2.4% in surimi-based products, when combined with a pasteurization process in the finished product container of 185°F (85°C) for 15 minutes (pasteurization controls are covered in Chapter 16);

  OR

- A combination of water phase salt, pH, and/or water activity that, when combined, have been demonstrated to prevent the growth of *C. botulinum* type E and non-proteolytic types B and F.

For unrefrigerated (shelf-stable), reduced oxygen-packaged products:

- A water phase salt level of at least 20% (based on the maximum salt level for growth of *S. aureus*);

  OR

- A pH of 4.6 or below;

  OR

- A water activity of 0.85 or below (based on the minimum water activity for growth and toxin formation of *S. aureus*).

A heat treatment, addition of chemical additives, or other treatment may be necessary to inhibit or eliminate spoilage organisms (e.g., mold) in shelf-stable products.

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- The critical factors of the established pickling, brining, or formulation process. These may include: brine and acid strength; brine or acid to fish ratio; brining and pickling time; brine and acid temperature; thickness, texture, fat content, quality, and species of fish;

  OR

- The water phase salt, pH, and/or water activity of the finished product.

» **How Will Monitoring Be Done?**

- For brine strength:
  - Use a salinometer;

  AND

- For acid strength:
  - Use a pH meter or titrate for acid concentration;

  AND

- For brine/acid temperature:
  - Use a temperature-indicating device (e.g., a thermometer);

  AND

- For all other critical factors specified by the study:
  - Use equipment appropriate for the measurement;

  OR
- For water phase salt, pH, and/or water activity:
  - Collect a representative sample of the finished product, and conduct water phase salt, pH, and/or water activity analysis, as appropriate.

» **How Often Will Monitoring Be Done (Frequency)?**

- For brine and acid strength:
  - At the start of each brining, pickling, and formulation process;

  AND
- For brine and acid temperature:
  - At the start of each brining, pickling, and formulation process and at least every 2 hours thereafter;

  AND
- For brine or acid to fish ratio:
  - At the start of each brining, pickling, and formulation process;

  AND
- For other critical factors specified by the study:
  - As often as necessary to maintain control;

  OR
- Water phase salt, pH, and/or water activity analysis should be determined for each batch of finished product.

» **Who Will Do the Monitoring?**

- For water activity:
  - Any person with sufficient training to perform the analysis;

  OR
- For other checks:
  - Any person with an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Chill and hold the product until it can be evaluated based on its water phase salt, pH, and/or water activity level;

  OR
- Reprocess the product (if reprocessing does not jeopardize the safety of the product);

  OR
- Divert the product to a use in which the critical limit is not applicable (e.g., packaging that is not hermetically sealed, or a LACF, or a frozen product);

  OR
- Divert the product to a non-food use;

  OR
- Destroy the product.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Adjust the brine or acid strength or brine or acid to fish ratio;

  OR
- Extend the brining or pickling time to compensate for an improper brine or acid temperature.

Establish a Recordkeeping System.

- Records, as necessary, to document the monitoring of the critical factors of the brining or pickling process, as established by a study (e.g., a processing record showing the results of the brine or acid strength and temperature, brine or acid to fish ratio, size and species of fish, time of brining or pickling);

  OR
- Record of determinations of the finished product water phase salt, pH, or water activity.

Establish Verification Procedures.

- Process validation study (except where water phase salt, pH, or water activity analysis of the finished product is the monitoring procedure):
    - The adequacy of the pickling, brining, and formulation process steps should be established by a scientific study. For refrigerated, reduced oxygen-packaged products, it should be designed to consistently achieve: a water phase salt level of at least 5%; a pH of 5.0 or below; a water activity of below 0.97; a water phase salt level of at least 2.4% in surimi-based products, when combined with a pasteurization process in the finished product container of 185°F (85°C) for at least 15 minutes; or a combination of salt, pH, and/or water activity that, when combined, prevent the growth of *C. botulinum* type E and non-proteolytic types B and F (established by a scientific study). For unrefrigerated (shelf-stable), reduced oxygen-packaged products, it should be designed to consistently achieve: a water phase salt level of at least 20% (based on the maximum water phase salt level for the growth of *S. aureus*); a pH of 4.6 or below; or a water activity of 0.85 or below (based on the minimum water activity for the growth of *S. aureus*). Expert knowledge of pickling, brining, and formulation processes may be required to establish such a process. Such knowledge can be obtained by education or experience, or both. Establishment of pickling, brining, and formulation processes may require access to adequate facilities and the application of recognized methods. In some instances, pickling, brining, and formulation studies may be required to establish minimum processes. In other instances, existing literature, which establishes minimum processes, is available. Characteristics of the process and/or product that affect the ability of the established minimum pickling, brining, and formulation process should be taken into consideration in the process establishment. A record of the process establishment should be maintained;

AND

- Before a temperature-indicating device (e.g., a thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
    - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

      OR
    - Immersing the sensor in boiling water (212°F (100°C)) if the device will be used at or near the boiling point. Note that the temperature should be adjusted to compensate for altitude, when necessary);

      OR
    - Doing a combination of the above if the device will be used at or near room temperature;

      OR
    - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a NIST-traceable thermometer) under conditions that are similar to how it will be used (e.g., brine temperature) within the temperature range at which it will be used;

  AND
- Once in service, check the temperature-indicating device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your

facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational;

AND

- Calibrate the temperature-indicating device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable device). Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- Perform daily calibration of pH meters against standard buffers;

AND

- Perform other calibration procedures as necessary to ensure the accuracy of the monitoring instruments;

AND

- Do finished product sampling and analysis to determine water phase salt, pH, or water activity level, as appropriate, at least once every 3 months (except where such testing is performed as part of monitoring);

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

4B. REFRIGERATED FINISHED PRODUCT STORAGE

Follow the guidance for "Control Strategy Example 1 - Smoking (1d - Refrigerated Finished Product Storage)."

4C. RECEIPT OF PRODUCT BY SECONDARY PROCESSOR

Follow the guidance for "Control Strategy Example 1 - Smoking (1e - Receipt of Product by Secondary Processor)."

TABLE 13-4

CONTROL STRATEGY EXAMPLE 4 - PICKLING AND SALTING

This table is an example of a portion of a HACCP plan using "Control Strategy Example 4 - Pickling and Salting." This example illustrates how a pickled herring processor can control C. botulinum toxin formation. It is provided for illustrative purposes only.

C. botulinum toxin formation may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., histamine, environmental and chemical contaminants and pesticides, parasites, and metal fragments).

NOTES:

CHAPTER 14: **Pathogenic Bacteria Growth and Toxin Formation as a Result of Inadequate Drying**

This guidance represents the Food and Drug Administration's (FDA's) current thinking on this topic. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. You can use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations. If you want to discuss an alternative approach, contact the FDA staff responsible for implementing this guidance. If you cannot identify the appropriate FDA staff, call the telephone number listed on the title page of this guidance.

UNDERSTAND THE POTENTIAL HAZARD.

Pathogenic bacteria growth and toxin formation in the finished product as a result of inadequate drying of fishery products can cause consumer illness. The primary pathogens of concern are *Staphylococcus aureus* (*S. aureus*) and *Clostridium botulinum* (*C. botulinum*). See Appendix 7 for a description of the public health impacts of these pathogens.

- **Control by Drying**

Dried products are usually considered shelf stable and are, therefore, often stored and distributed unrefrigerated. Examples of shelf-stable dried fish products are salmon jerky, octopus chips, dried shrimp, stock fish, and shark cartilage. The characteristic of dried foods that makes them shelf stable is their low water activity (A_w). Water activity is the measure of the amount of water in a food that is available for the growth of microorganisms, including pathogenic bacteria. A water activity of 0.85 or below will prevent the growth and toxin production of all pathogenic bacteria, including *S. aureus* and *C. botulinum*, and is critical for the safety of a shelf-stable dried product. *S. aureus* grows at a lower water activity than other pathogenic bacteria, and should, therefore, be considered the target pathogen for drying for shelf-stable products.

You should select a packaging material that will prevent rehydration of the product under the expected conditions of storage and distribution. Additionally, finished product package closures should be free of gross defects that could expose the product to moisture during storage and distribution. Chapter 18 provides guidance on control of container closures.

Some dried products that are reduced oxygen packaged (e.g., vacuum packaged, modified atmosphere packaged) are dried only enough to control growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F (i.e., types that will not form toxin with a water activity of below 0.97). These dried products are then refrigerated to control growth and toxin formation by *C. botulinum* type A and proteolytic types B and F and by other pathogenic bacteria that may be present in the product, including *S. aureus*. The products might have the appearance of a fully dried product. Therefore, their packaging should include "keep refrigerated" labeling to ensure that temperature controls are applied throughout distribution.

Distributing partially dried, reduced oxygen packaged products frozen also could be used to control these pathogens. However, labeling with "keep frozen" instructions would then be important to ensure food safety. More information on *C. botulinum* and reduced oxygen packaging is contained in Chapter 13.

This chapter does not cover the growth of pathogenic bacteria, including *S. aureus*, which may occur as a result of time and temperature

abuse during processing, including before or during the drying process. That hazard is covered in Chapter 12. It also does not cover the control of *C. botulinum* type A and proteolytic types B and F and that of other pathogenic bacteria that may be present, including *S. aureus,* during refrigerated storage of reduced oxygen packaged, partially dried products. That hazard is covered in Chapters 12 and 13, respectively.

Controlling pathogenic bacteria growth and toxin formation by drying is best accomplished by:

- Scientifically establishing a drying process that reduces the water activity to 0.85 or below if the product will be stored and distributed unrefrigerated (shelf stable). Note that a heat treatment, addition of chemical additives, further drying, or other treatment may be necessary to inhibit or eliminate spoilage organisms, for example, mold;
- Scientifically establishing a drying process that reduces the water activity to below 0.97 if the product will be stored refrigerated (not frozen) in reduced oxygen packaging;
- Designing and operating the drying equipment so that every unit of a product receives at least the established minimum process;
- Packaging the finished product in a container that will prevent rehydration.

The drying operation used in the production of smoked or smoke-flavored fish is not designed to result in a finished product water activity of 0.85 or below. The controls for these products are described in Chapter 13.

Because spores of *C. botulinum* are known to be present in the viscera of fish, any product that will be preserved by salting, drying, pickling, or fermentation should be eviscerated prior to processing (see the "Compliance Policy Guide," Sec. 540.650). Without evisceration, toxin formation is possible during the process even with strict control of temperature. Evisceration should be thorough and performed to minimize contamination of the fish flesh. If even a portion of the viscera or its contents is left behind, the risk of toxin formation by *C. botulinum* remains. Small fish, less than 5 inches in length, that are processed in a manner that eliminates preformed toxin and prevents toxin formation and that reach (1) a water phase salt content of 10%, a value based on the control of *C. botulinum* type A and proteolytic types B and F, in refrigerated products; or (2) a water activity of 0.85 or below (note that this is a value based on the minimum water activity for toxin production by *S. aureus*, in shelf-stable products); or (3) a pH (acidity) level of 4.6 or less in shelf-stable products are not subject to the evisceration recommendation.

- **Strategies for controlling pathogenic bacteria growth**

Pathogens can enter the process on raw materials. They can also be introduced into foods during processing, from the air, unclean hands, insanitary utensils and equipment, contaminated water, and sewage. There are a number of strategies for the control of pathogenic bacteria in fish and fishery products. They include:

- Controlling the amount of moisture that is available for pathogenic bacteria growth (water activity) in the product by drying (covered in this chapter);
- Controlling the amount of moisture that is available for pathogenic bacteria growth (water activity) in the product by formulation (covered in Chapter 13);
- Controlling the amount of salt or preservatives, such as sodium nitrite, in the product (covered in Chapter 13);
- Controlling the pH in the product (covered by the Acidified Foods regulation, 21 CFR 114, for shelf-stable acidified products, and by Chapter 13 for refrigerated acidified products);
- Controlling the source of molluscan shellfish and the time from exposure to air (e.g., by harvest or receding tide) to refrigeration to control pathogens from the harvest area (covered in Chapter 12);

- Controlling the introduction of pathogenic bacteria after the pasteurization process (covered in Chapter 18);
- Managing the amount of time that food is exposed to temperatures that are favorable for pathogenic bacteria growth and toxin production (covered generally in Chapter 12; for *C. botulinum*, in Chapter 13; and for *S. aureus* in hydrated batter mixes, in Chapter 15);
- Killing pathogenic bacteria by cooking or pasteurization (covered in Chapter 16) or by retorting (covered by the Thermally Processed Low-Acid Foods Packaged in Hermetically Sealed Containers regulation, 21 CFR 113 (called the Low-Acid Canned Foods Regulation in this guidance document));
- Killing pathogenic bacteria by processes that retain raw product characteristics (covered in Chapter 17).

DETERMINE WHETHER THE POTENTIAL HAZARD IS SIGNIFICANT.

The following guidance will assist you in determining whether pathogenic bacteria growth and toxin formation as a result of inadequate drying is a significant hazard at a processing step:

1. For shelf-stable, dried products, is it reasonably likely that *S. aureus* will grow and form toxin in the finished product if the product is inadequately dried?

   Table A-1 (Appendix 4) provides information on the conditions under which *S. aureus* will grow. If your food that is not distributed refrigerated or frozen and meets these conditions (i.e., in Table A-1) before drying, then drying will usually be important to the safety of the product, because it provides the barrier to *S. aureus* growth and toxin formation. Under ordinary circumstances, it would be reasonably likely that *S. aureus* will grow and form toxin in such products during finished product storage and distribution if drying is not properly performed. Note that drying to control toxin formation by *S. aureus* will also control toxin formation by *C. botulinum* in these products.

2. For shelf-stable, dried products, can *S. aureus* toxin formation that is reasonably likely to occur be eliminated or reduced to an acceptable level at this processing step?

   Pathogenic bacteria growth and toxin formation as a result of inadequate drying should also be considered a significant hazard at any processing step where a preventive measure is, or can be, used to eliminate the hazard of *S. aureus* toxin formation (or reduce the likelihood of its occurrence to an acceptable level) if it is reasonably likely to occur. The preventive measure that can be applied for pathogenic bacteria growth and toxin formation as a result of inadequate drying are:

   - Proper design and control of the drying process (covered in this chapter);

3. For refrigerated or frozen, partially dried (i.e., not shelf stable) products, is it reasonably likely that *C. botulinum* type E and nonproteolytic types B and F will grow and form toxin in the finished product if the product is inadequately dried?

   Table A-1 (Appendix 4) provides information on the conditions under which *C. botulinum* type E and non-proteolytic types B and F will grow. Because of the need to prevent rehydration of dried products, these products generally will be contained in a reduced oxygen package. If your refrigerated (not frozen), reduced oxygen packaged food meets these conditions (i.e., Table A-1) before drying, then drying will usually be important to the safety of the product, because it provides the barrier to growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F. Note that refrigeration will control toxin formation by *S. aureus* and *C. botulinum* type A and non-proteolytic types B and F in these products. Under ordinary

circumstances, it would be reasonably likely that *C. botulinum* type E and non-proteolytic types B and F will grow and form toxin in such products during finished product storage and distribution if drying is not properly performed. In addition, controlling labeling (e.g., "keep refrigerated" labeling) to ensure that the product is held refrigerated throughout distribution may be important to the safety of the product, because the product may appear to retailers, consumers, and end users to be shelf stable.

However, if your dried, reduced oxygen packaged product is distributed frozen, then freezing may provide the barrier to growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F, rather than drying. In this case, labeling to ensure that the product is distributed frozen may be important to the safety of the product. Chapter 13 provides guidance on labeling controls to ensure that frozen product that supports the growth of non-proteolytic *C. botulinum* is distributed frozen.

4. For refrigerated or frozen, partially dried, reduced oxygen packaged dried products, can growth and toxin formation by *C. botulinum* type E and non-proteolytic types B and F that are reasonably likely to occur be eliminated or reduced to an acceptable level at this processing step?

   Pathogenic bacteria growth and toxin formation as a result of inadequate drying should be considered a significant hazard at any processing step where a preventive measure is, or can be, used to eliminate the hazard (or reduce the likelihood of its occurrence to an acceptable level) if it is reasonably likely to occur. The preventive measures that can be applied for pathogenic bacteria growth and toxin formation as a result of inadequate drying for refrigerated or frozen, partially dried, reduced oxygen packaged products are:

   - Proper design and control of the drying process (covered in this chapter);
   - Refrigeration (covered in Chapter 12) and labeling to ensure that the product is held refrigerated throughout distribution (covered in this chapter);
   - Freezing (Chapter 13 provides guidance on labeling controls to ensure that a frozen product that otherwise supports the growth of non-proteolytic *C. botulinum* is distributed frozen).

- **Intended use**

Because of the highly stable nature of *S. aureus* toxin and the extremely toxic nature of *C. botulinum* toxin, it is unlikely that the intended use will affect the significance of the hazard.

IDENTIFY CRITICAL CONTROL POINTS.

The following guidance will assist you in determining whether a processing step is a critical control point (CCP) for pathogenic bacteria growth and toxin formation as a result of inadequate drying:

1. If you identified the hazard of pathogenic bacteria growth and toxin formation as a result of inadequate drying as significant because drying (rather than, or in addition to, refrigeration) is important to the safety of the product, you should identify the drying step as a CCP for this hazard.

   Example:

   A salmon jerky processor that distributes the product unrefrigerated should set the CCP for controlling the hazard of pathogenic bacteria growth and toxin formation as a result of inadequate drying at the drying step. The processor would not need to identify the processing steps prior to drying as CCPs for that hazard. However, these steps may be CCPs for the control of other hazards, such as the growth of pathogenic bacteria as a result of time and temperature abuse during processing, covered by Chapter 12.

This control approach is a control strategy referred to in this chapter as "Control Strategy Example 1 - Control by Drying."

2. If you identified the hazard of pathogenic bacteria growth and toxin formation as a result of inadequate drying as significant because refrigeration (in addition to drying) is important to the safety of the product, you should identify the finished product storage step and the labeling step, where you will ensure that the "keep refrigerated" labeling is included on every package, as a CCP, for this hazard.

   Example:

   A partially dried catfish processor that distributes the product refrigerated and reduced oxygen packaged should set the CCPs for controlling the hazard of pathogenic bacteria growth and toxin formation as a result of inadequate drying at the drying step, finished product labeling step, and finished product storage step. The processor would not need to identify the processing steps prior to drying as CCPs for that hazard. However, these steps may be CCPs for the control of other hazards, such as the growth of pathogenic bacteria as a result of time and temperature abuse during processing, covered by Chapter 12.

The control by drying is covered in "Control Strategy Example 1 - Control by Drying." Control of labeling is referred to in this chapter as "Control Strategy Example 2 - Control by Refrigeration With Labeling." It should be used along with "Control Strategy Example 1 - Control by Drying." Note that control of refrigerated finished product storage is covered in Chapter 12. Note also that Chapter 13 provides guidance on labeling controls to ensure that a frozen product that otherwise supports the growth of non-proteolytic *C. botulinum* is distributed frozen.

DEVELOP A CONTROL STRATEGY.

The following guidance provides examples of two control strategies for pathogenic bacteria growth and toxin formation that occurs as a result of inadequate drying. It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation. It is important to note that you may select a control strategy that is different from those that are suggested, provided it complies with the requirements of the applicable food safety laws and regulations.

The following are examples of control strategies included in this chapter:

CONTROL STRATEGY	MAY APPLY TO PRIMARY PROCESSOR	MAY APPLY TO SECONDARY PROCESSOR
Control by drying	✓	✓
Control by refrigeration with labeling	✓	✓

- **CONTROL STRATEGY EXAMPLE 1 - CONTROL BY DRYING**

It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation.

Set Critical Limits.

- The minimum or maximum values for the critical factors established by a scientific study (i.e., for shelf-stable products, those which must be met in order to ensure that the finished product has a water activity of 0.85 or below; for refrigerated (not frozen), reduced oxygen packaged products, those which must be met in order to ensure that the finished product has a water activity of less than 0.97). These will likely include drying time, input/output air temperature, humidity, and velocity, as well as flesh thickness. Other critical factors that affect the rate of drying of the product may also be established by the study;

OR

- The minimum percent weight loss established by a scientific study (i.e., for shelf-stable products, that which must be met in order to ensure that the finished product has a water activity of 0.85 or below; for refrigerated (not frozen), reduced oxygen packaged products, that which must be met in order to ensure that the finished product has a water activity of less than 0.97);

OR

- For shelf-stable products:
  - Maximum finished product water activity of 0.85 or above;

OR

- For refrigerated (not frozen), reduced oxygen packaged products:
  - Maximum finished product water activity of less than 0.97.

Note: A heat treatment, addition of chemical additives, further drying, or other treatment may be necessary to inhibit or eliminate spoilage organisms (e.g., mold) in shelf-stable products.

Establish Monitoring Procedures.

» What Will Be Monitored?

- Critical factors of the established drying process that affect the ability of the process to ensure the desired finished product water activity (i.e., 0.85 or below for shelf-stable products, less than 0.97 for refrigerated (not frozen), reduced oxygen packaged products). These may include drying time, air temperature, humidity, and velocity, as well as flesh thickness;

OR

- Percent weight loss;

OR

- Water activity of the finished product.

» How Will Monitoring Be Done?

For batch drying equipment:

- For drying time and input/output air temperature:
  - Use a continuous temperature-recording device (e.g., a recording thermometer);

AND

- For all other critical factors specified by the study:
  - Use equipment appropriate for the measurement;

OR

- For percent weight loss:
  - Weigh all, or a portion, of the batch before and after drying;

OR

- For water activity analysis:
  - Collect a representative sample of the finished product and conduct water activity analysis.

For continuous drying equipment:

- For input/output air temperature:
  - Use a continuous temperature-recording device (e.g., a recording thermometer);

AND

- For drying time:
  - Measure:
    - The revolutions per minute (RPM) of the belt drive wheel, using a stopwatch or tachometer;

    OR

    - The time necessary for a test unit or belt marking to pass through the equipment, using a stopwatch;

AND

- For all other critical factors specified by the study:
  - Use equipment appropriate for the measurement;

OR

- For percent weight loss:
  - Weigh all, or a portion, of the batch before and after drying;

OR

- For water activity:
  - Collect a representative sample of the finished product and conduct water activity analysis.

» **How Often Will Monitoring Be Done (Frequency)?**

For batch drying equipment:

- For time and temperature:
  - Continuous monitoring, with a visual check of the recorded data at least once during each batch;

  AND
- For all other critical factors specified by the study:
  - As often as necessary to maintain control;

  OR
- For percent weight loss:
  - Each batch;

  OR
- For water activity:
  - Each batch.

For continuous drying equipment:

- For temperature:
  - Continuous monitoring, with a visual check of the recorded data at least once per day;

  AND
- For time:
  - At least once per day, and whenever any changes in belt speed are made;

  AND
- For all other critical factors specified by the study:
  - As often as necessary to maintain control;

  OR
- For percent weight loss:
  - Each lot of finished product;

  OR
- For water activity:
  - Each lot of finished product.

» **Who Will Do the Monitoring?**

- For continuous temperature-recording devices:
  - Monitoring is performed by the equipment itself. The visual check of the data generated by this equipment, to ensure that the critical limits have consistently been met, may be performed by any person who has an understanding of the nature of the controls;

  AND
- For all other critical factors specified by the study:
  - Any person who has an understanding of the nature of the controls;

  OR
- For percent weight loss:
  - Any person who has an understanding of the nature of the controls;

  OR
- For water activity:
  - Any person with sufficient training to perform the analysis.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Redry the product (provided that redrying does not present an unacceptable opportunity for pathogenic bacteria growth);

  OR
- Chill and hold the product for an evaluation of the adequacy of the drying process. The evaluation may involve water activity determination on a representative sample of the finished product. If the evaluation shows that the product has not received an adequate drying process, the product should be destroyed, diverted to a use in which

pathogenic bacteria growth in the finished product will be controlled by means other than drying, diverted to a non-food use, or redried;

OR

- Divert the product to a use in which the critical limit is not applicable because pathogenic bacteria growth in the finished product will be controlled by means other than drying (e.g., divert inadequately dried fish to a frozen fish operation);

OR

- Divert the product to a non-food use;

OR

- Destroy the product.

AND

Take the following corrective action to regain control over the operation after a critical limit deviation:

- Adjust the air temperature or velocity;

OR

- Adjust the length of the drying cycle to compensate for a temperature or velocity drop, humidity increase, or inadequate percent weight loss;

OR

- Adjust the belt speed to increase the length of the drying cycle.

Establish a Recordkeeping System.

For batch drying equipment:

- Record of continuous temperature monitoring;

AND

- Record of visual checks of recorded data;

AND

- Record of notation of the start time and end time of the drying periods;

AND

- Records that are appropriate for the other critical factors (e.g., a drying log that indicates input/output air humidity and/or velocity);

OR

- Record of weight before and after drying;

OR

- Record of water activity analysis.

For continuous drying equipment:

- Record of continuous temperature monitoring;

AND

- Record of visual checks of recorded data;

AND

- Drying log that indicates the RPM of the belt drive wheel or the time necessary for a test unit or belt marking to pass through the drier;

AND

- Records that are appropriate for the other critical factors (e.g., a drying log that indicates input/output air humidity and/or velocity);

OR

- Record of weight before and after drying;

OR

- Record of water activity analysis.

Establish Verification Procedures.

- Process validation study (except where a water activity analysis of the finished product is the monitoring procedure):
    - The adequacy of the drying process should be established by a scientific study. For shelf-stable products, the drying process should be designed to ensure the production of a shelf-stable product with a water activity of 0.85. For refrigerated (not frozen), reduced oxygen packaged products, it should be designed to ensure a finished product water activity of less than 0.97. Expert knowledge of drying process calculations and the dynamics of mass transfer in processing equipment may be required

to establish such a drying process. Such knowledge can be obtained by education or experience or both. Establishment of drying processes may require access to adequate facilities and the application of recognized methods. The drying equipment should be designed, operated, and maintained to deliver the established drying process to every unit of a product. In some instances, drying studies may be required to establish the minimum process. In other instances, existing literature that establishes minimum processes or adequacy of equipment is available. Characteristics of the process, product, and/or equipment that affect the ability to achive the established minimum drying process should be taken into consideration in the process establishment. A record of the process establishment should be maintained;

AND

- Finished product sampling and analysis to determine water activity at least once every 3 months (except where such testing is performed as part of monitoring);

  AND

- Before a temperature-recording device (e.g., a recording thermometer) is put into service, check the accuracy of the device to verify that the factory calibration has not been affected. This check can be accomplished by:
  - Immersing the sensor in an ice slurry (32°F (0°C)) if the device will be used at or near refrigeration temperature;

    OR
  - Immersing the sensor in boiling water (212°F (100°C)) if the device will be used at or near the boiling point. Note that the temperature should be adjusted to compensate for altitude, when necessary;

    OR
  - Doing a combination of the above if the device will be used at or near room temperature;

    OR
  - Comparing the temperature reading on the device with the reading on a known accurate reference device (e.g., a thermometer traceable to National Institute of Standards and Technology (NIST) standards) under conditions that are similar to how it will be used (e.g., air temperature) within the temperature range at which it will be used;

  AND

- Once in service, check the temperature-recording device daily before the beginning of operations. Less frequent accuracy checks may be appropriate if they are recommended by the instrument manufacturer and the history of use of the instrument in your facility has shown that the instrument consistently remains accurate for a longer period of time. In addition to checking that the device is accurate by one of the methods described above, this process should include a visual examination of the sensor and any attached wires for damage or kinks. The device should be checked to ensure that it is operational and, where applicable, has sufficient ink and paper;

  AND

- Calibrate the temperature-recording device against a known accurate reference device (e.g., a NIST-traceable thermometer) at least once a year or more frequently if recommended by the device manufacturer. Optimal calibration frequency is dependent upon the type, condition, past performance, and conditions of use of the device. Consistent temperature variations away from the actual value (drift) found during checks and/or calibration may show a need for more frequent calibration or the need to replace the device (perhaps with a more durable

device). For example, devices subjected to high temperatures for extended periods of time may require more frequent calibration. Calibration should be performed at a minimum of two temperatures that bracket the temperature range at which it is used;

AND

- Calibrate other instruments as necessary to ensure their accuracy;

AND

- Review monitoring, corrective action, and verification records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

TABLE 14-1

CONTROL STRATEGY EXAMPLE 1 - CONTROL BY DRYING

This table is an example of a portion of a Hazard Analysis Critical Control Point (HACCP) plan using "Control Strategy Example 1 - Control by Drying." This example illustrates how a processor of shelf-stable salmon jerky can control pathogenic bacteria growth and toxin formation as a result of inadequate drying. It is provided for illustrative purposes only. It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation.

Pathogenic bacteria growth and toxin formation as a result of inadequate drying may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., aquaculture drugs, environmental chemical contaminants and pesticides, parasites, and metal fragments).

Drying (forced convection oven)	Pathogenic bacteria growth and toxin formation	Minimum drying time: 5 hours	Drying time	Digital time and temperature data logger	Continuous, with visual check of recorded data each batch	Oven operator	Continue drying	Data logger printout	Documentation of drying process establishment Check the data logger for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Analyze the finished product sample once every 3 months for water activity Review of monitoring, corrective action and verification, records within 1 week of preparation

TABLE 14-1

CONTROL STRATEGY EXAMPLE 1 - CONTROL BY DRYING

This table is an example of a portion of a Hazard Analysis Critical Control Point (HACCP) plan using "Control Strategy Example 1 - Control by Drying." This example illustrates how a processor of shelf-stable salmon jerky can control pathogenic bacteria growth and toxin formation as a result of inadequate drying. It is provided for illustrative purposes only. It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation.

Pathogenic bacteria growth and toxin formation as a result of inadequate drying may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., aquaculture drugs, environmental chemical contaminants and pesticides, parasites, and metal fragments).

Example Only
See Text for Full Recommendations

(1)	(2)	(3)	(4)	(5)	(6)	(7)	(8)	(9)	(10)
CRITICAL CONTROL POINT	SIGNIFICANT HAZARD(S)	CRITICAL LIMITS FOR EACH PREVENTIVE MEASURE	MONITORING				CORRECTIVE ACTION(S)	RECORDS	VERIFICATION
			WHAT	HOW	FREQUENCY	WHO			
Drying (forced convection oven)	Pathogenic bacteria growth and toxin formation	Minimum oven temperature: 140°F To achieve a final water activity of 0.85 or less	Oven air input temperature	Digital time and temperature data logger	Continuous, with visual check of recorded data each batch	Oven operator	Extend drying process Segregate the product and hold under refrigeration for evaluation Evaluate by performing water activity analysis on finished product Redry if less than 0.85	Data logger printout	Documentation of drying process establishment Check the data logger for accuracy and damage and to ensure that it is operational before putting into operation; check it daily, at the beginning of operations; and calibrate it once per year Analyze the finished product sample once every 3 months for water activity Review of monitoring, corrective action and verification, records within 1 week of preparation

- **CONTROL STRATEGY EXAMPLE 2 - CONTROL BY REFRIGERATION WITH LABELING**

It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation.

Set Critical Limits.

- All finished product labels must contain a "keep refrigerated" statement (e.g., "Important, keep refrigerated until used").

Establish Monitoring Procedures.

» **What Will Be Monitored?**

- Finished product labels for presence of "keep refrigerated" statement.

» **How Will Monitoring Be Done?**

- Visual examination.

» **How Often Will Monitoring Be Done (Frequency)?**

- Representative number of packages from each lot of a finished product.

» **Who Will Do the Monitoring?**

- Any person who has an understanding of the nature of the controls.

Establish Corrective Action Procedures.

Take the following corrective action to a product involved in a critical limit deviation:

- Segregate and relabel any improperly labeled product.

AND

Take the following corrective actions to regain control over the operation after a critical limit deviation:

- Segregate and return or destroy any label stock or pre-labeled packaging stock that does not contain the proper statement;

AND

- Determine and correct the cause of improper labels.

Establish a Recordkeeping System.

- Record of labeling checks.

Establish Verification Procedures.

- Review monitoring and corrective action records within 1 week of preparation to ensure they are complete and any critical limit deviations that occurred were appropriately addressed.

TABLE 14-2

CONTROL STRATEGY EXAMPLE 2 - CONTROL BY REFRIGERATION WITH LABELING

This table is an example of a portion of a HACCP plan using "Control Strategy Example 2 - Control by Refrigeration With Labeling." This example illustrates how a processor of refrigerated, partially dried catfish can control pathogenic bacteria growth and toxin formation as a result of inadequate drying. It is provided for illustrative purposes only. It may be necessary to select more than one control strategy in order to fully control the hazard, depending upon the nature of your operation.

Pathogenic bacteria growth and toxin formation as a result of inadequate drying may be only one of several significant hazards for this product. Refer to Tables 3-2 and 3-4 (Chapter 3) for other potential hazards (e.g., environmental chemical contaminants and pesticides and metal fragments).

Example Only
See Text for Full Recommendations

APPENDIX 4: **Bacterial Pathogen Growth and Inactivation**

This guidance represents the Food and Drug Administration's (FDA's) current thinking on this topic. It does not create or confer any rights for or on any person and does not operate to bind FDA or the public. You can use an alternative approach if the approach satisfies the requirements of the applicable statutes and regulations. If you want to discuss an alternative approach, contact the FDA staff responsible for implementing this guidance. If you cannot identify the appropriate FDA staff, call the telephone number listed on the title page of this guidance.

This appendix contains information on the growth and inactivation of bacterial pathogens.

Table A-1 contains information on the minimum water activity (a_w), acidity (pH), and temperature; the maximum, pH, water phase salt, and temperature; and oxygen requirements that will sustain growth for the bacterial pathogens that are of greatest concern in seafood processing. Data shown are the minimum or maximum values, the extreme limits reported among the references cited. These values may not apply to your processing conditions.

Table A-2 contains information on maximum, cumulative time and internal temperature combinations for exposure of fish and fishery products that, under ordinary circumstances, will be safe for the bacterial pathogens that are of greatest concern in seafood processing. These maximum, cumulative exposure times are derived from published scientific information.

Because the nature of bacterial growth is logarithmic, linear interpolation using the time and temperature guidance may not be appropriate. Furthermore, the food matrix effects bacterial growth (e.g., presence of competing microorganisms, available nutrients, growth restrictive agents). Consideration of such attributes is needed when using the information in Tables A-1 and A-2.

In summary, Table A-2 indicates that:

For raw, ready-to-eat products:

- If at any time the product is held at internal temperatures above 70°F (21.1°C), exposure time (i.e., time at internal temperatures above 50°F (10°C) but below 135ºF (57.2ºC)) should be limited to 2 hours (3 hours if *Staphylococcus aureus* (*S. aureus*) is the only pathogen of concern),

  OR

  Alternatively, exposure time (i.e., time at internal temperatures above 50°F (10°C) but below 135ºF (57.2ºC)) should be limited to 4 hours, as long as no more than 2 of those hours are between 70°F (21.1°C) and 135ºF (57.2ºC);

OR

- If at any time the product is held at internal temperatures above 50°F (10°C) but never above 70°F (21.1°C), exposure time at internal temperatures above 50°F (10°C) should be limited to 5 hours (12 hours if *S. aureus* is the only pathogen of concern);

OR

- The product is held at internal temperatures below 50°F (10°C) throughout processing,

  OR

  Alternatively, the product is held at ambient air temperatures below 50°F (10°C) throughout processing.

For cooked, ready-to-eat products:

- If at any time the product is held at internal temperatures above 80°F (26.7°C), exposure time (i.e., time at internal temperatures above 50°F (10°C) but below 135ºF (57.2ºC)) should be limited to 1 hour (3 hours if *S. aureus* is the only pathogen of concern),

  OR

Alternatively, if at any time the product is held at internal temperatures above 80°F (26.7°C), exposure time (i.e., time at internal temperatures above 50°F (10°C) but below 135°F (57.2°C)) should be limited to 4 hours, as long as no more than 1 of those hours is above 70°F (21.1°C);

OR

- If at any time the product is held at internal temperatures above 70°F (21.1°C) but never above 80°F (26.7°C), exposure time at internal temperatures above 50°F (10°C) should be limited to 2 hours (3 hours if *S. aureus* is the only pathogen of concern),

  OR

  Alternatively, if the product is never held at internal temperatures above 80°F (26.7°C), exposure times at internal temperatures above 50°F (10°C) should be limited to 4 hours, as long as no more than 2 of those hours are above 70°F (21.1°C);

OR

- If at any time the product is held at internal temperatures above 50°F (10°C) but never above 70°F (21.1°C), exposure time at internal temperatures above 50°F (10°C) should be limited to 5 hours (12 hours if *S. aureus* is the only pathogen of concern);

OR

- The product is held at internal temperatures below 50°F (10°C) throughout processing,

  OR

  Alternatively, the product is held at ambient air temperatures below 50°F (10°C) throughout processing.

Note that the preceding recommended critical limits do not address internal product temperatures between 40°F (4.4°C), the recommended maximum storage temperature for refrigerated fish and fishery products, and 50°F (10°C). That is because growth of foodborne pathogenic bacteria is very slow at these temperatures and the time necessary for significant growth is longer than would be reasonably likely to occur in most fish and fishery product processing steps. However, if you have processing steps that occur at these temperatures that approach the maximum cumulative exposure times listed in Table A-2 below for the pathogenic bacteria of concern in your product, you should consider development of a critical limit for control at these temperatures.

It is not possible to furnish recommendations for each pathogenic bacteria, process, type of fish and fishery product, and temperature or combination of temperatures. Programmable models to predict growth rates for certain pathogens associated with various foods under differing conditions have been developed by the U.S. Department of Agriculture's (Pathogen Modeling Program (PMP)) and the United Kingdom's (Food MicroModel (FMM) program). These programs can provide growth curves for selected pathogens. You indicate the conditions, such as pH, temperature, and salt concentration that you are interested in and the models provide pathogen growth predictions (e.g., growth curve, time of doubling, time of lag phase, and generation time). FDA does not endorse or require the use of such modeling programs, but recognizes that the predictive growth information they provide may be of assistance to some processors. However, you are cautioned that significant deviations between actual microbiological data in specific products and the predictions do occur, including those for the lag phase of growth. Therefore, you should validate the time and temperature limits derived from such predictive models.

Table A-3 contains information on the destruction of *Listeria monocytogenes* (*L. monocytogenes*). Lethal rate, as used in this table, is the relative lethality of 1 minute at the designated internal product temperature as compared with the lethality of 1 minute at the reference internal product temperature of 158°F (70°C) (i.e., z = 13.5°F (7.5°C)). For example, 1

minute at 145°F (63°C) is 0.117 times as lethal as 1 minute at 158°F (70°C). The times provided are the length of time at the designated internal product temperature necessary to deliver a 6D process for *L. monocytogenes*. The length of time at a particular internal product temperature needed to accomplish a six logarithm reduction in the number of *L. monocytogenes* (6D) is, in part, dependent upon the food in which it is being heated. The values in the table are generally conservative and apply to all foods. You may be able to establish a shorter process time for your food by conducting scientific thermal death time studies. Additionally, lower degrees of destruction may be acceptable in your food if supported by a scientific study of the normal initial levels in the food. It is also possible that higher levels of destruction may be necessary in some foods, if especially high initial levels are anticipated.

Table A-4 contains information on the destruction of *Clostridium botulinum* (*C. botulinum*) type B (the most heat- resistant form of non-proteolytic *C. botulinum*). Lethal rate, as used in this table, is the relative lethality of 1 minute at the designated internal product temperature as compared with the lethality of 1 minute at the reference product internal temperature of 194°F (90°C) (i.e., for temperatures less than 194°F (90°C), z = 12.6°F (7.0°C); for temperatures above 194°F (90°C), z = 18°F (10°C)). The times provided are the length of time at the designated internal product temperature necessary to deliver a 6D process for *C. botulinum*. The values in the table are generally conservative. However, these values may not be sufficient for the destruction of non-proteolytic *C. botulinum* in dungeness crabmeat because of the potential protective effect of lysozyme. You may be able to establish a shorter process time for your food by conducting scientific thermal death time studies. Additionally, lower degrees of destruction may be acceptable in your food if supported by a scientific study of the normal innoculum in the food.

TABLE A-1
LIMITING CONDITIONS FOR PATHOGEN GROWTH

PATHOGEN	MIN. A_w (USING SALT)	MIN. pH	MAX. pH	MAX. % WATER PHASE SALT	MIN. TEMP.	MAX. TEMP.	OXYGEN REQUIREMENT
BACILLUS CEREUS	0.92	4.3	9.3	10	39.2°F 4°C	131°F[1] 55°C	facultative anaerobe[4]

196	91	1.260	7.9
198	92	1.600	6.3
199	93	2.000	5.0
201	94	2.510	4.0
203	95	3.160	3.2
205	96	3.980	2.5
207	97	5.010	2.0
208	98	6.310	1.6
210	99	7.940	1.3
212	100	10.000	1.0

Note: For temperatures less than 194°F (90°C), z = 12.6°F (7.0°C); for temperatures above 194°F (90°C), z = 18°F (10°C).

*Note: These lethal rates and process times may not be sufficient for the destruction of non-proteolytic C. botulinum in dungeness crabmeat because of the potential that substances that may be naturally present, such as lysozyme, may enable the pathogen to more easily recover from heat damage.

BIBLIOGRAPHY.

We have placed the following references on display in the Division of Dockets Management, Food and Drug Administration, 5630 Fishers Lane, rm. 1061, Rockville, MD 20852. You may see them at that location between 9 a.m. and 4 p.m., Monday through Friday. As of March 29, 2011, FDA had verified the Web site address for the references it makes available as hyperlinks from the Internet copy of this guidance, but FDA is not responsible for any subsequent changes to Non-FDA Web site references after March 29, 2011.

NOTES:

FDA U.S. FOOD & DRUG ADMINISTRATION
CENTER FOR FOOD SAFETY & APPLIED NUTRITION

Reference Document: 2013 FDA Food Code

Provision: 1-201.10

Document Name: Heat sealing without a vacuum v03

Date: January 4, 2017, Editorial change September 12, 2017, December 20, 2019

Question: When packaging food in a retail food establishment, does the 2013 Food Code definition of reduced oxygen packaging apply to the use of plastic bags or plastic films that have been heat sealed without drawing a vacuum?

Response:

No. The process of heat sealing a time temperature control for safety (TCS) food in packaging (a plastic bag or a plastic film on trays) without drawing a vacuum or otherwise modifying the atmosphere inside the package would not meet the 2013 Food Code definition of reduced oxygen packaging (ROP), provided the food being packaged has NOT been heated, just prior to packaging.

The 2013 FDA Food Code defines "Reduced Oxygen Packaging" (ROP) as:

- "The reduction of the amount of oxygen in a package by removing oxygen; displacing oxygen and replacing it with another gas or combination of gases; or otherwise controlling the oxygen content to a level below that normally found in the atmosphere (approximately 21% at sea level); and . . . .."

A reduced oxygen environment occurs in a package when less oxygen is present in the package relative to the amount of oxygen expected to be present in the atmosphere (typically 21% at sea level). The Food Code definition of reduced oxygen packaging is limited to the intentional or purposeful methods used by food establishments to create a reduced oxygen environment within a packaged TCS food product at the time of packaging.

The packaging and sealing, without drawing a vacuum, of a TCS food that has not been heated, just prior to packaging, is not considered to be removing oxygen to the degree that you are: 1) reducing the amount of oxygen in a package at the time of packaging, or 2) using an intentional or purposeful method to create a reduced oxygen environment within a packaged TCS food product at the time of packaging.

The information on this page is part of the Food and Drug Administration's (FDA's) Food Code Reference System (FCRS), a database which is available at https://accessdata.fda.gov/scripts/fcrs/. Links to any non-Federal organizations are provided solely as a service to our users. These links do not constitute an endorsement of these organizations or their programs by the FDA or the Federal Government, and none should be inferred. Any reference to a commercial product, process, service, or company is not an endorsement or recommendation by the U.S. government, the Department of Health and Human Services, FDA or any of its components. FDA is not responsible for the content of the individual organization Web pages found at these links. FDA is also not responsible for any subsequent changes to the Web addresses for these links after December 20, 2019.

Heat sealing a hot TCS food (which includes TCS foods cooked as specified in relevant Sections of Part 3-401 of the Food Code and TCS foods heated to hot holding temperatures) without modifying the atmosphere or drawing a vacuum raises a concern of *C. botulinum* growth in the packaged TCS food. This is because the process of cooking food drives off oxygen from the food thereby lowering the oxygen level in that food. After the bag is sealed, the oxygen level in the headspace and the oxygen level in the hot TCS food will begin to equilibrate. This results in a package with an oxygen level below what is normally found in the atmosphere, thereby creating a process that aligns with the Food Code definition of ROP.

The model Food Code is neither federal law nor federal regulation and is not preemptive. It represents FDA's best advice for a uniform system of regulation to ensure that food at retail is safe and properly protected and presented. The model Food Code provisions are designed to be consistent with federal food laws and regulations and are written for ease of legal adoption at all levels of government.

Reference Document: 2013 Food Code

Provision(s): 1-201.10; 3-502.12; 8-103.10; 8-103.11

Document Name: Vacuum packaging and oxygen transfer rate of the packaging material

Date: October 6, 2016

Question: Does the Food Code definition for "Reduced Oxygen Packaging" apply to fish, not frozen, that is vacuum packaged using packaging material with a greater than or equal to oxygen transfer rate (OTR) of 10,000 cc/m^2/24 hours at 24°C (10K)?

Response:

Vacuum packaging by definition is a reduced oxygen packaging process. The oxygen transfer rate (OTR) of the packaging material used in vacuum packaging a food item does not change this designation.

Paragraph 3-502.12 (C) of the 2013 FDA Food Code specifically states, "except for fish that is frozen before, during, and after packaging, a food establishment may not package fish using a reduced oxygen packaging method." This provision is intended to apply irrespective of the oxygen transfer rate of the packaging material used.

The 2013 FDA Food Code defines "Reduced Oxygen Packaging" (ROP) as:

a) The reduction of the amount of oxygen in a package by removing oxygen; displacing oxygen and replacing it with another gas or combination of gases; or otherwise controlling the oxygen content to a level below that normally found in the atmosphere (approximately 21% at sea level); and

b) A process as specified in (a) of this definition that involves a food for which the hazards *Clostridium botulinum* or *Listeria monocytogenes* require control in the final packaged form. "Reduced oxygen packaging" includes Vacuum packaging, in which air is removed from a package of food and the package is hermetically sealed so that a vacuum remains inside the package…"

Unfrozen raw fish and other seafood are excluded from being reduced oxygen packaged at retail because of these products' natural association with non-proteolytic *Clostridium botulinum* (primarily type E) which grows at 3.3°C (38°F). If a food establishment wants to employ a reduced oxygen packaging method for fish that is not frozen before, during and after packaging it is recommended that the food establishment seek a variance (8-103.10 Modifications and

The information on this page is part of the Food and Drug Administration's (FDA's) Food Code Reference System (FCRS), a database which is available at https://accessdata.fda.gov/scripts/fcrs/. Links to any non-Federal organizations are provided solely as a service to our users. These links do not constitute an endorsement of these organizations or their programs by the FDA or the Federal Government, and none should be inferred. Any reference to a commercial product, process, service, or company is not an endorsement or recommendation by the U.S. government, the Department of Health and Human Services, FDA or any of its components. FDA is not responsible for the content of the individual organization Web pages found at these links. FDA is also not responsible for any subsequent changes to the Web addresses for these links after October 6, 2016.

Waivers) from the regulatory authority that has jurisdiction.

FDA acknowledges that the reduced oxygen environment created in a reduced oxygen packaged product at the time of packaging can be impacted over time by the oxygen-permeability of the packaging material. As such, the FDA-CFSAN Retail Food Policy Team would not object to a variance request being approved based upon information that shows the OTR of the packaging material provides sufficient exchange of oxygen to allow naturally occurring, aerobic spoilage organisms on the fishery product to grow and spoil the product (under moderate abuse temperatures) before *Clostridium botulinum* toxin is produced.

Food Code Section 8-103.10 Modifications and Waivers, provides the regulatory authority the means to grant a variance by modifying or waiving the requirements of the Code, if in the opinion of the regulatory authority a health hazard or nuisance will not result from the variance. Food Code Section 8-103.11 Documentation of Proposed Variance and Justification, provides a means for the regulatory authority to obtain information from the operator regarding the proposed variance prior to approval. If the operator intends to produce and package the product for wholesale, it would be subject to federal and state food manufacturing regulations.

The FDA Food Code is neither federal law nor federal regulation and is not preemptive. It represents FDA's best advice for a uniform system of regulation to ensure that food at retail is safe and properly protected and presented. The FDA Food Code provisions are designed to be consistent with federal food laws and regulations, and are written for ease of legal adoption at all levels of government.

Controlling the Hazard of *Clostridium botulinum* Growth and Toxin Formation in Reduced Oxygen Packaged Fish and Fishery Products Including Refrigerated, Vacuum-Packed Crawfish Tail Meat

It has come to FDA's attention that processors of refrigerated, vacuum-packed crawfish tail meat may not be controlling the hazard of *Clostridium botulinum* growth and toxin formation. FDA considers the hazard of *C. botulinum* growth and toxin formation reasonably likely to occur in reduced oxygen packaged (ROP) fish and fishery products including refrigerated, vacuum-packed crawfish tail meat. All seafood processors are required to conduct a hazard analysis and implement a written HACCP plan to control hazards that are reasonably likely to occur within and outside the processing plant according to 21 CFR Part 123.6. FDA's Fish and Fishery Products Hazards and Controls Guidance provides recommendations to assist processors with assessing hazards and developing HACCP plans.

FDA considers ROP fish and fishery products including refrigerated, vacuum-packed crawfish tail meat to be adulterated under section 402 (a)(4) of the Food, Drug and Cosmetic Act when the hazard of *C. botulinum* growth and toxin formation is not controlled. Specific sections addressing primary processors and secondary processors including distributors are provided below in this document.

Background

ROP encompasses a large variety of packaging methods including vacuum packaging, modified atmosphere packaging, hermetically sealed containers, sealed plastic or laminated packaging, packing in oil, and using a material that is not considered oxygen-permeable. Packaging that is not considered oxygen-permeable restricts the exchange of oxygen and can lead to any oxygen present in the packaging being utilized by spoilage organisms resulting in a reduced oxygen environment. By reducing or preventing the exchange of oxygen, a processor introduces the hazard of *C. botulinum* growth and toxin formation.

C. botulinum is an anaerobic bacterium, meaning it can grow in low oxygen conditions, that is widely distributed in nature, in soil, the sediment of streams, lakes, and coastal waters, and in the intestinal tracts of fish and mammals. The toxin produced by *C. botulinum* is considered one of the most poisonous naturally occurring substances known and when ingested can result in paralysis, leading to death from asphyxiation. There are two major groups of *C. botulinum*, the proteolytic and non-proteolytic. Proteolytic strains can grow at 50°F and above. Non-proteolytic strains, commonly found in seafood, can grow at 38°F and above to render a food toxic without any apparent signs of spoilage.

Primary Processors

1. When refrigeration below 38°F is the sole control for the hazard *C. botulinum,* processors should use a Time-Temperature Indicator (TTI) on each reduced oxygen package of product and maintain the product below 38°F. Since product will likely not be maintained below 38°F during distribution, TTIs are needed to monitor time and temperatures exposures throughout distribution until consumption. TTIs should be designed specifically for *C. botulinum* and alert consumers and end users of potentially unsafe time and temperature exposures that could result in toxin formation.

Processors that use a TTI on each ROP package and maintain the product below 38°F should have a HACCP plan that, at a minimum, lists critical control points for finished product storage below 38°F, and TTI use and application. The critical control points and critical limits for the TTIs should be based on the TTI manufacturer's specifications.

2. For seafood, packaging that has an oxygen transmission rate (OTR) of 10,000 cc/m^2/24 hours at 24°C, or higher (often referred to as 10K OTR and occasionally printed on the packaging) is considered oxygen permeable and not ROP by FDA. Oxygen permeable packaging should provide a sufficient exchange of oxygen to allow naturally occurring aerobic spoilage organisms on the fishery product to grow and spoil the product before *C. botulinum* toxin is produced under moderate abuse temperatures.

3. Product can be frozen with proper labeling. The product should be immediately frozen after being placed in a reduced oxygen package. The HACCP plan should list a labeling critical control point for each package to be labeled "Important, keep frozen until used, thaw under refrigeration immediately before use."

Secondary Processors Including Distributors

The term secondary processor includes distributors that hold or store product because holding and storing is defined as processing in 21 CFR Part 123.3 (k)(1). Secondary processors should assess the hazard of *C. botulinum* when receiving ROP products and ensure the product is received with proper controls, in addition to implementing proper controls within their own facility, as necessary. For example, distributors of refrigerated ROP products including vacuum-packed crawfish tail meat, should receive product below 38°F with TTIs and have a HACCP plan that lists critical control points for receiving and storage with critical limits that maintain the product below 38°F.

For more information on *C. botulinum* and controls see Chapter 13 of FDA's Fish and Fishery Products Hazards and Controls Guidance (4th ed.) and FDA's Seafood HACCP Video titled "Time-Temperature Indicators" available at www.fda.gov/seafood.

Response to your Case 299700: Food Code [ref:_00D60KbN0._5003d5N9HNAA0:ref]

1 message

"FCIC Inquiry" <fcicinquiry@fda.hhs.gov> <fcicinquiry@fda.hhs.gov> Thu, Nov 17, 2022 at 10:02 AM
To: "troy.huffman@state.co.us" <troy.huffman@state.co.us>

This message is being sent in response to the following submitted inquiry:

When packaging food that has been heated just prior to packaging in a retail food establishment using a breathable plastic bag or plastic film and then allowing that product to cool, does the 2017 Food Code definition of reduced oxygen packaging apply? Does the film or bag have to be 10K OTR or greater to be considered breathable?

The Food and Drug Administration's (FDA) Food and Cosmetic Information Center (FCIC)/Technical Assistance Network (TAN) has prepared a response for case number 299700.

Response:

Thank you for your inquiry on the 2017 Food code definition of reduced oxygen packaging. The Food Code defines Reduced oxygen packaging (ROP) as:

(a) The reduction of the amount of oxygen in a PACKAGE by removing oxygen; displacing oxygen and replacing it with another gas or combination of gases; or otherwise controlling the oxygen content to a level below that normally found in the atmosphere (approximately 21% at sea level); and

(b) A process as specified in Subparagraph (1)(a) of this definition that involves a FOOD for which the HAZARDS Clostridium botulinum or Listeria monocytogenes require control in the final PACKAGED form.

ROP also includes:

1. Vacuum packaging
2. Modified atmosphere packaging
3. Controlled atmosphere packaging
4. Cook chill packaging
5. Sous Vide packaging

Based on the information provided in this inquiry, the trays are sealed with a film that allows oxygen transmission and the trays contain ambient air (no removal of oxygen by vacuum or displacement with another gas such as nitrogen), therefore, it is not considered ROP. It seems like the film is a measure to protect the food contents from contamination. Barrier properties of a container are not used to define what we mean by ROP. With the information provided, this practice would not be considered ROP as defined in the Food Code.

It is important to note that although it appears based on the information provided that this is not considered an ROP process, it can potentially create a ROP environment depending on the temperature at which the product is packaged (which is the case with many foods in many different storage containers). Heating temperatures were not provided in the inquiry. Heating a food drives off the oxygen. Also, when hot food cools in a package, it can draw a slight vacuum, thereby reducing oxygen, although oxygen can reenter the package once the food cools if the package material is oxygen permeable. In addition, there can be areas in a packaged food that have reduced oxygen capable of supporting growth of pathogens such as Clostridium botulinum if the food is not maintained at a temperature to prevent such growth.

We do not have a definition of "breathable." Note also that breathable packaging is usually designed to provide oxygen levels that will allow spoilage organisms to grow and spoil food before it becomes toxic, not as a measure to prevent growth of C. botulinum.

The Food Code is a model for adoption by state, local, tribal, territorial regulatory jurisdictions although some local laws may differ from the model Food Code.

To: "troy.huffman@state.co.us" <troy.huffman@state.co.us>

This message is being sent in response to the following submitted inquiry:

This is a follow-up to assigned case number 299700. The package is sealed with the breathable film and the product temperature is above 135F and then allowed to cool while still sealed with a breathable film. Would that be considered ROP if sealed hot then allowed to cool?

The Food and Drug Administration's (FDA) Food and Cosmetic Information Center (FCIC)/Technical Assistance Network (TAN) has prepared a response for case number 301854.

Response:

As explained in our response to case #299700, based on the limited information provided in your inquiry, the trays are sealed with a film that allows oxygen transmission and the trays contain ambient air (no removal of oxygen by vacuum or displacement with another gas such as nitrogen), therefore, it is not considered ROP as defined in the Food Code.

Thank you for contacting FDA's FCIC/TAN.

Lodge Cast Iron

Research & Development Report

VGSRN: 434

Cleaning Effectiveness of Cast Iron Pans and Glass and Plastic Plates when Machine Washed

Prepared For:

David Fletcher

QA Supervisor/Metallurgist

dfletcher@lodgecastiron.com

Prepared By:

Rachel Corken

Scientist, Research & Development

rachel.corken@sgs.com

OBJECTIVE

The objective of this study was to validate the reduction of *E. coli* and *Staphylococcus aureus* on cast iron pans and plates when place and cycled through a machine dishwasher.

MATERIAL AND METHODS

Test Product

Lodge Cast Iron provided a sufficient amount of product for inoculation to pass through a machine dishwasher. SGS North America provided all other testing supplies.

Test Organisms

A strain of generic *Escherichia coli* (ATCC 25922) and *Staphylococcus aureus* (ATCC 6538) was used to inoculate the products. The cultures were grown overnight in Brain Heart Infusion Broth (BHI) individually and diluted to achieve an inoculum level of approximately 8 log CFU/g sample.

Inoculation of Product

The product was inoculated with freshly prepared inoculum. The inoculum was combined with a 1% solution of reconstituted non-fat dry milk that served as a "soil". The pan surfaces were inoculated with a concentration between $1.0x10^8$ to $9.9x10^8$ cells/ml on the product. The inoculum was then allowed to dry overnight at room temperature.

Product Processing

Twelve of each Pioneer Woman 13.5" cast iron skillets, Mainstays 12" cast iron skillets, Lodge 8" cast iron skillets, Lodge cast iron oval servers pre-own and used by Chattanooga State University Culinary program, Corelle Pioneer Women Blue plates, and Mainstays black plastic plates were inoculated and tested for generic *E. coli* and *S. aureus*. For each test organism, three of each product were used to measure the viable bacteria after overnight drying without washing to serve as the untreated controls for each microorganism. The other nine of each pan type for each test organism were washed in triplicate in 3 separate wash cycles. After the wash cycle were complete, the products were tested for residual bacterial count. For both the treated and untreated products, the level of organisms remaining on the products was determined by swabbing the product surfaces with EZ-10NB-PUR swabs.

Microbial Analyses

Each of the swabs was serially diluted to obtain a countable range and plated in duplicate using 15 mL to 20 mL of TSA agar. The plates were incubated at 35±1°C for 48±2h. All typical colonies were enumerated.

DATA ANALYSIS AND REPORT

The cleaning effectiveness of cast iron pans, glass plates, and plastic plates was determined by comparing the level of organisms on the washed product to that of the unwashed product.

After the inoculation and drying of *Staphylococcus aureus,* the untreated Pioneer Woman Cast Iron had an average of 6.977 log CFU/g, Mainstays Cast Iron of 6.854 log CFU/g, Lodge 8in Cast Iron of 6.700 log CFU/g, Lodge Cast Iron Oval Server (pre-own and used by Chattanooga State University Culinary program) of 6.767 log CFU/g, Corelle Plate of 6.585 log CFU/g and Mainstays Plate of 6.729 log CFU/g (Table 1). Once the products where washed (treated) the Pioneer Woman Cast Iron had an average of 0.300 log CFU/g, Mainstays Cast Iron of 0.978 log CFU/g, Lodge 8in Cast Iron of 0.487 log CFU/g, Lodge Cast Iron Oval Server of 1.120 log CFU/g, Corelle Plate of 0.689 log CFU/g and Mainstays Plate of 1.034 log CFU/g.

For the inoculation of *Escherichia coli*, the untreated Pioneer Woman Cast Iron had an average of 4.472 log CFU/g, Mainstays Cast Iron of 2.867 log CFU/g, Lodge 8in Cast Iron of 4.000 log CFU/g, Lodge Cast Iron Oval Server (pre-own and used by Chattanooga State University Culinary program) of 4.667 log CFU/g, Corelle Plate of 2.767 log CFU/g and Mainstays Plate of 4.460 log CFU/g (Table 2). Ones the products where washed(treated) the Pioneer Woman Cast Iron had an average of 0.942 log CFU/g, Mainstays Cast Iron of 0.622 log CFU/g, Lodge 8in Cast Iron of 1.115 log CFU/g, Lodge Cast Iron Oval Server of 0.817 log CFU/g, Corelle Plate of 0.589 log CFU/g and Mainstays Plate of 0.742 log CFU/g.

The washing process effectively reduced the level of inoculated *Staphylococcus aureus* in Pioneer Woman Cast Iron by at least 6.677 log CFU/g, Mainstays Cast Iron by 5.876 log CFU/g, Lodge 8in Cast Iron by 6.213 log CFU/g, Lodge Cast Iron Oval Server (pre-own and used by Chattanooga State University Culinary program) by 5.647 log CFU/g, Corelle Plate by 5.896 log CFU/g and Mainstays Plate by 5.695 log CFU/g.

The washing process effectively reduced the level of inoculated *Escherichia coli* in Pioneer Woman Cast Iron by at least 3.530 log CFU/g, Mainstays Cast Iron by 2.245 log CFU/g, Lodge 8in Cast Iron by 2.885 log CFU/g, Lodge Cast Iron Oval Server (pre-own and used by Chattanooga State University Culinary program) by 3.850 log CFU/g, Corelle Plate by 2.178 log CFU/g and Mainstays Plate by 3.718log CFU/g.

Consumer dishwashing of cast iron, Correlle, and plastic plates, effectively reduced the level of inoculated *S. aureus* and *E. coli* on all three surface types.

Table 1: Comparison of level of *Staphylococcus aureus* in treated and untreated products.

Sample	Average Untreated (Log CFU/g)	Average Treated (Log CFU/g)	Reduction (Log CFU/g)
Pioneer Woman Cast Iron	6.977 (σ=0.046)	0.300 (σ=0.585)	6.677
Mainstays Cast Iron	6.854 (σ=0.052)	0.978 (σ=0.593)	5.876
Lodge 8in Cast Iron	6.700 (σ=0.062)	0.487 (σ=0.692)	6.213
Lodge Cast Iron Oval Server	6.767 (σ=0.087)	1.120 (σ=0.454)	5.647
Corelle Plate	6.585 (σ=0.108)	0.689 (σ=0.655)	5.896

Test Summary

Title: Microorganism Recovery Equivalence from Cast Iron and Food Grade Stainless Steel

Study Design: This study was designed to demonstrate that microorganisms can be removed from cast iron cookware with similar effectiveness as from stainless steel surfaces. The equivalence of recovery was demonstrated by inoculating both materials with equivalent numbers of each microorganism. For this study the following microorganisms were used: *Staphylococcus aureus*, *Escherichia coli*, *Salmonella* Enteritidis, *Listeria monocytogenes*, and *Clostridium perfringens*. Following inoculation, surfaces were sampled.

Test Articles:

The test articles evaluated were provided to the testing facility by the study sponsor, complete with appropriate documentation. Test articles were sterilized via autoclave upon receipt and stored at ambient temperature (20 - 25 °C) in autoclaved aluminum foil.

1. Cast Iron Cookware
   - 1.1 14 Ounce Round Cast Iron Mini Server (SKU: HMSRD)
   - 1.2 12 Ounce Cast Iron Mini Serving Bowl (SKU: HMSB)
   - 1.3 16 Ounce Oval Cast Iron Mini Server (SKU: HM16OS)
   - 1.4 9 Ounce Oval Cast Iron Mini Server (SKU: HMSOV)
   - 1.5 14 Ounce Rectangular Cast Iron Mini Server (SKU: HMS14RC)
   - 1.6 10 Ounce Square Cast Iron Mini Server (SKU: HMSS)
2. Food Grade Stainless Steel Carriers (18 GA 300 series, brush finish)

Sponsor: Lodge Manufacturing
204 East 5th Street
South Pittsburgh, TN 37380

Testing Conditions

Challenge Microorganisms:

1. *Staphylococcus aureus* American Type Culture Collection (ATCC) 6538
2. *Escherichia coli* ATCC 8739
3. *Salmonella* Enteritidis ATCC 13076
4. *Listeria monocytogenes* ATCC 7644
5. *Clostridium perfringens* ATCC 12915

Note: Appropriate laboratory safety conditions was employed while working with enriched culture suspensions. These conditions included, but were not limited to, the use of appropriate PPE (including disposable gloves, beard nets, hair nets, and lab coats), Biological Safety Cabinets, and protective eyewear.

Testing Conditions:

The evaluation was conducted at ambient temperature (20 - 25 °C).

Media/Reagents:

1. Tryptic Soy Agar with 5% Sheep Blood (SBA) (Fisher Scientific, PN 221261) or equivalent
2. Microbial Content Test (MCT) agar MP107
3. Tryptic Soy Broth (TSB) MP058
4. Phosphate Buffered Saline (PBS) MP416
5. Columbia Blood Agar (CBA) with 5% Sheep Blood MP086
6. Reinforced Clostridial Medium (RCM) MP158

Equipment/Supplies:

1. Incubator, temperature range 35 ± 1 °C
2. Incubator thermometer, NIST traceable
3. Sterile containers
4. Steam autoclave
5. Vortex mixer
6. Calibrated, traceable minute/second timer
7. Refrigerator, temperature range 2 - 8 °C
8. Refrigerator thermometer, NIST traceable
9. Traceable thermometer/clock/humidity monitor
10. Adjustable pipettor, 1 µL - 200 µL capacity
11. Adjustable pipettor, 100 µL - 1000 µL capacity
12. Sterile serological pipettes
13. Sterile 100 µL and 1000 µL micropipette tips
14. Reichert Quebec® Colony Counter, or equivalent
15. Hand tally

16. Test tubes, sterilized
17. Sterile disposable Petri dishes, 100 x 15 mm
18. Sterile polyurethane tip swabs
19. Sterile disposable loops
20. Rotator/shaker
21. Anaerobic Sachets, BBL GasPaks or equivalent

Study Dates and Facility

The analysis phase of this test was conducted at Q Laboratories in the Microbiology Research and Development Laboratory, 1930 Radcliff Drive, Cincinnati, Ohio 45204, from 10-28-19 to 11-11-19. The study sponsor and study director signed the protocol on 10-31-19. The final report was released 12-16-19.

Records to be Maintained

All testing data, protocol, protocol modifications, test material records, the final report, and correspondence between Q Laboratories and the sponsor will be stored in the archives at Q Laboratories, 1930 Radcliff Drive, Cincinnati, Ohio 45204 for a period of at least seven (7) years.

Test Procedure

Test Microorganism Preparation:

Staphylococcus aureus ATCC 6538, *Escherichia coli* ATCC 8739, *Salmonella* Enteritidis ATCC 13076, and *Listeria monocytogenes* ATCC 7644 were propagated on Tryptic Soy Agar with 5% Sheep Blood (SBA) from a Q Laboratories frozen stock culture stored at -70 °C. SBA plates were incubated aerobically at 35 ± 1 °C for 24 ± 2 hours. After incubation, an isolated colony was picked to Tryptic Soy Broth (TSB) and incubated at 35 ± 1 °C for 24 ± 2 hours. Test articles were inoculated with the 24 hour TSB culture.

Clostridium perfringens ATCC 12915 was propagated on SBA from a Q Laboratories frozen stock culture stored at -70 °C. The SBA plate was incubated anaerobically at 35 ± 1 °C for 24 ± 2 hours. After incubation, an isolated colony was transferred to pre-reduced Reinforced Clostridial Medium (RCM) and incubated anaerobically at 35 ± 1 °C for 24 ± 2 hours. Test articles were inoculated with the 24 hour RCM culture.

Pre-Inoculation Preparation:

The study sponsor reported that the test articles were pre-cleaned using one cycle in an industrial dishwasher prior to shipping.

Test articles and stainless-steel control carriers were placed in a sterile container and autoclaved after receipt by the testing facility. This step was done to ensure there is no residual bioburden prior to inoculation.

Using sterile gloves, the test article was placed on a disinfected flat surface. One (1) 1” x 1” location on each test article was marked for evaluation, depicted as red squares in Figures 1 - 4.

Inoculation of Test Articles:

A 100 µL aliquot of each test culture was applied to the 1” x 1” marked areas. The culture was uniformly spread over the sample area using 100 - 1000 µL micropipette tip to prevent areas of pooling.

After inoculation, the test articles were allowed to dry for 18 - 24 hours at ambient temperature (20 - 25 °C). After 18-24 hours, the test article was visually inspected to ensure the test culture suspension was uniformly dried and testing was initiated.

The inoculation steps above were repeated for the stainless-steel control carriers.

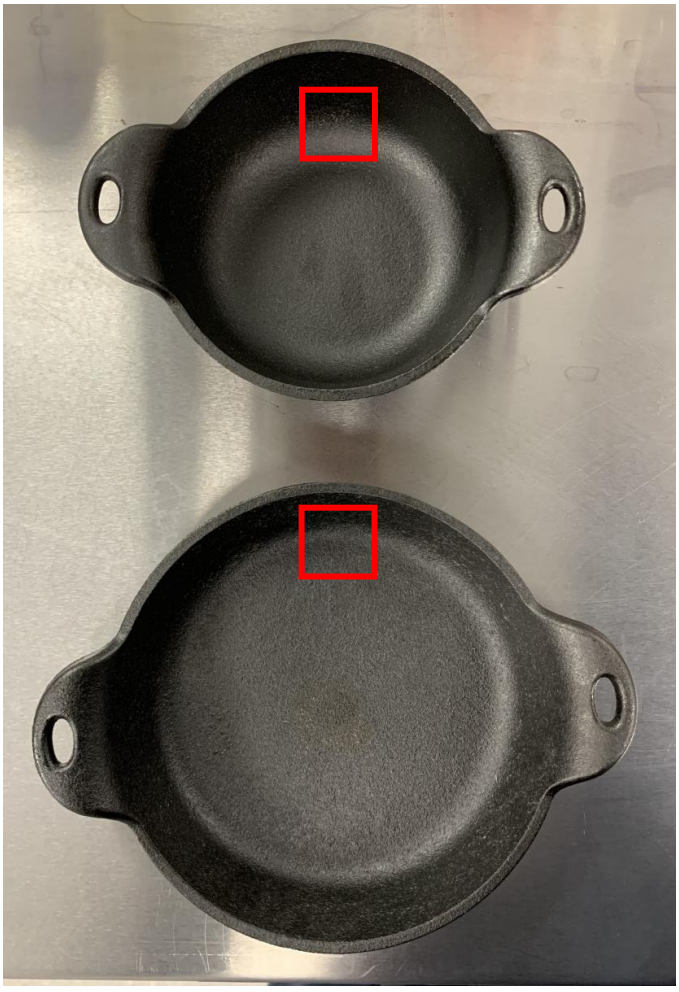

Figure 1. 12 Ounce Cast Iron Mini Serving Bowl and 14 Ounce Round Cast Iron Mini Server Sample Areas.

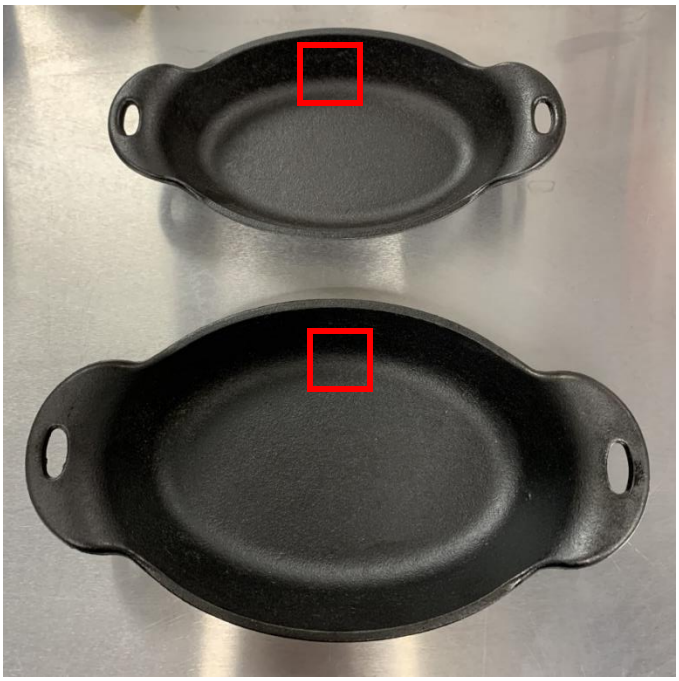

Figure 2. 9 Ounce Oval Cast Iron Mini Server and 16 Ounce Oval Cast Iron Mini Server Sample Areas.

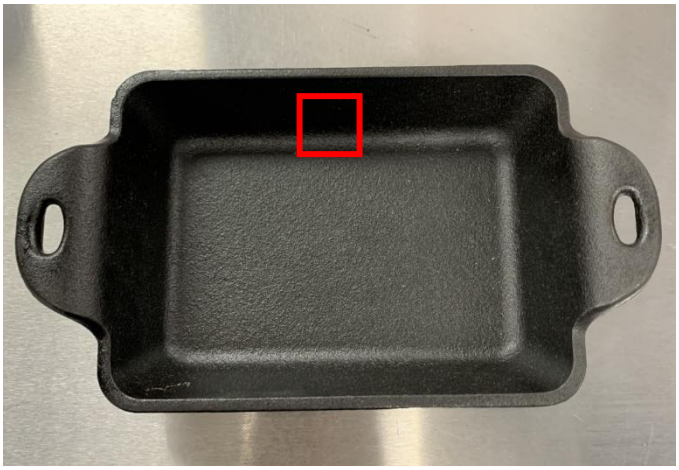

Figure 3. 14 Ounce Rectangular Cast Iron Mini Server Sample Area.

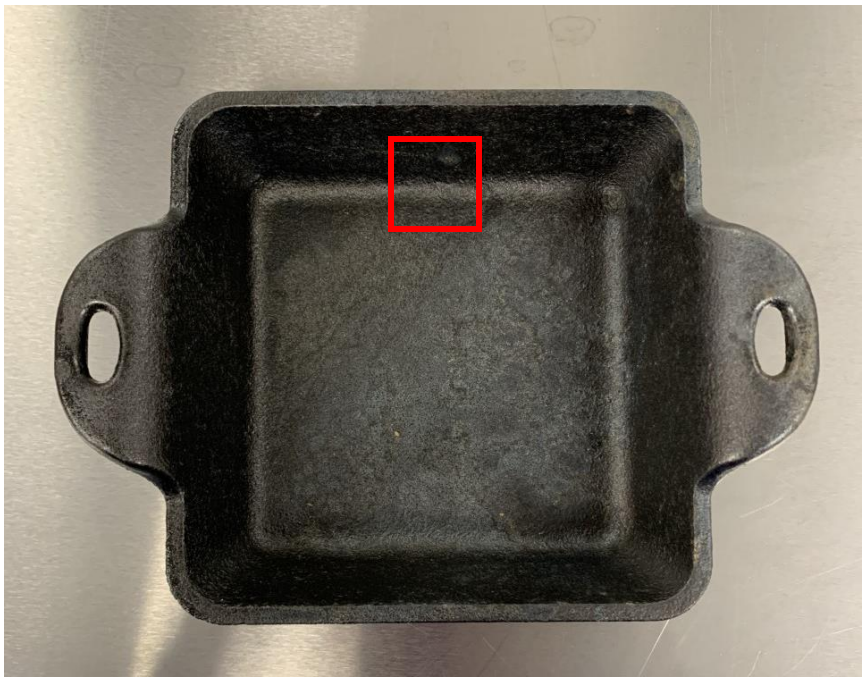

Figure 4. 10 Ounce Square Cast Iron Mini Server Sample Area.

Three (3) replicates of the test articles and three (3) replicates using food grade stainless steel carries were evaluated for each microorganism. A summary of the recovery study parameters is presented in Table 1.

Table 1. Summary of Recovery Study Parameters

Test Organisms	Test Article	No. of Test Replicates	No. of Stainless-Steel Control Replicates
S. aureus, *E. coli*, *S.* Enteritidis, *L. monocytogenes*, *C. perfringens*	14 Ounce Round Cast Iron Mini Server	3	3
	12 Ounce Cast Iron Mini Serving Bowl	3	3
	16 Ounce Oval Cast Iron Mini Server	3	3
	9 Ounce Oval Cast Iron Mini Server	3	3
	14 Ounce Rectangular Cast Iron Mini Server	3	3
	10 Ounce Square Cast Iron Mini Server	3	3

Recovery and Enumeration Procedure:

A 1.0 mL aliquot of PBS was added to a sterile swab. The marked 1" x 1" sample area was thoroughly swabbed in an up and down vertical motion and a left and right horizontal motion. This process was designed to remove viable microorganisms from the surface of the test article for enumeration.

The swab was placed in a test tube containing 9.0 mL of PBS. The swab was expressed into the test tube and thoroughly vortexed for 30 ± 5 seconds. Ten-fold serial dilutions of the sample were prepared by transferring 1.0 mL from the initial dilution into 9.0 mL of PBS.

For *S. aureus*, *E. coli*, *S.* Enteritidis and *L. monocytogenes*, each dilution was plated into duplicate sterile Petri dishes and 12 - 15 mL of tempered MCT was added. Plates were mixed thoroughly and allowed to solidify. Plates were inverted and incubated at 35 ± 1 °C for 48 ± 2 hours.

For *C. perfringens* each dilution was spread plated with sterile plating beads onto duplicate pre-poured plates of Columbia Blood Agar (CBA) with 5% Sheep Blood (CBA). Plates were inverted and incubated anaerobically at 35 ± 1 °C for 48 ± 2 hours.

After incubation, typical colonies were enumerated, and raw data was recorded as CFU/plate. Duplicate plates were averaged and multiplied by the dilution factor to arrive at CFU/test article. Raw values were recorded and used for the calculations in Tables 2-6.

Study Controls:

Food Grade Stainless Steel Controls – Three (3) 4" x 4" food grade stainless steel test articles were inoculated according to the test procedure. The recovered microorganisms were determined following the procedures found in Recovery and Enumeration. In order for the testing to be considered acceptable, the recovery data from the cast iron test articles had to be comparable to the food grade stainless steel.

Statistical Analysis

A logarithmic transformation measuring surviving microbial populations of the positive control article and test replicates for each microorganism were performed.

Equivalence of Recovery was calculated as follows:

ΔLog10 = Equivalence Recovery
TR1 = Test Article Replicate 1
TR2 = Test Article Replicate 2
TR3 = Test Article Replicate 3
SS1 = Stainless Steel 1
SS2 = Stainless Steel 2
SS3 = Stainless Steel 3

$$\left(\frac{TR1 + TR2 + TR3}{3}\right) - \left(\frac{SS1 + SS2 + SS3}{3}\right) = \Delta\text{Log10}$$

Media Quality Controls

The MCT plating media was inoculated with an aliquot of each *S. aureus, E. coli, S.* Enteritidis, and *L. monocytogenes* suspension and incubated at 35 ± 1 °C for 48 ± 2 hours. These plates served as positive growth controls for the media.

The CBA and RCM media were inoculated with an aliquot of the *C. perfringens* suspension and incubated anaerobically at 35 ± 1 °C for 48 ± 2 hours. These served as positive growth controls for the media.

The acceptance criterion for these bacterial media controls was "typical growth" of the organisms.

For negative sterility controls, two tubes each of TSB, PBS, and three plates of MCT were incubated at 35 ± 2 °C for 48 ± 2 hours.

The acceptance criterion for these uninoculated media controls was "negative for growth".

Summary of Results

The results of the initial microorganism recovery comparison are presented in Tables 2-6. The results of the retested test articles are presented in Tables 7-10. The mean Log values were obtained from duplicate plates. The Equivalence of Recovery was calculated as follows:

ΔLog10 = Equivalence Recovery
TR1 = Test Article Replicate 1
TR2 = Test Article Replicate 2
TR3 = Test Article Replicate 3
SS1 = Stainless Steel 1
SS2 = Stainless Steel 2
SS3 = Stainless Steel 3

$$\left(\frac{TR1 + TR2 + TR3}{3}\right) - \left(\frac{SS1 + SS2 + SS3}{3}\right) = \Delta\text{Log10}$$

Conclusion

Based on the results presented in this study report, the microorganism recovery equivalence from cast iron products and food grade stainless met the performance criteria for 2 of the 6 test articles. The performance criteria states that for equivalent recovery, the cast iron test articles must be within 0.5 Log of the stainless-steel carrier controls. Both 14 Ounce Round Cast Iron Mini Server and 12 Ounce Cast Iron Mini Serving Bowl met the performance criteria for each inoculum. The 9 Ounce Oval Cast Iron and 16 Ounce Oval Cast Iron did not meet the performance criteria for *Listeria monocytogenes,* and *Escherichia coli.* The 14 Ounce Rectangle Cast Iron Mini Server did not meet the performance criteria for *Staphylococcus aureus.* The 10 Ounce Square Cast Iron Mini server did not meet the performance criteria for *Salmonella* Enteritidis.

Since failure to meet the performance criteria could have been caused by variable inoculum levels due to homogenization of the test culture or by variable die off rate during the overnight drying, any test articles that did not meet the performance criteria were retested. Upon retesting all test articles met the performance criteria. The performance criteria states that for equivalent recovery, the cast iron test articles must be within 0.5 Log of the stainless-steel carrier controls.

1.0 **Title:** Microorganism Recovery Equivalence from Cast Iron and Food Grade Stainless Steel

2.0 **Sponsor:** Lodge Manufacturing
204 East 5th Street
South Pittsburgh, TN 37380

3.0 **Testing Facility:** Q Laboratories
1930 Radcliff Drive
Cincinnati, OH 45204

4.0 **Study Director:** Benjamin J. Bastin

5.0 **Purpose:**

This study is designed to demonstrate that microorganisms can be removed from cast iron cookware with similar effectiveness as from stainless steel surfaces.

6.0 **Scope:**

The equivalence of recovery will be demonstrated by inoculating both materials with equivalent numbers of each microorganism. For this study the following microorganisms will be used: *Staphylococcus aureus, Escherichia coli, Salmonella* Enteritidis, *Listeria monocytogenes,* and *Clostridium perfringens*. Following inoculation, surfaces will be sampled.

7.0 **Test Articles:**

The test articles to be evaluated will be provided to the testing facility by the study sponsor, complete with appropriate documentation. Test articles will be sterilized via autoclave upon receipt.

7.1 Cast Iron Cookware
- 7.1.1 14 Ounce Round Cast Iron Mini Server (SKU: HMSRD)
- 7.1.2 12 Ounce Cast Iron Mini Serving Bowl (SKU: HMSB)
- 7.1.3 16 Ounce Oval Cast Iron Mini Server (SKU: HM16OS)
- 7.1.4 9 Ounce Oval Cast Iron Mini Server (SKU: HMSOV)
- 7.1.5 14 Ounce Rectangular Cast Iron Mini Server (SKU: HMS14RC)
- 7.1.6 10 Ounce Square Cast Iron Mini Server (SKU: HMSS)

7.2 Food Grade Stainless Steel Carriers (18 GA 300 series, brush finish)

8.0 **Testing Conditions:**

8.1 The evaluation will be conducted at ambient temperature (20 - 25 °C).

9.0 Test Microorganisms:

9.1 *Staphylococcus aureus* American Type Culture Collection (ATCC) 6538
9.2 *Escherichia coli* ATCC 8739
9.3 *Salmonella* Enteritidis ATCC 13076
9.4 *Listeria monocytogenes* ATCC 7644
9.5 *Clostridium perfringens* ATCC 12915

Note: Appropriate laboratory safety conditions will be employed while working with enriched culture suspensions. These conditions will include, but are not limited to, the use of appropriate PPE (including disposable gloves, beard nets, hair nets, and lab coats), Biological Safety Cabinets, and protective eyewear.

10.0 Media/Reagents:

10.1 Tryptic Soy Agar with 5% Sheep Blood (SBA) Commercially available from BD 221261 or equivalent
10.2 Microbial Content Test (MCT) agar MP107
10.3 Tryptic Soy Broth (TSB) MP058
10.4 Phosphate Buffered Saline (PBS) MP416
10.5 Columbia Blood Agar (CBA) with 5% Sheep Blood MP086
10.6 Reinforced Clostridial Medium (RCM) MP158

11.0 Equipment/Supplies:

11.1 Incubator, temperature range 35 ± 1 °C
11.2 Incubator thermometers, NIST traceable
11.3 Sterile containers
11.4 Steam autoclave
11.5 Vortex mixer
11.6 Calibrated, traceable minute/second timer
11.7 Refrigerator, temperature range 2 - 8 °C
11.8 Refrigerator thermometer, NIST traceable
11.9 Traceable thermometer/clock/humidity monitor
11.10 Adjustable pipettor, 1 µL - 200 µL capacity
11.11 Adjustable pipettor, 100 µL - 1000 µL capacity
11.12 Sterile serological pipettes
11.13 Sterile 100 µL and 1000 µL micropipette tips
11.14 Reichert Quebec® Colony Counter, or equivalent
11.15 Hand tally
11.16 Test tubes, sterilized
11.17 Sterile disposable Petri dishes, 100 x 15 mm
11.18 Sterile polyurethane tip swabs
11.19 Sterile disposable loops
11.20 Rotator/shaker
11.21 Anaerobic Sachets, BBL GasPaks or equivalent

12.0 Test Microorganism Preparation:

12.1 *Staphylococcus aureus* ATCC 6538, *Escherichia coli* ATCC 8739, *Salmonella* Enteritidis ATCC 13076, and *Listeria monocytogenes* ATCC 7644 will be propagated on Tryptic Soy Agar with 5% Sheep Blood (SBA) from a Q Laboratories frozen stock culture stored at -70 °C. SBA plates will be incubated aerobically at 35 ± 1 °C for 24 ± 2 hours. After incubation, an isolated colony will be picked to Tryptic Soy Broth (TSB) and incubated at 35 ± 1 °C for 24 ± 2 hours.

12.2 *Clostridium perfringens* ATCC 12915 will be propagated on SBA from a Q Laboratories frozen stock culture stored at -70 °C. The SBA plate will be incubated anaerobically at 35 ± 1 °C for 24 ± 2 hours. After incubation, an isolated colony will be transferred to pre-reduced Reinforced Clostridial Medium (RCM) and incubated anaerobically at 35 ± 1 °C for 24 ± 2 hours.

13.0 Microorganism Recovery Study Parameters:

13.1 Three (3) total replicates of the test articles will be evaluated for each microorganism. A summary of the recovery study parameters is presented in Table 1.

13.2 Three (3) total replicates using food grade stainless steel carries will be evaluated for each microorganism as controls. A summary of the antimicrobial activity study parameters is presented in Table 1.

Table 1. Summary of Recovery Study Parameters.

Test Organisms	Test Article	No. of Test Replicates	No. of Stainless-Steel Control Replicates
S. aureus, *E. coli*, *S.* Enteritidis, *L. monocytogenes*, *C. perfringens*	14 Ounce Round Cast Iron Mini Server	3	3
	12 Ounce Cast Iron Mini Serving Bowl	3	3
	16 Ounce Oval Cast Iron Mini Server	3	3
	9 Ounce Oval Cast Iron Mini Server	3	3
	14 Ounce Rectangular Cast Iron Mini Server	3	3
	10 Ounce Square Cast Iron Mini Server	3	3

14.0 Test Procedure:

Preconditioning:

14.1 The study sponsor reported that the test articles were pre-cleaned using one cycle in an industrial dishwasher prior to shipping.

14.2 Test articles and stainless-steel control carriers will be placed in a sterile container and autoclaved after receipt by the testing facility. This step will be done to ensure there is no residual bioburden prior to inoculation.

Inoculation:

14.3 Using sterile gloves, place the test article on a disinfected flat surface. One (1) 1" x 1" location on the test article will be marked for evaluation as depicted in Figures 1 - 4.

14.4 Apply 100 µL of each test culture to the 1" x 1" marked areas. The culture will be uniformly spread over the sample area using 100 - 1000 µL micropipette tip to prevent areas of pooling.

14.5 After inoculation, the test articles will be allowed to dry for 18 - 24 hours at ambient temperature (20 - 25 °C). After 18-24 hours, the test article will be visually inspected to ensure the test culture suspension is uniformly dried and testing will be initiated.

14.6 Repeat inoculation steps 14.2 to 14.4 for the stainless-steel control carriers.

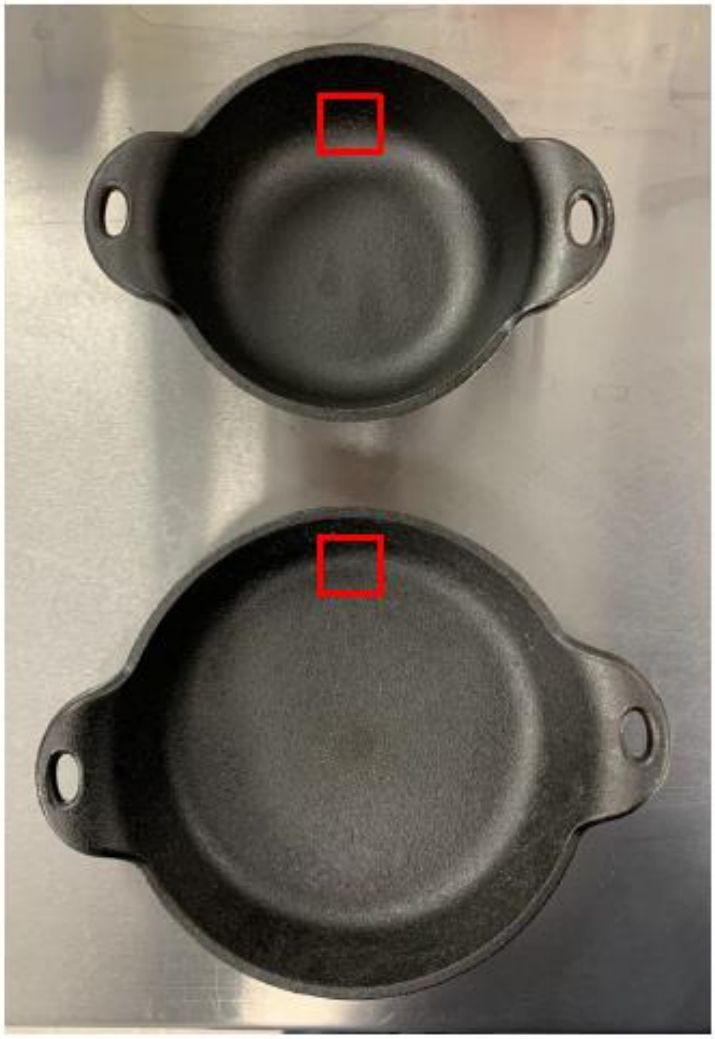

Figure 1. 12 Ounce Cast Iron Mini Serving Bowl and 14 Ounce Round Cast Iron Mini Server Sample Areas.

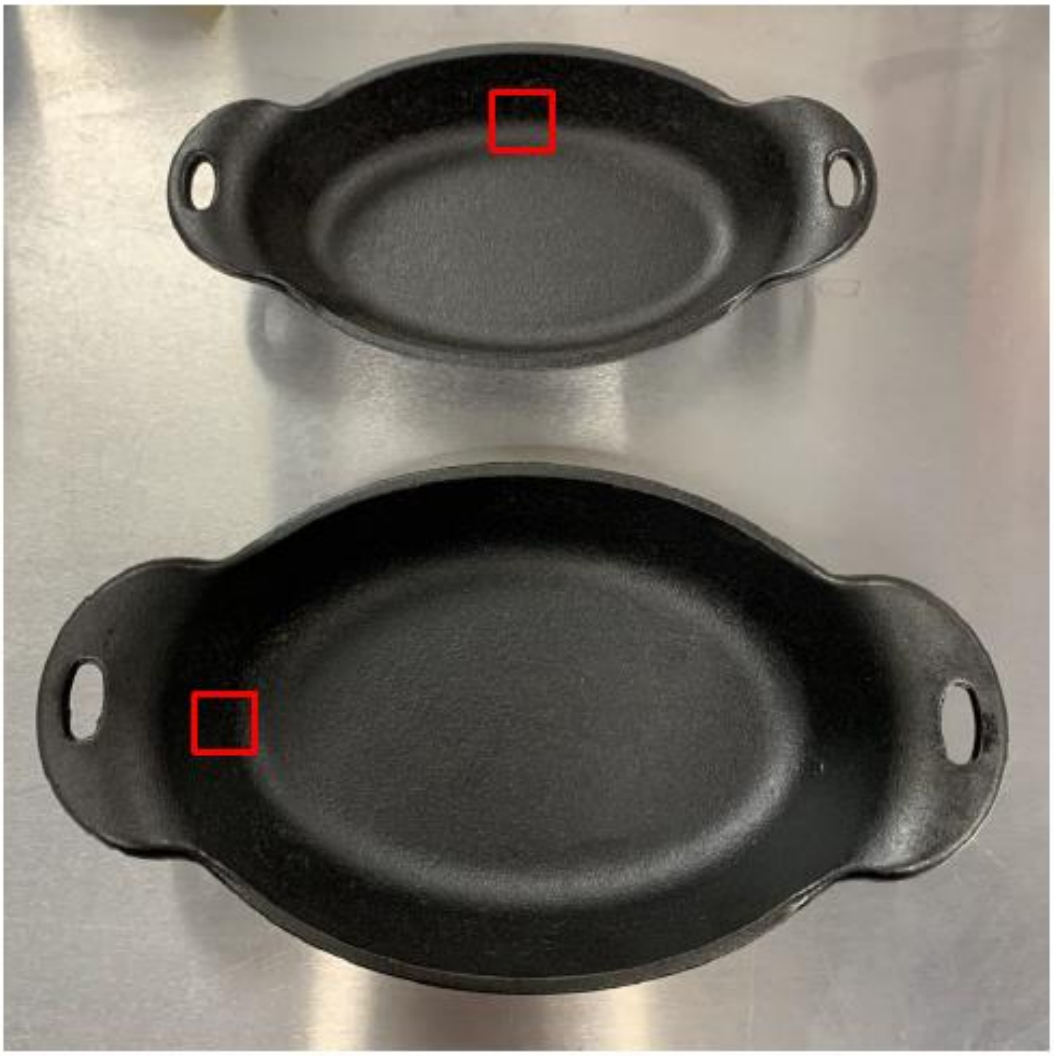

Figure 2. 9 Ounce Oval Cast Iron Mini Server and 16 Ounce Oval Cast Iron Mini Server Sample Areas.

Figure 3. 14 Ounce Rectangular Cast Iron Mini Server Sample Area.

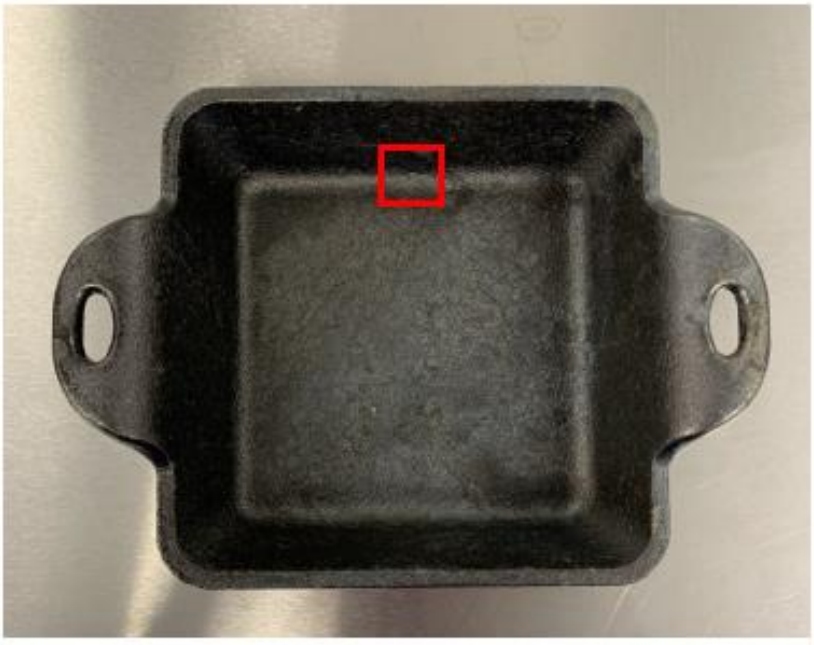

Figure 4. 10 Ounce Square Cast Iron Mini Server Sample Area.

15.0 Recovery and Enumeration Procedure:

15.1 Add 1.0 mL of PBS to a sterile swab. Thoroughly swab the 1" x 1" sample area in a both an up and down vertical motion and in a left and right horizontal motion. This process is designed to remove viable microorganisms from the surface of the test article for enumeration.

15.2 Place the swab in a test tube containing 9.0 mL of PBS. Express the swab into the test tube and thoroughly vortex. Prepare ten-fold serial dilutions of the sample by transferring 1.0 mL from the initial dilution into 9.0 mL of PBS.

15.3 For *S. aureus, E. coli, S.* Enteritidis and *L. monocytogenes*, plate each dilution into duplicate sterile Petri dishes and add 12 - 15 mL of tempered MCT to the Petri dishes. Mix thoroughly and allow the plates to solidify. Invert plates and incubate at 35 ± 1 °C for 48 ± 2 hours.

15.4 For *C. perfringens* spread plate each dilution on duplicate pre-poured plates of CBA. Spread inoculum with a sterile L-shaped spreader or sterile plating beads. Invert plates and incubate anaerobically at 35 ± 1 °C for 48 ± 2 hours.

15.5 After incubation, typical colonies will be enumerated and raw data recorded as CFU/plate. Duplicate plates will be averaged and multiplied by the dilution factor to arrive at CFU/test article. Raw values will be recorded and used for the calculations in section 18.0.

16.0 Study Controls:

16.1 Food Grade Stainless Steel Controls – Three (3) 4" x 4" food grade stainless steel test articles will be inoculated according to the procedures outlined in Section 14.0. The recovered microorganisms will be determined following the procedures in Section 15.0. In order for the testing to be considered acceptable, recovery data comparable to the cast iron test articles much be achieved.

17.0 Statistical Analysis:

17.1 A logarithmic transformation measuring surviving microbial populations of the positive control article and test replicates for each microorganism will be performed.

17.2 Equivalence of Recovery will be calculated as follows:

ΔLog10 = Equivalence Recovery
TR1 = Test Article Replicate 1
TR2 = Test Article Replicate 2
TR3 = Test Article Replicate 3
SS1 = Stainless Steel 1
SS2 = Stainless Steel 2
SS3 = Stainless Steel 3

$$\left(\frac{TR1 + TR2 + TR3}{3}\right) - \left(\frac{SS1 + SS2 + SS3}{3}\right) = \Delta\text{Log10}$$

18.0 Media Quality Controls:

18.1 The MCT plating media will be inoculated with an aliquot of each *S. aureus, E. coli, S.* Enteritidis, and *L. monocytogenes* suspension. The MCT plates will be incubated at 35 ± 1 °C for 48 ± 2 hours. These plates will serve as positive growth controls for the media.

18.2 The CBA and RCM media will be inoculated with an aliquot of the *C. perfringens* suspension. The CBA and RCM will be incubated anaerobically at 35 ± 1 °C for 48 ± 2 hours. These will serve as positive growth controls for the media.

18.3 The acceptance criterion for these bacterial media controls is "typical growth" of the organisms.

18.4 For negative sterility controls, two tubes each of TSB, PBS, and three plates of MCT will be incubated at 35 ± 2 °C for 48 ± 2 hours.

The acceptance criterion for these uninoculated media controls is "negative for growth".

19.0 Performance Criteria:

19.1 In order to demonstrate equivalent recovery the cast iron test articles must be within 0.5 Log of the stainless-steel carrier controls.

20.0 Acceptance Criteria:

20.1 The study controls below must perform according to the criteria detailed for the data to be considered acceptable.

20.1.1 Comparable growth acceptance will be within 50 - 200 % between the media. Sterility acceptance is no growth.

20.1.2 The acceptance criteria are growth from inoculated streaks and no growth from the sterility controls.

21.0 References:

21.1 U. S. Food and Drug Administration *Bacteriological Analytical Manual*, Chapter 3 *Aerobic Plate Count (*January 2001). (Accessed October 2019) http://www.fda.gov/Food/FoodScienceResearch/LaboratoryMethods/ucm063346.htm

22.0 Final Report:

A final validation report will be prepared upon completion of the study, including a tabularized summary of data and a description of results of the study.

23.0 Documentation and Record-Keeping:

All documentation and records will be compiled, analyzed, and retained by Q Laboratories at its facility in Cincinnati, Ohio. All raw data for this study, as well as the final report, will be sent to the study sponsor and retained in safe storage by the testing facility for a period of at least seven (7) years (20 –ADMN-ISO-008D, Control of Records).

24.0 Quality Compliance:

Q Laboratories has developed and implemented a quality management system that enhances our ability to provide testing services that consistently meet client expectations and regulatory requirements. Q Laboratories quality documentation requirements are defined by ISO 17025, FDA Quality System Regulations (QSR), FDA Current Good Manufacturing Practices (cGMPs), FDA Good Laboratory Practices (GLP), and EPA Good Laboratory Practices standards (GLPs).
Q Laboratories applies the following standards as applicable:

- ISO 17025:2017 General Requirements for the Competence of Testing and Calibration Laboratories
- FDA 21 CFR Part 820 Quality System Regulation
- FDA 21 CFR Part 58 Good Laboratory Practice for Non Clinical Laboratory Studies
- FDA 21 CFR Part 211 Current Good Manufacturing Practice for Finished Pharmaceuticals
- FDA 21 CFR Part 210 Current Good Manufacturing Practice in Manufacturing Processing, Packing or Holding of Drugs; General
- EPA 40 CFR Part 160 FIFRA Good Laboratory Practice Standards

25.0 Protocol Modifications:

During the testing phase, changes to the protocol may be required. The study sponsor will be notified immediately of any modifications to the protocol. Approval of the modifications is required before any additional analysis is conducted. The modifications will be added to the protocol as an amendment and approved by both the study director and study sponsor.

26.0 Test Article Disposition:

All unused test material will be offered for return to the Study Sponsor at expense of Study Sponsor. If not desired by Study Sponsor, all unused test material to be disposed of within 90 days following the study completion.

27.0 Acceptance of Study Protocol:

Title

Literature Demonstrating Microbial Growth in Cut Fruits/Vegetables

TYPE OF FOOD	PATHOGEN	TITLE	MICROBIAL GROWTH (≥ 1 log @RT)	REFERENCES
Cantaloupe flesh / Avocado pulp	*Listeria monocytogenes*	Growth kinetics of *Listeria monocytogenes* in cut produce.	Avocado pulp reached 1 log growth in 5.2-7.7 hrs. at 25°C and Cantaloupe reached 1 log growth in 7.3-10.7 hrs. at 25°C	(Salazar et al., 2017)
Avocado pulp and processed Guacamole	*Listeria monocytogenes*	Behavior of *Listeria monocytogenes* in Avocado Pulp and Processed Guacamole	1 log growth at approximately 8 hours at 22°C	(Iturriaga et al., 2002)
Cantaloupe flesh and Avocado pulp, green Olives, and Broccoli	*Listeria monocytogenes*	Growth kinetics of *Listeria monocytogenes* in cut produce.	At 25°C storage temp., growth rates of *L.* monocytogenes in Cantaloupe flesh and Avocado pulp were ≥ 0.1 log CFU/g/h	(Salazar et al., 2017)
Fresh-cut Celery	*Escherichia coli* O157:H7	Fate of *Escherichia coli* O157: H7, *Listeria monocytogenes*, and *Salmonella* on fresh-cut celery.	*E. coli* O157:H7 populations on fresh cut celery increased by 1.0 log CFU/g over the 2-day storage period at 22° C. The most growth occurred over the first 17 hours.	(Vandamm et al., 2013)
	Listeria monocytogenes		*L. monocytogenes* populations on fresh cut celery increased by 0.5 log CFU/g over the 2-day storage period at 22°C	
	Salmonella		*Salmonella* populations on fresh cut celery increased by 2.0 log CFU/g over the 2-day storage period at 22°C. The most growth occurred over the first 17 hours.	
Highbush blueberries	*Listeria monocytogenes*	Survival of *Listeria monocytogenes* on Fresh Blueberries (Vaccinium corymbosum) Stored under Controlled Atmosphere and Ozone.	Estimated initial inoculum per sample was approximately 10^7 CFU/mL. Blueberries inoculated with *L. monocytogenes* and stored in regular air conditions at 12°C for 10 days had bacterial recovery of 5.15 CFU/mL.	(Concha-Meyer et al., 2014)
Cut red round tomatoes	*Salmonella* (Includes four serotypes, Typhimurium, Newport, Javiana, and Braenderup)	Modeling the Growth of *Salmonella* in Cut Red Round Tomatoes as a Function of Temperature	Starting concentration on cut tomato was 10^2 CFU/g. Cut tomato was inoculated at 10, 12.5, 15, 17.5, 20, 22.5, 25, 27.5, 30, and 35°C for five to twelve hours. Concentration increased throughout incubation time to a final concentration of 10^7 to 10^8 CFU/g of tomato. Growth has little to no lag time which is in contrast to FDA research that indicates that *Salmonella* will	(Pan and Schaffner, 2010)

			have a growth lag time between 3 to 7 hours at 22.2˚C depending on tomato variety.	
Peaches	*Escherichia coli* O157:H7	Fate of *Escherichia coli* O157:H7, *Salmonella* and *Listeria innocua* on minimally processed peaches under different storage conditions	Initial population was 5.2 $\log_{10}$ cfu $plug^{-1}$. Population after 6 days at 20˚C was approximately 6.0 $\log_{10}$ cfu $plug^{-1}$. Peak growth was 8.0 $\log_{10}$ cfu $plug^{-1}$ after 2 days at 20˚C. Population after 6 days at 25˚C was 7.7 $\log_{10}$ cfu $plug^{-1}$. Peak growth was 8.0 $\log_{10}$ cfu $plug^{-1}$ after 24 hours at 25˚C.	(Alegre et al., 2010)
	Salmonella choleraesuis		Initial population was approximately 5.3 $\log_{10}$ cfu $plug^{-1}$ Population after 6 days at 20˚C was approximately 7.5 $\log_{10}$ cfu $plug^{-1}$. Peak growth was 7.7 $\log_{10}$ cfu $plug^{-1}$ after 3 days at 20˚C. Population after 6 days at 25˚C was approximately 7.7 $\log_{10}$ cfu $plug^{-1}$. Peak growth was 8.2 $\log_{10}$ cfu $plug^{-1}$ after 3 days at 25˚C.	
	Listeria innocua		Initial population was 5.3 $\log_{10}$ cfu $plug^{-1}$. Population after 6 days at 20˚C was approximately 7.5 $\log_{10}$ cfu $plug^{-1}$. Peak growth was 7.9 $\log_{10}$ cfu $plug^{-1}$ after 3 days at 20˚C. Peak growth was 8.1 $\log_{10}$ cfu $plug^{-1}$ after 6 days at 25˚C.	
Fresh cut mangoes and papayas	*Escherichia coli* O157:H7	Fate of *Escherichia coli* O157:H7 and *Salmonella* spp. on fresh and frozen cut mangoes and papayas	**Mangoes:** Initial population of 2.9 log CFU/g on day 0 at 23˚C. Peak growth was 4.7 log CFU/g on day 1 at 23˚C. Population after 7 days at 23˚C was 4.0 log CFU/g. Cut mango was visually determined to be spoiled on day 3 at 23˚C.	(Strawn and Danyluk, 2010)
			Papayas: Initial population was 2.6 log CFU/g on day 0 at 23˚C. Peak growth was 7.1 log CFU/g on day 3 at 23˚C. Population after 7 days at 23˚C was 6.3 log CFU/g. Initial population was 3.9 log CFU/g on day 0 at 12˚C. Peak growth was 6.9 log CFU/g on day 5 at	

			12˚C. Population after 7 days at 12˚C was 6.8 log CFU/g.	
	Salmonella spp.		**Mangoes:** Initial population was 2.9 CFU/g on day 0 at 23˚C. Peak growth was 6.2 CFU/g on day 3 at 23˚C. Population after 7 days at 23˚C was 2.4 CFU/g. Initial population was 4.5 CFU/g on day 0 at 12˚C. Peak growth was 5.9 CFU/g on day 1 at 12˚C. Population after 7 days at 12˚C was 4.5 CFU/g.	
			Papayas: Initial population was 2.6 CFU/g on day 0 at 23˚C. Peak growth was 7.4 CFU/g on day 3 at 23˚C. Population after 7 days at 23˚C was 6.6 CFU/g. Initial population was 4.1 CFU/g on day 0 at 12˚C. Peak growth was 7.7 CFU/g on day 5 at 12˚C. Population after 7 days at 12˚C was 7.6 CFU/g.	
Fresh cut Golden Delicious apple plugs	*Listeria monocytogenes*	Biocontrol of the Food-Borne Pathogens *Listeria monocytogenes* and *Salmonella enterica* Serovar Poona on Fresh-Cut Apples with Naturally Occurring Bacterial and Yeast Antagonists	Initial population was 2.8 log CFU/plug. Without antagonistic treatment, population increased to 5.3 log CFU/plug when stored at 10˚C for 5 days. Without antagonistic treatment, population increased to 6.0 log CFU/plug when stored at 25˚C for 7 days.	(Leverentz et al., 2006)
	Salmonella enterica		Initial population was 2.3 log CFU/plug. Without antagonistic treatment, population increased to 5.3 log CFU/plug when stored at 25˚C for 7 days.	
Sliced cucumbers	*Listeria monocytogenes*	Growth and Survival of *Listeria monocytogenes* and *Salmonella* on Whole and Sliced Cucumbers	**Non-selective Media:** Initial population was 4.3 log CFU/g on hour/day 0. Population after 24 hours at 23˚C was 6.0 log CFU/g (increase of 1.7 log CFU/g). Peak population growth was 6.5 log CFU/g at 23˚C on day 2. After day 2 populations declined. **Selective Media:** Initial population was 4.1 log CFU/g on hour/day 0. Population after 24 hours at 23˚C was 5.8 log CFU/g (increase of 1.7 log CFU/g). Peak population growth was 6.4 log CFU/g at 23˚C on day 2. After day 2 populations declined.	(Bardsley et al., 2019)
	Salmonella		**Non-selective Media:** Initial population was 2.8 log CFU/g on hour/day 0. Population after 8 hours at	

			23˚C was 5.9 log CFU/g (increase of 3.1 log CFU/g). Peak population growth was 6.3 log CFU/g at 23˚C at hour 17. After day 1 populations declined. **Selective Media:** Initial population was 2.7 log CFU/g on hour/day 0. Population after 8 hours at 23˚C was 5.7 log CFU/g (increase of 3.0 log CFU/g). Peak population growth was 6.1 log CFU/g at 23˚C at hour 17. After day 1 populations declined.	
Rocha fresh-cut pears	*Escherichia coli*	Growth of *Escherichia coli*, *Salmonella enterica* and *Listeria* spp., and their inactivation using ultraviolet energy and electrolyzed water, on 'Rocha' fresh-cut pears	At 12˚C maximum growth rate was 1.9±0.193 day^{-1} At 20˚C maximum growth rate was 2.98±0.258 day^{-1}	(Graça et al., 2017)
	Salmonella enterica		At 12˚C maximum growth rate was 2.2±0.23 day^{-1} At 20˚C maximum growth rate was 2.7±0.322 day^{-1}	
	Listeria spp.		At 12˚C maximum growth rate was 2.6± 0.636 day^{-1} At 20˚C maximum growth rate was 3.1±0.296 day^{-1}	
Various fresh cut produce items (summary of early literature findings)	*Shigella*	Outbreaks Fresh Produce Incidence, Growth, and Survival of Pathogens in Fresh and Fresh- Cut Produce	Populations of *S. sonnei, S. flexneri, and S. dysenteriae* inoculated on fresh cut cubes of papaya, jicama, and watermelon increased substantially within 4 to 6 hours at 22˚C - 27˚C. (Table G/S2, G/S4. GS1)	(Harris et al., 2003)
	Listeria monocytogenes		Chopped tomato stored at 21˚C with initial population of 5 log_{10} CFU/g. After 8 days, population was between 1.0 to 3.5 log_{10} CFU/g with survival slightly better in chlorine treated samples. Butternut squash cubes stored in a sealed bag at 10˚C had an initial concentration of 3.0 log_{10} CFU/g. After 9 days of storage at 10˚C population increased to approximately 8.5 log_{10} CFU/g. Shredded cabbage stored in plastic impermeable bags with ambient air had an initial concentration of 4.1 log_{10} CFU/g. For the first 24 hours, package was stored in refrigerator, afterwards stored at 25˚C. After 2 days at 25˚C, population increased to approximately 6.0 log_{10} CFU/g. Shredded cabbage stored in plastic impermeable bag with 70% CO_2 and 30% N_2 at 25˚C had an initial	

			concentration of 4.0 log_{10} CFU/g. After 2 days at 25˚C population increased to approximately 4.5 log_{10} CFU/g. Shredded carrots held at 15˚C had initial concentration of <1.0 log_{10} CFU/g. After 7 days of storage at 15˚C population increased to 3.4 - 5.8 log_{10} CFU/g. Sliced onion stored at 10˚C had initial concentration of 3.5 log_{10} CFU/g. After 9 days of storage at 10˚C population increased to approximately 4.8 log_{10} CFU/g. Rutabaga sticks stored at 10˚C had initial concentration of 3.0 log_{10} CFU/g. After 9 days of storage at 10˚C population increased to approximately 6.0 log_{10} CFU/g.	
	Salmonella		Cut tomato was stored at 22˚C with initial population of 1.1 log_{10} CFU/g. After 24 hours population increased to 6.3-6.9 log_{10} CFU/g.	
	Salmonella Typhi		Papaya cubes stored between 25-27˚C with initial population of 2.9 log_{10} CFU/cube (pH 5.69) and 3.0 log_{10} CFU/cube (pH 3.59). After 6 hours of incubation, population increased to 4.3 log_{10} CFU/cube (pH 5.69) and 3.8 log_{10} CFU/cube (pH 3.59). Jicama cubes stored between 25-27˚C with initial population of 3.1 log_{10} CFU/cube (pH 3.30) and 3.2 log_{10} CFU/cube (pH 5.97). After 6 hours of incubation, population increased to 3.4 log_{10} CFU/cube (pH 3.30) and 4.7 log_{10} CFU/cube (pH 5.97).	
	Salmonella Baildon		Diced tomatoes stored at 21˚C with initial population of 3.4 log_{10} CFU/g. After 72 hours, population was 8.1 log_{10} CFU/g.	

	Salmonella Montevideo		Slices of tomato stored at 25˚C with initial counts of 3.4 $\log_{10}$ CFU/slice and 4.4 $\log_{10}$ CFU/slice. After 12 hours, population was approximately 7.5 and 8.0 $\log_{10}$ CFU/slice respectively.	
	Clostridium botulinum		Butternut squash cubes inoculated with 2.0 $\log_{10}$ spores/g of 10 strains of proteolytic *C. botulinum* stored at 15˚C and 25˚C for 14 days and 3 days respectively. Toxin was detected at for both temperatures after storage for 14 days and 3 days respectively.	
	Escherichia coli O157:H7		Shredded carrot stored in 3% O_2 97% N_2 polyolefin L-bags with initial concentration of 2.5 $\log_{10}$ CFU/g at 21˚C. After 7 days population increased to 4.2 $\log_{10}$ CFU/g. Shredded carrot stored in air in polyolefin L-bags with initial concentration of 5.3 $\log_{10}$ CFU/g at 12˚C and 21˚C. After 14 days at 12˚C population increased to 6.3 $\log_{10}$ CFU/g. After 7 days at 21˚C population increased to 6.0 $\log_{10}$ CFU/g. Shredded carrot stored in polyolefin L-bags with initial concentration of 2.5 $\log_{10}$ CFU/g at 21˚C. After 7 days population increased to 3.8 $\log_{10}$ CFU/g. Sliced cucumber stored in 3% O_2 97% N_2 in polyolefin L-bags with initial concentration of 2.3 $\log_{10}$ CFU/g at 21˚C. After 7 days at 21˚C population increased to 2.6 $\log_{10}$ CFU/g. Sliced cucumber stored in air in polyolefin L-bags with initial concentration of 5.1 $\log_{10}$ CFU/g at 12˚C. After 10 days at 12˚C population increased to 5.7 $\log_{10}$ CFU/g. Sliced cucumber stored in air in polyolefin L-bags with initial concentration of 2.3 $\log_{10}$ CFU/g at 21˚C.	

			After 7 days at 21°C population increased to 3.1 log_{10} CFU/g.	
Cut turnips	*Listeria monocytogenes*	Growth of *Listeria monocytogenes* Inoculated on Packaged Fresh-Cut Turnips Stored at 4 and 10°C	Initial population was 3.40 log CFU/g (LOT 1) and 3.51 log CFU/g (LOT 2) on day 0 at 10°C. Peak growth was 4.7 log CFU/g (LOT 1) and 5.10 log CFU/g (LOT 2) on day 10 at 10°C.	(Brierley et al., 2020)
Cut red cabbage	*Listeria monocytogenes*	Growth Kinetics of *Listeria monocytogenes* on Cut Red Cabbage	Initial population on cut red cabbage was 3.67 log CFU/g. After 3 days of storage at 10°C, population increased to 4.25 log CFU/g. Maximum growth rate was 0.27 log CFU/g/day. After 3 days of storage at 25°C, population increased to 4.74 log CFU/g. Maximum growth rate was 1.15 log CFU/g/day.	(Salazar et al., 2022)
Sliced zucchini squash	*Salmonella* Typhimurium, Gaminara, Typhi, Montevideo	Incidence and Behavior of *Salmonella* and *Escherichia coli* on Whole and Sliced Zucchini Squash (Cucurbita pepo) Fruit	Initial populations were approximately 2.5 log CFU/slice. After two days at 25°C, populations increased to approximately 6.0 log CFU/slice.	(Castro-Rosas et al., 2010)
	Escherichia coli		Initial population was approximately 2.5 log CFU per slice. After two days at 25°C, population increased to approximately 7.0 log CFU/slice.	
Tomato and cucumber salad without lemon juice or salt (Arabic salad)	*Listeria monocytogenes*	Survival and growth of *Listeria monocytogenes* and *Staphylococcus aureus* in ready-to-eat Mediterranean vegetable salads: Impact of storage temperature and food matrix	Initial population was approximately 5.5 log CFU/g. After 1 day stored at 24°C, population increased to 7.2 log CFU/g. After 5 days stored at 10°C, population increased to 7.5 log CFU/g.	(Olaimat et al., 2021)
	Staphylococcus aureus		Initial population was approximately 5.7 log CFU/g. After 2 days stored at 24°C, population increased to 7.5 log CFU/g. After 5 days stored at 10°C, population increased to 6.7 log CFU/g.	

Fresh-cut canary melon and papaya	*Listeria monocytogenes*	Effect of citral nanoemulsion on the inactivation of *Listeria monocytogenes* and sensory properties of fresh-cut melon and papaya during storage	Initial population was 5.0 log CFU/g. After 7 days stored at 12˚C, population on cut melon increased to approximately 7.5 log CFU/g. After 7 days stored at 16˚C, population on cut melon increased to approximately 8.7 log CFU/g. After 7 days stored at 12˚C, population on cut papaya increased to approximately 7.3 log CFU/g. After 7 days stored at 16˚C, population on cut papaya increased to approximately 7.8 log CFU/g.	(Luciano et al., 2023)
Cut grapes, tomato, white cabbage, red cabbage	*Listeria monocytogenes*	Evaluating the growth potential of *Listeria monocytogenes* in Ready to Eat Vegetables	All cut produce was inoculated and stored at 5˚C for two days then 10˚C until a few days after shelf-life. Initial population on grapes was 4.2 log CFU/g. Two days after shelf life (9 days total), population on cut grapes increased to 4.9 log CFU/g. Initial population on tomatoes was 4.0 log CFU/g. Two days after shelf life (8 days total), population on cut tomatoes increased to 4.1 log CFU/g. Initial population on white cabbage was 4.1 log CFU/g. Two days after shelf life (9 days total), population on cut white cabbage increased to 4.2 log CFU/g. Initial population on red cabbage was 3.6 log CFU/g. Two days after shelf life (9 days total), population on cut red cabbage increased to 4.0 log CFU/g.	(Shoja Gharehbagh et al., 2023)

Chapter 1. Purpose and Definitions

- Page 20 *(page 49 in PDF)* –
  - "Time/temperature control for safety food" included:
    a. An animal FOOD that is raw or heat-treated; a plant FOOD that is heat-treated or consists of raw seed sprouts, cut melons, cut leafy greens, cut tomatoes or mixtures of cut tomatoes that are not modified in a way so that they are unable to support pathogenic microorganism growth or toxin formation, or garlic-in-oil mixtures that are not modified in a way so that they are unable to support pathogenic microorganism growth or toxin formation

    This document can be found at the web site: http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm113843.htm

    The Retail Food Protection Program Information Manual, Storage and Handling of Tomatoes provides safe storage and handling practices for cut tomatoes and additional rationale for including cut tomatoes in the definition of time/temperature control for safety food in the 2005 Food Code. Historically, uncooked fruits and vegetables have been considered non-TCS food unless they were epidemiologically implicated in foodborne illness outbreaks and are capable of supporting the growth of pathogenic bacteria in the absence of temperature control. Since 1990, at least 12 multi-state foodborne illness outbreaks have been associated with different varieties of tomatoes. From 1998 – 2006, outbreaks associated with tomatoes made up 17% of the produce-related outbreaks reported to FDA. Salmonella has been the pathogen of concern most often associated with tomato outbreaks. Recommendations are being offered to prevent contamination in food service facilities and retail food stores and to reduce the growth of pathogenic bacteria when contamination of fresh tomatoes may have already occurred (regardless of the location where the contamination occurred).

  - O. Retail Food Protection Program Information Manual: Recommendations to Food Establishments for Serving or Selling Cut Leafy Greens.

    This document can be found at: http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm113843.htm.

    Following 24 multi-state outbreaks between 1998 and 2008, cut leafy greens was added to the definition of time/temperature for safety food requiring time-temperature control for safety (TCS). The term used in the definition includes a variety of cut lettuces and leafy greens. Raw agricultural commodities (RACs) that are not processed or cut on-site are excluded from the definition of cut leafy greens. Herbs such as cilantro or parsley are also not considered cut leafy greens. The pH, water activity, available

moisture and nutrients of cut leafy greens supports the growth of foodborne pathogens and refrigeration at 41ºF (5ºC) or less inhibits growth and promotes general die off in some pathogens such as E. coli O157:H7. Salmonella, E. coli O157:H7 and Listeria monocytogenes, once attached to the surface or internalized into cut surfaces of leafy greens, are only marginally affected by chemical sanitizers. Recommended handling instructions for leafy greens during purchasing and receiving, storage, food employee handling fresh produce, washing fresh produce, preparation for sale or service and display for sale or service are attached to the document.

Annex 3. Public Health Reasons/Administrative Guidelines

- Page 295-297 *(page 327-329 in PDF)* –
    - **Time/Temperature Control for Safety Food**

      Time Temperature Control for Safety Food (TCS) is defined in terms of whether or not it requires time/temperature control for safety to limit pathogen growth or toxin formation. The term does not include foods that do not support growth but may contain a pathogenic microorganism or chemical or physical food safety hazard at a level sufficient to cause foodborne illness or injury. The progressive growth of all foodborne pathogens is considered whether slow or rapid.

      The definition of TCS food takes into consideration pH, aw, pH and aw interaction, heat treatment, and packaging for a relatively simple determination of whether the food requires time/temperature control for safety. If the food is heat-treated to eliminate vegetative cells, it needs to be addressed differently than a raw product with no, or inadequate, heat treatment. In addition, if the food is packaged after heat treatment to destroy vegetative cells and subsequently packaged to prevent re-contamination, higher ranges of pH and/or aw can be tolerated because remaining spore-forming bacteria are the only microbial hazards of concern. While foods will need to be cooled slightly to prevent condensation inside the package, they must be protected from contamination in an area with limited access and packaged before temperatures drop below 57°C (135°F). In some foods, it is possible that neither the pH value nor the aw value is low enough by itself to control or eliminate pathogen growth; however, the interaction of pH and aw may be able to accomplish it. This is an example of a hurdle technology. Hurdle technology involves several inhibitory factors being used together to control or eliminate pathogen growth, when they would otherwise be ineffective if used alone. When no other inhibitory factors are present and the pH and/or aw values are unable to control or eliminate bacterial pathogens which may be present, growth may occur and foodborne outbreaks result. Cut melons, cut tomatoes, and cut leafy greens are examples where intrinsic factors are unable to control bacterial growth once pathogens are exposed to the cellular fluids and nutrients after cutting.

      .
      .
      .

      The Food Code definition designates certain raw plant foods as TCS food because they have been shown to support the growth of foodborne pathogens in the absence of temperature control and to lack intrinsic factors that would inhibit pathogen growth. Unless product assessment shows otherwise, these designations are supported by Tables A and B. For example:

For cut cantaloupe (pH 6.2-7.1, aw > 0.99, not heat-treated),. fresh sprouts (pH > 6.5, aw > 0.99, not heat-treated), and cut tomatoes (pH 4.23 – 5.04, aw > 0.99, not heat-treated), Table B indicates that they are considered TCS Foods unless a product assessment shows otherwise. Maintaining these products under the temperature control requirements prescribed in this code for TCS food will limit the growth of pathogens that may be present in or on the food and may help prevent foodborne illness.

More information can be found in the Institute of Food Technologists (IFT) Report, "Evaluation and Definition of Potentially Hazardous Foods" at http://www.fda.gov/Food/FoodScienceResearch/SafePracticesforFoodProcesses/ucm094141.htm

- Page 389 *(page 421 in PDF)* –
  - 3-302.15 Washing Fruits and Vegetables

    After being cut, certain produce such as melons, leafy greens and tomatoes are considered time/temperature control for safety food (TCS) requiring time/temperature control for safety and should be refrigerated at 41°F or lower to prevent any pathogens that may be present from multiplying. For more retail food guidance on the storage and handling of tomatoes, leafy greens, and other produce, you may consult the FDA Program Information Manual, Retail Food Protection Storage and Handling of Tomatoes, dated October 5, 2007, available at http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm113843.htm, the document, Time as a Public Health Control for Cut Tomatoes, dated June 8, 2010 available at http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm215053.htm and the FDA Program Information Manual, Recommendations for the Temperature Control of Cut Leafy Greens during Storage and Display in Retail Food Establishments dated July 7, 2010 available at http://www.fda.gov/Food/GuidanceRegulation/RetailFoodProtection/IndustryandRegulatoryAssistanceandTrainingResources/ucm218750.htm

- Page 427 (*page 459 in PDF)* –
  - At the 2018 meeting of the CFP it was recommended that Section 3-501.19 be amended to allow raw agricultural commodities (RACs) that are cut on-site (such as tomatoes, melons, or leafy greens) or shelf-stable hermetically sealed containers (such as canned tuna) opened on-site have an initial temperature of 21°C (70°F) or less when time without temperature control is used as a public health control for a maximum of 4 hours. Peer-reviewed scientific literature and the above-mentioned pathogen modeling has shown Salmonella spp. and L. monocytogenes will not exceed a 1-log increase in growth when started and maintained at 21°C (70°F) or less for up to 4 hours.

Let me know if this doesn't work and I'll edit as appropriate. I've copied Kate Piche from my team as a heads up.

The National Restaurant Association Food Safety/Compliance team supports this Issue. With continually decreasing time and resources in the face of increasing demands, the recommended solution reduces the regulatory burden without jeopardizing public health and food safety. As indicated in the Issue, several States are now relying on the more recent technology of culture independent diagnostic tests to help determine an appropriate time frame to allow a restricted or excluded food employee to return to work. We add our voice to those asking FDA to consider this change to the Food Code.

ABSTRACT

Concern has been raised regarding the public health risks from refillable bulk-soap dispensers because they provide an environment for potentially pathogenic bacteria to grow. This study surveyed the microbial quality of open refillable bulk soap in four different food establishment types in three states. Two hundred ninety-six samples of bulk soap were collected from food service establishments in Arizona, New Jersey, and Ohio. Samples were tested for total heterotrophic viable bacteria, *Pseudomonas,* coliforms and *Escherichia coli,* and *Salmonella*. Bacteria were screened for antibiotic resistance. The pH, solids content, and water activity of all soap samples were measured. Samples were assayed for the presence of the common antibacterial agents triclosan and parachlorometaxylenol. More than 85% of the soap samples tested contained no detectable microorganisms, but when a sample contained any detectable microorganisms, it was most likely contaminated at a very high level (~7 log CFU/mL). Microorganisms detected in contaminated soap included *Klebsiella oxytoca, Serratia liquefaciens, Shigella sonnei, Enterobacter gergoviae, Serratia odorifera,* and *Enterobacter cloacae*. Twenty-three samples contained antibiotic-resistant organisms, some of which were resistant to two or more antibiotics. Every sample containing less than 4% solids had some detectable level of bacteria, whereas no samples with greater than 14% solids had detectable bacteria. This finding suggests the use of dilution and/or low-cost formulations as a cause of bacterial growth. There was a statistically significant difference ($P = 0.0035$) between the fraction of bacteria-positive samples with no detected antimicrobial agent (17%) and those containing an antimicrobial agent (7%). Fast food operations and grocery stores were more likely to have detectable bacteria in bulk-soap samples compared with convenience stores ($P < 0.05$). Our findings underscore the risk to public health from use of refillable bulk-soap dispensers in food service establishments.

Key words: Bulk soap; Coliforms; Contamination; Hand washing

Washing hands with soap and water is a universally accepted practice to reduce cross-contamination and the incidence of nosocomial infections *(9, 12–14, 16, 18, 20, 26, 29, 33)*. The U.S. Food and Drug Administration (FDA), the U.S. Centers for Disease Control and Prevention (CDC), and the World Health Organization (WHO) suggest proper hand hygiene with soap and water and/or an alcohol-based hand sanitizer in health care and food preparation settings *(3, 35, 39)*. The CDC and WHO recommend alcohol-based hand sanitizer as the primary means for hand hygiene at key moments in health care settings *(3, 31, 39),* whereas food handling guidance from FDA *(35)* supports gloving or hand washing for primary prevention. The respective hand hygiene guidance documents from these three public health agencies all have language that indicates that a hand wash is not complete without the use of soap *(3, 35, 39)*. However, concern has been raised that the use of refillable bulk-soap dispensers is a public health risk because they provide an environment for potentially pathogenic bacteria to grow, especially if the bulk soap is diluted with water to reduce cost *(8, 21, 25, 30, 40)*.

Outbreaks associated with contaminated soap have been extensively documented in health care settings *(1, 2, 5, 24, 27, 30, 38),* but none to date have been connected to food service settings. Organisms found in bulk soaps are primarily gram-negative bacteria *(8),* and these bacteria include microorganisms that are commonly associated with nosocomial infection in hospitals *(3, 19)*. *Klebsiella pneumonia,* a bacterium associated with contaminated bulk soaps, can cause community-acquired pneumonia; proper hand hygiene is a good way of preventing cross-contamination by these bacteria because health care workers' hands can be vectors for these organisms *(7)*. Outbreaks of *Serratia marcescens* have also been traced to contaminated soap *(2, 5, 27, 30, 37)*. Although no outbreaks in food service have been directly linked to contaminated bulk-soap dispensers, roughly 50% of food service–linked outbreaks can be traced to food workers' hands as the source of pathogens *(16)*. Whereas soaps and other cosmetics are not required to be

sterile, good manufacturing practices for soaps and cosmetics require that any bacteria present should not constitute a hazard to consumers during regular use *(32)*.

Several factors contribute to bulk-soap contamination, including design of dispenser, soap formulation, and economically motivated dilution of soap *(5, 25)*. To refill sealed dispensers, new cartridges, which contain soap sealed inside with a new nozzle, are placed into the dispenser; in contrast, open refillable bulk-soap dispensers reuse a permanent nozzle and are refilled with soap from a larger bottle. A top-fill reservoir design allows for "topping-off" the soap. Although this potentially reduces soap waste, it also allows mixing of multiple soap lots and types and exposes the soap to an open-air environment, which increases the risk of contamination *(3, 25, 40)*. Furthermore, top-fill design dispensers may never thoroughly be rinsed out, as commonly recommended by dispenser manufacturers. The CDC recommends that bulk liquid soap dispensers be thoroughly cleaned every time before fresh soap is added *(3, 8, 14)*. However, as pointed out by Lorenz et al. *(21)*, no data exist to show that cleanings in between soap refills actually prevent contamination of soap. Regardless, bulk soap can quickly become contaminated due to biofilm formation inside the dispenser (up to 9 log CFU/mL) and can support growth in as little as 24 h *(25)*. Once pump mechanisms are colonized with bacteria, cells from the biofilm continue to contaminate soap, even if completely new bacteria-free soap is used to fill the container *(15)*. Soap formulations will often include preservatives to prevent growth, but because these preservatives are concentration dependent, dilution (as a cost savings measure) can render them ineffective. There has been no evidence of contamination in soap samples collected from dispensers in sealed disposable refills to date.

Potentially harmful bacteria will remain on hands after using contaminated soap *(8, 30, 40)*. Although the bacteria may not be a health concern for the hand washer, these bacteria can transfer from hands to food, objects, and surfaces *(6, 9, 12, 13, 16, 17, 22, 29)*. Hands are one of the main sources of cross-contamination in both health care and food service *(12, 20)*.

The purpose of this study was to survey the microbial quality of open refillable bulk soap sampled in four different food establishment types, within three different states, and to determine the influence of formulation factors on the degree of contamination.

MATERIALS AND METHODS

Sample collection. Samples were acquired from food service establishments around New Brunswick, NJ; Tucson, AZ; and Akron, OH. The categories of merchants from which soap samples were collected were convenience stores, grocery stores, "sit-down" restaurants, and fast food (quick-service) restaurants. Categories were sampled based on the prevalence of the types of establishment in each area and on the likelihood of finding bulk soap in the establishment. Soap was collected from the bathrooms of these establishments. Men's and women's restrooms were sampled in approximately equal frequency. Although soap color was noted, no attempt was made to sample specific colors.

Samples were shipped to the University of Arizona for microbiological analysis, and to GOJO Industries, Inc. (Akron, OH) for physical and chemical analysis. One hundred samples each were collected from Arizona and New Jersey, and 96 samples were collected from Ohio.

Soap samples were collected in a 50-mL sterile conical tube (Corning, Union City, CA), with a minimum volume goal of 45 mL. Two tubes of soap were collected from most establishments, except in a few instances in which a facility only had enough soap for one tube. Soap was collected in the tube by catching the soap released when the dispenser lever was pressed. We used this method to ensure that the soap collected was representative of what would be dispensed onto a customer's hands. Foaming soap was not sampled because bulk refillable foam soap dispensers are uncommon, and challenges in collecting an adequate mass of foaming soap made sampling impractical. Samples were sealed using parafilm (Bemis NA, Neenah, WI) and were placed in an ice pack–chilled cooler after collection.

Microbiological analysis. Total heterotrophic viable bacteria were assayed on Reasoner's 2A agar (R2A; EMD Chemicals, Inc., Gibbstown, NJ), using serial dilutions of 10^{-1} through 10^{-3} of the soap samples, with colonies counted after 5 days of incubation at 22 ± 2°C. R2A agar was originally developed as a rapid method for fecal coliforms in water *(28)*; however, since its development, it has been used in a wide variety of applications, including screening of bulk soap for contaminants *(8)* because it may be especially suitable for culturing slower growing organisms from stressed environments *(36)*. Colonies of the three most predominant morphologies were streaked onto plates of Trypticase soy agar (TSA; EMD Chemicals, Inc.) for isolation and identification. R2A plates were also examined for the presence of *Pseudomonas,* which was then isolated and confirmed.

Coliforms and *E. coli* were quantified using the IDEXX Quanti-Tray/2000 system (IDEXX Laboratories, Westbrook, MA). A 10-mL aliquot of the sample was added to 90 mL of sterile water containing the Quanti-Tray reagent, poured into the Quanti-Tray, and then sealed and incubated at 35°C for 24 h. Coliforms were identified by yellow pigmentation and *E. coli* by fluorescence under UV light. The number of positive yellow and fluorescing wells were quantified, and the IDEXX most-probable-number (MPN) generator program was used for quantification.

Randomly selected coliform-positive wells from the IDEXX Colilert Quanti-Tray/2000 (IDEXX Laboratories) were spread plated on MacConkey agar (EMD Chemicals, Inc.) to select for lactose fermenters. These isolates were then spread plated to TSA (EMD Chemicals, Inc.) and subjected to an oxidase test (BD, Sparks, MD) and API 20E identification biochemical test strips (bioMérieux, Durham, NC) for confirmation as coliforms. Twenty-eight isolates were identified as coliforms and tested for antibiotic resistance by placing antibiotic disks for vancomycin, ampicillin, gentamicin, and ciprofloxacin (Sigma Chemical, St. Louis, MO) onto bacterial lawns of the individual bacteria.

Salmonella preenrichment started by placing a 5-mL aliquot of the soap sample into a tube that contained 10 mL of tryptic soy broth (TSB; EMD), followed by incubation at 35°C for 24 h. After 24 h, 1 mL of the TSB was transferred to a tube that contained 10 mL of Rappaport-Vassiliadis broth (Hardy Diagnostics, Santa Maria, CA), followed by incubation at 41.5°C for 24 h. One milliliter of TSB was also added to a tube that contained 10 mL of selenite cystine broth (EMD Chemicals, Inc.) and was incubated at 35.0°C for 24 h. Each tube showing turbidity was streaked onto plates of Hektoen (EMD Chemicals, Inc.) and xylose lysine desoxycholate (XLD; EMD Chemicals, Inc.) agars and incubated

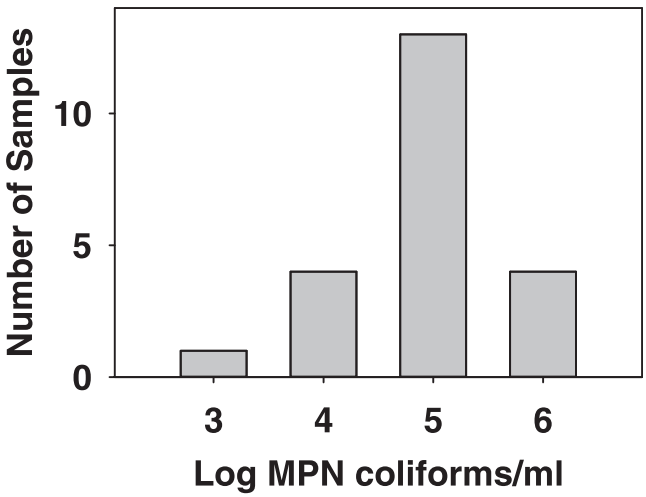

FIGURE 2. *The distribution of coliform counts in contaminated soap samples.*

at 35°C for 24 h. Presumptive *Salmonella* isolates were transferred to TSA for biochemical identification using the API 20E (bioMérieux). If the isolate was presumptively identified as *Salmonella,* the isolated colonies were sent to the National Veterinary Services Laboratories (Ames, IA) for serotyping.

pH and water activity. The pH of all samples was evaluated using a Thermo Orion 720A+ pH with the Thermo Scientific Orion ROSS Sure-Flow pH electrode (Thermo Fisher Scientific, Pittsburgh, PA). Five grams of each test sample was evaluated using the Ohaus standard moisture analyzer (model MB45, Ohaus, Pine Brook, NJ).

A water activity meter (Rotronic Instrument Corp., Hauppauge, NY) was used to measure the water activity of soap samples. Distilled water and glycerol solutions were used as standards. Each sample cup was filled with about 10 mL of soap sample, and after 4 to 5 min the temperature and water activity were recorded. The sample cup was rinsed using distilled water and was dried completely using a Kimwipe (Kimberly-Clark, New York, NY) after each test.

Antimicrobial analysis. All samples were evaluated for the presence and quantity of triclosan using the Waters (Milford, MA) e2695 Alliance high-performance liquid chromatography system with a UV/Visible Detector (Waters 2489) and a Waters μBondapak C18 column (125Å, 10 μm, 3.9 by 150 mm; Waters no. WAT086684). All samples that tested negative for the presence of triclosan were evaluated for the presence and quantity of parachlorometaxylenol, using the same system, detector, and column as used for triclosan.

RESULTS

Most of the soap samples tested (>85%) contained no detectable microorganisms (10 CFU/mL detection limit). The distribution of microbial counts found in contaminated soap samples is shown in Figure 1. Samples containing detectable microorganisms were most often contaminated at a very high level (~7 log CFU/mL), with counts on the remaining samples ranging uniformly from 1 to 6 log CFU/mL. Although not all bacteria recovered were identified, microorganisms detected in contaminated soap included *Klebsiella oxytoca, Serratia liquefaciens, Shigella sonnei, Enterobacter gergoviae, Serratia odorifera,* and *Enterobacter cloacae*. Four of the soap samples were positive for *Salmonella* by API 20E, but were not confirmed as *Salmonella* by the National Veterinary Services Laboratories. Twenty-three samples contained vancomycin-resistant organisms. Seven of these were also resistant to ampicillin, and two of those, in turn, were resistant to gentamicin. One sample contained an organism resistant to vancomycin, ampicillin, gentamicin, and ciprofloxacin (antibiotic resistance data not shown).

When a sample contained detectable coliforms, similarly, the population was likely to be high, as shown in Figure 2. The distribution of coliforms is likely higher than what is shown in Figure 2, because the two highest populations were at the upper limit of quantification (i.e., >241,960 MPN/mL or >24,196 MPN/mL).

Figure 3 shows that higher coliform counts tended to be associated with samples that contained higher bacterial counts overall. Coliform counts at the upper limits of the MPN method are especially associated with high total bacterial counts.

Figure 4 shows the relationship between sample pH and the population of detectable microorganisms. Of samples with a pH less than 7.0, 18% had detectable contamination, whereas only 10% of samples with a pH of 7 and above had detectable contamination. Note, however, that contaminated soap samples with a pH ≥7.0 are more likely to result in contamination at a relatively higher level (i.e., >1,000 CFU/mL), perhaps because pH influences bacterial growth or survival.

Figure 5 shows the relationship between the measured percent solids (top panel) or water activity (bottom panel) of a sample and the bacterial count. Note that every sample containing less than 4% solids had some detectable level of bacteria, whereas only two samples with greater than 14% solids had detectable bacteria. A similar pattern is shown with water activity (Fig. 5, bottom panel), and samples with water activities between 0.99 and 1.0 were associated with a range of bacterial populations, including the highest populations observed. As the measured water activity

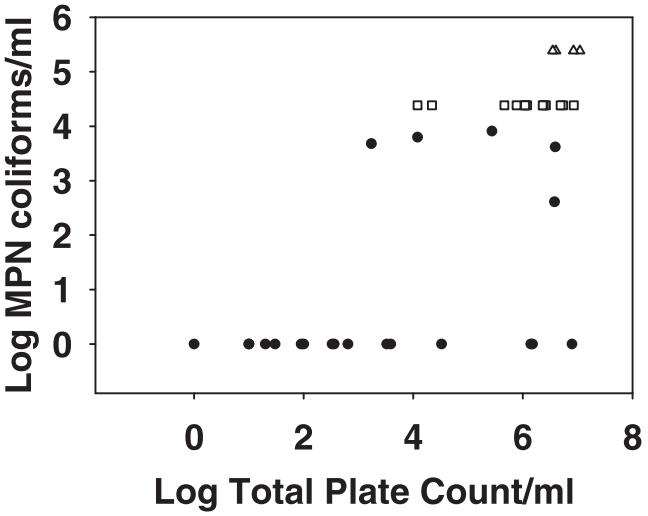

FIGURE 3. *Relationship between coliform counts and total plate counts in contaminated soap samples. Coliform counts above 4.4 log MPN or above 5.4 log MPN are shown using open squares and open triangles, respectively. Counts below the detection limit (10 CFU/mL) are plotted as 0 log CFU or MPN.*

decreased, the occurrence of higher bacterial populations declined, although there was a low population of bacteria in the soap with the lowest water activity measured. There was no clear relationship between the solids content and the water activity (data not shown).

Figure 6 expands upon the analysis of the relationships between percent solids (top panel) or water activity (bottom panel) and bacterial count. As percent solids increases, the fraction of samples with a bacterial count above the detection limit (10 CFU/mL) decreases (Fig. 6, top panel). Note that the two leftmost bars in the figure are associated with very few observations (three and six observations, respectively), whereas all other points are always associated with 30 or more observations. The bottom panel of Figure 6 shows the number of samples associated with different water

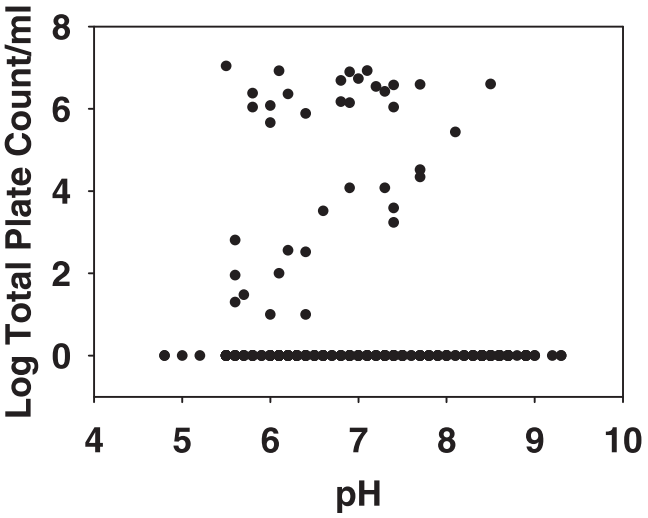

FIGURE 4. *Relationship between sample pH and the population of detectable microorganisms. Counts below the detection limit (10 CFU/mL) are plotted as 0 log CFU.*

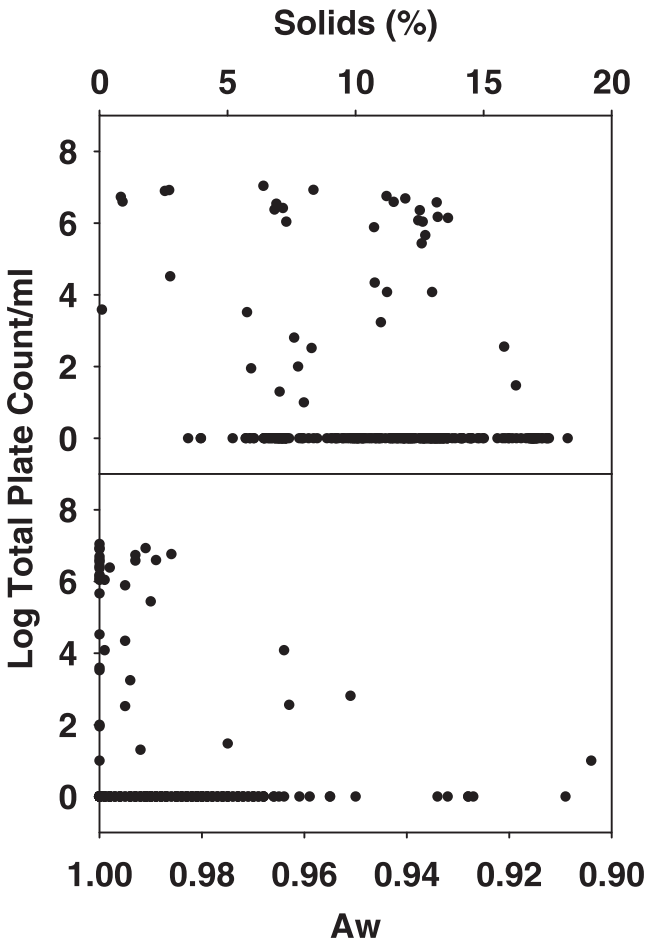

FIGURE 5. *Relationship between soap sample percent solids (top panel) or water activity (bottom panel) and bacterial count. Counts below the detection limit (10 CFU/mL) are plotted as 0 log CFU.*

activities, with the number of samples generally decreasing as water activity increases. The number of contaminated (gray) versus uncontaminated (black) samples are shown by shading on the bars. Clearly the greatest number, as well as the greatest fraction, of samples containing detectable bacteria is associated with higher (0.99 to 1.00) water activities, although even soaps with lower water activity can also contain detectable bacteria.

Figure 7 shows the relationship between the measured population of antimicrobial agent in the soap and the bacterial count. Samples containing no detected antimicrobial agent have widely distributed contamination levels. Although samples containing triclosan were contaminated regardless of the triclosan level (~0.15 to 0.65%), only one sample containing parachlorometaxylenol was contaminated, and that was at a relatively low level (0.15%).

Table 1 shows a summary of these antimicrobial data. Most of the samples tested contained no detected antimicrobial, and these samples contained the greatest fraction with countable microorganisms, almost 17%. There was a statistically significant difference between the fraction of bacteria-positive samples with no detected antimicrobial agent and those containing an antimicrobial agent ($P = 0.0035$). There was not a statistically significant difference between the fractions of bacteria-positive samples for the two types of

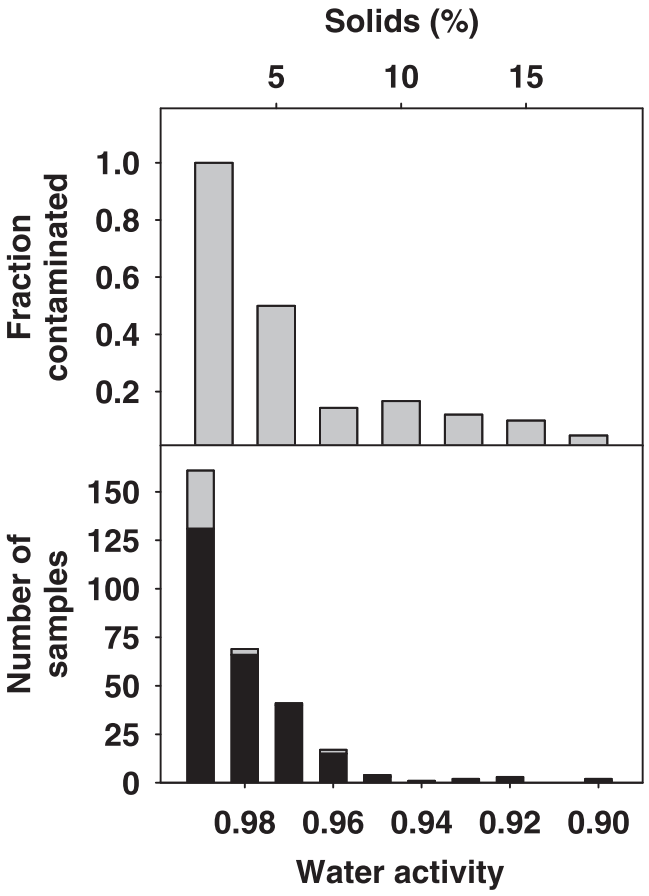

FIGURE 6. *Relationship between fraction of soap samples with bacterial counts above the detection limit (10 CFU/mL) and percent solids (top panel) or number of soap samples contaminated (gray) or uncontaminated (black) and soap water activity (bottom panel).*

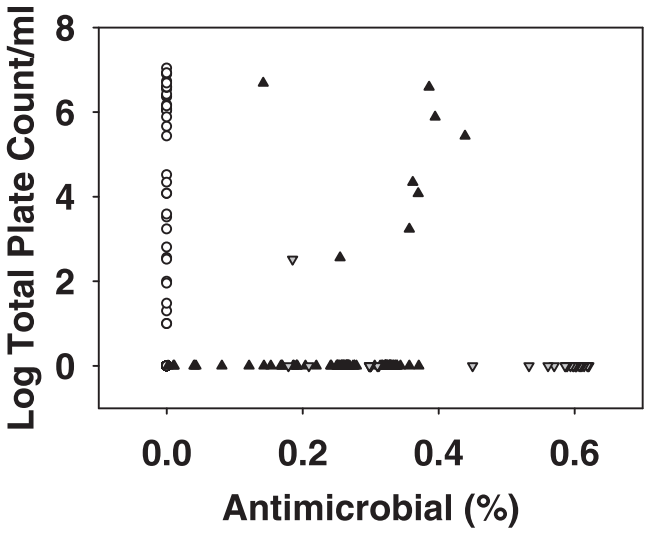

FIGURE 7. *Relationship between the measured concentration of the antimicrobial agent triclosan (black triangle) or parachlorometaxylenol (gray downward triangle) or no detectable antimicrobial agent (open circles) and total bacterial count. TABLE 1. *Comparison of the fraction of samples containing detectable bacteria for soap samples with detectable antimicrobial agents*[a]

	No. sampled	No. countable	% total samples	% countable
None	166	28	56.1	16.9 A
Triclosan	97	8	32.8	8.2 B
Parachlorometaxylenol	33	1	11.1	3.0 B
Total	296	37	100.0	12.5

[a] Percent countable values followed by a different letter are significantly different ($P < 0.05$).

antimicrobial agents ($P = 0.1022$). The fraction contaminated in total for all soap samples collected was 12.5%.

The relationship between the type of location sampled and the fraction of the time that samples contained detectable microorganisms is shown in Table 2. Grocery stores and fast food operations each had more than 10% bulk-soap samples positive. Grocery stores, fast food restaurants, and sit-down restaurants did not have significantly different fractions of contaminated samples from one another ($P > 0.05$), but grocery stores and fast food restaurants had significantly more ($P < 0.05$) contaminated bulk-soap samples than convenience stores.

The breakdown of bulk-soap samples in Table 3 shows that both men's and women's bathrooms have contaminated soap >10% of the time. Although samples collected from men's restrooms have a slightly higher frequency of detectable bacteria, the difference was not significant ($P = 0.29$).

The relationship between soap color and the presence of detectable bacteria is shown in Table 4. There are differences in the fraction of samples containing detectable bacteria, by soap color. However, given the wide array of soap colors observed, and the small number of samples containing detectable microorganisms, no differences were statistically significant.

Table 5 shows the fraction of samples containing detectable microorganisms by state, with >10% of soap contaminated in all three states. There were not statistically significant differences among the three states where soap samples were collected ($P > 0.05$).

DISCUSSION

This study identified gram-negative organisms as the primary organisms that colonize bulk-soap dispensers,

consistent with past outbreaks *(1, 2, 24, 38)* and screening studies *(8, 25)*. We identified gram-negative organisms at a broad range of populations (1 to 7 log CFU/mL), as reported by Momeni et al. (2 to 9 log CFU/mL *(25)*). Whereas Momeni et al. found detectable bacteria in ~60% of their samples, we found detectable bacteria in 15% of samples. This may be owing to differences in sample size (our 296 versus their 14), locations (three states versus two institutes), and type of facility (food service versus dental institute). Chattman et al. *(8)* collected 541 bulk-soap samples from five U.S. cities (Boston, Atlanta, Columbus, Los Angeles, Dallas), from liquid soap dispensers in a wide variety of public settings: offices, health clubs, restaurants, and retail stores. These authors found heterotrophic and coliform populations greater than ~2 log CFU/mL in ~19% of the sink area dispensers, similar to what we found (>2 log CFU/mL in ~15% of dispensers).

Specifically relevant to the food industry was the identification of *S. sonnei* from a contaminated soap dispenser in Arizona. According to the CDC, *S. sonnei* is the predominant cause of shigellosis in industrialized countries (and is the most common species in the United States). Consumption of ready-to-eat food contaminated due to handling by an infected worker could be a significant contributor to the spread of *S. sonnei (4)*.

The published literature reports that bacteria are more commonly isolated from plain soaps *(1, 5, 27, 30)* and are less frequently isolated from antimicrobial soaps *(1, 2, 24)*, which is consistent with the findings from our study. Although fewer bacteria are generally isolated from antimicrobial soaps (as they were in our study), it is a major technical challenge to maintain the activity of active ingredients, such as triclosan, so that they are not bound by the surfactant micelles *(11, 34)*. Our research clearly shows that the presence of an antimicrobial agent is not a safeguard

against the colonization of bulk soap by bacteria. This is consistent with Archibald et al. *(1)*, who detected *S. marcescens* in 1% chloroxylenol soap (parachlorometaxylenol), and with Barry et al. *(2)* and McNaughton et al. *(24)*, who isolated bacteria from soap that contained triclosan.

It is well understood by chemists that formulation affects the performance of hand hygiene products *(10, 23)*. Our study is a reminder that quality also matters in soap development. For example, high water–low solids formulations may be less expensive to manufacture, but they are more likely to be contaminated. Soap delivery systems designed to allow mixing (or dilution of soaps to save money) promote colonization and lead to less-stable formulations. We also observed differences among types of food establishments. Fast food and grocery stores are more likely to be contaminated than convenience stores; this may be because, in the former, there is less maintenance and management oversight of the bathrooms, whereas convenience stores typically have small bathrooms that are cleaned frequently. Fast food restaurants should be of the greatest concern because food handlers often use the bathrooms we sampled that were located in the "front of the house" and then often return directly from the bathroom into the kitchen. This finding warrants strong consideration of Food Code restrictions on the use of bulk soap in restaurants, analogous to rules that discourage their use in health care *(3, 31, 39)*.

We believe this work is generalizable across the United States. Samples were obtained from a variety of food handling environments in three states spread across the country, with a wide range of weather (temperature and humidity); we found no significant differences in level of microbial contamination among states. Our findings show that the design of open refillable systems for dispensing bulk soap is fundamentally flawed and creates opportunities for contamination and biofilm development, independent of geographic location. Future needs and opportunities include better understanding the relationship of bathroom design (e.g., toilet proximity to the soap dispenser, size of bathroom) and further assessment of the risk of antibiotic-resistant bacteria in bulk soaps. Alternative approaches to achieve a lower or acceptable cost to the food service provider are also important, because low cost is the primary attraction to bulk-soap systems. Changing this practice will require good policy development, analogous to what happened in health care *(3)*.

Use of refillable bulk-soap dispensers is a clear public health concern because they provide an environment for bacteria to grow, often to high populations *(8, 21, 25, 30, 40)*, and their use has led to non–foodborne disease outbreaks *(1, 2, 5, 24, 27, 30, 38)*. In our study, most soap

samples had no detectable bacteria; however, those soap samples that did have detectable bacteria (12.5%) had populations that would be considered highly risky if the bacteria present were pathogenic (~7 log CFU/mL). Whereas the CDC recommends that bulk liquid soap dispensers be thoroughly cleaned before adding fresh soap *(3, 8, 14),* cleanings in between soap refills might not prevent recontamination *(21),* and difficult-to-clean biofilms may develop. Bulk soap has been proven to cause infection outbreaks in health care settings. It has been difficult to document outbreaks in food service settings to date; however, our findings show that the use of bulk soap presents a clear risk in food service facilities.

ACKNOWLEDGMENTS

We thank the technicians who visited food handling establishments and collected soap samples, including Robyn Miranda and Brandon Arbogast.

Abstract

Introduction: Daily use of public restrooms may have a significant impact on spreading infectious diseases. Human society could be affected by spreading of transitional infectious diseases through feces, urinary tract infection and poor personal hygiene. According to the World Health Organization reports, plenty of people's developed diseases caused by contaminated public restrooms that may result in severe health problems. **Methods:** This descriptive cross-sectional study was conducted on 7,482 samples that were collected randomly in 6 months (spring and summer 2019) in different regions of Tehran. The Data were obtained by analyzing 804 restroom's indoor and outdoor handles, 1062 toilet faucet, 826 washbasin taps, 1,062 toilet hoses, 804 flush tank levers, 643 soap dispenser bottoms, 643 liquid soaps, 99 bar soaps, 169 toilet papers and paper towels, and 50 hand dryer machines. Samples which were tested, based on bacteriology standard methods. **Result:** 7,482 samples were gathered of which 6,678 contaminated cases (89.25%) were observed and 804 cases (10.75%) were found non-contaminated. *Escherichia coli* with 28.48% and *Pseudomonas* with 0.39% were the most and the least common bacteria, respectively, in this study. **Conclusion:** The required tests to identify the bacteria that cause contamination through the use of public restrooms have been done. It is essential to inform the public of the mentioned items and teach how to prevent infectious diseases.

Keywords: Bacterial contamination, hand dryer soaps, public restrooms

Introduction

Using public restrooms on a regular basis could have a significant effect on the transmission and diffusion of infectious diseases and other bacterial contamination. Due to many people using public toilets or washbasins and touching doorknobs several times a day, it can cause transmission of such contamination and pathogenic infectious disease. Therefore, the importance of toilets and washbasins as a source of transmission of bacterial contamination becomes more evident. It's obvious that if people's awareness of transitional contamination and related diseases enhances, it can be good for better social health and prevention of various infections. The purpose of this research is to boost health care in public services. In this study, by the

survey of bacteriology and sampling of every facility that exist in restrooms and public services, we have measured the kind and amount of contamination that may be transferred by one to another people while they are using this places.

It seems that public services and home services must be more sanitized; absolutely in order to use public services and preventing problem for public health, more care of these services are recommended. Public services such as cinemas, hotels, hospitals, libraries, parks, etc., are more intended to be polluted because of severe public usage this should be done repeatedly to prevent transmission of disease and not to establish various illnesses such as skin disease, digestive disease, genital and venereal disease to the public. Such diseases are commonly transferable to public services because of sharing the same spaces of usage. All the points that are touchable for publics such as door handles, toilet paper, flush tanks, water hoses, valve handles, sink, liquid and solid soap, tissues, electrical driers, etc., subjects to be cleaned properly. The ventilation of public services areas is a very important factor to keep health care for public services.[1] Per annum, many cases of disease from public places occur to the people who are using these services, because of lack of sanitizing procedure; furthermore, by being infected with multidrug-resistant (MDR) bacteria or a harmful one, the process of recovery will become more complicated; this causes many economic and mental consequences to these people. Knowing the variety of contamination and checking infected facilities (such as an important one, toilet papers) that are existing in such services and have an important role in publishing the infection, McCusky *et al.*[2] and Robinton *et al.*[3] can help us to find means of preventing or diminishing infectious diffusion.

Recognizing the transmittal ways of"germs" and the means, help us to prevent establishing of contamination and to decrease the prevalence rate of disease that we expect to come after use of these facilities. . Also, making people aware of the bad consequences of poor health services and encouraging them to keep their personal belongings clean will cause social behavior more confident in their health. This study examines whether electric driers, liquid or solid soaps, toilet paper and toilet valves, outdoor, and indoor handles etc., and whether they can play a positive or negative role in the transmission of diseases. In this article, we tried to answer this question by determining the type of microorganisms that we presume to exist. By the 7,482 samples we had taken from different points of many services, we get rich to achieve the trustful answer to the question. Definitely, by the numerous numbers of samples taken, its precision, accuracy, and reliability would be also higher.

Materials and Methods

This descriptive cross-sectional study was conducted in different areas of Tehran during 2019. The subjects which were sampled are indoor and outdoor handles, taps, flush tank bottoms and levers, liquid and bar soaps. For bacterial type detecting, we have used of principals scientific sources and standard methods of bacteriology.

For a bacterial sampling of cases mentioned above, first provided wet sterile swabs which after sampling, transported on transport culture media and then as soon as possible it was transferred to the laboratory for passaging them on culture medias such as nutrient agar (HIMEDIA, LOT45114591), blood agar (HIMEDIA, LOT45114591), MacConkey agar (HIMEDIA, LOTWe215), and EMB (HIMEDIA, LOT00000015320) which had been prepared before and were keeping on the refrigerator. Before passaging the samples on culture media, the prepared media were brought out from the refrigerator in order to reach room temperature. After passage, in order to bacterial growth, the culture media which were passaged on were put into the incubator on 37 centigrade degrees (for 24–48 h). Finally, in order to assess the bacterial growth and colony-formation, the preserved culture media were examined precisely. When it manifested that the bacterial colonies had been grown on culture media, the Gram-staining method used to determine Gram-positive and Gram-negative bacteria.

Generally, all the species with their bacterial load of up to 100,000 CFU/g were designated detrimental even though those between 50,000 and 100,000 CFU/g were repeated for sampling and reassessed. Although, less than 50,000 colonies of bacteria/g are also considered normal and were excluded from the samples.

We realized that all the bacteria (whether Gram-positive and Gram-negative) could be able to grow on Nutrient agar media; also Gram-positive bacteria were grown on blood agar media and Gram-negative bacteria were grown on EMB and MacConkey agar media. For determining the specious of bacteria, these biochemical tests had been done; as mentioned below: For detecting the specious of Gram-negative bacilli such as *Shigella*, *Salmonella*, *Pseudomonas*, etc., Catalase, oxidase, urease test and triple sugar iron agar (TSI) (HIMEDIA, LOT00000015312) culture media were used. For detecting the specious of Gram-positive bacteria such as *Enterococcus faecalis*, *Staphylococcus aureus*, etc., Catalase, coagulase, and MSA culture media (HIMEDIA, LOT0000287212) were used, too.

Result

In the above study, we sampled 1,062 restrooms that in this survey: 2,124 restroom indoor and outdoor handles, 1,062 toilet faucet, 826 washbasin taps, 1,062 toilet hoses, 804 flush bottoms, 643 soap dispenser bottoms, 643 liquid soaps, 99 bar soaps, 169 toilet papers and paper towels, and 50 hand dryer machines. In total 7482 samples were tested from which 6,678 samples (89.25%) were contaminated and 804 samples (10.75%) uncontaminated.

Discussion

In this study, 7,482 samples were taken from various cases. According to Table 1, there were 6,678 contaminated specimens, of which the highest rate was found in toilet hoses and taps with 99.72% (Out of 1,062 samples, 1,058 specimens were contaminated), followed by toilet outdoor handles with 99.62% (out of 1,062 samples, 1,058 specimens were

contaminated). Flush tank levers with 99.14% (out of 804 samples, 781 samples were contaminated), toilet indoor handles with 95.52%, soap dispenser bottoms with 97.82%, washbasin taps with 95.52%, bar soaps with 91.92%, hand dryer with 56% and towel papers with 20.12% were placed in terms of the amount of contamination.

According to results of Table 2. *E. coli* (28.5%) and Klebsiella (1.51%) were the most and least present bacteria in toilet indoor handles, respectively. On toilet outdoor handles, *E. coli* was the most (28.54%) and *Pseudomonas* was the least (1.32%). On flush tank levers, maximum bacteria was *E. coli* (35.08%) and *Pseudomonas* (0.26%) was the minimum. *E. coli* (30.6%) and *Salmonella* (1.52%) were the most and the least bacteria on

Table 1: Absolute and relative frequency table of contaminated and non-contaminated public restrooms

washbasin taps, respectively. In soap dispenser bottoms, *E. coli* was the most (29.73%) and *Pseudomonas* was the least (0.32%). The most and the least bacteria that were found in liquid soaps were *Proteus vulgaris* (27.78%) and *Enterococcus* (1.85%). The most bacteria in bar soaps was *E. coli* (17.58%) and the least was *Klebsiella (1.1%)*. On toilet papers, *Staphylococcus epidermidis* and mix bacteria were the most with (29.41%) and *Proteus spp.* and *Bacillus spp.* with (11.76%) were the least and finally in hand dryer machines *S. epidermidis* (35.71%) was the most and *S. aureus* and *Bacillus spp.* (7.14%) were the least.

In general, *E. coli* is the highest rate of contamination related to flush tank levers or bottoms and *Pseudomonas* is the lowest rate of contamination. It seems that after using the bathroom, flush tank levers can be effective in transmitting bacterial infectious diseases due to non-adherence in health care. It seems that *E. coli*, which is an intestinal bacteria, causes various parts of restroom contamination during the use of toilets, which is a sign of non-adherence in health care. Also, *E. coli* bacteria are very sensitive to drying on the contaminated hands; so the high potential of this bacteria for cross-contamination is expected due to soppy hands.[4] *Pseudomonas* in liquid soap and the other parts of restrooms, which were contaminated by these bacteria, is a sign that subjects and materials are not used correctly. People are infected, and they transmit diseases.

A study performed by Buffet-Bataillon *et al.*,[5] has questioned the outbreak of *Serratia marcescens* and its investigation and control in the neonatal intensive care unit (NICU). In this study, during 3 months period, five infants were colonized by a single strain of *Serratia marcescens*. The researchers of this study achieved that a bottle soap dispenser can be a reservoir of this nosocomial pathogenic bacteria. So, these microorganisms can be easily transferred to newborns by healthcare workers. Conversely, *P. vulgaris* (27.78%) were the most bacteria sampled from liquid soaps as well as *E. coli* (29.73%), *Bacillus subtilis* (17.65%), and *Entrococcus faecalis* (14.63%) liquid soap dispenser bottoms. Although some researchers have proved that washing hands with non-antibacterial soaps and water are more effective than with water alone, Burton *et al.*,[6] basically by regarding the contamination of soap dispensers, we suggest using of alcoholic hand antiseptic instead of liquid or solid soaps.

In the study of microbial biogeography of public restroom surfaces which have been done by Flores *et al.*,[7] the communities were clustered into three general categories: those found on surfaces associated with toilets, those on the restroom floor, and those found on the surface routinely touched with hands. However, by comparison to our study, the sample items and bacterial diversity were almost alike, also vagina-associated *Lactobacillaceae* were wildly distributed in female restrooms.

In the study of Kanayama *et al.*,[8] 252 samples were contaminated from 292 specimens, taken from toilets and warm water taps. *S. aureus*, *Streptococcus spp*, *Enterococcus spp*, *Enterobacteriaceae* and other negative bacteria had been found. From the above items, *Enterobacteriaceae* were isolated as 84 (%28.8) bidets and *E. coli*, *Enterobacter spp. Klebsiella, Citrobacter spp, and Enterobacteriaceae* by 38 (13.0%), 22 (7.5%), 13 (4.5%), 5 (1.7%) and 6 (2.1%) were isolated in toilet bidets warm water, respectively.

In the study of McCusky *et al.*, *Bacillus licheniformis* was the most isolated bacteria with 20.2% that shows a remarkable difference to compare with our study.[2] Also, in the study of Harrison *et al.*, *Micrococcus luteus* and some strains of *Serratia marcescens* were the two specious of bacteria found in paper towel specimens.[9] In addition, Robinton *et al.*,[3] showed that paper towels have substantially fewer viable bacteria on them than cloth towels, although in the opposite of cloth towels, the number of bacteria found on paper towels does not seem to be a variable appreciably influenced by geographic and/or climatic differences. In the above study, *Bacillus spp* were the most bacterial species found in both kinds of towels. This is in contrast to our results in which *S. epidermidis* was common. There is no difference in the type of infectious bacteria in the above study compared with our study, but there is a significant difference in the percentage of contamination.[10] In a study by Sabra in Egypt in 2011,[11] the contamination of the women's public toilets were examined. 71.9% of the samples being positively infected. Toilets door handles (91.3%), toilet doors (73.8%), toilet sinks (63.3%), and flush tank levers (50%) were contaminated. *S. aureus* (40.6%) and *E. coli* (22.5%) were the most isolated bacteria from positive samples and *P. vulgaris* was the least one. There is no significant difference to compare with our study.

In the study of Alharbi *et al.*,[12] five different bacterial isolations were sampled from the airflow of 15 warm air dryers used in washrooms; including *Staphylococcus haemolyticus*, *Micrococcus luteus*, *Pseudomonas alcaligenes*, *Bacillus cereus,* and *Brevandimonad diminuta (vascularis)*. In this survey, the most bacterial isolates were due to *S. haemolyticus* with 95% pathogenicity; however, in our study, hand dryer machines were highly contaminated by *S. epidermidis* (35.71%). It is obvious that hot air dryers can deposit the pathogenic bacteria onto the hands and body of users as well as distributing them into the general environment whenever dryers are running. Also, some microorganisms could be inhaled by users and nonusers alike. So, it is imperative to recommend the sanitization of this machines several times a day. It is notable that in some studies it's manifested by which using warm air dryers or some jet dryers, we actually have augmented the aerosolization of bacteria and facilitating the microbial cross-contamination via airborne dissemination to the environment.[1] Best *et al.* reported that higher levels of contamination were due to washrooms using a jet air dryers compared with those using paper towels.[13] The hand-drying method can affect the risk of (airborne) dissemination of bacteria in real-world settings. JADs may not be suitable for settings where microbial cross-contamination risks are high, including hospitals.

The study that was conducted by Zapka *et al.*, in 2011,[14] the *K. pneumoniae* was isolated from samples after the bacteria were recovered and transferred by hand after washing with liquid soap which had been spontaneously infused and liquid soaps which were contaminated without control.

A study of bacteriological assessment of door handles/knobs of toilets and washrooms was conducted by Frank Ngonda in a hospital setting in 2017,[15] which revealed some bacteriological similar results. Among the total of 442 samples, 184 cases (41.6%) were contaminated and also *S. aureus* was the most bacteria had isolated. The male toilet handles were most contaminated than the females (35.5% beside 19.4%), followed by general sets (9.7%). Whilst the washroom was less contaminated in general, the highest contamination being observed in the male washroom 19.4% as compared to the female washroom at 9.7%.

In the study of Ogba *et al.*,[16] the researchers have checked on 151 samples of public toilet seats. Out of the 151 samples examined, *E. coli* 70 (46.4%) was the most prevalent isolate followed by *Salmonella spp.* 45 (29.8%) while *Staphylococcus aureus* 15 (9.9%) was the least encountered isolate. Nevertheless, most of the samples and isolates were from hostels 41 (44.0%). This study demonstrates that public toilet seats that have been washed still harbor a high number of bacterial organisms and may serve as a potential source of infections.

Conclusion

The results of this study and other similar related studies, that have been presented, demonstrate that illnesses such as genitourinary tract infections as well as gastrointestinal diseases can be found in children and adults by using contaminated services. In females, some genitourinary tract disorders such as vulvovaginocistitis, acute and chronic pregnancy, premature rupture of membrane (PROM), and acute pyelonephritis would arise mostly due to *E. coli*. In males, acute and chronic urethritis, cystitis, and prostatitis are most likely. Also, *E. coli* contamination is principally qualified to lead on Infertility in males and females. Acute cystitis, urethritis, and vaginal discharges are the main problems that occur in children are affected by this bacteria, therefore, enhancing personal hygiene, sanitizing public restrooms regularly and correctly, and using public toilets safely can prevent the transmission, diffusion, and spread of bacterial infections.

Received 11 November 2010/Accepted 26 February 2011

Bulk-soap-refillable dispensers are prone to extrinsic bacterial contamination, and recent studies demonstrated that approximately one in four dispensers in public restrooms are contaminated. The purpose of this study was to quantify bacterial hand contamination and transfer after use of contaminated soap under controlled laboratory and in-use conditions in a community setting. Under laboratory conditions using liquid soap experimentally contaminated with 7.51 $\log_{10}$ CFU/ml of *Serratia marcescens*, an average of 5.28 $\log_{10}$ CFU remained on each hand after washing, and 2.23 $\log_{10}$ CFU was transferred to an agar surface. In an elementary-school-based field study, Gram-negative bacteria on the hands of students and staff increased by 1.42 $\log_{10}$ CFU per hand (26-fold) after washing with soap from contaminated bulk-soap-refillable dispensers. In contrast, washing with soap from dispensers with sealed refills significantly reduced bacteria on hands by 0.30 $\log_{10}$ CFU per hand (2-fold). Additionally, the mean number of Gram-negative bacteria transferred to surfaces after washing with soap from dispensers with sealed-soap refills (0.06 $\log_{10}$ CFU) was significantly lower than the mean number after washing with contaminated bulk-soap-refillable dispensers (0.74 $\log_{10}$ CFU; $P < 0.01$). Finally, significantly higher levels of Gram-negative bacteria were recovered from students (2.82 $\log_{10}$ CFU per hand) than were recovered from staff (2.22 $\log_{10}$ CFU per hand) after washing with contaminated bulk soap ($P < 0.01$). These results demonstrate that washing with contaminated soap from bulk-soap-refillable dispensers can increase the number of opportunistic pathogens on the hands and may play a role in the transmission of bacteria in public settings.

Hand washing with soap and water is a universally accepted practice for reducing the transmission of potentially pathogenic microorganisms. However, liquid soap can become contaminated with bacteria and poses a recognized health risk in health care settings. In particular, bulk-soap-refillable dispensers (ones in which new soap is poured into a dispenser) are prone to bacterial contamination, and several outbreaks linked to the use of contaminated soap in health care settings have been reported (2, 3, 5, 15, 18, 22–24). The Centers for Disease Control and Prevention (CDC) "Guideline for Hand Hygiene in Health-Care Settings" addresses this risk in a recommendation: "Do not add soap to a partially empty soap dispenser. This practice of 'topping off' dispensers can lead to bacterial contamination of soap" (4). This "category IA recommendation" was "strongly supported by well-designed experimental, clinical, and epidemiologic studies." (4) Sealed-soap-dispensing systems, in contrast, are typically refilled by inserting into the dispenser a new bag or cartridge of soap that usually includes a new nozzle.

Bulk-soap-refillable dispensers are the predominant dispenser type in community settings, such as public restrooms. However, few studies have been conducted to evaluate the occurrence of microbial soap contamination in community settings. One study, conducted in Japan, examined bacterial contamination of hand washing soaps obtained from restrooms of various public use facilities. The authors found 17 different species of bacteria, many of which were opportunistic pathogens, including *Klebsiella pneumoniae*, *Serratia marcescens*, *Enterobacter* species, and *Pseudomonas* species (1). Recent studies conducted in the United States demonstrated that 25% of bulk-soap-refillable dispensers in public restrooms were excessively contaminated (8). Bacterial loads averaged more than 10^6 CFU/ml of soap, and 16% of the samples contained coliform bacteria. Interestingly, of the 15 different species isolated in this study, 7 were identical to those found in the Japanese study, including both *K. pneumoniae* and *S. marcescens.* Both *S. marcescens* and *K. pneumoniae* are opportunistic pathogens known to transmit via the hands (7, 17, 21).

Despite these findings, the public health risk associated with the use of contaminated bulk-soap-refillable dispensers in community settings is unclear. It would be very difficult if not impossible to trace the source of a community-acquired infection back to contaminated soap in a public restroom. Therefore, to better understand this risk, a greater understanding of the potential for bacteria from contaminated soap to remain on the hands and to be transferred to secondary surfaces after washing with contaminated soap is needed. The objectives of this study were to (i) quantify the levels of bacteria remaining on hands after washing with contaminated soap; (ii) quantify the transfer of contaminating bacteria from the hands to a secondary surface; and (iii) collect microbiological data in a field setting under actual use conditions. To our knowledge this is the first study of its kind in any setting.

MATERIALS AND METHODS

Controlled hand washing studies. (i) Test articles. The liquid test soap contained a surfactant system representative of soaps found in public restrooms but did not contain preservatives. Soap was prepared by mixing 1,648 g of soft water, 17 g of ammonium chloride, 330 g of surfactant blends (Lubrizol Advanced Materials, Cleveland, OH; and Rhodia, Inc., Mississauga, Ontario, Canada), 2 g of fragrance (Flavorchem Orchidia, Downers Grove, IL), and 2 g of citric acid. Contaminated-soap samples were prepared by 8 successive inoculations with 300-μl to 10-ml aliquots of overnight tryptic soy broth (TSB) cultures of the marker organism *S. marcescens* ATCC 14756 or *K. pneumoniae* ATCC 13883 over the 3-week period prior to the hand wash test date. Populations of marker organisms were determined by standard plating on tryptic soy agar (TSA) and monitored over time to achieve the target contamination level.

(ii) Subjects. Eighteen subjects participated in controlled study I, and 16 participated in study II. Subjects recruited from the Bozeman, MT, area were at least 18 years of age, and the study demographics were mixed for age, sex, and race. Exclusion criteria included dermatoses or other injuries to the skin of the hands or forearms or any other conditions that would have compromised the subjects and the study.

(iii) Study design. Two controlled studies (study I and study II) assessed bacterial hand contamination and transfer post-hand washing with contaminated or uncontaminated soap. Protocols were approved by the Gallatin Institutional Review Board (Bozeman, MT). In study I, 6 subjects washed with uncontaminated test soap, 6 subjects washed with soap contaminated with *K. pneumoniae* (5.85 $\log_{10}$ CFU/ml), and 6 subjects washed with soap contaminated with *S. marcescens* (3.72 $\log_{10}$ CFU/ml). Following the hand wash, hands were sampled for residual *S. marcescens* and/or *K. pneumoniae* as described below. In study II, 8 subjects washed with soap contaminated with a low level of *S. marcescens* (4.51 $\log_{10}$ CFU/ml), and 8 subjects washed with soap contaminated with a high level of *S. marcescens* (7.51 $\log_{10}$ CFU/ml). Following the hand wash, the hands of 6 random subjects per test soap were sampled for residual *S. marcescens*. Two subjects per test soap touched agar plates to create hand imprints of bacteria transferred to the agar surfaces.

(iv) Hand washing procedure. Water used for wetting and rinsing the hands was maintained at a temperature of 40°C ± 2°C. In study I, subjects washed with 5 ml of test soap for 30 s, followed by a 30-s water rinse. In study II, subjects washed with 1.5 ml of test soap for 10 s followed by a 10-s rinse.

(v) Bacterial recovery and enumeration. To recover bacteria from the hands, powder-free, sterile, latex gloves were placed on subjects' hands, 75 ml of a recovery solution (0.4 g KH_2PO_4, 10.1 g Na_2HPO_4, and 1.0 g isooctylphenoxypolyethoxyethanol [Triton X-100] in 1 liter distilled water [pH adjusted to 7.8]) was transferred into each glove, and gloves were secured above the wrist. Technicians massaged the hands through the gloves for 60 s. Within 1 min of completing the massage, a 5-ml aliquot of the "glove juice" sample was removed and serially diluted in Butterfield's phosphate buffer solution containing lecithin and polysorbate 80 (BPB+). Dilutions were plated in duplicate onto appropriate agar plates by spread plating 1.0 ml of the recovery solution manually and spiral plating 50-μl aliquots of all dilutions (Spiral Biotech Autoplate; Advanced Instruments, Inc., Norwood, MA). *S. marcescens* was recovered on TSA with lecithin and polysorbate 80 (TSA+) and incubated for 24 to 48 h at 25°C. *K. pneumoniae* was recovered on MacConkey agar and incubated for 24 to 48 h at 35°C (7). Colonies with a morphology qualitatively similar to that of the marker organism were counted (i.e., red pigment on TSA+ for *S. marcescens* and pink mucoid on MacConkey agar for *K. pneumoniae*) with a plate-counting system (QCount model 510; Advanced Instruments, Inc., Norwood, MA). For the hand-stamp sampling procedure, subjects pressed the palms of the hands onto TSA+-containing polystyrene bioassay trays for 15 s. Trays were placed in laminar flow hoods to remove residual moisture and then incubated for 24 to 48 h at 25°C.

Field hand washing study. (i) Study site and test site. The field study was conducted in the restrooms of an elementary school in Ohio. Twenty-two subjects participated, including 12 adult staff members (teachers, administration, and janitorial staff) and 10 students (fourth and fifth grades). Exclusion criteria included cuts, rashes, or other skin conditions that would have compromised the subjects and the study. All adult subjects signed an informed consent form preapproved by Chesapeake Research Review, Inc. (Columbia, MD). All students participated only after signed parental consent, which was also preapproved by Chesapeake Research Review, Inc.

(ii) Test articles and assessment of microbial contamination. The contaminated soap used in the field study was a commercially available antimicrobial soap formulation that had been in use in the school for years prior to this study. Samples were obtained from all 14 bulk-soap-refillable soap dispensers used in the school restrooms. Approximately 10 ml of soap was aseptically collected from the dispenser nozzle into sterile 50-ml conical centrifuge tubes. The sealed-soap dispensers contained a foam soap which was sampled by filling a 120-ml sterile cup with foam. Samples were vortexed for at least 30 s and placed at rest until all bubbles dissipated. An aliquot of soap was removed with a positive displacement pipette and serially diluted in BPB+. One hundred microliters of each dilution was spiral plated onto R2A agar plates in duplicate. R2A agar is a nonselective medium designed for heterotrophic plate counts from potable water and has been previously used to quantify levels of bacteria in contaminated soap (8). Plates were incubated for 96 h at 37°C, and colonies were enumerated by hand by the standard spiral plate count methodology. The number of CFU/ml of bacteria in the original soap sample was determined based on the average colony count and the dilution factor. Soaps were considered to be contaminated if the level exceeded 1,000 CFU/ml, which is the level typically considered acceptable in nonsterile cosmetic products (13). Representatives of each dominant colony type were streak purified by multiple passages on TSA. Bacterial species were identified by using AP120E strips (bioMérieux, Marcy-l'Etoile, France). Contamination levels were monitored in the bulk-soap dispensers for 3 months prior to the hand washing trials (data not shown). All soap samples used in hand washing trials were also collected and tested for the presence of contaminating bacteria on the same days that the hand washing trials were conducted.

(iii) Study design. The study protocol was approved by Chesapeake Research Review, Inc., and was conducted in compliance with procedures approved under this protocol. Hand wash trials were conducted in 14 different restroom locations throughout the school. Technicians executing the study were of the gender indicated by the restroom. In phase I of the study, the contaminated bulk soap and uncontaminated bulk soap trials were conducted over a 4-day period. The bulk dispensers were then replaced with sealed-system dispensers. Phase II of the study, which evaluated the sealed system, was conducted 6 months later and was completed in 1 day. Each subject participated in up to 6 hand washes total for the entire study. No subject participated in more than 2 hand washes on a single day, and a minimum of 30 min was required between each hand wash. Each subject's visit consisted of a pre-hand wash (baseline) sampling, a hand wash, and a post-hand wash sampling. Right and left hands were randomized for glove juice or hand-stamp sampling at the first wash for each participant and alternated at each subsequent wash.

(iv) Hand washing and decontamination procedures. Subjects were asked to wash their hands with soap as they normally would do when washing after using the restroom facilities. The amount of soap and the length and technique of washing, rinsing, and towel drying were at the discretion of each test subject. The temperature of the water used was not controlled. The participants' hands were decontaminated at the end of each visit by washing with soap from a bottle of commercially available uncontaminated soap and then sanitizing with an ethanol-based hand sanitizer.

(v) Bacterial recovery and enumeration. The glove juice sampling method was performed similarly to the controlled study method, except for a few modifications designed to improve the detection limit of the method. Fifty milliliters of recovery solution was added to each glove, and all of the solution recovered from each hand sample was transferred to a sterile 50-ml centrifuge tube. The solution was centrifuged (10 min at 5,000 × *g*) to concentrate the bacteria. Pilot testing verified the effectiveness of the concentration method. All but 5 ml of recovery solution supernatant was removed, and the pellet was vortexed for 1 min to resuspend the cells back into the remaining 5 ml. One milliliter of the concentrated recovery solution was pour plated in duplicate, and 0.1 ml of 10-fold dilutions prepared in BPB+ was spiral plated. All plating was conducted in duplicate on both MacConkey and Chromagar orientation agar (BD, Franklin Lakes, NJ). MacConkey agar was used to select for Gram-negative bacteria. Chromagar orientation results are not presented here, but were used to qualitatively verify that MacConkey plates were adequately selective for contaminants in the soap (versus normal skin microbiota). For the hand-stamp method, subjects placed the palms of their hands and fingers onto MacConkey agar plates for 10 s. All agar plates were incubated for 96 h at 37°C and photographed for archiving. Colonies present on the MacConkey plates were counted.

Data analysis and statistical considerations. For the controlled studies, the estimated $\log_{10}$ number of viable *S. marcescens* or *K. pneumoniae* cells recovered from each hand (the "*R* value") was determined with the formula $R = \log_{10}(75 \times C_i \times 10^D)$, where 75 is the amount (ml) of recovery solution instilled in each glove, C_i is the arithmetic average colony count of the 2 plate counts at a particular dilution, and D is dilution factor. The limit of detection for the controlled studies was 1.57 $\log^{10}$ CFU/hand. For the field study, the total number of Gram-negative bacteria recovered from each hand was determined by the

TABLE 1. Bacteria recovered from hands after washing with contaminated liquid soap

Bacterial contaminant (marker organism)	Bacterial load		Postwash bacterial recovery (mean $\log_{10}$ CFU/hand ± SD [n = 12])
	Test soap ($\log_{10}$ CFU/ml)	Applied ($\log_{10}$ CFU/hand)	
None	0.00	0.00	<1.57[a]

formula $R = \log_{10}(5 \times C_i \times 10^D)$. The limit of detection for the field studies was 0.40 $\log_{10}$ CFU/hand. The total numbers of bacteria transferred to MacConkey agar hand-stamp plates were counted directly from the agar plates. Results were obtained by analysis of 91 hand wash trials that yielded usable results for all four measurements taken (CFU recovered before, CFU recovered after, CFU transferred before, and CFU transferred after). Raw CFU values were converted to $\log_{10}$ CFU values, and statistical comparisons were performed by using paired and unpaired t tests on GraphPad Prism version 5.04 for Windows (GraphPad Software, San Diego, CA).

RESULTS

Recovery and transfer of bacteria from hands after washing with experimentally contaminated liquid soap. Human subjects washed for 30 s with 5 ml of soap experimentally contaminated with either *K. pneumoniae* (5.85 $\log_{10}$ CFU/ml) or *S. marcescens* (3.72 $\log_{10}$ CFU/ml) followed by a 30-s rinse. Neither test organism was recovered from the hands of subjects prior to washing hands or from the subjects that washed with uncontaminated control soap. In contrast, for *K. pneumoniae*, a mean of 2.74 $\log_{10}$ CFU/hand was recovered from subjects after washing with *K. pneumoniae*-contaminated soap, and for *S. marcescens*, a mean of 3.60 $\log_{10}$ CFU/hand was recovered from subjects after washing with *S. marcescens*-contaminated soap (Table 1). Interestingly, more bacteria were recovered from hands washed with *S. marcescens*-contaminated soap than from those washed with *K. pneumoniae*-contaminated soap ($P < 0.0001$), even though the level of *K. pneumoniae* contamination was 100-fold higher.

In a second experiment, subjects performed a 10-s hand wash with 1.5 ml of liquid soap experimentally contaminated with either a high level of *S. marcescens* (7.51 $\log_{10}$ CFU/ml) or with a low level of *S. marcescens* (4.51 $\log_{10}$ CFU/ml) followed by a 10-s rinse. It is known that when soap that is not contaminated is used for hand washing, it is more effective at removing transient bacteria when greater volumes of soap and longer wash times are used (11). Therefore, the second controlled study was conducted under conditions chosen to be more representative of the hand washing behaviors typically observed (6, 12, 14, 16, 19). The mean numbers of *S. marcescens* cells recovered after washing with high- and low-level-contaminated soap were 5.28 $\log_{10}$ CFU and 1.70 $\log_{10}$ CFU per hand, respectively (Table 2) ($P < 0.0001$). The number of bacteria transferred to an agar surface after washing were 2.23 $\log_{10}$ CFU and 0.30 $\log_{10}$ CFU per hand for the high- and low-level-contaminated soap, respectively (Table 2 and Fig. 1) ($P = 0.001$).

Recovery and transfer of bacteria from hands after washing with contaminated liquid soap in an elementary school. An elementary school was identified in which all (14/14) of the bulk-soap-refillable dispensers being used in the restrooms were found to be contaminated with bacteria at levels ranging from 6.0 to 7.0 $\log_{10}$ CFU/ml of soap (Table 3). A variety of Gram-negative species from the *Citrobacter*, *Providencia*, *Pseudomonas*, and *Serratia* genera were identified among the recovered contaminants. All of the contaminated dispensers were replaced with sealed-soap-dispensing systems after the first phase of the field hand washing study. After 1 year postinstallation, all of the soap dispensed from the sealed-soap dispensers was confirmed to be contamination free.

A study was conducted with students and staff to assess the levels of Gram-negative bacteria remaining on or transferred from hands after washing with contaminated soap from these dispensers or with uncontaminated control soaps (Table 4). Prior to washing with contaminated bulk soap, uncontaminated bulk soap, and uncontaminated soap from sealed refills, the mean numbers of bacteria recovered from hands of subjects were 1.17, 0.99, and 1.67 $\log_{10}$ CFU per hand, respectively. The mean number of bacteria recovered from the hands after hand washing with the contaminated soap (2.59 $\log_{10}$ CFU per hand) was significantly higher than the pre-hand-washing value ($P < 0.0001$). Gram-negative bacteria were detected in 97% (60/62) of hands tested after washing with bulk soap compared to 52% (32/62) before washing. In contrast, the mean number of bacteria recovered from hands after washing with uncontaminated bulk soap (0.82 $\log_{10}$ CFU per hand) was reduced compared to the prewashing numbers. When hands were washed with uncontaminated soap from the new replacement sealed-system dispensers, the mean numbers of bacteria recovered from hands after washing (1.37 $\log_{10}$ CFU per hand) were also reduced compared to the prewashing numbers and were statistically lower than those recovered from hands washed with contaminated soap ($P < 0.0001$). The mean number of Gram-negative bacteria recovered from the hands after washing with contaminated soap was significantly higher for students (2.82 $\log_{10}$ CFU per hand) than that for staff (2.22 $\log_{10}$ CFU per hand; $P = 0.008$) (Table 5).

Figure 2 compiles $\log_{10}$ CFU changes after individual hand washes into a histogram in which the bars represent the number of times each reduction or increase was observed. When contaminated soap was used, an increase was observed for 55 of 62 hand washes (89%), and the mean change was a 1.42-$\log_{10}$ CFU increase. In contrast, when uncontaminated soap (bulk or sealed) was used, an increase was observed for only 3

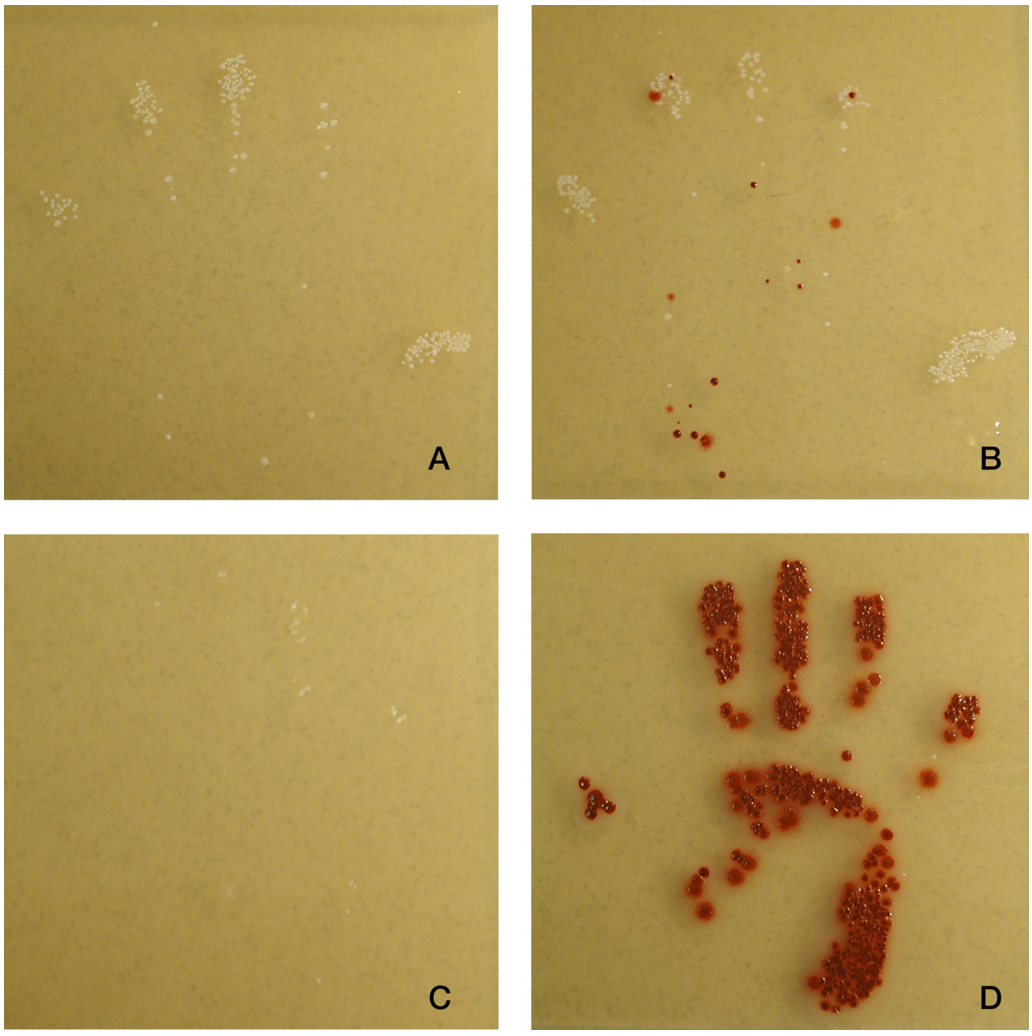

FIG. 1. Sample images from a controlled study (Table 2) to determine the number of bacteria from contaminated hands transferred to an agar surface before (A and C) and after (B and D) hand washing with soap containing 4.51 $\log_{10}$ CFU/ml (A and B) or 7.51 $\log_{10}$ CFU/ml (C and D) of *S. marcescens*.

of 29 hand washes (10%), and the mean change was a 0.26-$\log_{10}$ CFU decrease.

Prior to washing, subjects transferred on average 0.10, 0.10, and 0.18 $\log_{10}$ CFU/hand of Gram-negative bacteria to touched agar surfaces. This number increased significantly after washing with soap from the contaminated dispensers (0.74 $\log_{10}$ CFU/hand; $P < 0.0001$) (Table 4). Washing with uncontaminated-soap controls did not significantly change the mean number of transferred Gram-negative bacteria ($P = 0.945$, uncontaminated bulk soap; $P = 0.100$, uncontaminated sealed soap). Furthermore, fewer bacteria were transferred from subjects' hands after washing with uncontaminated sealed soap (0.06 versus 0.74 $\log_{10}$ CFU; $P = 0.0004$) or uncontaminated bulk soap (0.09 versus 0.74 $\log_{10}$ CFU; $P = 0.012$), compared to bacteria that were transferred from subjects' hands after washing with contaminated soap. Transfer of at least 1 CFU of Gram-negative bacteria after washing was observed in 61% (38/62) of hands washed with contaminated soap versus 21% (4/19) of hands washed with uncontaminated sealed soap. In addition, significantly more Gram-negative bacteria were transferred to agar surfaces touched by students (0.98 $\log_{10}$ CFU per hand) after using contaminated soap than by the adult staff (0.37 $\log_{10}$ CFU per hand; $P = 0.003$) (Table 5).

A comparison of the pre- and postwash recoveries of bacteria for the individual bulk-soap-refillable dispensers tested in the field study is shown in Fig. 3. The number of bacteria recovered from hands postwash increased significantly relative to the prewash recoveries for all of the contaminated dispensers, and the increase was significant for 8 of the 14 contaminated dispensers (P values ranging from 0.0003 to 0.03). In contrast, the number of bacteria recovered from hands after washing with the uncontaminated control soaps decreased relative to the prewash recoveries, but was not significant ($P = 0.199$ for control 1, and $P = 0.324$ for control 2).

DISCUSSION

The purpose of hand washing is to remove soil and to reduce the level of potentially pathogenic transient microorganisms. This is the first study to quantitatively demonstrate that wash-

ing hands with contaminated liquid soap actually increases the number of Gram-negative bacteria on hands. Furthermore, the results directly demonstrate that bacteria from contaminated hands can be transferred to secondary surfaces. We therefore conclude that washing with contaminated soap not only defeats the purpose of hand washing but may contribute to the transmission of potentially harmful bacteria. The results of the two laboratory hand washing studies were corroborated by the elementary school field study, which demonstrated a 26-fold increase in the number of Gram-negative bacteria present on the hands (Table 4) after washing with contaminated soap from bulk-soap-refillable dispensers, demonstrating a potential public health risk in public, non-health-care settings. Importantly, when the contaminated dispensers in the school were replaced with dispensers containing sealed-soap refills, none were found to be contaminated after 12 months of use. Furthermore, washing hands with soap from the sealed-soap system reduced the number of bacteria on hands of the study participants (Table 4). Taken together, these results indicate that use of dispensers with sealed refills instead of open bulk-soap-refillable dispensers can lower the risk of extrinsic microbial contamination and can reduce the spread of potentially pathogenic bacteria.

Previous studies have demonstrated an association between the use of bulk-soap-refillable dispensers and bacterial contamination of the liquid soap. Contamination rates in these studies ranged from 20% to 25% (8; C. A. Zapka, M. Chattman, S. L. Maxwell, D. R. Macinga, M. J. Dolan, and C. P. Gerba, unpublished data). In the present study, we found that 100% (Table 3) of bulk soap dispensers in one elementary school were contaminated. A single soap formulation was used in the school and was dispensed from two similar bulk-soap dispensers. In previous studies, multiple sites using different soap formulations and different dispensers were surveyed. These differences may account for the higher rate of contamination in this facility. Further analysis of the factors contributing to the unusually high prevalence of contaminated soap in this school will be presented elsewhere (C. A. Zapka, unpublished data). Many of the bacteria isolated from the bulk soap in the elementary school are considered to be opportunistic pathogens and can cause infections in compromised populations (10, 15). In fact, use of a shampoo contaminated with *Pseudomonas aeruginosa*, an organism found in 43% (6/14) of the dispensers in this elementary school (Table 3), has been reported to have led to a fatality (9).

The levels of bacteria in the soaps tested in the two laboratory hand washing studies (3.72 to 7.51 log_{10} CFU/ml) were representative of those encountered in this and our previous field studies (2.77 to 7.81 log_{10} CFU/ml) (8; C.A. Zapka, unpublished data). Significantly higher levels of *S. marcescens* were recovered from the hands despite a lower level of contamination in the test soap compared to *K. pneumoniae* (Table 1). These results suggest that the two organisms may interact with human skin in qualitatively different ways. Both organisms have been reported to contaminate soaps and lead to infections in health care settings (5, 18, 20, 22). Even a brief contact

(10 s) with contaminated soap resulted in detectable levels of bacteria on hands (Table 2). Significantly higher levels of *S. marcescens* were recovered from the hands and were transferrable to a secondary surface when the liquid soap was contaminated with a higher bacterial load. These results demonstrate that both the identity of the microbial contaminant and the level of contamination are important factors influencing the public health risk associated with the use of contaminated soap.

The elementary school field study revealed that students retained more bacteria on the hands and transferred significantly more after washing with contaminated bulk soap than the adult staff (Table 4). Although the reasons for these observed differences are not clear, we hypothesize that differences in hand size, skin condition, and/or hand washing technique (e.g., thoroughness of water rinsing and paper towel drying) may be contributing factors. Children represent a vulnerable population with potentially a greater susceptibility to bacterial infections due to their less developed immune systems. Hence, further studies to identify these factors are warranted.

The number of bacteria transferred to agar surfaces was directly proportional to the number of bacteria recovered from subjects' hands post-hand washing in both laboratory studies and in the field study. Analysis of the combined data set showed the concentration of bacteria in contaminated soap correlated positively with both the number of CFU recovered from the hands ($P < 0.0001$) and the number of CFU transferred from the hands ($P < 0.0001$) post-hand washing (data not shown). Based on the observed correlations, washing with soap containing less than 3.7 $\log_{10}$ CFU of bacteria/ml would not lead to detectable bacteria on the hands, and washing with soap with less than 5.4 $\log_{10}$ CFU/ml would not result in detectable transfer of the bacteria to touched surfaces. Coincidentally, this observation confirms the appropriateness of a current industry guideline that recommends that cosmetic products contain less than 3.0 $\log_{10}$ CFU of bacteria/g (13).

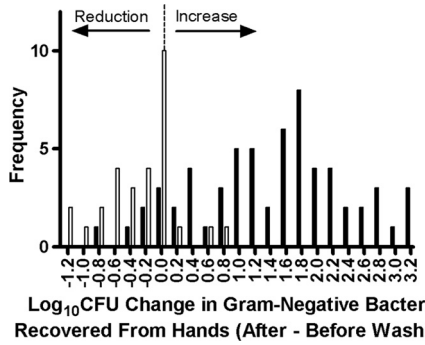

FIG. 2. $\log_{10}$ CFU change in Gram-negative bacteria recovered from hands of elementary school students and staff as a result of hand washing with contaminated soap (solid bars) versus uncontaminated control soaps (open bars).

In summary, this study is the first to quantify the levels of bacteria remaining on hands after washing with contaminated soap and to quantify the transfer of contaminating bacteria from the hands to a secondary surface. This research confirms previous work demonstrating a strong association between open bulk-soap-refillable soap dispensers and extrinsic bacterial soap contamination and demonstrates that washing with contaminated soap poses a potential public health risk in community settings. Our findings further show that extrinsic contamination of hand soap can be eliminated or considerably reduced through the use of sealed-soap-dispensing systems.

Limitations of our study that future studies should be designed to address include species identification of the entire microbial communities present on the hands before and after washing, comparison of results between dominant and nondominant hands, and correlation of hand washing techniques (volume of soap used, length of washing and rinsing, paper towel use behaviors, etc.) employed by participants with the observed results. Further studies to confirm these preliminary findings and to develop accurate risk models should be considered. Epidemiological studies of the causal relationship between contaminated soap and disease would be very useful to quantify the risk; however, they may be impractical to execute. The lack of such study data, however, should not preclude proactive efforts to reduce the

Recent studies evaluating bulk soap in public restroom soap dispensers have demonstrated up to 25% of open refillable bulk-soap dispensers were contaminated with * 6 $\log_{10}$(CFU ml^{71}) heterotrophic bacteria. In this study, plastic counter-mounted, plastic wall-mounted and stainless steel wall-mounted dispensers were analyzed for suspended and biofilm bacteria using total cell and viable plate counts. Independent of dispenser type or construction material, the bulk soap was contaminated with 4–7 $\log_{10}$(CFU ml^{71}) bacteria, while 4–6 $\log_{10}$(CFU cm^{72}) biofilm bacteria were isolated from the inside surfaces of the dispensers (n ¼ 6). Dispenser remediation studies, including a 10 min soak with 5000 mg l^{71} sodium hypochlorite, were then conducted to determine the efficacy of cleaning and disinfectant procedures against established biofilms. The testing showed that contamination of the bulk soap returned to pre-test levels within 7–14 days. These results demonstrate biofilm is present in contaminated bulk-soap dispensers and remediation studies to clean and sanitize the dispensers are temporary.

Keywords: biofilm; bulk soap; soap dispensers; efficacy testing

Introduction

Hand washing has long been recognized to play an important role in public health (Garner and Favero 1986), and is generally accepted as an important practice to help prevent the spread of infectious microorganisms, which is especially significant in the healthcare industry. Hand washing sinks and liquid soap are generally provided to patrons of public restrooms to encourage good hand hygiene. Shared public bathrooms, however, can be a vector, con-tributing to the spread of pathogenic microorganisms (Mokhtari and Jaykus 2009). As early as the 1960s, studies were published regarding significant surface contamination of bar soap (Bannan and Judge 1965; Kabara and Brady 1983). Liquid soap was eventually recommended to be a more hygienic solution, and dispensers were developed to distribute liquid soaps (Graf et al. 1988; Chattman et al. 2011).

Like bar soaps, liquid soap dispensers have been associated with microbial contamination issues. Reports dating back to the 1960s have linked bulk liquid hand soap and hand lotion contamination to nosocomial infections in hospital operating rooms and neonatal units (Morse et al. 1967; Archibald et al. 1997; Sartor et al. 2000; Rabier et al. 2008; Buffet-Bataillon et al. 2009). Washing with contaminated soap can leave more bacteria present on the hands after the washing event than before, which undermines the effectiveness of hand washing (Sartor et al. 2000; Zapka et al. 2011). In 1986, the healthcare industry hand hygiene guidelines recognized that 'since liquid-soap containers can become contaminated and might serve as reservoirs of microorganisms, reusable liquid containers need to be cleaned when empty and refilled with fresh soap. Completely disposable containers obviate the need to empty and clean dispensers.' (Garner and Favero 1986). In response to this guideline, the use of bulk hand soap dispensers is now rare in US healthcare settings. How-ever, these types of dispensers are still common in public restrooms. Recent research has demonstrated that up to 25% of bulk hand soap dispensers from office buildings, health clubs, schools, food service centers, retail spaces and other locations are contaminated. Heterotrophic bacteria in contaminated soap averages 6 $\log_{10}$(CFU ml^{71}), which is approximately 1000 times in excess of what industry guidelines recommend (Krowka and Bailey 2007; Chattman et al. 2011).

There are numerous unique dispenser designs but all include a reservoir area to store the soap, a mechanism to pump the soap out of the reservoir onto hands, and a way to refill the dispenser with new soap. Dispensers are constructed of metal or plastic and are typically semi-permanently mounted to the wall or under the counter near the sink. Dispensers are

designed to be refilled by one of two methods: bulk refill and sealed soap refill. Bulk refill dispensers are manually refilled by pouring soap through an opening in the top from a separate bulk soap refill bottle, commonly supplied in a 1 gallon volume. These bulk soap dispenser models typically have a built-in permanent nozzle through which soap is dispensed and is not replaced under normal circumstances. Sealed soap dispensing systems, in contrast, are typically refilled by inserting a new bag or cartridge of soap that contains a new built-in nozzle. As such, the nozzles in these systems are replaced regularly and the soap does not come into contact with the dispenser itself. Empty cartridges are then either disposed or recycled.

Personal care and cosmetic products, such as soap, are not expected to be sterile, but US manufacturers are required by law to ensure that their products do not present a hazard to consumers when they are used as directed (Steinberg 2006). The Federal Food, Drug, and Cosmetic Act 'requires that successful preservation can only be established if one considers all aspects of development from concept and design through manufacturing to the last consumer use before disposal' (Geis 2006). Industry guidelines suggest that to be safe, a product should not contain any pathogens and that the bacterial load should not exceed 1000 total bacteria per gram or milliliter of product (Krowka and Bailey 2007). In order to protect products from contamination during use, soap manufacturers include preservatives in their formulations and verify their performance by testing that each newly-developed formulation effectively inhibits the growth of a range of microorganisms (Sutton 2006). Liquid hand soaps, however, are perishable and can become contaminated with microorganisms under certain adverse circumstances, particularly when consumers use or store the product in unintended ways that are hostile to preservative efficacy (Geis 2006). Occasionally, products are sold that are either already contaminated (intrinsic contamination) or that are inherently susceptible to becoming contaminated because of poor formulation design. However, the primary cause of failure of even a robust, well-preserved formulation is the introduction of contamination during use of the product when a consumer intentionally adds water, mixes products, or stores the product in inhospitable conditions, such as in warm or humid places (extrinsic contamination) (Geis 2006). The design of packaging and dispensing mechanisms used to store and deliver products affects the probability that a product will become contaminated. Systems that have an open design and that allow for increased opportunity for consumers to manipulate the product inside are inherently at greater risk of becoming contaminated as compared to products with a closed design (Garner and Favero 1986; Brannan and Dille 1990; Geis 2006).

Dispenser design and construction of soap packaging is a critical factor to both the occurrence of contamination and the challenge of contamination remediation. The likelihood of extrinsic contamination is greatest when products are packaged, stored, or used in a manner that allows for repeated introduction of microorganisms from the consumer or the surrounding environment (Brannan and Dille 1990; Geis 2006). Dispenser designs, particularly those for wall-mounted dispensers, do not take into consideration the potential for microbial contamination, thus, cleaning is impractical because the dispensers are often securely bolted into walls, making them difficult to remove. For this reason, the same dispensers often remain in facilities for many years. Some wall-mounted dispensers are designed with a nozzle that is located centimeters above the bottom of the dispenser, rather than dispensing the soap from the bottom of the dispenser. This design flaw ensures that the dispenser will never completely drain. Once the soap becomes contaminated, this serves to provide a reservoir of bacteria that are uniquely adapted to survive in the soap environment. Also, some counter-mounted dispensers are sold with one dispensing pump to be reused between bottles (Sartor et al. 2000). Once the pump becomes contaminated, it can transfer the bacteria between bottles (Graf et al. 1988).

Remediation of contaminated dispensers is one option for reducing potential health risks to the general public. There are no published research studies to date that have determined if there is an effective way to eliminate or reduce the contamination problem by washing and/or sanitizing the dispenser. Furthermore, even as far back as the late 1980s, biofilm was suspected of being present in bulk soap dispensers (Graf et al. 1988). Given that bacterial biofilm is known to be more tolerant to disinfectants (Stewart et al. 2000; Donlan and Costerton 2002; Smith and Hunter 2008; Peeters et al. 2008), biofilms likely survive on internal surfaces in contact with soap. While most published studies only tested the bulk soap coming out of the dispenser for bacterial contamination, the entire soap dispenser could be considered a microbial habitat and should be examined. This examination should include both the bulk soap for planktonic contamination and the inner dispenser surfaces to test for the presence of biofilm.

The objectives of this study were to test for the presence of biofilm within dispensers collected from public restrooms and to determine which organisms were present, to understand the efficacy of cleaning and disinfection procedures against established biofilm, and to examine the recurrence of bulk soap contamination following cleaning. Plastic counter-mounted, plastic wall-mounted, and stainless steel (SS) wall-mounted

dispensers were analyzed for planktonic and biofilm heterotrophic and coliform bacteria using viable plate counts (VPC) and total cell counts (TCC). Isolated bacterial colonies were identified using biochemical and molecular profiling. Once the presence of biofilm within dispensers was confirmed, several washing and sanitizing procedures were evaluated for their ability to remediate contamination using both plastic and SS wall-mounted dispensers.

Methods

Sampling dispensers for biofilm

Test dispenser information

Three counter-mounted plastic dispensers from a shopping complex, two plastic wall-mounted dispensers from an elementary school, and two SS wall-mounted dispensers from a middle school and high school, all located in Ohio, USA were evaluated. The dispensers were sampled in the field and determined to be contaminated prior to being sent to the Center for Biofilm Engineering (CBE) for analysis. The plastic dispensers tested were designed with a top lid that completely lifted open for refilling the dispenser with new soap. The SS dispensers were designed with a small, hinged lid that is lifted to refill the dispenser with soap.

Experimental design

A schematic of the process used to sample the refillable soap dispensers for viable and total cells is found in Figure 1. Dispensers were visually inspected and imaged after arrival from the collection site. Three samples were collected from each dispenser: bulk soap to enumerate viable, planktonic bacteria (CFU ml^{-1}); rinse water to enumerate loosely-attached, surface-associated bacteria (CFU cm^{-2}); and inner surface scrapings to determine the density of attached, biofilm bacteria (CFU cm^{-2}). In addition, TCC were determined for each sample type collected, as described below.

Determination of planktonic bacteria

For the plastic counter- and wall-mounted dispensers, the soap was drained through the nozzle into a sterile beaker containing 220 g of 3 mm glass beads. For the SS dispensers, the soap was drained into a sterile glass beaker, and after vigorous mixing, a 10 ml aliquot was added to a 50 ml conical vial containing 10 g of glass beads.

Determination of loosely-attached bacteria

After the soap was removed from the dispenser, 100 ml of sterile phosphate buffered water was added to the dispenser and swirled around to remove any loosely-attached bacteria. For the plastic dispensers, the rinse water was drained into a sterile beaker containing 60 g of glass beads. For the SS dispensers, the rinse water was drained into a beaker and a 10 ml aliquot was collected for culturing.

Determination of strongly-attached bacteria

For the plastic dispensers, the entire inside of the dispenser was scraped with a Teflon scraper and then rinsed with 100 ml of DeyEngley (D/E) Neutralizing Broth.

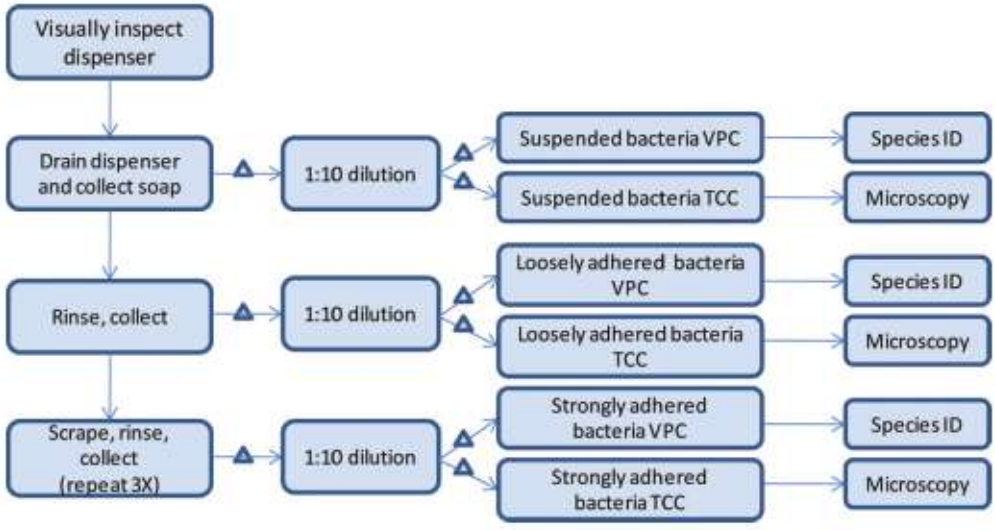

Figure 1. Schematic of the experimental design used to analyze bacteria suspended in the soap and loosely- or strongly-attached to the inside surfaces of contaminated bulk soap dispensers. Three samples were collected and analyzed for viable cells (VPC) and total cells (TCC). Δ = sample disaggregation steps.

The D/E broth was poured into a beaker containing 185 g of glass beads. The scrape and rinse procedure was completed three times and all rinses were combined.

For the SS dispensers, 150 ml of cold phosphate buffered water were added to the dispenser. The dispenser was shaken vigorously for 5 min and the inside surfaces of the dispenser that were accessible were scraped with a sterile Teflon scraper.

Disaggregation and plating methods

All samples were neutralized with D/E broth. Three cycles of sonication and vortexing (1 min each) followed to disaggregate the biofilm. Sterile glass beads were included to aid in biofilm disaggregation. The efficiency of this method was confirmed microscopically. Samples were serially diluted and 1 ml aliquots were plated on both R2A and MacConkey agar. The R2A plates were incubated at room temperature for 7 days and the MacConkey plates were incubated at 36°C for a period of 24–72 h. In addition, 1 ml of the disaggregated, undiluted soap was plated.

For TCC, an additional 1 ml aliquot from the diluted sample was pipetted onto a 0.2 μm membrane. LIVE/DEAD *Bac*Light Bacterial Viability Kit stain (Invitrogen #L7012, Carlsbad, CA) was added, incubated for 15 min in the dark, and after rinsing, the membrane was placed on a glass slide. The total cell count slides were imaged on a Nikon Eclipse E800 microscope with a FITC cube (ex 480/15, DM 505, em 535/20) for the green and a TRITC cube (ex 546/5, DM 575, em 590 LP) for the red. Images were analyzed for total cells regardless of the color the cell stained. A scan of 20 fields per slide was performed and this information was processed for total counts per sample dilution using Metamorph, v7.6.4 Software (MDS Analytical Technologies, Sunnyvale, CA).

Identification of bacterial isolates

Colonies collected from the three sample types that expressed a unique morphology were streaked for isolation and sent to an outside laboratory (Medical Laboratory Services, Inc., Bozeman, MT) for bacterial identification based upon biochemical profiling. Identification of bacterial isolates was confirmed by sequence determination of the V1–V3 region of the SSU rRNA gene. The SSU rRNA gene was amplified with previously described primers FD1 and 1540R and sequenced with 529R via capillary Sanger sequencing (Ye et al. 2004; Hwang et al. 2009). Sequences were identified using the BLASTn algorithm through NCBI (http://ncbi.nlm.nih.gov/blast).

For the plastic wall-mounted dispensers, the field identifications (from historical data) and laboratory identifications were determined using biochemical profiling and molecular analysis. For the SS wall-mounted dispensers, the laboratory identifications were determined biochemically and the isolated colonies used in the biochemical identifications were sent in for molecular testing to provide direct comparisons between the two methods.

Molecular analysis of whole biofilm community

Using separate dispensers from above, two plastic wall-mounted and two SS wall-mounted dispensers were sampled to determine microbial diversity of biofilm within the dispensers. For each dispenser tested, bulk soap was removed and 100 ml cold, sterile 1X PBS were added. The inside surfaces of the dispenser were scraped into the PBS and transferred to 50 ml conical centrifuge tubes. Biomass was collected *via* centrifugation and multiple pellets from the same dispenser were combined until all biomass was in a single pellet for each sample. Pellets were resuspended in 10 ml of PowerBead solution and transferred into sterile mortars with sand. Samples were flash frozen with liquid nitrogen and ground with pestles three times. The whole sample was collected into PowerBead tubes and nucleic acid extraction was done according to the manufacturer's instructions with the PowerMax Soil DNA Extraction Kit (MO BIO, Inc., Carlsbad, CA). The extracted DNA was amplified as above with primers FD1 and 1540R using PCR program 80°C 1:30, 94°C 2:00, 25 cycles of (94°C 0:30, 58°C 1:00, 72°C 1:00), 72°C 7:00 followed by 4°C hold. Appropriately-sized DNA was cloned into plasmid pCR2.1-TOPO (plastic) or pCR4-TOPO (SS), transformed into competent *E.coli* DH5α and plated on LB-Kan50 plates as per the manufacturer's instructions (Invitrogen, Inc., Carlsbad, CA). Transformants were screened for appropriately-sized inserts using primers M13F and M13R. Ninety-six M13 amplicons were submitted from each dispenser for Sanger sequencing using primer 529R. Sequence libraries were checked for chimeras and identified as described above.

Dispenser imaging

Prior to any sampling steps, the dispensers were visually inspected and various outside and/or removable dispenser pieces were imaged using a Nikon SMZ1500 stereo zoom microscope.

Experimental design of remediation study

Washing studies were conducted on plastic and SS wall-mounted dispensers. Five plastic wall-mounted dispensers from an elementary school in Ohio were used in the first set of experiments. Some of these

dispensers were previously used to investigate hand transfer of contaminants in a different study (Zapka et al. 2011). Eight SS wall-mounted dispensers from a school district in New Jersey were used in the second set of experiments. Each experiment included a positive control (randomly chosen dispenser that had tested positive for contamination in the bulk soap) and a negative control (a new dispenser that had never tested positive for bacteria in the bulk soap). The experiments were performed in triplicate and control dispensers remained the same for each of three experimental repeats. The remaining dispensers used in the studies had all tested positive for viable bacteria (at least 3 $\log_{10}$(CFU ml^{-1})) in the bulk soap prior to commencing each washing experiment. The washing procedure tested on each dispenser was randomly assigned before every experiment.

The washing procedures were designed to vary in difficulty and to utilize products that would be readily available to any cleaning personnel, including the use of tap water. Just prior to washing the dispenser, a sample of the bulk soap was collected and analyzed for heterotrophic bacteria. Samples from plastic dispensers were neutralized with D/E Neutralizing Broth and disaggregated and plated on R2A, while samples from SS dispensers were neutralized with a modified Butterfield's phosphate buffer solution containing lecithin, polysorbate 80, KH_2PO_4, K_2HPO_4, $Na_2S_2O_3 \cdot 5H_2O$, Tamol SN, and Triton X-100 (BPB^+ Neutralizer) (Beausoleil 1999), followed by disaggregation and plating on TSA. The control dispensers were then drained and refilled with an antibacterial soap labeled to contain triclosan (percent triclosan not listed on the label) for the plastic dispensers or a bland (non-antimicrobial) soap for the SS dispensers. The soap formulation used to fill each dispenser was consistent with the formulation used to fill that dispenser in the field. The test dispensers were washed with sodium hypochlorite (5000 mg l^{-1}), a quaternary ammonium compound-containing disinfectant (Ecolab Oasis 146 Multi-Quat Sanitizer, 8 ml l^{-1}), or a mildew remover (Tilex Mildew Root Penetrator & Remover, 24,000 mg l^{-1} sodium hypochlorite, active ingredient), as depicted in Figure 2. They were then filled with the appropriate soaps as described above. The bulk soap from all the dispensers was then sampled immediately after filling and for up to 2 weeks or until the population reached pre-test levels. Both the fresh soap and tap water were plated and tested on each experiment day for viable cells.

Results

Planktonic and biofilm contamination

Bulk soap from contaminated dispensers harbored between 3.7 to 6.7 $\log_{10}$(CFU ml^{-1}) of viable coliform and heterotrophic bacteria and between 6.9 to 8.0 $\log_{10}$(CFU ml^{-1}) total cells (Figure 3). Soap from plastic wall-mount dispensers had the highest density of viable planktonic bacteria (5.4 to 6.7 $\log_{10}$(CFU ml^{-1})) while plastic counter-mounted dispensers contained the lowest density (3.7 to 4.9 $\log_{10}$(CFU ml^{-1})) and SS wall-mounted dispensers contained an intermediate density (4.9 to 5.2 $\log_{10}$(CFU ml^{-1})). The TCC in the soap were $\sim$ 1 to 3 logs greater than the viable counts for all of the dispensers.

Loosely- and strongly-adhered viable coliform or heterotrophic cells were present at densities between 3.3 to 6.4 $\log_{10}$(CFU cm^{-2}) in all dispensers (Figure 4). The SS wall-mounted dispensers had the highest density of surface-associated viable bacteria (5.1 to 6.4 $\log_{10}$(CFU cm^{-2})) as compared to the plastic counter-mounted and wall-mounted (3.3-5.8 $\log_{10}$(CFU cm^{-2})) dispensers. The TCC from the loosely- and strongly adhered bacteria were generally greater than the loosely- and strongly-adhered viable bacteria, except for the strongly-adhered bacteria from the plastic wall-mounted dispenser. For the majority of dispensers, slightly more strongly-adhered and total cell count bacteria were recovered than loosely-adhered bacteria, except for the plastic counter-mounted dispensers, in which much higher densities of loosely-attached bacteria and TCC were recovered (6.3 to 6.9 as compared to the strongly-associated bacteria at 4.6 to 5.1).

Bacterial identification

The colonies recovered from the plastic counter-mounted dispensers were identified through biochemical profiles as *Klebsiella oxytoca* and *Kluyvera ascorbata*, both of which are Gram-negative opportunistic pathogens. The bacteria identified in the plastic wall-mounted dispensers were commonly Gram-negative, presumptive opportunistic pathogens (eg *Providencia, Citrobacter, Klebsiella, Serratia*, and *Pseudomonas*) (Table 1). Bacterial populations were also identified *via* clone libraries of SSU rRNA gene sequences. The isolates identified with both biochemical and molecular techniques revealed similar identifications at the genus level, although not surprisingly the clone library data identified potential organisms that were not cultivated. The bacteria identified in the SS wall-mounted dispensers were consistent with that observed for the other dispensers (Table 2). In total, the SS dispensers contained bacteria from five unique genera that included *Pseudomonas, Providencia, Serratia, Stenotrophomonas* and *Acinetobacter*. Interestingly, the molecular data did not reveal additional sequences that were not cultivated from the SS dispensers. In previous unpublished work, historical data indicated

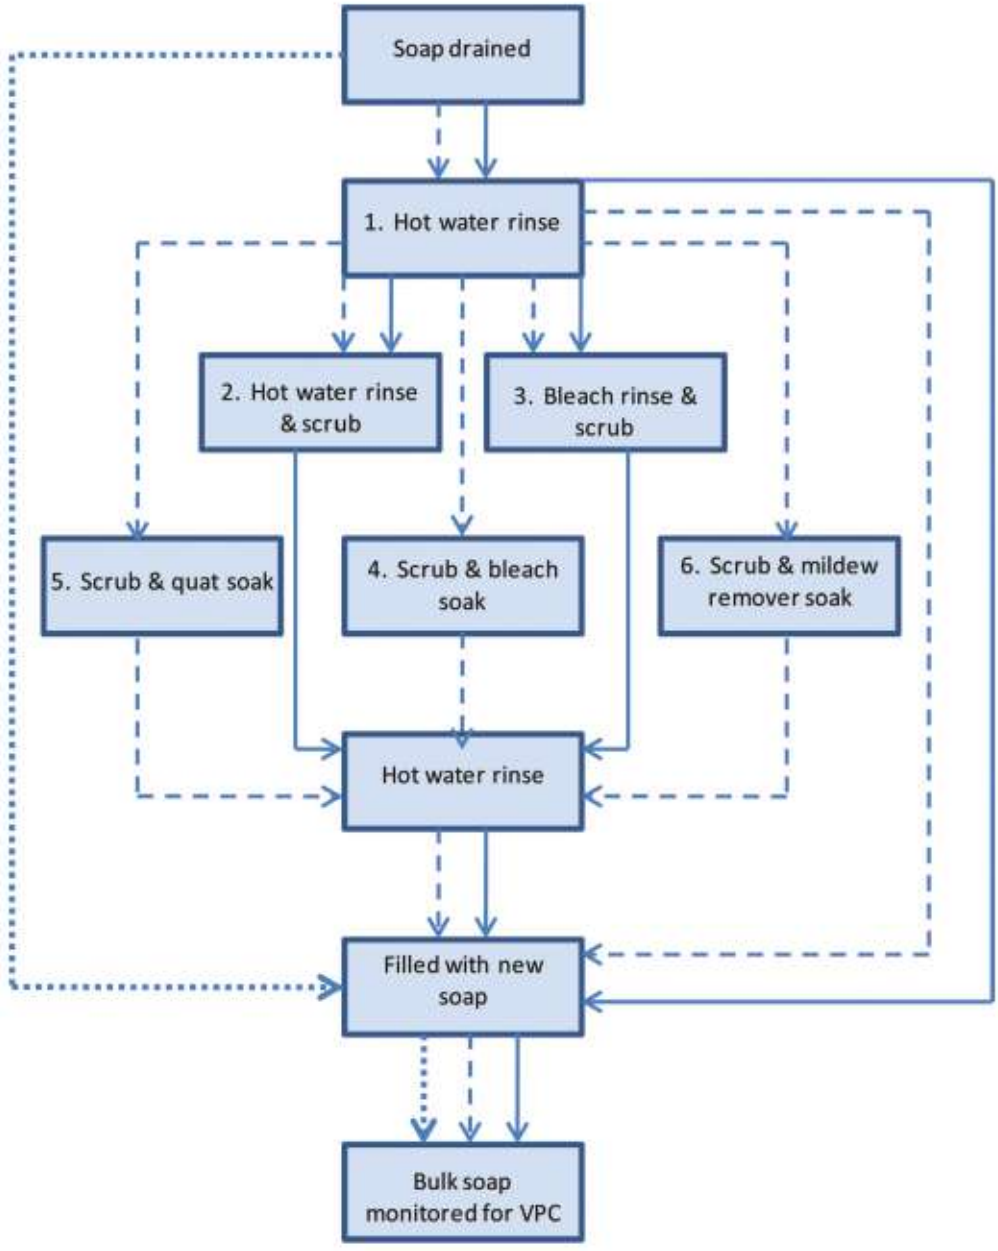

Figure 2. Schematic of the experimental design used to evaluate the effectiveness of dispenser remediation procedures. Procedures 1, 2, and 3 were followed for plastic wall-mounted dispensers (solid lines). Procedures 1–6 were tested for the SS dispensers (dashed lines). The dotted line denotes the control dispenser protocol.

that the dominant colony types in each dispenser were *Pseudomonas aeruginosa* and *Serratia liquefaciens*. This research confirmed that these genera were present in the respective dispensers but did not confirm that they were the dominant colony types. Bacterial isolates obtained from SS dispensers were also identified using both SSU rRNA gene sequencing biochemical profiling to compare the two techniques. The results from the comparison revealed equivalent identities at the genus level for all but one of 14 isolates.

Effectiveness of dispenser remediation techniques

The heterotrophic plate count results of the dispenser washing experiments are shown in Figures 5 and 6 for the plastic wall-mounted and SS wall-mounted dispensers, respectively. In Figure 5, the standard error of the mean (SEM) for the hot water rinse procedure was 0.10 and 0.47 on day 0 and day 4, as averaged over the three experiments. The SEM for the hot water rinse and scrub procedure on day 0 was 0.28 and ranged from 0.07 to 0.53 on days 0, 4, and 7 for the scrub and

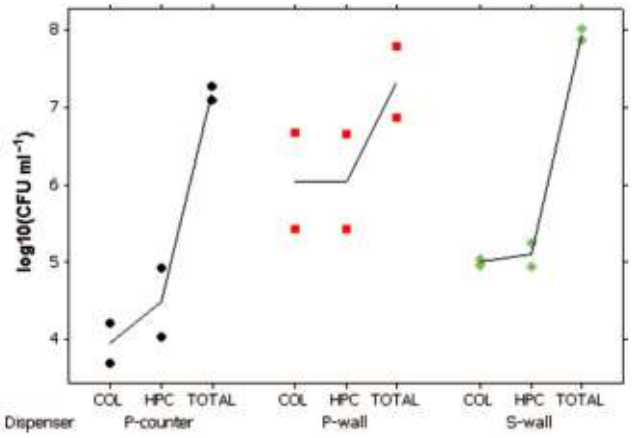

Figure 3. Coliform (COL), heterotrophic (HPC), and total cell count (TOTAL) results from the bulk soap for plastic counter-mount, plastic wall-mount, and SS wall-mount dispensers ($n = 2$ of each). The black solid line connects the mean $\log_{10}$(CFU ml^{-1}) of the data points.

sodium hypochlorite rinse washing procedure, over the three experiments. The triplicate experiments for these dispensers were not conducted consistently with respect to the frequency of plating. In experiment 1, the dispensers were only plated on day 0 and 14, whereas in experiment 2, they were plated on days 0, 2, 4, 7, and 10. The dispensers were plated on days 0, 1, 4, and 7 for experiment 3 and for all experiments, plating was discontinued once the bacterial counts returned to pre-test contamination levels. For these reasons, the SEM could not be calculated for all dispensers and all experiments for each day.

In Figure 6, the SEM for the hot water rinse procedure over the three experiments was 0.30, 0.14, and 0.20 for days 0, 2, and 4. The SEM could not be calculated for day 7 because some of the dispensers had reached their pre-test contamination levels and plating was discontinued. The SEM for the hot water rinse and scrub procedure was 0.27, 0.25, 0.15, and 0.15 for days 0, 2, 4, and 7 averaged over three experiment replicates. For the scrub and sodium hypochlorite rinse procedure, the SEM was 0.25, 0.52, 1.01, and 0.34 for days 0, 2, 4, and 7. The SEM could not be calculated on day 10 because some of the dispensers had already reached their pre-test contamination levels. For the 10 min sodium hypochlorite soak procedure and for the 10 min quat soak procedure, the SEM was 0.26, 0.31, 0.71, and 0.22, and 0.28, 0.15, 0.87, and 0.16 on days 0, 2, 4, and 7, respectively. For the 10 min mildew remover soak washing procedure, the SEM was 0.34, 0.63, 1.55, and 1.24 for days 0, 2, 4, and 7. The SEM could not be calculated for days 10 and 14 because some of the dispensers had already reached their pre-test contamination levels and plating was discontinued.

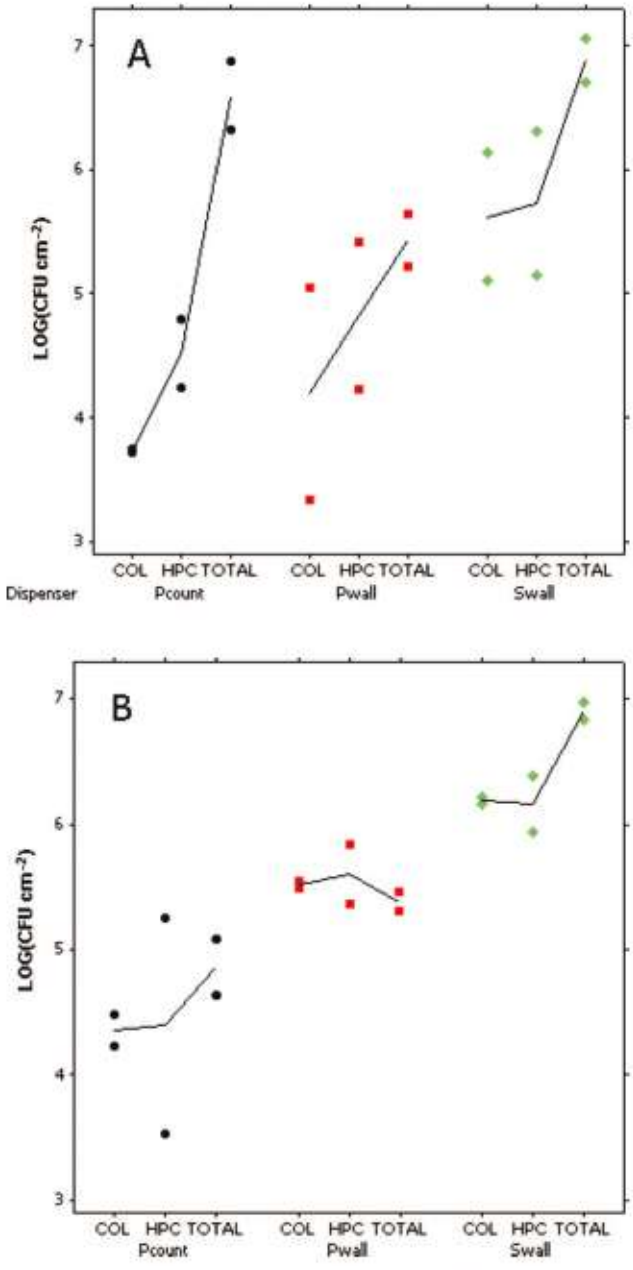

Figure 4. Coliform (COL), heterotrophic (HPC), and total cell count (TOTAL) results from the loosely-attached (Panel A) and strongly-adhered (Panel B) sampling steps for plastic counter-mounted, plastic wall-mounted, and SS wall-mounted dispensers ($n = 2$ of each). The black solid line connects the mean $\log_{10}$(CFU cm^{-2}) of the data points.

The dispensers initially contained 4.3 to 6.0 $\log_{10}$(CFU ml^{-1}) in the bulk soap dispensed after cleaning. Rinsing the dispenser with hot water, with or without scrubbing, did little to reduce the contamination levels in the soap. Based upon industry guidelines that suggest a microbial load limit of 1000 CFU ml^{-1}, these soaps would be considered contaminated within 1–2 days after performing the remediation procedures.

Table 1. Bacteria identified in wall-mounted plastic dispensers.

The most effective remediation treatments were the sodium hypochlorite soak, sodium hypochlorite rinse and scrub, and the mildew remover soak, which were all able to reduce the bacterial contamination densities to below the 1000 CFU ml^{-1} threshold for $\sim$ 4 to 5 days after treatment. However, the levels in the soap continued to increase and returned to pre-remediation

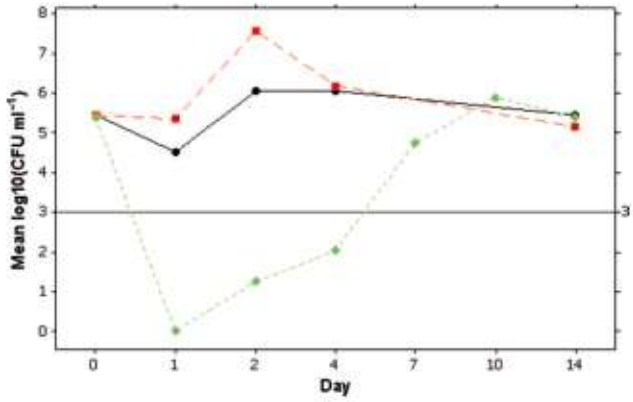

Figure 5. HPC results for plastic wall-mounted dispenser washing studies, averaged over three experiments. ● = hot water rinse procedure; ■ = hot water rinse and scrub procedure; ♦ = scrub and sodium hypochlorite rinse washing procedure. The solid horizontal line at 3 $\log_{10}$(CFU ml^{-1}) depicts the cosmetic industry guideline recommendation.

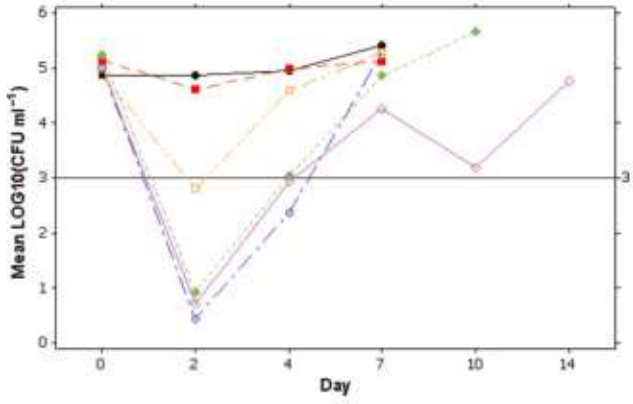

Figure 6. HPC results for SS wall-mounted dispenser washing studies, averaged over three experiments. ● = hot water rinse procedure; ■ = hot water rinse and scrub procedure; ♦ = scrub and sodium hypochlorite rinse washing procedure, ○ = 10 min sodium hypochlorite soak procedure; □ = 10 min quat soak procedure; ◇ = 10 min mildew remover soak washing procedure. The dispenser bulk soap was sampled until the populations reached pre-test contamination levels. The solid horizontal line at 3 $\log_{10}$(CFU ml^{-1}) depicts the cosmetic industry guideline recommendation.

levels after only 7 to 14 days post-remediation. The quat soak did little to decrease contamination levels, and on average, only decreased levels below the 3 $\log_{10}$(CFU ml^{-1}) microbial load limit for 2 days, post-treatment.

When considering the individual data points, the 10 min mildew remover soap procedure in experiment 3 took 10 days to recover beyond a 3 $\log_{10}$(CFU ml^{-1}) level. Interestingly, it had reached that level after 4 days in the first two experiments.

The effectiveness of the three remediation methods performed on both the plastic and SS dispensers (hot water rinse, hot water rinse and scrub, and sodium hypochlorite rinse and scrub) was not significantly different depending on dispenser type. Positive control dispensers, which were simply drained of soap and refilled with fresh soap, maintained their contamination levels at approximately 5 $\log_{10}$(CFU ml^{-1}), and no bacteria were detected from the negative control dispensers throughout the experiments (data not shown).

Discussion

The results of this study demonstrate that open, bulk-refillable soap dispensers found to contain contaminated soap also contained bacterial biofilms. Three samples were collected from each dispenser to assess the bacterial contamination, viz. bulk soap, loosely-attached cells, and biofilm. Analyzing the soap for bacteria in addition to the surface samples allowed for comparisons between historical findings, field data, and the present laboratory evaluation.

The density of surface-associated bacteria in SS wall-mounted dispensers was up to ten-fold greater than that seen for the other two dispenser types. This is interesting because the bacterial density in the soap was slightly greater than that recovered in the plastic counter-mounted dispensers and slightly less than the bacteria recovered from the soap in the plastic wall-mounted dispensers. This result suggests that there is no direct correlation between biofilm density in a dispenser and the level of contamination in the bulk soap.

Previous reports suggest that bulk liquid samples are not necessarily predictive of the microbial health of the system (Goeres 2010). In general, if the bulk soap is contaminated, then biofilm is also most likely present in the dispenser. Perhaps the most interesting case would be to determine whether dispensers containing no bulk soap contamination still contain biofilm. Additional factors that would be interesting to include in a correlation study are the type of soap, the location of dispenser, and the use pattern.

For this study, the type of dispenser (plastic wall-mounted, plastic counter-mounted and SS wall-mounted) did not appear to be a significant factor, although a slightly greater diversity of organisms was detected in the plastic dispensers. This is an interesting result given the design of the SS dispensers, which does not allow for the dispenser to ever completely empty.

Bacterial isolates from the soap were almost exclusively Gram-negative. While isolates were identified to at least the genus level, the identifications provided a qualitative description of organisms contaminating the dispensers but did not serve to quantify each species. In most cases, molecular typing of the isolates provided similar results to the biochemical typing. Identifications from both methods are limited to matching the biochemical profile or the sequence to an organism already in the database. Biochemical profiling of environmental isolates is particularly limited due to the extremely great diversity of organisms which have not yet been characterized as well as those multiple species which are similar, if not identical, in the limited size of the array used for profiling. While the bacterial diversity was relatively low compared to other environments, 16S rRNA gene sequencing demonstrated the presence of organisms not detected *via* cultivation-based techniques in plastic dispensers. The same was not true for the SS dispensers. Identified isolates are consistent with organisms previously reported to have been isolated from liquid soap (Chattman et al. 2011; Zapka et al. 2011). The molecular data can be used to further direct cultivation methods in order to isolate a broader diversity of the present microbiota, which could be useful information when crafting new formulations of soap. Intentional incubation of isolates already known to be well-suited for survival in soaps during the formulation phase would give insight into the ability of the new formulation to resist bacterial growth. Future work could include molecular techniques that differentiate bacterial populations in the bulk soap *vs* biofilm populations.

Inclusion of microscopy in these experiments proved to be useful for two reasons. First, the TCC demonstrated that only a fraction of the bacteria were recovered by the VPC. On average, the TCC were 1 to 2 $\log_{10}$(CFU ml^{-1}) higher than the VPC, indicating the presence of a population that was either non-viable or non-culturable by the plating techniques used in this study. Second, microscopy demonstrated whether or not the disaggregation method was adequate (Figure 7).

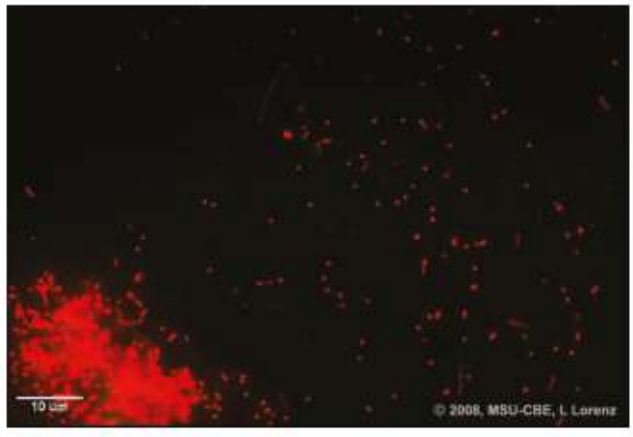

Figure 7. Total cell count image displaying biofilm clumping when disaggregation was inadequate. X100. Bar = 10 um.

The physical properties of soap makes it challenging to disaggregate cell clusters; it foams when homogenized and is difficult to vortex vigorously, so microscopy was an important means by which to assess the disaggregation method used. Improper disaggregation will result in an underestimate of the viable cells present in a sample (Hamilton et al. 2009). Previously published results obtained without using disaggregation techniques showed that contaminated bulk soap in public restrooms contains an average of 6 $\log_{10}$(CFU ml^{-1}) of heterotrophic bacteria, therefore, they may have underestimated the true levels of viable bacteria in the soaps (Chattman et al. 2011). Another interesting use of the imaging from the dispensers was to visually record that the dispensers often contained substances that presumably did not originate from the soap (Figure 8).

Once a biofilm has established on a surface, cleaning and eradicating the biofilm from that surface becomes a challenge, as the dispenser remediation experiments demonstrated. The ineffectiveness of washing soap bottles dates back to the 1960s, so these findings are not surprising (Burdon and Whitby 1967). The present study showed that even soaking the dispensers with sodium hypochlorite, a quat, or with a full strength mildew remover for 10 min before adding new soap, was ineffective at eradicating biofilm. Because the soap used to refill each dispenser contained no detectable bacteria, the results demonstrated that the recovery of bacterial populations in the bulk soap resulted from dispersal of bacteria from biofilms present inside the dispensers. The rate of recolonization was inconsistent between replicates and likely represents a host of different factors including density of the biofilm, age of the biofilm, species composition of the biofilm, and quality of disruption of the biofilm during disinfection. The slowest recovery took 14 days to reach pre-test contamination levels. This particular dispenser received the mildew remover treatment in experiment 3, where the recovery was 14 days, but this dispenser also received that treatment in experiment 1 and received the sodium hypochlorite rinse treatment in experiment 2. The mildew remover contains 24,000 mg l^{-1} sodium hypochlorite. It is conceivable that the two mildew sodium hypochlorite treatments, coupled with an approximate 5,000 mg l^{-1} sodium hypochlorite rinse treatment, all occurring within just under 2 months, were able to decrease the biofilm counts and delay regrowth and contamination, but still failed to completely eradicate the biofilm.

Figure 8. Stereoscope image of inner dispensing tube of a plastic counter-mounted dispenser coated with unknown brown substance. 7.5X.

The soap dispenser remediation procedures evaluated in this study were very time and labor intensive and would not realistically be utilized by a custodial staff, especially in a facility with multiple dispensers to maintain. Furthermore, the trials conducted in triplicate were completed in rather quick succession, sometimes with just a week between replicate experiments. A custodian would be very unlikely to add an every-other-week soap dispenser cleaning regimen to an already long list of cleaning duties. Finally, the design of the dispenser systems contributes to the challenges of keeping them clean. They are composed of intricate pieces that are difficult to reach with a scrubbing brush. For instance, some of the top openings are quite small, making it difficult to use a scrubbing brush or to get into them at all. Bulk soap dispensers are constructed of many materials including plastics, SS, and rubber (gaskets). SS and rubber are incompatible with high level concentrations of sodium hypochlorite, which makes continuous cleaning of these materials with such disinfectants impractical, as the dispenser components will begin to corrode or deteriorate.

It is possible that dispenser design guidelines could be written to facilitate easier cleaning and disinfecting protocols for bulk soap dispensers. The SS wall-mounted dispensers, for example, had an inefficient valve placement on the front of the dispenser, about 2.5 cm above the bottom, leaving a constant reservoir of soap. Valve systems that are both easily replaceable and not economically prohibitive would eliminate the need to clean intricate and delicate valve components. It is important to consider both the potential for contamination and the ease of cleaning a system as design parameters for a dispenser. As with any environment where microbial contamination could be a concern, including dispenser systems, these considerations must be evaluated in the engineering design.

Conclusions

Bulk soap dispensers were shown to be highly contaminated, both by bacteria in the soap, and also

by biofilm bacteria attached to the inner dispenser surfaces. The bacteria identified were consistent with those typically found in cosmetics/soap environments, as determined by both culture- and molecular-based identification analyses. The remediation effectiveness experiments demonstrated that, due to biofilm attached to the dispenser surfaces, even cleaning with highly concentrated disinfectants does not eliminate the bacterial populations that are adapted to live in the soap environment.

Soap

Summary This study describes an outbreak of *Serratia marcescens* and its investigation and control in a neonatal intensive care unit (NICU). During a three-month period, five infants were colonised or infected by a single strain of *S. marcescens*. A case–control study, culture surveys and pulse-field gel electrophoresis analysis implicated a bottle soap dispenser as a reservoir of *S. marcescens* ($P = 0.032$). Infants with *S. marcescens* colonisation or infection were also more likely to have been exposed to a central or percutaneous venous catheter ($P = 0.05$) and had had longer exposure to endotracheal intubation ($P = 0.05$). Soap dispensers are used in many hospitals and may be an unrecognised source of nosocomial infections. This potential source of infection could be reduced by using 'airless' dispensers which have no air intake for the distribution of soap. Prompt intervention and strict adherence to alcoholic hand disinfection were the key factors that led to the successful control of this outbreak.

Introduction

Serratia marcescens is a nosocomial pathogen involved in many outbreaks and endemic nosocomial infections.[1] Outbreaks of *S. marcescens* have been traced to several sources, such as

contaminated antiseptic solution or soap, tap water, hand soap, fluid tanks of nebulisers, breast pumps, milk bottles, laryngoscopes, bronchoscopes, heparin—saline solution, and recently, contaminated intravenous magnesium sulphate solution.[2–16] No source was identified in other studies.[17,18]

This study describes an outbreak of *S. marcescens* that occurred over a three-month period in a neonatal intensive care unit (NICU), in which a retrospective case—control study was performed to identify risk factors for infection or colonisation with *S. marcescens*.

Methods

Hospital

The study was carried out in an 1819-bed, tertiary care, university teaching hospital in Rennes, France. The neonatal intensive care unit (NICU) is a 12-bed unit with 10 rooms.

Epidemic investigation

Each week, all bacteriological positive results from the NICU are routinely discussed by a neonatologist and a bacteriologist. In early June 2006, four infants were identified with cultures of *S. marcescens*, and so all neonates on the unit were screened for respiratory and gastrointestinal carriage. This screening was repeated weekly and for each new admission. An audit of hygiene practices and infection control of the healthcare environment was carried out. Environmental samples were collected based on the results of the audit.

Culture surveys

Water samples (1000 mL) from each room were filtered, and the filters were cultured on blood agar. Samples of unmedicated soap (1 mL) were plated onto chocolate agar plates (bioMérieux, Marcy l'Etoile, France). All the plates were incubated for 48 h at 37 °C and for 72 h at 22 °C. Bacterial colonies were identified using a commercial identification strip (API 20E Systems, bioMérieux).

Antimicrobial susceptibility testing

S. marcescens isolates were tested for susceptibility to a panel of 23 antimicrobial agents: amoxicillin, amoxicillin/clavulanate, ticarcillin, ticarcillin/clavulanate, piperacillin/tazobactam, imipenem, aztreonam, cefalotin, cefoxitin, cefamandole, cefotaxime, ertapenem, ceftazidime, cefepime, amikacin, tobramycin, gentamicin, nalidixic acid, ciprofloxacin, norfloxacin, fosfomycin, colistin, co-trimoxazole.

Susceptibility testing was performed by using an agar diffusion method according to current recommendations of the French Society for Microbiology.

Pulsed-field gel electrophoresis (PFGE)

Chromosomal DNA was extracted from stored *S. marcescens* isolates (Cryobeds, AES Laboratoires, Bruz, France). DNA was digested with *Xba*I (Promega, Charbonnières, France) and PFGE was performed.[19] The pulse time was ramped from 10—90 s and gels were run for 24 h.

The gels were stained with ethidium bromide and photographed under ultraviolet light. Isolates were considered to be the same strain if all bands matched, to be subtypes of the same strain if one to three bands differed, and to be different strains if more than three bands differed.[20]

Case—control study

The infection control team reviewed the medical records to identify possible risk factors for colonisation or infection. Previously reported risk factors include: female gender, lower gestational age, birthweight, preterm birth, prolonged respiratory therapy, prolonged use of antibiotics, maternal antimicrobial therapy with β-lactams prior to delivery, and oral cleaning care.[7,21–25] Based on these studies, each case infant was matched to three randomly selected control infants by four criteria.

A case was defined as any patient who had the epidemic *S. marcescens* strain isolated from a clinical specimen. Controls were infants who: (a) were hospitalised in the NICU during the same period but whose clinical specimens did not yield the epidemic strain; (b) were hospitalised in the NICU for at least as long as the time from admission to infection for the matched case patient (i.e. exposure time); (c) had a primary diagnosis that was similar to that of the affected patient; and (d) were within two weeks of age of the case patient. If an exact match could not be identified, the selection criteria were prioritised in the order listed above.

Data on risk factors were taken from the patients' medical records and were analysed using Epi-Info, version 6.04 (CDC). Potential risk factors, represented by continuous variables, were assessed using Student's *t*-test or Wilcoxon test. Categorical variables were assessed using χ^2-test or

Fisher's exact test. $P \leq 0.05$ was considered to be statistically significant.

Results

Description of the epidemic

On 8 June 2006, the neonatologist and the bacteriologist in the NICU notified the infection control practitioner that two hospitalised infants were colonised (patients B, D; Figure 1) and two were infected (patients A, C; Figure 1) by *S. marcescens*. All the isolates were the same antibiotype (resistant to amoxicillin, amoxicillin/clavulanate, cefalotin, cefamandole and colistin; intermediate to cefoxitin; susceptible to ticarcillin, ticarcillin/clavulanate, piperacillin/tazobactam, imipenem, aztreonam, cefotaxime, ertapenem, ceftazidime, cefepime, amikacin, tobramycin, gentamicin, nalidixic acid, ciprofloxacin, norfloxacin, fosfomycin and cotrimoxazole). The infection control team implemented isolation precautions for the four infants. Screening for both respiratory and gastrointestinal carriage of all infants in the NICU was undertaken. Despite these precautions, a fifth patient (patient E; Figure 1) was identified as being infected with a strain of *S. marcescens* having a similar antibiotype. PFGE results indicated that all five patients were infected or colonised with the same strain of *S. marcescens*. The results of the infection control audit suggested that it was unlikely that devices, drugs or incubators were an environmental source. Devices used for multiple patients such as breast pumps, milk bottles, and bronchoscope were used with appropriate disinfection. Each bottle of antiseptic had been dated, and was discarded after each infant's discharge. The daily cleaning of incubators, and their periodic disinfection were observed to comply with infection control guidelines. Based on these observations, the investigation of the outbreak was extended, and tap water and liquid soap samples were analysed. However, the infection control audit also showed that alcohol-based hand rubbing and use of gloves between infants were not being performed adequately.

Environmental culture surveys

None of the water samples collected from the 10 patients' rooms was contaminated with *S. marcescens*. However, samples of the single soap dispenser collected from room no. 10 grew *S. marcescens*. This isolate had the same antibiotype and PFGE pattern as the epidemic strain of *S. marcescens*.

Intervention

Following the positive result from the soap sample, the unmedicated soap was removed from patient

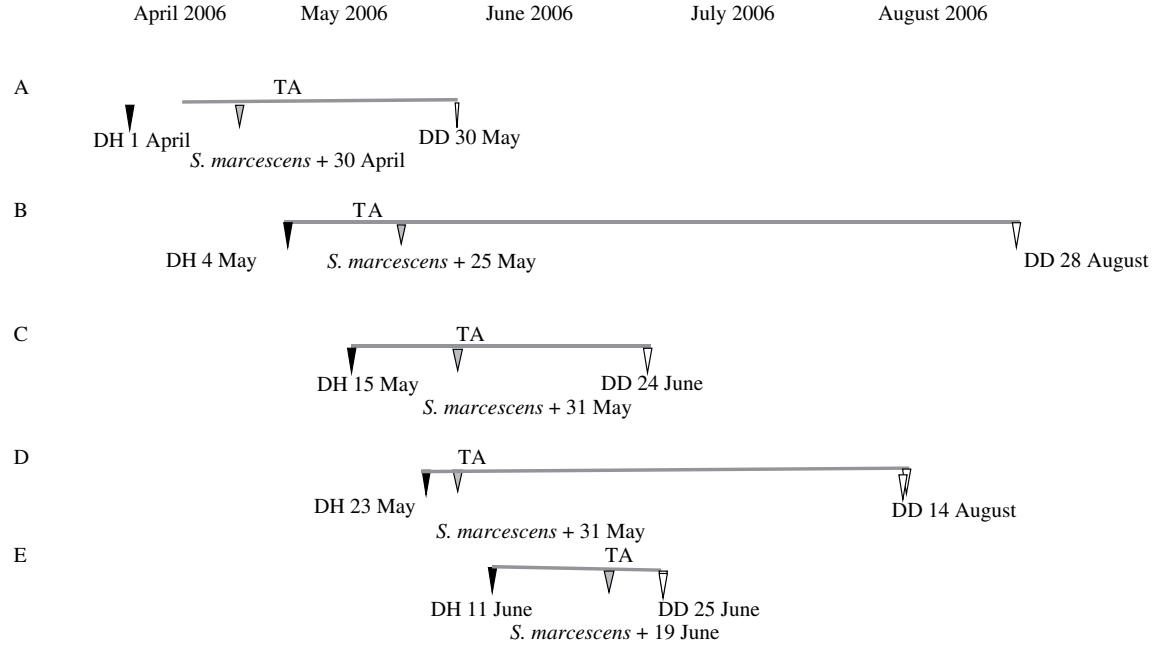

Figure 1 Graphic representation of *Serratia marcescens* outbreak. TA, transtracheal aspirate specimen positive for *S. marcescens*; DH, date of hospitalisation in the neonatal intensive care unit (NICU); DD, date of departure from the NICU.

rooms after each discharge. Before the outbreak, staff in the affected unit changed the soap only when the bottle soap dispenser was empty. The soap bottle dispensers were replaced with 'airless' dispensers in every room. These have a flexible bag as the reservoir and an internal pump, and were wall-mounted.

An education program was instituted to reinforce adherence to universal precautions, and the use of alcohol-based hand rub for all care. Despite these measures, a sixth case (patient F) was identified in November 2006. The infection control staff reinforced the use of alcohol-based hand rub for all care, and nearly one year later, no further epidemic cases have been identified.

Case–control study

All the case and control patients were matched for exposure time, primary diagnosis and age (Table I). As indicated in Table II, cases were more likely to be exposed to central or percutaneous venous catheters than controls ($P = 0.05$). However, the mean duration of exposure to central or percutaneous venous catheter was nine days for case patients and 12 days for control patients ($P = 0.46$) (Table II). Cases had longer exposure to endotracheal intubation (median of nine days), than controls (six days) ($P = 0.05$) (Table II). The case–control analysis confirmed that hospitalisation in the room contaminated by the unmedicated soap was a risk factor for infection or colonisation with *S. marcescens*. Three of the five cases were nursed in room no. 10 compared with one of 15 controls ($P = 0.032$) (Table II).

Table I Demographic and clinical characteristics of case and control patients

	Cases ($N = 5$)	Controls ($N = 15$)	*P* value

sources have been implicated in outbreaks with *S. marcescens*.[2–16] To our knowledge, this is the first reported outbreak in which a case–control study, culture surveys and PFGE implicated unmedicated soap from a dispenser as a reservoir.

We hypothesise that the soap dispenser acted as a continuous source of *S. marcescens*, facilitating handborne transmission of *S. marcescens* by healthcare workers (HCWs). Several facts support this proposed mechanism.

First, three of the five infants who became infected or colonised with the epidemic strain were nursed in the room with the contaminated soap dispenser (room no. 10). HCWs who were in charge of those three infants also looked after different infants in the neonatal unit.

Second, the infants who were infected or colonised with the epidemic strain were more likely to have been exposed to a central or percutaneous venous catheter ($P = 0.05$) and endotracheal intubation ($P = 0.05$). All cases had *S. marcescens* cultured from transtracheal aspirates. Oral cleaning care has been recognised as a risk factor.[7]

Third, it was unlikely that the outbreak strain was selected by antibiotic use. There was no significant difference between the five cases and 15 controls with regard to antimicrobial therapy with β-lactams, β-lactam and aminoglycoside combination or β-lactam and vancomycin combination (Table II).

We believe that the design of the soap dispenser was an important factor in the spread of the epidemic *S. marcescens* strain. Contamination of the soap was probably due to a retrograde contamination during hand washing. The 'airless' soap dispenser reduced this risk of soap contamination, and was probably an important part of controlling the outbreak.

Potential limitations of this study include the fact that the sixth *S. marcescens* epidemic strain was detected five months after replacement of the contaminated soap. This may be explained by prolonged carriage by HCWs. DeVries *et al.* sampled the hands of 100 HCWs and showed colonisation of a single HCW with the epidemic strain of *S. marcescens*.[27] Although this HCW went on leave, repeated culture surveys found prolonged carriage of the epidemic strain on the hands of the other HCWs for three months. This hypothesis cannot be proved in our study, as in France legal agreement is required for sampling HCWs' hands and this was not allowed in the unit. However, nearly one year later, no further cases with the epidemic strain of *S. marcescens* have been identified.

Our results suggest that the soap dispenser acted as the source of *S. marcescens* which facilitated handborne transmission of *S. marcescens* by HCWs.

Acknowledgements

Summary

The Guideline for Hand Hygiene in Health-Care Settings provides health-care workers (HCWs) with a review of data regarding handwashing and hand antisepsis in health-care settings. In addition, it provides specific recommendations to promote improved hand-hygiene practices and reduce transmission of pathogenic microorganisms to patients and personnel in health-care settings. This report reviews studies published since the 1985 CDC guideline (Garner JS, Favero MS. CDC guideline for handwashing and hospital environmental control, 1985. Infect Control 1986;7:231–43) *and the 1995 APIC guideline* (Larson EL, APIC Guidelines Committee. APIC guideline for handwashing and hand antisepsis in health care settings. Am J Infect Control 1995;23:251–69) *were issued and provides an in-depth review of hand-hygiene practices of HCWs, levels of adherence of personnel to recommended handwashing practices, and factors adversely affecting adherence. New studies of the in vivo efficacy of alcohol-based hand rubs and the low incidence of dermatitis associated with their use are reviewed. Recent studies demonstrating the value of multidisciplinary hand-hygiene promotion programs and the potential role of alcohol-based hand rubs in improving hand-hygiene practices are summarized. Recommendations concerning related issues (e.g., the use of surgical hand antiseptics, hand lotions or creams, and wearing of artificial fingernails) are also included.*

Part I. Review of the Scientific Data Regarding Hand Hygiene

Historical Perspective

For generations, handwashing with soap and water has been considered a measure of personal hygiene (*1*). The concept of cleansing hands with an antiseptic agent probably emerged in the early 19th century. As early as 1822, a French pharmacist demonstrated that solutions containing chlorides of lime or soda could eradicate the foul odors associated with human corpses and that such solutions could be used as disinfectants and antiseptics (*2*). In a paper published in 1825, this pharmacist stated that physicians and other persons attending patients with contagious diseases would benefit from moistening their hands with a liquid chloride solution (*2*).

In 1846, Ignaz Semmelweis observed that women whose babies were delivered by students and physicians in the First Clinic at the General Hospital of Vienna consistently had a higher mortality rate than those whose babies were delivered by midwives in the Second Clinic (*3*). He noted that physicians who went directly from the autopsy suite to the obstetrics ward had a disagreeable odor on their hands despite washing their hands with soap and water upon entering the obstetrics clinic. He postulated that the puerperal fever that affected so many parturient women was caused by "cadaverous particles" transmitted from the autopsy suite to the obstetrics ward via the hands of students and physicians. Perhaps because of the known deodorizing effect of chlorine compounds, as of May 1847, he insisted that students and physicians clean their hands with a chlorine solution between each patient in the clinic. The maternal mortality rate in the First Clinic subsequently dropped dramatically and remained low for years. This intervention by Semmelweis represents the first evidence indicating that cleansing heavily contaminated hands with an antiseptic agent between patient contacts may reduce health-care–associated transmission of contagious diseases more effectively than handwashing with plain soap and water.

In 1843, Oliver Wendell Holmes concluded independently that puerperal fever was spread by the hands of health personnel (*1*). Although he described measures that could be taken to limit its spread, his recommendations had little impact on

The material in this report originated in the National Center for Infectious Diseases, James M. Hughes, M.D., Director; and the Division of Healthcare Quality Promotion, Steve Solomon, M.D., Acting Director.

obstetric practices at the time. However, as a result of the seminal studies by Semmelweis and Holmes, handwashing gradually became accepted as one of the most important measures for preventing transmission of pathogens in health-care facilities.

In 1961, the U. S. Public Health Service produced a training film that demonstrated handwashing techniques recommended for use by health-care workers (HCWs) (*4*). At the time, recommendations directed that personnel wash their hands with soap and water for 1–2 minutes before and after patient contact. Rinsing hands with an antiseptic agent was believed to be less effective than handwashing and was recommended only in emergencies or in areas where sinks were unavailable.

In 1975 and 1985, formal written guidelines on handwashing practices in hospitals were published by CDC (*5,6*). These guidelines recommended handwashing with nonantimicrobial soap between the majority of patient contacts and washing with antimicrobial soap before and after performing invasive procedures or caring for patients at high risk. Use of waterless antiseptic agents (e.g., alcohol-based solutions) was recommended only in situations where sinks were not available.

In 1988 and 1995, guidelines for handwashing and hand antisepsis were published by the Association for Professionals in Infection Control (APIC) (*7,8*). Recommended indications for handwashing were similar to those listed in the CDC guidelines. The 1995 APIC guideline included more detailed discussion of alcohol-based hand rubs and supported their use in more clinical settings than had been recommended in earlier guidelines. In 1995 and 1996, the Healthcare Infection Control Practices Advisory Committee (HICPAC) recommended that either antimicrobial soap or a waterless antiseptic agent be used for cleaning hands upon leaving the rooms of patients with multidrug-resistant pathogens (e.g., vancomycin-resistant enterococci [VRE] and methicillin-resistant *Staphylococcus aureus* [MRSA]) (*9,10*). These guidelines also provided recommendations for handwashing and hand antisepsis in other clinical settings, including routine patient care. Although the APIC and HICPAC guidelines have been adopted by the majority of hospitals, adherence of HCWs to recommended handwashing practices has remained low (*11,12*).

Recent developments in the field have stimulated a review of the scientific data regarding hand hygiene and the development of new guidelines designed to improve hand-hygiene practices in health-care facilities. This literature review and accompanying recommendations have been prepared by a Hand Hygiene Task Force, comprising representatives from HICPAC, the Society for Healthcare Epidemiology of America (SHEA), APIC, and the Infectious Diseases Society of America (IDSA).

Normal Bacterial Skin Flora

To understand the objectives of different approaches to hand cleansing, a knowledge of normal bacterial skin flora is essential. Normal human skin is colonized with bacteria; different areas of the body have varied total aerobic bacterial counts (e.g., 1×10^6 colony forming units (CFUs)/cm^2 on the scalp, 5×10^5 CFUs/cm^2 in the axilla, 4×10^4 CFUs/cm^2 on the abdomen, and 1×10^4 CFUs/cm^2 on the forearm) (*13*). Total bacterial counts on the hands of medical personnel have ranged from 3.9×10^4 to 4.6×10^6 (*14–17*). In 1938, bacteria recovered from the hands were divided into two categories: transient and resident (*14*). Transient flora, which colonize the superficial layers of the skin, are more amenable to removal by routine handwashing. They are often acquired by HCWs during direct contact with patients or contact with contaminated environmental surfaces within close proximity of the patient. Transient flora are the organisms most frequently associated with health-care–associated infections. Resident flora, which are attached to deeper layers of the skin, are more resistant to removal. In addition, resident flora (e.g., coagulase-negative staphylococci and diphtheroids) are less likely to be associated with such infections. The hands of HCWs may become persistently colonized with pathogenic flora (e.g., *S. aureus*), gram-negative bacilli, or yeast. Investigators have documented that, although the number of transient and resident flora varies considerably from person to person, it is often relatively constant for any specific person (*14,18*).

Physiology of Normal Skin

The primary function of the skin is to reduce water loss, provide protection against abrasive action and microorganisms, and act as a permeability barrier to the environment. The basic structure of skin includes, from outer- to innermost layer, the superficial region (i.e., the stratum corneum or horny layer, which is 10- to 20-µm thick), the viable epidermis (50- to 100-µm thick), the dermis (1- to 2-mm thick), and the hypodermis (1- to 2-mm thick). The barrier to percutaneous absorption lies within the stratum corneum, the thinnest and smallest compartment of the skin. The stratum corneum contains the corneocytes (or horny cells), which are flat, polyhedral-shaped nonnucleated cells, remnants of the terminally differentiated keratinocytes located in the viable epidermis. Corneocytes are composed primarily of insoluble bundled keratins surrounded by a cell envelope stabilized by cross-linked proteins and covalently bound lipid. Interconnecting the corneocytes of the stratum corneum are polar structures (e.g., corneodesmosomes), which contribute to stratum corneum cohesion.

The intercellular region of the stratum corneum is composed of lipid primarily generated from the exocytosis of lamellar bodies during the terminal differentiation of the keratinocytes. The intercellular lipid is required for a competent skin barrier and forms the only continuous domain. Directly under the stratum corneum is a stratified epidermis, which is composed primarily of 10–20 layers of keratinizing epithelial cells that are responsible for the synthesis of the stratum corneum. This layer also contains melanocytes involved in skin pigmentation; Langerhans cells, which are important for antigen presentation and immune responses; and Merkel cells, whose precise role in sensory reception has yet to be fully delineated. As keratinocytes undergo terminal differentiation, they begin to flatten out and assume the dimensions characteristic of the corneocytes (i.e., their diameter changes from 10–12 µm to 20–30 µm, and their volume increases by 10- to 20-fold). The viable epidermis does not contain a vascular network, and the keratinocytes obtain their nutrients from below by passive diffusion through the interstitial fluid.

The skin is a dynamic structure. Barrier function does not simply arise from the dying, degeneration, and compaction of the underlying epidermis. Rather, the processes of cornification and desquamation are intimately linked; synthesis of the stratum corneum occurs at the same rate as loss. Substantial evidence now confirms that the formation of the skin barrier is under homeostatic control, which is illustrated by the epidermal response to barrier perturbation by skin stripping or solvent extraction. Circumstantial evidence indicates that the rate of keratinocyte proliferation directly influences the integrity of the skin barrier. A general increase in the rate of proliferation results in a decrease in the time available for 1) uptake of nutrients (e.g., essential fatty acids), 2) protein and lipid synthesis, and 3) processing of the precursor molecules required for skin-barrier function. Whether chronic but quantitatively smaller increases in rate of epidermal proliferation also lead to changes in skin-barrier function remains unclear. Thus, the extent to which the decreased barrier function caused by irritants is caused by an increased epidermal proliferation also is unknown.

The current understanding of the formation of the stratum corneum has come from studies of the epidermal responses to perturbation of the skin barrier. Experimental manipulations that disrupt the skin barrier include 1) extraction of skin lipids with apolar solvents, 2) physical stripping of the stratum corneum using adhesive tape, and 3) chemically induced irritation. All of these experimental manipulations lead to a decreased skin barrier as determined by transepidermal water loss (TEWL). The most studied experimental system is the treatment of mouse skin with acetone. This experiment results in a marked and immediate increase in TEWL, and therefore a decrease in skin-barrier function. Acetone treatment selectively removes glycerolipids and sterols from the skin, which indicates that these lipids are necessary, though perhaps not sufficient in themselves, for barrier function. Detergents act like acetone on the intercellular lipid domain. The return to normal barrier function is biphasic: 50%–60% of barrier recovery typically occurs within 6 hours, but complete normalization of barrier function requires 5–6 days.

Definition of Terms

Alcohol-based hand rub. An alcohol-containing preparation designed for application to the hands for reducing the number of viable microorganisms on the hands. In the United States, such preparations usually contain 60%–95% ethanol or isopropanol.

Antimicrobial soap. Soap (i.e., detergent) containing an antiseptic agent.

Antiseptic agent. Antimicrobial substances that are applied to the skin to reduce the number of microbial flora. Examples include alcohols, chlorhexidine, chlorine, hexachlorophene, iodine, chloroxylenol (PCMX), quaternary ammonium compounds, and triclosan.

Antiseptic handwash. Washing hands with water and soap or other detergents containing an antiseptic agent.

Antiseptic hand rub. Applying an antiseptic hand-rub product to all surfaces of the hands to reduce the number of microorganisms present.

Cumulative effect. A progressive decrease in the numbers of microorganisms recovered after repeated applications of a test material.

Decontaminate hands. To Reduce bacterial counts on hands by performing antiseptic hand rub or antiseptic handwash.

Detergent. Detergents (i.e., surfactants) are compounds that possess a cleaning action. They are composed of both hydrophilic and lipophilic parts and can be divided into four groups: anionic, cationic, amphoteric, and nonionic detergents. Although products used for handwashing or antiseptic handwash in health-care settings represent various types of detergents, the term "soap" is used to refer to such detergents in this guideline.

Hand antisepsis. Refers to either antiseptic handwash or antiseptic hand rub.

Hand hygiene. A general term that applies to either handwashing, antiseptic handwash, antiseptic hand rub, or surgical hand antisepsis.

Handwashing. Washing hands with plain (i.e., non-antimicrobial) soap and water.

Persistent activity. Persistent activity is defined as the prolonged or extended antimicrobial activity that prevents or inhibits the proliferation or survival of microorganisms after application of the product. This activity may be demonstrated by sampling a site several minutes or hours after application and demonstrating bacterial antimicrobial effectiveness when compared with a baseline level. This property also has been referred to as "residual activity." Both substantive and nonsubstantive active ingredients can show a persistent effect if they substantially lower the number of bacteria during the wash period.

Plain soap. Plain soap refers to detergents that do not contain antimicrobial agents or contain low concentrations of antimicrobial agents that are effective solely as preservatives.

Substantivity. Substantivity is an attribute of certain active ingredients that adhere to the stratum corneum (i.e., remain on the skin after rinsing or drying) to provide an inhibitory effect on the growth of bacteria remaining on the skin.

Surgical hand antisepsis. Antiseptic handwash or antiseptic hand rub performed preoperatively by surgical personnel to eliminate transient and reduce resident hand flora. Antiseptic detergent preparations often have persistent antimicrobial activity.

Visibly soiled hands. Hands showing visible dirt or visibly contaminated with proteinaceous material, blood, or other body fluids (e.g., fecal material or urine).

Waterless antiseptic agent. An antiseptic agent that does not require use of exogenous water. After applying such an agent, the hands are rubbed together until the agent has dried.

Food and Drug Administration (FDA) product categories. The 1994 FDA Tentative Final Monograph for Health-Care Antiseptic Drug Products divided products into three categories and defined them as follows (*19*):

- *Patient preoperative skin preparation.* A fast-acting, broad-spectrum, and persistent antiseptic-containing preparation that substantially reduces the number of microorganisms on intact skin.
- *Antiseptic handwash or HCW handwash*. An antiseptic-containing preparation designed for frequent use; it reduces the number of microorganisms on intact skin to an initial baseline level after adequate washing, rinsing, and drying; it is broad-spectrum, fast-acting, and if possible, persistent.
- *Surgical hand scrub*. An antiseptic-containing preparation that substantially reduces the number of microorganisms on intact skin; it is broad-spectrum, fast-acting, and persistent.

Evidence of Transmission of Pathogens on Hands

Transmission of health-care–associated pathogens from one patient to another via the hands of HCWs requires the following sequence of events:

- Organisms present on the patient's skin, or that have been shed onto inanimate objects in close proximity to the patient, must be transferred to the hands of HCWs.
- These organisms must then be capable of surviving for at least several minutes on the hands of personnel.
- Next, handwashing or hand antisepsis by the worker must be inadequate or omitted entirely, or the agent used for hand hygiene must be inappropriate.
- Finally, the contaminated hands of the caregiver must come in direct contact with another patient, or with an inanimate object that will come into direct contact with the patient.

Health-care–associated pathogens can be recovered not only from infected or draining wounds, but also from frequently colonized areas of normal, intact patient skin (*20– 31*). The perineal or inguinal areas are usually most heavily colonized, but the axillae, trunk, and upper extremities (including the hands) also are frequently colonized (*23,25,26,28,30–32*). The number of organisms (e.g., *S. aureus*, *Proteus mirabilis*, *Klebsiella* spp., and *Acinetobacter* spp.) present on intact areas of the skin of certain patients can vary from 100 to $10^6/cm^2$ (*25,29,31,33*). Persons with diabetes, patients undergoing dialysis for chronic renal failure, and those with chronic dermatitis are likely to have areas of intact skin that are colonized with *S. aureus* (*34–41*). Because approximately 10^6 skin squames containing viable microorganisms are shed daily from normal skin (*42*), patient gowns, bed linen, bedside furniture, and other objects in the patient's immediate environment can easily become contaminated with patient flora (*30,43–46*). Such contamination is particularly likely to be caused by staphylococci or enterococci, which are resistant to dessication.

Data are limited regarding the types of patient-care activities that result in transmission of patient flora to the hands of personnel (*26,45–51*). In the past, attempts have been made to stratify patient-care activities into those most likely to cause hand contamination (*52*), but such stratification schemes were never validated by quantifying the level of bacterial contamination that occurred. Nurses can contaminate their hands with 100–1,000 CFUs of *Klebsiella* spp. during "clean" activities (e.g., lifting a patient; taking a patient's pulse, blood pressure, or oral temperature; or touching a patient's hand, shoulder, or groin) (*48*). Similarly, in another study, hands were cultured of nurses who touched the groins of patients heavily colonized with *P. mirabilis* (*25*); 10–600 CFUs/mL of this

organism were recovered from glove juice samples from the nurses' hands. Recently, other researchers studied contamination of HCWs' hands during activities that involved direct patient-contact wound care, intravascular catheter care, respiratory-tract care, and the handling of patient secretions (*51*). Agar fingertip impression plates were used to culture bacteria; the number of bacteria recovered from fingertips ranged from 0 to 300 CFUs. Data from this study indicated that direct patient contact and respiratory-tract care were most likely to contaminate the fingers of caregivers. Gram-negative bacilli accounted for 15% of isolates and *S. aureus* for 11%. Duration of patient-care activity was strongly associated with the intensity of bacterial contamination of HCWs' hands.

HCWs can contaminate their hands with gram-negative bacilli, *S. aureus*, enterococci, or *Clostridium difficile* by performing "clean procedures" or touching intact areas of the skin of hospitalized patients (*26,45,46,53*). Furthermore, personnel caring for infants with respiratory syncytial virus (RSV) infections have acquired RSV by performing certain activities (e.g., feeding infants, changing diapers, and playing with infants) (*49*). Personnel who had contact only with surfaces contaminated with the infants' secretions also acquired RSV by contaminating their hands with RSV and inoculating their oral or conjunctival mucosa. Other studies also have documented that HCWs may contaminate their hands (or gloves) merely by touching inanimate objects in patient rooms (*46,53–56*). None of the studies concerning hand contamination of hospital personnel were designed to determine if the contamination resulted in transmission of pathogens to susceptible patients.

Other studies have documented contamination of HCWs' hands with potential health-care–associated pathogens, but did not relate their findings to the specific type of preceding patient contact (*15,17,57–62*). For example, before glove use was common among HCWs, 15% of nurses working in an isolation unit carried a median of 1 x 10^4 CFUs of *S. aureus* on their hands (*61*). Of nurses working in a general hospital, 29% had *S. aureus* on their hands (median count: 3,800 CFUs), whereas 78% of those working in a hospital for dermatology patients had the organism on their hands (median count: 14.3 x 10^6 CFUs). Similarly, 17%–30% of nurses carried gram-negative bacilli on their hands (median counts: 3,400–38,000 CFUs). One study found that *S. aureus* could be recovered from the hands of 21% of intensive-care–unit personnel and that 21% of physician and 5% of nurse carriers had >1,000 CFUs of the organism on their hands (*59*). Another study found lower levels of colonization on the hands of personnel working in a neurosurgery unit, with an average of 3 CFUs of *S. aureus* and 11 CFUs of gram-negative bacilli (*16*). Serial cultures revealed that 100% of HCWs carried gram-negative bacilli at least once, and 64% carried *S. aureus* at least once.

Models of Hand Transmission

Several investigators have studied transmission of infectious agents by using different experimental models. In one study, nurses were asked to touch the groins of patients heavily colonized with gram-negative bacilli for 15 seconds — as though they were taking a femoral pulse (*25*). Nurses then cleaned their hands by washing with plain soap and water or by using an alcohol hand rinse. After cleaning their hands, they touched a piece of urinary catheter material with their fingers, and the catheter segment was cultured. The study revealed that touching intact areas of moist skin of the patient transferred enough organisms to the nurses' hands to result in subsequent transmission to catheter material, despite handwashing with plain soap and water.

The transmission of organisms from artificially contaminated "donor" fabrics to clean "recipient" fabrics via hand contact also has been studied. Results indicated that the number of organisms transmitted was greater if the donor fabric or the hands were wet upon contact (*63*). Overall, only 0.06% of the organisms obtained from the contaminated donor fabric were transferred to recipient fabric via hand contact. *Staphylococcus saprophyticus, Pseudomonas aeruginosa,* and *Serratia* spp. were also transferred in greater numbers than was *Escherichia coli* from contaminated fabric to clean fabric after hand contact (*64*). Organisms are transferred to various types of surfaces in much larger numbers (i.e., >10^4) from wet hands than from hands that are thoroughly dried (*65*).

Relation of Hand Hygiene and Acquisition of Health-Care–Associated Pathogens

Hand antisepsis reduces the incidence of health-care–associated infections (*66,67*). An intervention trial using historical controls demonstrated in 1847 that the mortality rate among mothers who delivered in the First Obstetrics Clinic at the General Hospital of Vienna was substantially lower when hospital staff cleaned their hands with an antiseptic agent than when they washed their hands with plain soap and water (*3*).

In the 1960s, a prospective, controlled trial sponsored by the National Institutes of Health and the Office of the Surgeon General demonstrated that infants cared for by nurses who did not wash their hands after handling an index infant colonized with *S. aureus* acquired the organism more often and more rapidly than did infants cared for by nurses who used hexachlorophene to clean their hands between infant

contacts *(68)*. This trial provided evidence that, when compared with no handwashing, washing hands with an antiseptic agent between patient contacts reduces transmission of health-care–associated pathogens.

Trials have studied the effects of handwashing with plain soap and water versus some form of hand antisepsis on health-care–associated infection rates (*69,70*). Health-care–associated infection rates were lower when antiseptic handwashing was performed by personnel (*69*). In another study, antiseptic handwashing was associated with lower health-care–associated infection rates in certain intensive-care units, but not in others (70).

Health-care–associated infection rates were lower after antiseptic handwashing using a chlorhexidine-containing detergent compared with handwashing with plain soap or use of an alcohol-based hand rinse (*71*). However, because only a minimal amount of the alcohol rinse was used during periods when the combination regimen also was in use and because adherence to policies was higher when chlorhexidine was available, determining which factor (i.e., the hand-hygiene regimen or differences in adherence) accounted for the lower infection rates was difficult. Investigators have determined also that health-care–associated acquisition of MRSA was reduced when the antimicrobial soap used for hygienic handwashing was changed (*72,73*).

Increased handwashing frequency among hospital staff has been associated with decreased transmission of *Klebsiella* spp. among patients (*48*); these studies, however, did not quantitate the level of handwashing among personnel. In a recent study, the acquisition of various health-care–associated pathogens was reduced when hand antisepsis was performed more frequently by hospital personnel (*74*); both this study and another (*75*) documented that the prevalence of health-care–associated infections decreased as adherence to recommended hand-hygiene measures improved.

Outbreak investigations have indicated an association between infections and understaffing or overcrowding; the association was consistently linked with poor adherence to hand hygiene. During an outbreak investigation of risk factors for central venous catheter-associated bloodstream infections (*76*), after adjustment for confounding factors, the patient-to-nurse ratio remained an independent risk factor for bloodstream infection, indicating that nursing staff reduction below a critical threshold may have contributed to this outbreak by jeopardizing adequate catheter care. The understaffing of nurses can facilitate the spread of MRSA in intensive-care settings (*77*) through relaxed attention to basic control measures (e.g., hand hygiene). In an outbreak of *Enterobacter cloacae* in a neonatal intensive-care unit (*78*), the daily number of hospitalized children was above the maximum capacity of the unit, resulting in an available space per child below current recommendations. In parallel, the number of staff members on duty was substantially less than the number necessitated by the workload, which also resulted in relaxed attention to basic infection-control measures. Adherence to hand-hygiene practices before device contact was only 25% during the workload peak, but increased to 70% after the end of the understaffing and overcrowding period. Surveillance documented that being hospitalized during this period was associated with a fourfold increased risk of acquiring a health-care–associated infection. This study not only demonstrates the association between workload and infections, but it also highlights the intermediate cause of antimicrobial spread: poor adherence to hand-hygiene policies.

Methods Used To Evaluate the Efficacy of Hand-Hygiene Products

Current Methods

Investigators use different methods to study the in vivo efficacy of handwashing, antiseptic handwash, and surgical hand antisepsis protocols. Differences among the various studies include 1) whether hands are purposely contaminated with bacteria before use of test agents, 2) the method used to contaminate fingers or hands, 3) the volume of hand-hygiene product applied to the hands, 4) the time the product is in contact with the skin, 5) the method used to recover bacteria from the skin after the test solution has been used, and 6) the method of expressing the efficacy of the product (i.e., either percent reduction in bacteria recovered from the skin or log reduction of bacteria released from the skin). Despite these differences, the majority of studies can be placed into one of two major categories: studies focusing on products to remove transient flora and studies involving products that are used to remove resident flora from the hands. The majority of studies of products for removing transient flora from the hands of HCWs involve artificial contamination of the volunteer's skin with a defined inoculum of a test organism before the volunteer uses a plain soap, an antimicrobial soap, or a waterless antiseptic agent. In contrast, products tested for the preoperative cleansing of surgeons' hands (which must comply with surgical hand-antisepsis protocols) are tested for their ability to remove resident flora from without artificially contaminating the volunteers' hands.

In the United States, antiseptic handwash products intended for use by HCWs are regulated by FDA's Division of Over-the-Counter Drug Products (OTC). Requirements for in vitro and in vivo testing of HCW handwash products and surgical

hand scrubs are outlined in the FDA Tentative Final Monograph for Healthcare Antiseptic Drug Products (TFM) (*19*). Products intended for use as HCW handwashes are evaluated by using a standardized method (*19*). Tests are performed in accordance with use directions for the test material. Before baseline bacterial sampling and before each wash with the test material, 5 mL of a standardized suspension of *Serratia marcescens* are applied to the hands and then rubbed over the surfaces of the hands. A specified volume of the test material is dispensed into the hands and is spread over the hands and lower one third of the forearms. A small amount of tap water is added to the hands, and hands are completely lathered for a specified time, covering all surfaces of the hands and the lower third of the forearms. Volunteers then rinse hands and forearms under 40°C tap water for 30 seconds. Ten washes with the test formulation are required. After the first, third, seventh, and tenth washes, rubber gloves or polyethylene bags used for sampling are placed on the right and left hands, and 75 mL of sampling solution is added to each glove; gloves are secured above the wrist. All surfaces of the hand are massaged for 1 minute, and samples are obtained aseptically for quantitative culture. No neutralizer of the antimicrobial is routinely added to the sampling solution, but if dilution of the antimicrobial in the sampling fluid does not result in demonstrable neutralization, a neutralizer specific for the test formulation is added to the sampling solution. For waterless formulations, a similar procedure is used. TFM criteria for efficacy are as follows: a 2-$\log_{10}$ reduction of the indicator organism on each hand within 5 minutes after the first use, and a 3-$\log_{10}$ reduction of the indicator organism on each hand within 5 minutes after the tenth use (*19*).

Products intended for use as surgical hand scrubs have been evaluated also by using a standardized method (*19*). Volunteers clean under fingernails with a nail stick and clip their fingernails. All jewelry is removed from hands and arms. Hands and two thirds of forearms are rinsed with tap water (38°C–42°C) for 30 seconds, and then they are washed with a nonantimicrobial soap for 30 seconds and are rinsed for 30 seconds under tap water. Baseline microbial hand counts can then be determined. Next, a surgical scrub is performed with the test formulation using directions provided by the manufacturer. If no instructions are provided with the formulation, two 5-minute scrubs of hands and forearms followed by rinsing are performed. Reduction from baseline microbial hand counts is determined in a series of 11 scrubs conducted during 5 days. Hands are sampled at 1 minute, 3 hours, and 6 hours after the first scrubs on day 1, day 2, and day 5. After washing, volunteers wear rubber gloves; 75 mL of sampling solution are then added to one glove, and all surfaces of the hands are massaged for 1 minute. Samples are then taken aseptically and cultured quantitatively. The other glove remains on the other hand for 6 hours and is sampled in the same manner. TFM requires that formulations reduce the number of bacteria 1 $\log_{10}$ on each hand within 1 minute of product application and that the bacterial cell count on each hand does not subsequently exceed baseline within 6 hours on day 1; the formulation must produce a 2-$\log_{10}$ reduction in microbial flora on each hand within 1 minute of product application by the end of the second day of enumeration and a 3-$\log_{10}$ reduction of microbial flora on each hand within 1 minute of product use by the end of the fifth day when compared with the established baseline (*19*).

The method most widely used in Europe to evaluate the efficacy of hand-hygiene agents is European Standard 1500–1997 (EN 1500—Chemical disinfectants and antiseptics. Hygienic hand-rub test method and requirements) (*79*). This method requires 12–15 test volunteers and an 18- to 24-hour growth of broth culture of *E. coli* K12. Hands are washed with a soft soap, dried, and then immersed halfway to the metacarpals in the broth culture for 5 seconds. Hands are removed from the broth culture, excess fluid is drained off, and hands are dried in the air for 3 minutes. Bacterial recovery for the initial value is obtained by kneading the fingertips of each hand separately for 60 seconds in 10 mL of tryptic soy broth (TSB) without neutralizers. The hands are removed from the broth and disinfected with 3 mL of the hand-rub agent for 30 seconds in a set design. The same operation is repeated with total disinfection time not exceeding 60 seconds. Both hands are rinsed in running water for 5 seconds and water is drained off. Fingertips of each hand are kneaded separately in 10 mL of TSB with added neutralizers. These broths are used to obtain the final value. Log_{10} dilutions of recovery medium are prepared and plated out. Within 3 hours, the same volunteers are tested with the reference disinfectant (60% 2-propanol [isopropanol]) and the test product. Colony counts are performed after 24 and 48 hours of incubation at 36°C. The average colony count of both left and right hand is used for evaluation. The log-reduction factor is calculated and compared with the initial and final values. The reduction factor of the test product should be superior or the same as the reference alcohol-based rub for acceptance. If a difference exists, then the results are analyzed statistically using the Wilcoxon test. Products that have log reductions substantially less than that observed with the reference alcohol-based hand rub (i.e., approximately 4 $\log_{10}$ reduction) are classified as not meeting the standard.

Because of different standards for efficacy, criteria cited in FDA TFM and the European EN 1500 document for establishing alcohol-based hand rubs vary (*1,19,79*). Alcohol-based

hand rubs that meet TFM criteria for efficacy may not necessarily meet the EN 1500 criteria for efficacy (*80*). In addition, scientific studies have not established the extent to which counts of bacteria or other microorganisms on the hands need to be reduced to minimize transmission of pathogens in health-care facilities (*1,8*); whether bacterial counts on the hands must be reduced by 1 $\log_{10}$ (90% reduction), 2 $\log_{10}$ (99%), 3 $\log_{10}$ (99.9%), or 4 $\log_{10}$ (99.99%) is unknown. Several other methods also have been used to measure the efficacy of antiseptic agents against various viral pathogens (*81–83*).

Shortcomings of Traditional Methodologies

Accepted methods of evaluating hand-hygiene products intended for use by HCWs require that test volunteers wash their hands with a plain or antimicrobial soap for 30 seconds or 1 minute, despite the observation in the majority of studies that the average duration of handwashing by hospital personnel is <15 seconds (*52,84–89*). A limited number of investigators have used 15-second handwashing or hygienic hand-wash protocols (*90–94*). Therefore, almost no data exist regarding the efficacy of plain or antimicrobial soaps under conditions in which they are actually used by HCWs. Similarly, certain accepted methods for evaluating waterless antiseptic agents for use as antiseptic hand rubs require that 3 mL of alcohol be rubbed into the hands for 30 seconds, followed by a repeat application for the same duration. This type of protocol also does not reflect actual usage patterns among HCWs. Furthermore, volunteers used in evaluations of products are usually surrogates for HCWs, and their hand flora may not reflect flora found on the hands of personnel working in health-care settings. Further studies should be conducted among practicing HCWs using standardized protocols to obtain more realistic views of microbial colonization and risk of bacterial transfer and cross-transmission (*51*).

Review of Preparations Used for Hand Hygiene

Plain (Non-Antimicrobial) Soap

Soaps are detergent-based products that contain esterified fatty acids and sodium or potassium hydroxide. They are available in various forms including bar soap, tissue, leaflet, and liquid preparations. Their cleaning activity can be attributed to their detergent properties, which result in removal of dirt, soil, and various organic substances from the hands. Plain soaps have minimal, if any, antimicrobial activity. However, handwashing with plain soap can remove loosely adherent transient flora. For example, handwashing with plain soap and water for 15 seconds reduces bacterial counts on the skin by 0.6–1.1 $\log_{10}$, whereas washing for 30 seconds reduces counts by 1.8–2.8 $\log_{10}$ (*1*). However, in several studies, handwashing with plain soap failed to remove pathogens from the hands of hospital personnel (*25,45*). Handwashing with plain soap can result in paradoxical increases in bacterial counts on the skin (*92,95–97*). Non-antimicrobial soaps may be associated with considerable skin irritation and dryness (*92,96,98*), although adding emollients to soap preparations may reduce their propensity to cause irritation. Occasionally, plain soaps have become contaminated, which may lead to colonization of hands of personnel with gram-negative bacilli (*99*).

Alcohols

The majority of alcohol-based hand antiseptics contain either isopropanol, ethanol, n-propanol, or a combination of two of these products. Although n-propanol has been used in alcohol-based hand rubs in parts of Europe for many years, it is not listed in TFM as an approved active agent for HCW handwashes or surgical hand-scrub preparations in the United States. The majority of studies of alcohols have evaluated individual alcohols in varying concentrations. Other studies have focused on combinations of two alcohols or alcohol solutions containing limited amounts of hexachlorophene, quaternary ammonium compounds, povidone-iodine, triclosan, or chlorhexidine gluconate (*61,93,100–119*).

The antimicrobial activity of alcohols can be attributed to their ability to denature proteins (*120*). Alcohol solutions containing 60%–95% alcohol are most effective, and higher concentrations are less potent (*120–122*) because proteins are not denatured easily in the absence of water (*120*). The alcohol content of solutions may be expressed as percent by weight (w/w), which is not affected by temperature or other variables, or as percent by volume (vol/vol), which can be affected by temperature, specific gravity, and reaction concentration (*123*). For example, 70% alcohol by weight is equivalent to 76.8% by volume if prepared at 15°C, or 80.5% if prepared at 25°C (*123*). Alcohol concentrations in antiseptic hand rubs are often expressed as percent by volume (*19*).

Alcohols have excellent in vitro germicidal activity against gram-positive and gram-negative vegetative bacteria, including multidrug-resistant pathogens (e.g., MRSA and VRE), *Mycobacterium tuberculosis*, and various fungi (*120–122,124–129*). Certain enveloped (lipophilic) viruses (e.g., herpes simplex virus, human immunodeficiency virus [HIV], influenza virus, respiratory syncytial virus, and vaccinia virus) are susceptible to alcohols when tested in vitro (*120,130,131*) (Table 1). Hepatitis B virus is an enveloped virus that is somewhat less susceptible but is killed by 60%–70% alcohol; hepatitis C virus also is likely killed by this percentage of alcohol (*132*). In a porcine tissue carrier model used to study antiseptic activity, 70% ethanol and 70% isopropanol were found to

Note: HIV = human immunodeficiency virus, EA = ethanol, LR = Log_{10} reduction, IPA = isopropanol, CHG = chlorhexidine gluconate, HBV = hepatitis B virus, RSV = respiratory syncitial virus, HSV = herpes simplex virus, HAV = hepatitis A virus, and PCMX = chloroxylenol.

reduce titers of an enveloped bacteriophage more effectively than an antimicrobial soap containing 4% chlorhexidine gluconate (*133*). Despite its effectiveness against these organisms, alcohols have very poor activity against bacterial spores, protozoan oocysts, and certain nonenveloped (nonlipophilic) viruses.

Numerous studies have documented the *in vivo* antimicrobial activity of alcohols. Alcohols effectively reduce bacterial counts on the hands (*14,121,125,134*). Typically, log reductions of the release of test bacteria from artificially contaminated hands average 3.5 log_{10} after a 30-second application and 4.0–5.0 log_{10} after a 1-minute application (*1*). In 1994, the FDA TFM classified ethanol 60%–95% as a Category I agent (i.e., generally safe and effective for use in antiseptic handwash or HCW hand-wash products) (*19*). Although TFM placed isopropanol 70%–91.3% in category IIIE (i.e., insufficient data to classify as effective), 60% isopropanol has subsequently been adopted in Europe as the reference standard against which alcohol-based hand-rub products are compared (*79*). Alcohols are rapidly germicidal when applied to the skin, but they have no appreciable persistent (i.e., residual) activity. However, regrowth of bacteria on the skin occurs slowly after use of alcohol-based hand antiseptics, presumably because of the sublethal effect alcohols have on some of the skin bacteria (*135,136*). Addition of chlorhexidine, quaternary ammonium compounds, octenidine, or triclosan to alcohol-based solutions can result in persistent activity (*1*).

Alcohols, when used in concentrations present in alcohol-based hand rubs, also have in vivo activity against several nonenveloped viruses (Table 2). For example, 70% isopropanol and 70% ethanol are more effective than medicated soap or nonmedicated soap in reducing rotavirus titers on fingerpads (*137,138*). A more recent study using the same test methods evaluated a commercially available product containing 60%

TABLE 2. Virucidal activity of antiseptic agents against nonenveloped viruses

			80% EA	LR = 0.4

Note: HIV = human immunodeficiency virus, EA = ethanol, LR = Log_{10} reduction, IPA = isopropanol, CHG = chlorhexidine gluconate, HBV = hepatitis B virus, RSV = respiratory syncitial virus, HSV = herpes simplex virus, and HAV = hepatitis A virus.

ethanol and found that the product reduced the infectivity titers of three nonenveloped viruses (i.e., rotavirus, adenovirus, and rhinovirus) by >3 logs (*81*). Other nonenveloped viruses such as hepatitis A and enteroviruses (e.g., poliovirus) may require 70%–80% alcohol to be reliably inactivated (*82,139*). However, both 70% ethanol and a 62% ethanol foam product with emollients reduced hepatitis A virus titers on whole hands or fingertips more than nonmedicated soap; both were equally as effective as antimicrobial soap containing 4% chlorhexidine gluconate in reducing reduced viral counts on hands (*140*). In the same study, both 70% ethanol and the 62% ethanol foam product demonstrated greater virucidal activity against poliovirus than either non-antimicrobial soap or a 4% chlorhexidine gluconate-containing soap (*140*). However, depending on the alcohol concentration, the amount of time that hands are exposed to the alcohol, and viral variant, alcohol may not be effective against hepatitis A and other nonlipophilic viruses. The inactivation of nonenveloped viruses is influenced by temperature, disinfectant-virus volume ratio, and protein load (*141*). Ethanol has greater activity against viruses than isopropanol. Further in vitro and in vivo studies of both alcohol-based formulations and antimicrobial soaps are warranted to establish the minimal level of virucidal activity that is required to interrupt direct contact transmission of viruses in health-care settings.

Alcohols are not appropriate for use when hands are visibly dirty or contaminated with proteinaceous materials. However, when relatively small amounts of proteinaceous material (e.g., blood) are present, ethanol and isopropanol may reduce viable bacterial counts on hands more than plain soap or antimicrobial soap (*142*).

Alcohol can prevent the transfer of health-care–associated pathogens (*25,63,64*). In one study, gram-negative bacilli were transferred from a colonized patient's skin to a piece of catheter material via the hands of nurses in only 17% of experiments after antiseptic hand rub with an alcohol-based hand rinse (*25*). In contrast, transfer of the organisms occurred in 92% of experiments after handwashing with plain soap and water. This experimental model indicates that when the hands of HCWs are heavily contaminated, an antiseptic hand rub using an alcohol-based rinse can prevent pathogen transmission more effectively than can handwashing with plain soap and water.

Alcohol-based products are more effective for standard handwashing or hand antisepsis by HCWs than soap or antimicrobial soaps (Table 3) (*25,53,61,93,106–112,119,143–152*). In all but two of the trials that compared alcohol-based solutions with antimicrobial soaps or detergents, alcohol reduced bacterial counts on hands more than washing hands with soaps or detergents containing hexachlorophene, povidone-iodine, 4% chlorhexidine, or triclosan. In studies examining antimicrobial-resistant organisms, alcohol-based products reduced the number of multidrug-resistant pathogens recovered from the hands of HCWs more effectively than did handwashing with soap and water (*153–155*).

Alcohols are effective for preoperative cleaning of the hands of surgical personnel (*1,101,104,113–119,135,143,147,156–159*) (Tables 4 and 5). In multiple studies, bacterial counts on the hands were determined immediately after using the product and again 1–3 hours later; the delayed testing was performed to determine if regrowth of bacteria on the hands is inhibited during operative procedures. Alcohol-based solutions were more effective than washing hands with plain soap in all studies, and they reduced bacterial counts on the hands more than antimicrobial soaps or detergents in the majority of experiments (*101,104,113–119,135,143,147,157–159*). In addition, the majority of alcohol-based preparations were more effective than povidone-iodine or chlorhexidine.

The efficacy of alcohol-based hand-hygiene products is affected by several factors, including the type of alcohol used, concentration of alcohol, contact time, volume of alcohol used, and whether the hands are wet when the alcohol is applied. Applying small volumes (i.e., 0.2–0.5 mL) of alcohol to the hands is not more effective than washing hands with plain soap and water (*63,64*). One study documented that 1 mL of alcohol was substantially less effective than 3 mL (*91*). The ideal volume of product to apply to the hands is not known

TABLE 3. Studies comparing the relative efficacy (based on log_{10} reductions achieved) of plain soap or antimicrobial soaps versus alcohol-based antiseptics in reducing counts of viable bacteria on hands

¶ After 4 hours.

and may vary for different formulations. However, if hands feel dry after rubbing hands together for 10–15 seconds, an insufficient volume of product likely was applied. Because alcohol-impregnated towelettes contain a limited amount of alcohol, their effectiveness is comparable to that of soap and water (*63,160,161*).

Alcohol-based hand rubs intended for use in hospitals are available as low viscosity rinses, gels, and foams. Limited data are available regarding the relative efficacy of various formulations. One field trial demonstrated that an ethanol gel was slightly more effective than a comparable ethanol solution at reducing bacterial counts on the hands of HCWs (*162*). However, a more recent study indicated that rinses reduced bacterial counts on the hands more than the gels tested (*80*). Further studies are warranted to determine the relative efficacy of alcohol-based rinses and gels in reducing transmission of health-care–associated pathogens.

Frequent use of alcohol-based formulations for hand antisepsis can cause drying of the skin unless emollients, humectants, or other skin-conditioning agents are added to the formulations. The drying effect of alcohol can be reduced or eliminated by adding 1%–3% glycerol or other skin-conditioning agents (*90,93,100,101,106,135,143,163,164*). Moreover, in several recent prospective trials, alcohol-based rinses or gels containing emollients caused substantially less skin irritation and dryness than the soaps or antimicrobial detergents tested (*96,98,165,166*). These studies, which were conducted in clinical settings, used various subjective and objective methods for assessing skin irritation and dryness. Further studies are warranted to establish whether products with different formulations yield similar results.

Even well-tolerated alcohol hand rubs containing emollients may cause a transient stinging sensation at the site of any broken skin (e.g., cuts and abrasions). Alcohol-based hand-rub preparations with strong fragrances may be poorly tolerated by HCWs with respiratory allergies. Allergic contact dermatitis or contact urticaria syndrome caused by hypersensitivity to alcohol or to various additives present in certain alcohol hand rubs occurs only rarely (*167,168*).

Alcohols are flammable. Flash points of alcohol-based hand rubs range from 21°C to 24°C, depending on the type and concentration of alcohol present (*169*). As a result, alcohol-based hand rubs should be stored away from high temperatures or flames in accordance with National Fire Protection Agency recommendations. In Europe, where alcohol-based hand rubs have been used extensively for years, the incidence of fires associated with such products has been low (*169*). One recent U.S. report described a flash fire that occurred as a result of an unusual series of events, which included an HCW applying an alcohol gel to her hands, immediately removing a polyester isolation gown, and then touching a metal door before the alcohol had evaporated (*170*). Removing the polyester gown created a substantial amount of static electricity that generated an audible static spark when the HCW touched the metal door, igniting the unevaporated alcohol on her hands (*170*). This incident emphasizes the need to rub hands together after application of alcohol-based products until all the alcohol has evaporated.

Because alcohols are volatile, containers should be designed to minimize evaporation. Contamination of alcohol-based solutions has seldom been reported. One report documented a cluster of pseudoinfections caused by contamination of ethyl alcohol by *Bacillus cereus* spores (*171*).

Chlorhexidine

Chlorhexidine gluconate, a cationic bisbiguanide, was developed in England in the early 1950s and was introduced into the United States in the 1970s (*8,172*). Chlorhexidine base is only minimally soluble in water, but the digluconate form is water-soluble. The antimicrobial activity of chlorhexidine is likely attributable to attachment to, and subsequent disruption of, cytoplasmic membranes, resulting in precipitation of cellular contents (*1,8*). Chlorhexidine's immediate antimicrobial activity occurs more slowly than that of alcohols. Chlorhexidine has good activity against gram-positive bacteria, somewhat less activity against gram-negative bacteria and fungi, and only minimal activity against tubercle bacilli (*1,8,172*). Chlorhexidine is not sporicidal (*1,172*). It has in vitro activity against enveloped viruses (e.g., herpes simplex virus, HIV, cytomegalovirus, influenza, and RSV) but substantially less activity against nonenveloped viruses (e.g., rotavirus, adenovirus, and enteroviruses) (*130,131,173*). The antimicrobial activity of chlorhexidine is only minimally affected by the presence of organic material, including blood. Because chlorhexidine is a cationic molecule, its activity can be reduced by natural soaps, various inorganic anions, nonionic surfactants, and hand creams containing anionic emulsifying agents (*8,172,174*). Chlorhexidine gluconate has been incorporated into a number of hand-hygiene preparations. Aqueous or detergent formulations containing 0.5% or 0.75% chlorhexidine are more effective than plain soap, but they are less effective than antiseptic detergent preparations containing 4% chlorhexidine gluconate (*135,175*). Preparations with 2% chlorhexidine gluconate are slightly less effective than those containing 4% chlorhexidine (*176*).

Chlorhexidine has substantial residual activity (*106,114–116,118,135,146,175*). Addition of low concentrations (0.5%–1.0%) of chlorhexidine to alcohol-based preparations results in greater residual activity than alcohol alone (*116,135*). When used as recommended, chlorhexidine has a good safety

record (*172*). Minimal, if any, absorption of the compound occurs through the skin. Care must be taken to avoid contact with the eyes when using preparations with ≥1% chlorhexidine, because the agent can cause conjunctivitis and severe corneal damage. Ototoxicity precludes its use in surgery involving the inner or middle ear. Direct contact with brain tissue and the meninges should be avoided. The frequency of skin irritation is concentration-dependent, with products containing 4% most likely to cause dermatitis when used frequently for antiseptic handwashing (*177*); allergic reactions to chlorhexidine gluconate are uncommon (*118,172*). Occasional outbreaks of nosocomial infections have been traced to contaminated solutions of chlorhexidine (*178–181*).

Chloroxylenol

Chloroxylenol, also known as parachlorometaxylenol (PCMX), is a halogen-substituted phenolic compound that has been used as a preservative in cosmetics and other products and as an active agent in antimicrobial soaps. It was developed in Europe in the late 1920s and has been used in the United States since the 1950s (*182*).

The antimicrobial activity of PCMX likely is attributable to inactivation of bacterial enzymes and alteration of cell walls (*1*). It has good in vitro activity against gram-positive organisms and fair activity against gram-negative bacteria, mycobacteria, and certain viruses (*1,7,182*). PCMX is less active against *P. aeruginosa*, but addition of ethylenediaminetetraacetic acid (EDTA) increases its activity against *Pseudomonas* spp. and other pathogens.

A limited number of articles focusing on the efficacy of PCMX-containing preparations intended for use by HCWs have been published in the last 25 years, and the results of studies have sometimes been contradictory. For example, in studies in which antiseptics were applied to abdominal skin, PCMX had the weakest immediate and residual activity of any of the agents studied (*183*). However, when 30-second handwashes were performed using 0.6% PCMX, 2% chlorhexidine gluconate, or 0.3% triclosan, the immediate effect of PCMX was similar to that of the other agents. When used 18 times per day for 5 consecutive days, PCMX had less cumulative activity than did chlorhexidine gluconate (*184*). When PCMX was used as a surgical scrub, one report indicated that 3% PCMX had immediate and residual activity comparable to 4% chlorhexidine gluconate (*185*), whereas two other studies demonstrated that the immediate and residual activity of PCMX was inferior to both chlorhexidine gluconate and povidone-iodine (*176,186*). The disparity between published studies may be associated with the various concentrations of PCMX included in the preparations evaluated and with other aspects of the formulations tested, including the presence or absence of EDTA (*7,182*). PCMX is not as rapidly active as chlorhexidine gluconate or iodophors, and its residual activity is less pronounced than that observed with chlorhexidine gluconate (*7,182*). In 1994, FDA TFM tentatively classified PCMX as a Category IIISE active agent (i.e., insufficient data are available to classify this agent as safe and effective) (*19*). Further evaluation of this agent by the FDA is ongoing.

The antimicrobial activity of PCMX is minimally affected by the presence of organic matter, but it is neutralized by nonionic surfactants. PCMX, which is absorbed through the skin (*7,182*), is usually well-tolerated, and allergic reactions associated with its use are uncommon. PCMX is available in concentrations of 0.3%–3.75%. In-use contamination of a PCMX-containing preparation has been reported (*187*).

Hexachlorophene

Hexachlorophene is a bisphenol composed of two phenolic groups and three chlorine moieties. In the 1950s and early 1960s, emulsions containing 3% hexachlorophene were widely used for hygienic handwashing, as surgical scrubs, and for routine bathing of infants in hospital nurseries. The antimicrobial activity of hexachlorophene results from its ability to inactivate essential enzyme systems in microorganisms. Hexachlorophene is bacteriostatic, with good activity against *S. aureus* and relatively weak activity against gram-negative bacteria, fungi, and mycobacteria (*7*).

Studies of hexachlorophene as a hygienic handwash and surgical scrub demonstrated only modest efficacy after a single handwash (*53,143,188*). Hexachlorophene has residual activity for several hours after use and gradually reduces bacterial counts on hands after multiple uses (i.e., it has a cumulative effect) (*1,101,188,189*). With repeated use of 3% hexachlorophene preparations, the drug is absorbed through the skin. Infants bathed with hexachlorophene and personnel regularly using a 3% hexachlorophene preparation for handwashing have blood levels of 0.1–0.6 ppm hexachlorophene (*190*). In the early 1970s, certain infants bathed with hexachlorophene developed neurotoxicity (vacuolar degeneration) (*191*). As a result, in 1972, the FDA warned that hexachlorophene should no longer be used routinely for bathing infants. However, after routine use of hexachlorophene for bathing infants in nurseries was discontinued, investigators noted that the incidence of health-care–associated *S. aureus* infections in hospital nurseries increased substantially (*192,193*). In several instances, the frequency of infections decreased when hexachlorophene bathing of infants was reinstituted. However, current guidelines still recommend against the routine bathing of neonates with hexachlorophene because of its potential neurotoxic effects (*194*). The agent is classified by FDA TFM as not

generally recognized as safe and effective for use as an antiseptic handwash (*19*). Hexachlorophene should not be used to bathe patients with burns or extensive areas of susceptible, sensitive skin. Soaps containing 3% hexachlorophene are available by prescription only (*7*).

Iodine and Iodophors

Iodine has been recognized as an effective antiseptic since the 1800s. However, because iodine often causes irritation and discoloring of skin, iodophors have largely replaced iodine as the active ingredient in antiseptics.

Iodine molecules rapidly penetrate the cell wall of microorganisms and inactivate cells by forming complexes with amino acids and unsaturated fatty acids, resulting in impaired protein synthesis and alteration of cell membranes (*195*). Iodophors are composed of elemental iodine, iodide or triiodide, and a polymer carrier (i.e., the complexing agent) of high molecular weight. The amount of molecular iodine present (so-called "free" iodine) determines the level of antimicrobial activity of iodophors. "Available" iodine refers to the total amount of iodine that can be titrated with sodium thiosulfate (*196*). Typical 10% povidone-iodine formulations contain 1% available iodine and yield free iodine concentrations of 1 ppm (*196*). Combining iodine with various polymers increases the solubility of iodine, promotes sustained release of iodine, and reduces skin irritation. The most common polymers incorporated into iodophors are polyvinyl pyrrolidone (i.e., povidone) and ethoxylated nonionic detergents (i.e., poloxamers) (*195,196*). The antimicrobial activity of iodophors also can be affected by pH, temperature, exposure time, concentration of total available iodine, and the amount and type of organic and inorganic compounds present (e.g., alcohols and detergents).

Iodine and iodophors have bactericidal activity against gram-positive, gram-negative, and certain spore-forming bacteria (e.g., clostridia and *Bacillus* spp.) and are active against mycobacteria, viruses, and fungi (*8,195,197–200*). However, in concentrations used in antiseptics, iodophors are not usually sporicidal (*201*). In vivo studies have demonstrated that iodophors reduce the number of viable organisms that are recovered from the hands of personnel (*113,145,148,152,155*). Povidone-iodine 5%–10% has been tentatively classified by FDA TFM as a Category I agent (i.e., a safe and effective agent for use as an antiseptic handwash and an HCW handwash) (*19*). The extent to which iodophors exhibit persistent antimicrobial activity after they have been washed off the skin is unclear. In one study, persistent activity was noted for 6 hours (*176*); however, several other studies demonstrated persistent activity for only 30–60 minutes after washing hands with an iodophor (*61,117,202*). In studies in which bacterial counts were obtained after gloves were worn for 1–4 hours after washing, iodophors have demonstrated poor persistent activity (*1,104,115,189,203–208*). The in vivo antimicrobial activity of iodophors is substantially reduced in the presence of organic substances (e.g., blood or sputum) (*8*).

The majority of iodophor preparations used for hand hygiene contain 7.5%–10% povidone-iodine. Formulations with lower concentrations also have good antimicrobial activity because dilution can increase free iodine concentrations (*209*). However, as the amount of free iodine increases, the degree of skin irritation also may increase (*209*). Iodophors cause less skin irritation and fewer allergic reactions than iodine, but more irritant contact dermatitis than other antiseptics commonly used for hand hygiene (*92*). Occasionally, iodophor antiseptics have become contaminated with gram-negative bacilli as a result of poor manufacturing processes and have caused outbreaks or pseudo-outbreaks of infection (*196*).

Quaternary Ammonium Compounds

Quaternary ammonium compounds are composed of a nitrogen atom linked directly to four alkyl groups, which may vary in their structure and complexity (*210*). Of this large group of compounds, alkyl benzalkonium chlorides are the most widely used as antiseptics. Other compounds that have been used as antiseptics include benzethonium chloride, cetrimide, and cetylpyridium chloride (*1*). The antimicrobial activity of these compounds was first studied in the early 1900s, and a quaternary ammonium compound for preoperative cleaning of surgeons' hands was used as early as 1935 (*210*). The antimicrobial activity of this group of compounds likely is attributable to adsorption to the cytoplasmic membrane, with subsequent leakage of low molecular weight cytoplasmic constituents (*210*).

Quaternary ammonium compounds are primarily bacteriostatic and fungistatic, although they are microbicidal against certain organisms at high concentrations (*1*); they are more active against gram-positive bacteria than against gram-negative bacilli. Quaternary ammonium compounds have relatively weak activity against mycobacteria and fungi and have greater activity against lipophilic viruses. Their antimicrobial activity is adversely affected by the presence of organic material, and they are not compatible with anionic detergents (*1,210*). In 1994, FDA TFM tentatively classified benzalkonium chloride and benzethonium chloride as Category IIISE active agents (i.e., insufficient data exists to classify them as safe and effective for use as an antiseptic handwash) (*19*). Further evaluation of these agents by FDA is in progress.

Quaternary ammonium compounds are usually well tolerated. However, because of weak activity against

gram-negative bacteria, benzalkonium chloride is prone to contamination by these organisms. Several outbreaks of infection or pseudoinfection have been traced to quaternary ammonium compounds contaminated with gram-negative bacilli (*211–213*). For this reason, in the United States, these compounds have been seldom used for hand antisepsis during the last 15–20 years. However, newer handwashing products containing benzalkonium chloride or benzethonium chloride have recently been introduced for use by HCWs. A recent study of surgical intensive-care unit personnel found that cleaning hands with antimicrobial wipes containing a quaternary ammonium compound was about as effective as using plain soap and water for handwashing; both were less effective than decontaminating hands with an alcohol-based hand rub (*214*). One laboratory-based study reported that an alcohol-free hand-rub product containing a quaternary ammonium compound was efficacious in reducing microbial counts on the hands of volunteers (*215*). Further studies of such products are needed to determine if newer formulations are effective in health-care settings.

Triclosan

Triclosan (chemical name: 2,4,4' –trichloro-2'-hydroxydiphenyl ether) is a nonionic, colorless substance that was developed in the 1960s. It has been incorporated into soaps for use by HCWs and the public and into other consumer products. Concentrations of 0.2%–2% have antimicrobial activity. Triclosan enters bacterial cells and affects the cytoplasmic membrane and synthesis of RNA, fatty acids, and proteins (*216*). Recent studies indicate this agent's antibacterial activity is attributable to binding to the active site of enoyl-acyl carrier protein reductase (*217,218*).

Triclosan has a broad range of antimicrobial activity, but it is often bacteriostatic (*1*). Minimum inhibitory concentrations (MICs) range from 0.1 to 10 ug/mL, whereas minimum bactericidal concentrations are 25–500 ug/mL. Triclosan's activity against gram-positive organisms (including MRSA) is greater than against gram-negative bacilli, particularly *P. aeruginosa* (*1,216*). The agent possesses reasonable activity against mycobacterial and *Candida* spp., but it has limited activity against filamentous fungi. Triclosan (0.1%) reduces bacterial counts on hands by 2.8 $\log_{10}$ after a 1-minute hygienic handwash (*1*). In several studies, log reductions have been lower after triclosan is used than when chlorhexidine, iodophors, or alcohol-based products are applied (*1,61,149,184,219*). In 1994, FDA TFM tentatively classified triclosan ≤1.0% as a Category IIISE active agent (i.e., insufficient data exist to classify this agent as safe and effective for use as an antiseptic handwash) (*19*). Further evaluation of this agent by the FDA is underway. Like chlorhexidine, triclosan has persistent activity on the skin. Its activity in hand-care products is affected by pH, the presence of surfactants, emollients, or humectants and by the ionic nature of the particular formulation (*1,216*). Triclosan's activity is not substantially affected by organic matter, but it can be inhibited by sequestration of the agent in micelle structures formed by surfactants present in certain formulations. The majority of formulations containing <2% triclosan are well-tolerated and seldom cause allergic reactions. Certain reports indicate that providing hospital personnel with a triclosan-containing preparation for hand antisepsis has led to decreased MRSA infections (*72,73*). Triclosan's lack of potent activity against gram-negative bacilli has resulted in occasional reports of contamination (*220*).

Other Agents

Approximately 150 years after puerperal-fever–related maternal mortality rates were demonstrated by Semmelweis to be reduced by use of a hypochlorite hand rinse, the efficacy of rubbing hands for 30 seconds with an aqueous hypochlorite solution was studied once again (*221*). The solution was demonstrated to be no more effective than distilled water. The regimen used by Semmelweis, which called for rubbing hands with a 4% [w/w] hypochlorite solution until the hands were slippery (approximately 5 minutes), has been revisited by other researchers (*222*). This more current study indicated that the regimen was 30 times more effective than a 1-minute rub using 60% isopropanol. However, because hypochlorite solutions are often irritating to the skin when used repeatedly and have a strong odor, they are seldom used for hand hygiene.

Certain other agents are being evaluated by FDA for use in health-care-related antiseptics (*19*). However, the efficacy of these agents has not been evaluated adequately for use in handwashing preparations intended for use by HCWs. Further evaluation of these agents is warranted. Products that use different concentrations of traditional antiseptics (e.g., low concentrations of iodophor) or contain novel compounds with antiseptic properties are likely to be introduced for use by HCWs. For example, preliminary studies have demonstrated that adding silver-containing polymers to an ethanol carrier (i.e., Surfacine®) results in a preparation that has persistent antimicrobial activity on animal and human skin (*223*). New compounds with good in vitro activity must be tested in vivo to determine their abilities to reduce transient and resident skin flora on the hands of HCWs.

Activity of Antiseptic Agents Against Spore-Forming Bacteria

The widespread prevalence of health-care–associated diarrhea caused by *Clostridium difficile* and the recent occurrence

in the United States of human *Bacillus anthracis* infections associated with contaminated items sent through the postal system has raised concern regarding the activity of antiseptic agents against spore-forming bacteria. None of the agents (including alcohols, chlorhexidine, hexachlorophene, iodophors, PCMX, and triclosan) used in antiseptic handwash or antiseptic hand-rub preparations are reliably sporicidal against *Clostridium* spp. or *Bacillus* spp. (*120,172,224,225*). Washing hands with non-antimicrobial or antimicrobial soap and water may help to physically remove spores from the surface of contaminated hands. HCWs should be encouraged to wear gloves when caring for patients with *C. difficile*-associated diarrhea (*226*). After gloves are removed, hands should be washed with a non-antimicrobial or an antimicrobial soap and water or disinfected with an alcohol-based hand rub. During outbreaks of *C. difficile*-related infections, washing hands with a non-antimicrobial or antimicrobial soap and water after removing gloves is prudent. HCWs with suspected or documented exposure to *B. anthracis*-contaminated items also should be encouraged to wash their hands with a non-antimicrobial or antimicrobial soap and water.

Reduced Susceptibility of Bacteria to Antiseptics

Reduced susceptibility of bacteria to antiseptic agents can either be an intrinsic characteristic of a species or can be an acquired trait (*227*). Several reports have described strains of bacteria that appear to have acquired reduced susceptibility (when defined by MICs established in vitro) to certain antiseptics (e.g., chlorhexidine, quaternary ammonium compounds, and triclosan) (*227–230*). However, because the antiseptic concentrations that are actually used by HCWs are often substantially higher than the MICs of strains with reduced antiseptic susceptibility, the clinical relevance of the in vitro findings is questionable. For example, certain strains of MRSA have chlorhexidine and quaternary ammonium compound MICs that are several-fold higher than methicillin-susceptible strains, and certain strains of *S. aureus* have elevated MICs to triclosan (*227,228*). However, such strains were readily inhibited by the concentrations of these antiseptics that are actually used by practicing HCWs (*227,228*). The description of a triclosan-resistant bacterial enzyme has raised the question of whether resistance to this agent may develop more readily than to other antiseptic agents (*218*). In addition, exposing *Pseudomonas* strains containing the MexAB-OprM efflux system to triclosan may select for mutants that are resistant to multiple antibiotics, including fluoroquinolones (*230*). Further studies are needed to determine whether reduced susceptibility to antiseptic agents is of epidemiologic significance and whether resistance to antiseptics has any influence on the prevalence of antibiotic-resistant strains (*227*).

Surgical Hand Antisepsis

Since the late 1800s, when Lister promoted the application of carbolic acid to the hands of surgeons before procedures, preoperative cleansing of hands and forearms with an antiseptic agent has been an accepted practice (*231*). Although no randomized, controlled trials have been conducted to indicate that surgical-site infection rates are substantially lower when preoperative scrubbing is performed with an antiseptic agent rather than a non-antimicrobial soap, certain other factors provide a strong rationale for this practice. Bacteria on the hands of surgeons can cause wound infections if introduced into the operative field during surgery (*232*); rapid multiplication of bacteria occurs under surgical gloves if hands are washed with a non-antimicrobial soap. However, bacterial growth is slowed after preoperative scrubbing with an antiseptic agent (*14,233*). Reducing resident skin flora on the hands of the surgical team for the duration of a procedure reduces the risk of bacteria being released into the surgical field if gloves become punctured or torn during surgery (*1,156,169*). Finally, at least one outbreak of surgical-site infections occurred when surgeons who normally used an antiseptic surgical scrub preparation began using a non-antimicrobial product (*234*).

Antiseptic preparations intended for use as surgical hand scrubs are evaluated for their ability to reduce the number of bacteria released from hands at different times, including 1) immediately after scrubbing, 2) after wearing surgical gloves for 6 hours (i.e., persistent activity), and 3) after multiple applications over 5 days (i.e., cumulative activity). Immediate and persistent activity are considered the most important in determining the efficacy of the product. U.S. guidelines recommend that agents used for surgical hand scrubs should substantially reduce microorganisms on intact skin, contain a nonirritating antimicrobial preparation, have broad-spectrum activity, and be fast-acting and persistent (*19,235*).

Studies have demonstrated that formulations containing 60%–95% alcohol alone or 50%–95% when combined with limited amounts of a quaternary ammonium compound, hexachlorophene, or chlorhexidine gluconate, lower bacterial counts on the skin immediately postscrub more effectively than do other agents (Table 4). The next most active agents (in order of decreasing activity) are chlorhexidine gluconate, iodophors, triclosan, and plain soap (*104,119,186,188, 203,204,206,208,236*). Because studies of PCMX as a surgical scrub have yielded contradictory results, further studies are needed to establish how the efficacy of this compound compares with the other agents (*176,185,186*).

Although alcohols are not considered to have persistent antimicrobial activity, bacteria appear to reproduce slowly on the hands after a surgical scrub with alcohol, and bacterial counts on hands after wearing gloves for 1–3 hours seldom exceed baseline (i.e., prescrub) values (*1*). However, a recent study demonstrated that a formulation containing 61% ethanol alone did not achieve adequate persistent activity at 6 hours postscrub (*237*). Alcohol-based preparations containing 0.5% or 1% chlorhexidine gluconate have persistent activity that, in certain studies, has equaled or exceeded that of chlorhexidine gluconate-containing detergents (*1,118,135,237*).*

Persistent antimicrobial activity of detergent-based surgical scrub formulations is greatest for those containing 2% or 4% chlorhexidine gluconate, followed by hexachlorophene, triclosan, and iodophors (*1,102,113–115,159,189,203, 204,206–208,236*). Because hexachlorophene is absorbed into the blood after repeated use, it is seldom used as a surgical scrub.

Surgical staff have been traditionally required to scrub their hands for 10 minutes preoperatively, which frequently leads to skin damage. Several studies have demonstrated that scrubbing for 5 minutes reduces bacterial counts as effectively as a 10-minute scrub (*117,238,239*). In other studies, scrubbing for 2 or 3 minutes reduced bacterial counts to acceptable levels (*156,205,207,240,241*).

Studies have indicated that a two-stage surgical scrub using an antiseptic detergent, followed by application of an alcohol-containing preparation, is effective. For example, an initial 1- or 2-minute scrub with 4% chlorhexidine gluconate or povidone-iodine followed by application of an alcohol-based product has been as effective as a 5-minute scrub with an antiseptic detergent (*114,242*).

Surgical hand-antisepsis protocols have required personnel to scrub with a brush. But this practice can damage the skin of personnel and result in increased shedding of bacteria from the hands (*95,243*). Scrubbing with a disposable sponge or combination sponge-brush has reduced bacterial counts on the hands as effectively as scrubbing with a brush (*244–246*). However, several studies indicate that neither a brush nor a sponge is necessary to reduce bacterial counts on the hands of surgical personnel to acceptable levels, especially when alcohol-based products are used (*102,117,159,165,233,237, 247,248*). Several of these studies performed cultures immediately or at 45–60 minutes postscrub (*102,117, 233,247,248*), whereas in other studies, cultures were obtained 3 and 6 hours postscrub (*159,237*). For example, a recent laboratory-based study using volunteers demonstrated that brushless application of a preparation containing 1% chlorhexidine gluconate plus 61% ethanol yielded lower bacterial counts on the hands of participants than using a sponge/brush to apply a 4% chlorhexidine-containing detergent preparation (*237*).

Relative Efficacy of Plain Soap, Antiseptic Soap/Detergent, and Alcohols

Comparing studies related to the in vivo efficacy of plain soap, antimicrobial soaps, and alcohol-based hand rubs is problematic, because certain studies express efficacy as the percentage reduction in bacterial counts achieved, whereas others give $\log_{10}$ reductions in counts achieved. However, summarizing the relative efficacy of agents tested in each study can provide an overview of the in vivo activity of various formulations intended for handwashing, hygienic handwash, antiseptic hand rub, or surgical hand antisepsis (Tables 2–4).

Irritant Contact Dermatitis Resulting from Hand-Hygiene Measures

Frequency and Pathophysiology of Irritant Contact Dermatitis

In certain surveys, approximately 25% of nurses report symptoms or signs of dermatitis involving their hands, and as many as 85% give a history of having skin problems (*249*). Frequent and repeated use of hand-hygiene products, particularly soaps and other detergents, is a primary cause of chronic irritant contact dermatitis among HCWs (*250*). The potential of detergents to cause skin irritation can vary considerably and can be ameliorated by the addition of emollients and humectants. Irritation associated with antimicrobial soaps may be caused by the antimicrobial agent or by other ingredients of the formulation. Affected persons often complain of a feeling of dryness or burning; skin that feels "rough;" and erythema, scaling, or fissures. Detergents damage the skin by causing denaturation of stratum corneum proteins, changes in intercellular lipids (either depletion or reorganization of lipid moieties), decreased corneocyte cohesion, and decreased stratum corneum water-binding capacity (*250,251*). Damage

* In a recent randomized clinical trial, surgical site infection rates were monitored among patients who were operated on by surgical personnel who cleaned their hands preoperatively either by performing a traditional 5-minute surgical hand scrub using 4% povidone-iodine or 4% antisepsis antimicrobial soap, or by washing their hands for 1 minute with a non-antimicrobial soap followed by a 5-minute hand-rubbing technique using an alcohol-based hand rinse containing 0.2% mecetronium etilsulfate. The incidence of surgical site infections was virtually identical in the two groups of patients. (**Source:** Parienti JJ, Thibon P, Heller R, et al. for Members of the Antisepsie Chirurgicale des Mains Study Group. Hand-rubbing with an aqueous alcoholic solution vs traditional surgical hand-scrubbing and 30-day surgical site infection rates: a randomized equivalence study. JAMA 2002;288:722–7).

to the skin also changes skin flora, resulting in more frequent colonization by staphylococci and gram-negative bacilli (*17,90*). Although alcohols are among the safest antiseptics available, they can cause dryness and irritation of the skin (*1,252*). Ethanol is usually less irritating than n-propanol or isopropanol (*252*).

Irritant contact dermatitis is more commonly reported with iodophors (*92*). Other antiseptic agents that can cause irritant contact dermatitis (in order of decreasing frequency) include chlorhexidine, PCMX, triclosan, and alcohol-based products. Skin that is damaged by repeated exposure to detergents may be more susceptible to irritation by alcohol-based preparations (*253*). The irritancy potential of commercially prepared hand-hygiene products, which is often determined by measuring transepidermal water loss, may be available from the manufacturer. Other factors that can contribute to dermatitis associated with frequent handwashing include using hot water for handwashing, low relative humidity (most common in winter months), failure to use supplementary hand lotion or cream, and the quality of paper towels (*254,255*). Shear forces associated with wearing or removing gloves and allergy to latex proteins may also contribute to dermatitis of the hands of HCWs.

Allergic Contact Dermatitis Associated with Hand-Hygiene Products

Allergic reactions to products applied to the skin (i.e., contact allergies) may present as delayed type reactions (i.e., allergic contact dermatitis) or less commonly as immediate reactions (i.e., contact urticaria). The most common causes of contact allergies are fragrances and preservatives; emulsifiers are less common causes (*256–259*). Liquid soaps, hand lotions or creams, and "udder ointments" may contain ingredients that cause contact allergies among HCWs (*257,258*).

Allergic reactions to antiseptic agents, including quaternary ammonium compounds, iodine or iodophors, chlorhexidine, triclosan, PCMX, and alcohols have been reported (*118,167,172,256,260–265*). Allergic contact dermatitis associated with alcohol-based hand rubs is uncommon. Surveillance at a large hospital in Switzerland, where a commercial alcohol hand rub has been used for >10 years, failed to identify a single case of documented allergy to the product (*169*). In late 2001, a Freedom of Information Request for data in the FDA's Adverse Event Reporting System regarding adverse reactions to popular alcohol hand rubs in the United States yielded only one reported case of an erythematous rash reaction attributed to such a product (John M. Boyce, M.D., Hospital of St. Raphael, New Haven, Connecticut, personal communication, 2001). However, with increasing use of such products by HCWs, true allergic reactions to such products likely will be encountered.

Allergic reactions to alcohol-based products may represent true allergy to alcohol, allergy to an impurity or aldehyde metabolite, or allergy to another constituent of the product (*167*). Allergic contact dermatitis or immediate contact urticarial reactions may be caused by ethanol or isopropanol (*167*). Allergic reactions can be caused by compounds that may be present as inactive ingredients in alcohol-based hand rubs, including fragrances, benzyl alcohol, stearyl or isostearyl alcohol, phenoxyethanol, myristyl alcohol, propylene glycol, parabens, and benzalkonium chloride (*167,256,266–270*).

Proposed Methods for Reducing Adverse Effects of Agents

Potential strategies for minimizing hand-hygiene–related irritant contact dermatitis among HCWs include reducing the frequency of exposure to irritating agents (particularly anionic detergents), replacing products with high irritation potential with preparations that cause less damage to the skin, educating personnel regarding the risks of irritant contact dermatitis, and providing caregivers with moisturizing skin-care products or barrier creams (*96,98,251,271–273*). Reducing the frequency of exposure of HCWs to hand-hygiene products would prove difficult and is not desirable because of the low levels of adherence to hand-hygiene policies in the majority of institutions. Although hospitals have provided personnel with non-antimicrobial soaps in hopes of minimizing dermatitis, frequent use of such products may cause greater skin damage, dryness, and irritation than antiseptic preparations (*92,96,98*). One strategy for reducing the exposure of personnel to irritating soaps and detergents is to promote the use of alcohol-based hand rubs containing various emollients. Several recent prospective, randomized trials have demonstrated that alcohol-based hand rubs containing emollients were better tolerated by HCWs than washing hands with non-antimicrobial soaps or antimicrobial soaps (*96,98,166*). Routinely washing hands with soap and water immediately after using an alcohol hand rub may lead to dermatitis. Therefore, personnel should be reminded that it is neither necessary nor recommended to routinely wash hands after each application of an alcohol hand rub.

Hand lotions and creams often contain humectants and various fats and oils that can increase skin hydration and replace altered or depleted skin lipids that contribute to the barrier function of normal skin (*251,271*). Several controlled trials have demonstrated that regular use (e.g., twice a day) of such products can help prevent and treat irritant contact dermatitis caused by hand-hygiene products (*272,273*). In one study, frequent and scheduled use of an oil-containing lotion improved skin condition, and thus led to a 50% increase in

handwashing frequency among HCWs (273). Reports from these studies emphasize the need to educate personnel regarding the value of regular, frequent use of hand-care products.

Recently, barrier creams have been marketed for the prevention of hand-hygiene–related irritant contact dermatitis. Such products are absorbed to the superficial layers of the epidermis and are designed to form a protective layer that is not removed by standard handwashing. Two recent randomized, controlled trials that evaluated the skin condition of caregivers demonstrated that barrier creams did not yield better results than did the control lotion or vehicle used (*272,273*). As a result, whether barrier creams are effective in preventing irritant contact dermatitis among HCWs remains unknown.

In addition to evaluating the efficacy and acceptability of hand-care products, product-selection committees should inquire about the potential deleterious effects that oil-containing products may have on the integrity of rubber gloves and on the efficacy of antiseptic agents used in the facility (*8,236*).

Factors To Consider When Selecting Hand-Hygiene Products

When evaluating hand-hygiene products for potential use in health-care facilities, administrators or product-selection committees must consider factors that can affect the overall efficacy of such products, including the relative efficacy of antiseptic agents against various pathogens (Appendix) and acceptance of hand-hygiene products by personnel (*274,275*). Soap products that are not well-accepted by HCWs can be a deterrent to frequent handwashing (*276*). Characteristics of a product (either soap or alcohol-based hand rub) that can affect acceptance by personnel include its smell, consistency (i.e., "feel"), and color (*92,277,278*). For soaps, ease of lathering also may affect user preference.

Because HCWs may wash their hands from a limited number of times per shift to as many as 30 times per shift, the tendency of products to cause skin irritation and dryness is a substantial factor that influences acceptance, and ultimate usage (*61,98,274,275,277,279*). For example, concern regarding the drying effects of alcohol was a primary cause of poor acceptance of alcohol-based hand-hygiene products in hospitals in the United States (*5,143*). However, several studies have demonstrated that alcohol-based hand rubs containing emollients are acceptable to HCWs (*90,93,98,100,101,106, 143,163,164,166*). With alcohol-based products, the time required for drying may also affect user acceptance.

Studies indicate that the frequency of handwashing or antiseptic handwashing by personnel is affected by the accessibility of hand-hygiene facilities (*280–283*). In certain health-care facilities, only one sink is available in rooms housing several patients, or sinks are located far away from the door of the room, which may discourage handwashing by personnel leaving the room. In intensive-care units, access to sinks may be blocked by bedside equipment (e.g., ventilators or intravenous infusion pumps). In contrast to sinks used for handwashing or antiseptic handwash, dispensers for alcohol-based hand rubs do not require plumbing and can be made available adjacent to each patient's bed and at many other locations in patient-care areas. Pocket carriage of alcohol-based hand-rub solutions, combined with availability of bedside dispensers, has been associated with substantial improvement in adherence to hand-hygiene protocols (*74,284*). To avoid any confusion between soap and alcohol hand rubs, alcohol hand-rub dispensers should not be placed adjacent to sinks. HCWs should be informed that washing hands with soap and water after each use of an alcohol hand rub is not necessary and is not recommended, because it may lead to dermatitis. However, because personnel feel a "build-up" of emollients on their hands after repeated use of alcohol hand gels, washing hands with soap and water after 5–10 applications of a gel has been recommended by certain manufacturers.

Automated handwashing machines have not been demonstrated to improve the quality or frequency of handwashing (*88,285*). Although technologically advanced automated handwashing devices and monitoring systems have been developed recently, only a minimal number of studies have been published that demonstrate that use of such devices results in enduring improvements in hand-hygiene adherence among HCWs. Further evaluation of automated handwashing facilities and monitoring systems is warranted.

Dispenser systems provided by manufacturers or vendors also must be considered when evaluating hand-hygiene products. Dispensers may discourage use by HCWs when they 1) become blocked or partially blocked and do not deliver the product when accessed by personnel, and 2) do not deliver the product appropriately onto the hands. In one hospital where a viscous alcohol-based hand rinse was available, only 65% of functioning dispensers delivered product onto the caregivers' hands with one press of the dispenser lever, and 9% of dispensers were totally occluded (*286*). In addition, the volume delivered was often suboptimal, and the product was sometimes squirted onto the wall instead of the caregiver's hand.

Only limited information is available regarding the cost of hand-hygiene products used in health-care facilities (*165,287*). These costs were evaluated in patient-care areas at a 450-bed community teaching hospital (*287*); the hospital spent $22,000 ($0.72 per patient-day) on 2% chlorhexidine-containing preparations, plain soap, and an alcohol hand rinse. *(287)* When

hand-hygiene supplies for clinics and nonpatient care areas were included, the total annual budget for soaps and hand antiseptic agents was $30,000 (approximately $1 per patient-day). Annual hand-hygiene product budgets at other institutions vary considerably because of differences in usage patterns and varying product prices. One researcher (*287*) determined that if non-antimicrobial liquid soap were assigned an arbitrary relative cost of 1.0, the cost per liter would be 1.7 times as much for 2% chlorhexidine gluconate detergent, 1.6–2.0 times higher for alcohol-based hand-rub products, and 4.5 times higher for an alcohol-based foam product. A recent cost comparison of surgical scrubbing with an antimicrobial soap versus brushless scrubbing with an alcohol-based hand rub revealed that costs and time required for preoperative scrubbing were less with the alcohol-based product (*165*). In a trial conducted in two critical-care units, the cost of using an alcohol hand rub was half as much as using an antimicrobial soap for handwashing ($0.025 versus $0.05 per application, respectively) (*166*).

To put expenditures for hand-hygiene products into perspective, health-care facilities should consider comparing their budget for hand-hygiene products to estimated excess hospital costs resulting from health-care–associated infections. The excess hospital costs associated with only four or five health-care–associated infections of average severity may equal the entire annual budget for hand-hygiene products used in inpatient-care areas. Just one severe surgical site infection, lower respiratory tract infection, or bloodstream infection may cost the hospital more than the entire annual budget for antiseptic agents used for hand hygiene (*287*). Two studies provided certain quantitative estimates of the benefit of hand-hygiene–promotion programs (*72,74*). One study demonstrated a cost saving of approximately $17,000 resulting from reduced use of vancomycin after the observed decrease in MRSA incidence in a 7-month period (*72*). In another study that examined both direct costs associated with the hand-hygiene promotion program (increased use of hand-rub solution and poster production) and indirect costs associated with health-care–personnel time (*74*), costs of the program were an estimated $57,000 or less per year (an average of $1.42 per patient admitted). Supplementary costs associated with the increased use of alcohol-based hand-rub solution averaged $6.07 per 100 patient-days. Based on conservative estimates of $2,100 saved per infection averted and on the assumption that only 25% of the observed reduction in the infection rate was associated with improved hand-hygiene practice, the program was substantially cost-effective. Thus, hospital administrators must consider that by purchasing more effective or more acceptable hand-hygiene products to improve hand-hygiene practices, they will avoid the occurrence of nosocomial infections; preventing only a limited number of additional health-care–associated infections per year will lead to savings that will exceed any incremental costs of improved hand-hygiene products.

Hand-Hygiene Practices Among HCWs

In observational studies conducted in hospitals, HCWs washed their hands an average of five times per shift to as many as 30 times per shift (Table 6) (*17,61,90,98,274,288*); certain nurses washed their hands ≤100 times per shift (*90*). Hospitalwide surveillance of hand hygiene reveals that the average number of handwashing opportunities varies markedly between hospital wards. For example, nurses in pediatric wards had an average of eight opportunities for hand hygiene per hour of patient care compared with an average of 20 for nurses in intensive-care units (*11*). The duration of handwashing or hygienic handwash episodes by HCWs has averaged 6.6–24.0 seconds in observational studies (Table 7) (*17,52,59,84–87,89,249,279*). In addition to washing their

hands for limited time periods, personnel often fail to cover all surfaces of their hands and fingers (*288*).

Adherence of HCWs to Recommended Hand-Hygiene Practices

Observational Studies of Hand-Hygiene Adherence. Adherence of HCWs to recommended hand-hygiene procedures has been poor, with mean baseline rates of 5%–81% (overall average: 40%) (Table 8) (*71,74,86,87,276,280,281,283,285, 289–313*). The methods used for defining adherence (or nonadherence) and those used for conducting observations vary considerably among studies, and reports do not provide detailed information concerning the methods and criteria used. The majority of studies were conducted with hand-hygiene adherence as the major outcome measure, whereas a limited number measured adherence as part of a broader investigation. Several investigators reported improved adherence after implementing various interventions, but the majority of studies had short follow-up periods and did not confirm whether behavioral improvements were long-lasting. Other studies established that sustained improvements in handwashing behavior occurred during a long-term program to improve adherence to hand-hygiene policies (*74,75*).

Factors Affecting Adherence. Factors that may influence hand hygiene include those identified in epidemiologic studies and factors reported by HCWs as being reasons for lack of adherence to hand-hygiene recommendations. Risk factors for poor adherence to hand hygiene have been determined objectively in several observational studies or interventions to improve adherence (*11,12,274,292,295,314–317*). Among these, being a physician or a nursing assistant, rather than a nurse, was consistently associated with reduced adherence (Box 1).

In the largest hospitalwide survey of hand-hygiene practices among HCWs *(11),* predictors of poor adherence to recommended hand-hygiene measures were identified. Predictor variables included professional category, hospital ward, time of day/week, and type and intensity of patient care, defined as the number of opportunities for hand hygiene per hour of patient care. In 2,834 observed opportunities for hand hygiene, average adherence was 48%. In multivariate analysis, nonadherence was lowest among nurses and during weekends

BOX 1. Factors influencing adherence to hand-hygiene practices*

Observed risk factors for poor adherence to recommended hand-hygiene practices

- Physician status (rather than a nurse)
- Nursing assistant status (rather than a nurse)
- Male sex
- Working in an intensive-care unit
- Working during the week (versus the weekend)
- Wearing gowns/gloves
- Automated sink
- Activities with high risk of cross-transmission
- High number of opportunities for hand hygiene per hour of patient care

Self-reported factors for poor adherence with hand hygiene

- Handwashing agents cause irritation and dryness
- Sinks are inconveniently located/shortage of sinks
- Lack of soap and paper towels
- Often too busy/insufficient time
- Understaffing/overcrowding
- Patient needs take priority
- Hand hygiene interferes with health-care worker relationships with patients
- Low risk of acquiring infection from patients
- Wearing of gloves/beliefs that glove use obviates the need for hand hygiene
- Lack of knowledge of guidelines/protocols
- Not thinking about it/forgetfulness
- No role model from colleagues or superiors
- Skepticism regarding the value of hand hygiene
- Disagreement with the recommendations
- Lack of scientific information of definitive impact of improved hand hygiene on health-care–associated infection rates

Additional perceived barriers to appropriate hand hygiene

- Lack of active participation in hand-hygiene promotion at individual or institutional level
- Lack of role model for hand hygiene
- Lack of institutional priority for hand hygiene
- Lack of administrative sanction of noncompliers/rewarding compliers
- Lack of institutional safety climate

* **Source:** Adapted from Pittet D. Improving compliance with hand hygiene in hospitals. Infect Control Hosp Epidemiol 2000;21:381–6.

(Odds Ratio [OR]: 0.6; 95% confidence interval [CI] = 0.4–0.8). Nonadherence was higher in intensive-care units compared with internal medicine wards (OR: 2.0; 95% CI = 1.3–3.1), during procedures that carried a high risk of bacterial contamination (OR: 1.8; 95% CI = 1.4–2.4), and when intensity of patient care was high (21–40 handwashing opportunities — OR: 1.3; 95% CI = 1.0-1.7; 41–60 opportunities — OR: 2.1; 95% CI = 1.5-2.9; >60 opportunities — OR: 2.1; 95% CI = 1.3–3.5). The higher the demand for hand hygiene, the lower the adherence; on average, adherence decreased by 5% (± 2%) for each increase of 10 opportunities per hour when the intensity of patient care exceeded 10 opportunities per hour. Similarly, the lowest adherence rate (36%) was found in intensive-care units, where indications for hand hygiene were typically more frequent (on average, 20 opportunities per patient-hour). The highest adherence rate (59%) was observed in pediatrics wards, where the average intensity of patient care was lower than in other hospital areas (an average of eight opportunities per patient-hour). The results of this study indicate that full adherence to previous guidelines may be unrealistic, and that facilitated access to hand hygiene could help improve adherence (*11,12,318*).

Perceived barriers to adherence with hand-hygiene practice recommendations include skin irritation caused by hand-hygiene agents, inaccessible hand-hygiene supplies, interference with HCW-patient relationships, priority of care (i.e., the patients' needs are given priority over hand hygiene), wearing of gloves, forgetfulness, lack of knowledge of the guidelines, insufficient time for hand hygiene, high workload and understaffing, and the lack of scientific information indicating a definitive impact of improved hand hygiene on health-care–associated infection rates (*11,274,292,295,315–317*). Certain perceived barriers to adherence with hand-hygiene guidelines have been assessed or quantified in observational studies (*12,274,292,295,314–317*) (Box 1).

Skin irritation by hand-hygiene agents constitutes a substantial barrier to appropriate adherence (*319*). Because soaps and detergents can damage skin when applied on a regular basis, HCWs must be better informed regarding the possible adverse effects associated with hand-hygiene agents. Lack of knowledge and education regarding this subject is a barrier to motivation. In several studies, alcohol-based hand rubs containing emollients (either isopropanol, ethanol, or n-propanol in 60%–90% vol/vol) were less irritating to the skin than the soaps or detergents tested. In addition, the alcohol-based products containing emollients that were tested were at least as tolerable and efficacious as the detergents tested. Also, studies demonstrate that several hand lotions have reduced skin scaling and cracking, which may reduce microbial shedding from the hands (*67,272,273*).

Easy access to hand-hygiene supplies, whether sink, soap, medicated detergent, or alcohol-based hand-rub solution, is essential for optimal adherence to hand-hygiene recommendations. The time required for nurses to leave a patient's bedside, go to a sink, and wash and dry their hands before attending the next patient is a deterrent to frequent handwashing or hand antisepsis (*11,318*). Engineering controls could facilitate adherence, but careful monitoring of hand-hygiene behavior should be conducted to exclude the possible negative effect of newly introduced handwashing devices (*88*).

The impact of wearing gloves on adherence to hand-hygiene policies has not been definitively established, because published studies have yielded contradictory results (*87,290,301,320*). Hand hygiene is required regardless of whether gloves are used or changed. Failure to remove gloves after patient contact or between "dirty" and "clean" body-site care on the same patient must be regarded as nonadherence to hand-hygiene recommendations (*11*). In a study in which experimental conditions approximated those occurring in clinical practice (*321*), washing and reusing gloves between patient contacts resulted in observed bacterial counts of 0–4.7 log on the hands after glove removal. Therefore, this practice should be discouraged; handwashing or disinfection should be performed after glove removal.

Lack of 1) knowledge of guidelines for hand hygiene, 2) recognition of hand-hygiene opportunities during patient care, and 3) awareness of the risk of cross-transmission of pathogens are barriers to good hand-hygiene practices. Furthermore, certain HCWs believe they have washed their hands when necessary, even when observations indicate they have not (*89,92,295,296,322*).

Perceived barriers to hand-hygiene behavior are linked not only to the institution, but also to HCWs' colleagues. Therefore, both institutional and small-group dynamics need to be considered when implementing a system change to secure an improvement in HCWs' hand-hygiene practice.

Possible Targets for Hand-Hygiene Promotion

Targets for the promotion of hand hygiene are derived from studies assessing risk factors for nonadherence, reported reasons for the lack of adherence to recommendations, and additional factors perceived as being important to facilitate appropriate HCW behavior. Although certain factors cannot be modified (Box 1), others can be changed.

One factor that must be addressed is the time required for HCWs to clean their hands. The time required for traditional handwashing may render full adherence to previous guidelines unrealistic (*11,12,318*) and more rapid access to hand-hygiene materials could help improve adherence. One study conducted in an intensive-care unit demonstrated that it took

nurses an average of 62 seconds to leave a patient's bedside, walk to a sink, wash their hands, and return to patient care (*318*). In contrast, an estimated one fourth as much time is required when using alcohol-based hand rub placed at each patient's bedside. Providing easy access to hand-hygiene materials is mandatory for appropriate hand-hygiene behavior and is achievable in the majority of health-care facilities (*323*). In particular, in high-demand situations (e.g., the majority of critical-care units), under hectic working conditions, and at times of overcrowding or understaffing, HCWs may be more likely to use an alcohol-based hand rub than to wash their hands (*323*). Further, using alcohol-based hand rubs may be a better option than traditional handwashing with plain soap and water or antiseptic handwash, because they not only require less time (*166,318*) but act faster (*1*) and irritate hands less often (*1,67,96,98,166*). They also were used in the only program that reported a sustained improvement in hand-hygiene adherence associated with decreased infection rates (*74*). However, making an alcohol-based hand rub available to personnel without providing ongoing educational and motivational activities may not result in long-lasting improvement in hand-hygiene practices (*313*). Because increased use of hand-hygiene agents might be associated with skin dryness, the availability of free skin-care lotion is recommended.

Education is a cornerstone for improvement with hand-hygiene practices. Topics that must be addressed by educational programs include the lack of 1) scientific information for the definitive impact of improved hand hygiene on health-care–associated infection and resistant organism transmission rates; 2) awareness of guidelines for hand hygiene and insufficient knowledge concerning indications for hand hygiene during daily patient care; 3) knowledge concerning the low average adherence rate to hand hygiene by the majority of HCWs; and 4) knowledge concerning the appropriateness, efficacy, and understanding of the use of hand-hygiene and skin-care–protection agents.

HCWs necessarily evolve within a group that functions within an institution. Possible targets for improvement in hand-hygiene behavior not only include factors linked to individual HCWs, but also those related to the group(s) and the institution as a whole (*317,323*). Examples of possible targets for hand-hygiene promotion at the group level include education and performance feedback on hand-hygiene adherence; efforts to prevent high workload, downsizing, and understaffing; and encouragement and provision of role models from key members in the work unit. At the institutional level, targets for improvement include 1) written guidelines, hand-hygiene agents, skin-care promotions and agents, or hand-hygiene facilities; 2) culture or tradition of adherence; and 3) administrative leadership, sanction, support, and rewards. Several studies, conducted in various types of institutions, reported modest and even low levels of adherence to recommended hand-hygiene practices, indicating that such adherence varied by hospital ward and by type of HCW. These results indicate educational sessions may need to be designed specifically for certain types of personnel (*11,289,290,294,317,323)*.

Lessons Learned from Behavioral Theories

In 1998, the prevailing behavioral theories and their applications with regard to the health professions were reviewed by researchers in an attempt to better understand how to target more successful interventions (*317*). The researchers proposed a hypothetical framework to enhance hand-hygiene practices and stressed the importance of considering the complexity of individual and institutional factors when designing behavioral interventions.

Although behavioral theories and secondary interventions have primarily targeted individual workers, this practice might be insufficient to produce sustained change (*317,324,325*). Interventions aimed at improving hand-hygiene practices must account for different levels of behavior interaction (*12,317,326*). Thus, the interdependence of individual factors, environmental constraints, and the institutional climate must be taken into account in the strategic planning and development of hand-hygiene campaigns. Interventions to promote hand hygiene in hospitals should consider variables at all these levels. Various factors involved in hand-hygiene behavior include intention, attitude towards the behavior, perceived social norm, perceived behavioral control, perceived risk for infection, hand-hygiene practices, perceived role model, perceived knowledge, and motivation (*317*). The factors necessary for change include 1) dissatisfaction with the current situation, 2) perception of alternatives, and 3) recognition, both at the individual and institutional level, of the ability and potential to change. Although the latter implies education and motivation, the former two necessitate a system change.

Among the reported reasons for poor adherence with hand-hygiene recommendations (Box 1), certain ones are clearly associated with the institution or system (e.g., lack of institutional priority for hand hygiene, administrative sanctions, and a safety climate). Although all of these reasons would require a system change in the majority of institutions, the third requires management commitment, visible safety programs, an acceptable level of work stress, a tolerant and supportive attitude toward reported problems, and belief in the efficacy

of preventive strategies (*12,317,325,327*). Most importantly, an improvement in infection-control practices requires 1) questioning basic beliefs, 2) continuous assessment of the group (or individual) stage of behavioral change, 3) intervention(s) with an appropriate process of change, and 4) supporting individual and group creativity (*317*). Because of the complexity of the process of change, single interventions often fail. Thus, a multimodal, multidisciplinary strategy is likely necessary (*74,75,317,323,326*).

Methods Used To Promote Improved Hand Hygiene

Hand-hygiene promotion has been challenging for >150 years. In-service education, information leaflets, workshops and lectures, automated dispensers, and performance feedback on hand-hygiene adherence rates have been associated with transient improvement (*291,294–296,306,314*).

Several strategies for promotion of hand hygiene in hospitals have been published (Table 9). These strategies require education, motivation, or system change. Certain strategies are based on epidemiologic evidence, others on the authors' and other investigators' experience and review of current knowledge. Some strategies may be unnecessary in certain circumstances, but may be helpful in others. In particular, changing the hand-hygiene agent could be beneficial in institutions or hospital wards with a high workload and a high demand for hand hygiene when alcohol-based hand rubs are not available (*11,73,78,328*). However, a change in the recommended hand-hygiene agent could be deleterious if introduced during winter, at a time of higher hand-skin irritability, and if not accompanied by the provision of skin-care products (e.g., protective creams and lotions). Additional specific elements should be considered for inclusion in educational and motivational programs (Box 2).

Several strategies that could potentially be associated with successful promotion of hand hygiene require a system change (Box 1). Hand-hygiene adherence and promotion involve factors at both the individual and system level. Enhancing individual and institutional attitudes regarding the feasibility of making changes (self-efficacy), obtaining active participation of personnel at both levels, and promoting an institutional safety climate represent challenges that exceed the current perception of the role of infection-control professionals.

Whether increased education, individual reinforcement technique, appropriate rewarding, administrative sanction, enhanced self-participation, active involvement of a larger number of organizational leaders, enhanced perception of health threat, self-efficacy, and perceived social pressure (*12,317,329,330*), or combinations of these factors can improve HCWs' adherence with hand hygiene needs further investigation. Ultimately, adherence to recommended hand-hygiene practices should become part of a culture of patient safety where a set of interdependent quality elements interact to achieve a shared objective (*331*).

On the basis of both these hypothetical considerations and successful, actual experiences in certain institutions, strategies to improve adherence to hand-hygiene practices should be both multimodal and multidisciplinary. However, strategies must be further researched before they are implemented.

BOX 2. Elements of health-care worker educational and motivational programs

Rationale for hand hygiene
- Potential risks of transmission of microorganisms to patients
- Potential risks of health-care worker colonization or infection caused by organisms acquired from the patient
- Morbidity, mortality, and costs associated with health-care–associated infections

Indications for hand hygiene
- Contact with a patient's intact skin (e.g., taking a pulse or blood pressure, performing physical examinations, lifting the patient in bed) (*25,26,45,48,51,53*)
- Contact with environmental surfaces in the immediate vicinity of patients (*46,51,53,54*)
- After glove removal (*50,58,71*)

Techniques for hand hygiene
- Amount of hand-hygiene solution
- Duration of hand-hygiene procedure
- Selection of hand-hygiene agents
  - — Alcohol-based hand rubs are the most efficacious agents for reducing the number of bacteria on the hands of personnel. Antiseptic soaps and detergents are the next most effective, and non-antimicrobial soaps are the least effective (*1,398*).
  - — Soap and water are recommended for visibly soil hands.
  - — Alcohol-based hand rubs are recommended for routine decontamination of hands for all clinical indications (except when hands are visibly soiled) and as one of the options for surgical hand hygiene.

Methods to maintain hand skin health
- Lotions and creams can prevent or minimize skin dryness and irritation caused by irritant contact dermatitis
- Acceptable lotions or creams to use
- Recommended schedule for applying lotions or creams

Expectations of patient care managers/administrators
- Written statements regarding the value of, and support for, adherence to recommended hand-hygiene practices
- Role models demonstrating adherence to recommended hand hygiene practices (*399*)

Indications for, and limitations of, glove use
- Hand contamination may occur as a result of small, undetected holes in examination gloves (*321,361*)
- Contamination may occur during glove removal (50)
- Wearing gloves does not replace the need for hand hygiene (58)
- Failure to remove gloves after caring for a patient may lead to transmission of microorganizations from one patient to another *(373).*

Efficacy of Promotion and Impact of Improved Hand Hygiene

The lack of scientific information of the definitive impact of improved hand hygiene on health-care–associated infection rates is a possible barrier to appropriate adherence with hand-hygiene recommendations (Box 1). However, evidence supports the belief that improved hand hygiene can reduce health-care–associated infection rates. Failure to perform appropriate hand hygiene is considered the leading cause of health-care–associated infections and spread of multiresistant organisms and has been recognized as a substantial contributor to outbreaks.

Of nine hospital-based studies of the impact of hand hygiene on the risk of health-care–associated infections (Table 10) (*48,69–75,296*), the majority demonstrated a temporal relationship between improved hand-hygiene practices and reduced infection rates.

In one of these studies, endemic MRSA in a neonatal intensive-care unit was eliminated 7 months after introduction of a new

TABLE 10. Association between improved adherence with hand-hygiene practice and health-care–associated infection rates

Year	Ref. no.	Hospital setting	Results	Duration of follow-up
1977	(*48*)	Adult ICU	Reduction in health-care–associated infections caused by endemic *Klebsiella* spp.	2 years
1982	(*69*)	Adult ICU	Reduction in health-care-associated infection rates	N.S.
1984	(*70*)	Adult ICU	Reduction in health-care–associated infection rates	N.S.
1990	(*296*)	Adult ICU	No effect (average hand hygiene adherence improvement did not reach statistical significance)	11 months
1992	(*71*)	Adult ICU	Substantial difference between rates of health-care–associated infection between two different hand-hygiene agents	8 months
1994	(*72*)	NICU	Elimination of MRSA, when combined with multiple other infection-control measures. Reduction of vancomycin use	9 months
1995	(*73*)	Newborn nursery	Elimination of MRSA, when combined with multiple other infection-control measures	3.5 years
2000	(*75*)	MICU/NICU	85% relative reduction of VRE rate in the intervention hospital; 44% relative reduction in control hospital; no change in MRSA	8 months
2000	(*74*)	Hospitalwide	Substantial reduction in the annual overall prevalence of health-care–associated infections and MRSA cross-transmission rates. Active surveillance cultures and contact precautions were implemented during same period	5 years

Note: ICU = intensive care unit, NICU = neonatal ICU, MRSA = methicillin-resistant *Staphylococcus aureus*, MICU = medical ICU, and N.S. = not stated.

hand antiseptic (1% triclosan); all other infection-control measures remained in place, including the practice of conducting weekly active surveillance by obtaining cultures (*72*). Another study reported an MRSA outbreak involving 22 infants in a neonatal unit (*73*). Despite intensive efforts, the outbreak could not be controlled until a new antiseptic was added (i.e., 0.3% triclosan); all previously used control measures remained in place, including gloves and gowns, cohorting, and obtaining cultures for active surveillance.

The effectiveness of a longstanding, hospitalwide program to promote hand hygiene at the University of Geneva hospitals was recently reported (*74*). Overall adherence to hand-hygiene guidelines during routine patient care was monitored during hospitalwide observational surveys. These surveys were conducted biannually during December 1994–December 1997, before and during implementation of a hand-hygiene campaign that specifically emphasized the practice of bedside, alcohol-based hand disinfection. Individual-sized bottles of hand-rub solution were distributed to all wards, and custom-made holders were mounted on all beds to facilitate access to hand disinfection. HCWs were also encouraged to carry bottles in their pockets, and in 1996, a newly designed flat (instead of round) bottle was made available to further facilitate pocket carriage. The promotional strategy was multimodal and involved a multidisciplinary team of HCWs, the use of wall posters, the promotion of antiseptic hand rubs located at bedsides throughout the institution, and regular performance feedback to all HCWs (see http://www.hopisafe.ch for further details on methodology). Health-care–associated infection rates, attack rates of MRSA cross-transmission, and consumption of hand-rub disinfectant were measured. Adherence to recommended hand-hygiene practices improved progressively from 48% in 1994 to 66% in 1997 ($p < 0.001$). Whereas recourse to handwashing with soap and water remained stable, frequency of hand disinfection markedly increased during the study period ($p < 0.001$), and the consumption of alcohol-based hand-rub solution increased from 3.5 to 15.4 liters per 1,000 patient-days during 1993–1998 ($p < 0.001$). The increased frequency of hand disinfection was unchanged after adjustment for known risk factors of poor adherence. During the same period, both overall health-care–associated infection and MRSA transmission rates decreased (both $p < 0.05$). The observed reduction in MRSA transmission may have been affected by both improved hand-hygiene adherence and the simultaneous implementation of active surveillance cultures for detecting and isolating patients colonized with MRSA (*332*). The experience from the University of Geneva hospitals constitutes the first report of a hand-hygiene campaign with a sustained improvement over several years. An additional multimodal program also yielded sustained improvements in hand-hygiene practices over an extended period (*75*); the majority of studies have been limited to a 6- to 9-month observation period.

Although these studies were not designed to assess the independent contribution of hand hygiene on the prevention of health-care–associated infections, the results indicate that

improved hand-hygiene practices reduce the risk of transmission of pathogenic microorganisms. The beneficial effects of hand-hygiene promotion on the risk of cross-transmission also have been reported in surveys conducted in schools and day care centers (*333–338*), as well as in a community setting (*339–341*).

Other Policies Related to Hand Hygiene

Fingernails and Artificial Nails

Studies have documented that subungual areas of the hand harbor high concentrations of bacteria, most frequently coagulase-negative staphylococci, gram-negative rods (including *Pseudomonas* spp.), Corynebacteria, and yeasts (*14,342,343*). Freshly applied nail polish does not increase the number of bacteria recovered from periungual skin, but chipped nail polish may support the growth of larger numbers of organisms on fingernails (*344,345*). Even after careful handwashing or the use of surgical scrubs, personnel often harbor substantial numbers of potential pathogens in the subungual spaces (*346–348*).

Whether artificial nails contribute to transmission of health-care–associated infections is unknown. However, HCWs who wear artificial nails are more likely to harbor gram-negative pathogens on their fingertips than are those who have natural nails, both before and after handwashing (*347–349*). Whether the length of natural or artificial nails is a substantial risk factor is unknown, because the majority of bacterial growth occurs along the proximal 1 mm of the nail adjacent to subungual skin (*345,347,348*). Recently, an outbreak of *P. aeruginosa* in a neonatal intensive care unit was attributed to two nurses (one with long natural nails and one with long artificial nails) who carried the implicated strains of *Pseudomonas* spp. on their hands (*350*). Patients were substantially more likely than controls to have been cared for by the two nurses during the exposure period, indicating that colonization of long or artificial nails with *Pseudomonas* spp. may have contributed to causing the outbreak. Personnel wearing artificial nails also have been epidemiologically implicated in several other outbreaks of infection caused by gram-negative bacilli and yeast (*351–353*). Although these studies provide evidence that wearing artificial nails poses an infection hazard, additional studies are warranted.

Gloving Policies

CDC has recommended that HCWs wear gloves to 1) reduce the risk of personnel acquiring infections from patients, 2) prevent health-care worker flora from being transmitted to patients, and 3) reduce transient contamination of the hands of personnel by flora that can be transmitted from one patient to another (*354*). Before the emergence of the acquired immunodeficiency syndrome (AIDS) epidemic, gloves were worn primarily by personnel caring for patients colonized or infected with certain pathogens or by personnel exposed to patients with a high risk of hepatitis B. Since 1987, a dramatic increase in glove use has occurred in an effort to prevent transmission of HIV and other bloodborne pathogens from patients to HCWs (*355*). The Occupational Safety and Health Administration (OSHA) mandates that gloves be worn during all patient-care activities that may involve exposure to blood or body fluids that may be contaminated with blood (*356*).

The effectiveness of gloves in preventing contamination of HCWs' hands has been confirmed in several clinical studies (*45,51,58*). One study found that HCWs who wore gloves during patient contact contaminated their hands with an average of only 3 CFUs per minute of patient care, compared with 16 CFUs per minute for those not wearing gloves (*51*). Two other studies, involving personnel caring for patients with *C. difficile* or VRE, revealed that wearing gloves prevented hand contamination among the majority of personnel having direct contact with patients (*45,58*). Wearing gloves also prevented personnel from acquiring VRE on their hands when touching contaminated environmental surfaces (*58*). Preventing heavy contamination of the hands is considered important, because handwashing or hand antisepsis may not remove all potential pathogens when hands are heavily contaminated (*25,111*).

Several studies provide evidence that wearing gloves can help reduce transmission of pathogens in health-care settings. In a prospective controlled trial that required personnel to routinely wear vinyl gloves when handling any body substances, the incidence of *C. difficile* diarrhea among patients decreased from 7.7 cases/1,000 patient discharges before the intervention to 1.5 cases/1,000 discharges during the intervention (*226*). The prevalence of asymptomatic *C. difficile* carriage also decreased substantially on "glove" wards, but not on control wards. In intensive-care units where VRE or MRSA have been epidemic, requiring all HCWs to wear gloves to care for all patients in the unit (i.e., universal glove use) likely has helped control outbreaks (*357,358*).

The influence of glove use on the hand-hygiene habits of personnel is not clear. Several studies found that personnel who wore gloves were less likely to wash their hands upon leaving a patient's room (*290,320*). In contrast, two other studies found that personnel who wore gloves were substantially more likely to wash their hands after patient care (*87,301*).

The following caveats regarding use of gloves by HCWs must be considered. Personnel should be informed that gloves

do not provide complete protection against hand contamination. Bacterial flora colonizing patients may be recovered from the hands of ≤30% of HCWs who wear gloves during patient contact (*50,58*). Further, wearing gloves does not provide complete protection against acquisition of infections caused by hepatitis B virus and herpes simplex virus (*359,360*). In such instances, pathogens presumably gain access to the caregiver's hands via small defects in gloves or by contamination of the hands during glove removal (*50,321,359,361*).

Gloves used by HCWs are usually made of natural rubber latex and synthetic nonlatex materials (e.g., vinyl, nitrile, and neoprene [polymers and copolymers of chloroprene]). Because of the increasing prevalence of latex sensitivity among HCWs and patients, FDA has approved several powdered and powder-free latex gloves with reduced protein contents, as well as synthetic gloves that can be made available by health-care institutions for use by latex-sensitive employees. In published studies, the barrier integrity of gloves varies on the basis of type and quality of glove material, intensity of use, length of time used, manufacturer, whether gloves were tested before or after use, and method used to detect glove leaks (*359,361–366*). In published studies, vinyl gloves have had defects more frequently than latex gloves, the difference in defect frequency being greatest after use (*359,361,364,367*). However, intact vinyl gloves provide protection comparable to that of latex gloves (*359*). Limited studies indicate that nitrile gloves have leakage rates that approximate those of latex gloves (*368–371*). Having more than one type of glove available is desirable, because it allows personnel to select the type that best suits their patient-care activities. Although recent studies indicate that improvements have been made in the quality of gloves (*366*), hands should be decontaminated or washed after removing gloves (*8,50,58,321,361*). Gloves should not be washed or reused (*321,361*). Use of petroleum-based hand lotions or creams may adversely affect the integrity of latex gloves (*372*). After use of powdered gloves, certain alcohol hand rubs may interact with residual powder on the hands of personnel, resulting in a gritty feeling on the hands. In facilities where powdered gloves are commonly used, various alcohol-based hand rubs should be tested after removal of powdered gloves to avoid selecting a product that causes this undesirable reaction. Personnel should be reminded that failure to remove gloves between patients may contribute to transmission of organisms (*358,373*).

Jewelry

Several studies have demonstrated that skin underneath rings is more heavily colonized than comparable areas of skin on fingers without rings (*374–376*). One study found that 40% of nurses harbored gram-negative bacilli (e.g., *E. cloacae*, *Klebsiella*, and *Acinetobacter*) on skin under rings and that certain nurses carried the same organism under their rings for several months (*375*). In a more recent study involving >60 intensive care unit nurses, multivariable analysis revealed that rings were the only substantial risk factor for carriage of gram-negative bacilli and *S. aureus* and that the concentration of organisms recovered correlated with the number of rings worn (*377*). Whether the wearing of rings results in greater transmission of pathogens is unknown. Two studies determined that mean bacterial colony counts on hands after handwashing were similar among persons wearing rings and those not wearing rings (*376,378*). Further studies are needed to establish if wearing rings results in greater transmission of pathogens in health-care settings.

Hand-Hygiene Research Agenda

Although the number of published studies concerning hand hygiene has increased considerably in recent years, many questions regarding hand-hygiene products and strategies for improving adherence of personnel to recommended policies remain unanswered. Several concerns must still be addressed by researchers in industry and by clinical investigators (Box 3).

Web-Based Hand-Hygiene Resources

Additional information regarding improving hand hygiene is available at http://www.hopisafe.ch

University of Pennsylvania, Philadelphia, Pennsylvania

BOX 3. Hand-hygiene research agenda

Education and promotion

- Provide health-care workers (HCWs) with better education regarding the types of patient care activities that can result in hand contamination and cross-transmission of microorganisms.
- Develop and implement promotion hand-hygiene programs in pregraduate courses.
- Study the impact of population-based education on hand-hygiene behavior.
- Design and conduct studies to determine if frequent glove use should be encouraged or discouraged.
- Determine evidence-based indications for hand cleansing (considering that it might be unrealistic to expect HCWs to clean their hands after every contact with the patient).
- Assess the key determinants of hand-hygiene behavior and promotion among the different populations of HCWs.
- Develop methods to obtain management support.
- Implement and evaluate the impact of the different components of multimodal programs to promote hand hygiene.

Hand-hygiene agents and hand care

- Determine the most suitable formulations for hand-hygiene products.
- Determine if preparations with persistent antimicrobial activity reduce infection rates more effectively than do preparations whose activity is limited to an immediate effect.
- Study the systematic replacement of conventional handwashing by the use of hand disinfection.
- Develop devices to facilitate the use and optimal application of hand-hygiene agents.
- Develop hand-hygiene agents with low irritancy potential.
- Study the possible advantages and eventual interaction of hand-care lotions, creams, and other barriers to help minimize the potential irritation associated with hand-hygiene agents.

Laboratory-based and epidemiologic research and development

- Develop experimental models for the study of cross-contamination from patient to patient and from environment to patient.
- Develop new protocols for evaluating the in vivo efficacy of agents, considering in particular short application times and volumes that reflect actual use in health-care facilities.
- Monitor hand-hygiene adherence by using new devices or adequate surrogate markers, allowing frequent individual feedback on performance.
- Determine the percentage increase in hand-hygiene adherence required to achieve a predictable risk reduction in infection rates.
- Generate more definitive evidence for the impact on infection rates of improved adherence to recommended hand-hygiene practices.
- Provide cost-effectiveness evaluation of successful and unsuccessful promotion campaigns.

Part II. Recommendations

Categories

These recommendations are designed to improve hand-hygiene practices of HCWs and to reduce transmission of pathogenic microorganisms to patients and personnel in health-care settings. This guideline and its recommendations are not intended for use in food processing or food-service establishments, and are not meant to replace guidance provided by FDA's Model Food Code.

As in previous CDC/HICPAC guidelines, each recommendation is categorized on the basis of existing scientific data, theoretical rationale, applicability, and economic impact. The CDC/HICPAC system for categorizing recommendations is as follows:

Category IA. Strongly recommended for implementation and strongly supported by well-designed experimental, clinical, or epidemiologic studies.

Category IB. Strongly recommended for implementation and supported by certain experimental, clinical, or epidemiologic studies and a strong theoretical rationale.

Category IC. Required for implementation, as mandated by federal or state regulation or standard.

Category II. Suggested for implementation and supported by suggestive clinical or epidemiologic studies or a theoretical rationale.

No recommendation. Unresolved issue. Practices for which insufficient evidence or no consensus regarding efficacy exist.

Recommendations

1. Indications for handwashing and hand antisepsis
   - A. When hands are visibly dirty or contaminated with proteinaceous material or are visibly soiled with blood or other body fluids, wash hands with either a non-antimicrobial soap and water or an antimicrobial soap and water (IA) (*66*).
   - B. If hands are not visibly soiled, use an alcohol-based hand rub for routinely decontaminating hands in all other clinical situations described in items 1C–J (IA) (*74,93,166,169,283,294,312,398*). Alternatively, wash hands with an antimicrobial soap and water in all clinical situations described in items 1C–J (IB) (*69-71,74*).
   - C. Decontaminate hands before having direct contact with patients (IB) (*68,400*).
   - D. Decontaminate hands before donning sterile gloves when inserting a central intravascular catheter (IB) (*401,402*).
   - E. Decontaminate hands before inserting indwelling urinary catheters, peripheral vascular catheters, or other invasive devices that do not require a surgical procedure (IB) (*25,403*).
   - F. Decontaminate hands after contact with a patient's intact skin (e.g., when taking a pulse or blood pressure, and lifting a patient) (IB) (*25,45,48,68*).
   - G. Decontaminate hands after contact with body fluids or excretions, mucous membranes, nonintact skin, and wound dressings if hands are not visibly soiled (IA) (*400*).
   - H. Decontaminate hands if moving from a contaminated-body site to a clean-body site during patient care (II) (*25,53*).
   - I. Decontaminate hands after contact with inanimate objects (including medical equipment) in the immediate vicinity of the patient (II) (*46,53,54*).
   - J. Decontaminate hands after removing gloves (IB) (*50,58,321*).
   - K. Before eating and after using a restroom, wash hands with a non-antimicrobial soap and water or with an antimicrobial soap and water (IB) (*404-409*).
   - L. Antimicrobial-impregnated wipes (i.e., towelettes) may be considered as an alternative to washing hands with non-antimicrobial soap and water. Because they are not as effective as alcohol-based hand rubs or washing hands with an antimicrobial soap and water for reducing bacterial counts on the hands of HCWs, they are not a substitute for using an alcohol-based hand rub or antimicrobial soap (IB) (*160,161*).
   - M. Wash hands with non-antimicrobial soap and water or with antimicrobial soap and water if exposure to *Bacillus anthracis* is suspected or proven. The physical action of washing and rinsing hands under such circumstances is recommended because alcohols, chlorhexidine, iodophors, and other antiseptic agents have poor activity against spores (II) (*120,172, 224,225*).
   - N. No recommendation can be made regarding the routine use of nonalcohol-based hand rubs for hand hygiene in health-care settings. Unresolved issue.
2. Hand-hygiene technique
   - A. When decontaminating hands with an alcohol-based hand rub, apply product to palm of one hand and rub hands together, covering all surfaces of hands and fingers, until hands are dry (IB) (*288,410*). Follow the manufacturer's recommendations regarding the volume of product to use.
   - B. When washing hands with soap and water, wet hands first with water, apply an amount of product recommended by the manufacturer to hands, and rub hands together vigorously for at least 15 seconds, covering all surfaces of the hands and fingers. Rinse hands with water and dry thoroughly with a disposable towel. Use towel to turn off the faucet (IB) (*90-92,94,411*). Avoid using hot water, because repeated exposure to hot water may increase the risk of dermatitis (IB) (*254,255*).
   - C. Liquid, bar, leaflet or powdered forms of plain soap are acceptable when washing hands with a non-antimicrobial soap and water. When bar soap is used, soap racks that facilitate drainage and small bars of soap should be used (II) (*412-415*).
   - D. Multiple-use cloth towels of the hanging or roll type are not recommended for use in health-care settings (II) (*137,300*).
3. Surgical hand antisepsis
   - A. Remove rings, watches, and bracelets before beginning the surgical hand scrub (II) (*375,378,416*).
   - B. Remove debris from underneath fingernails using a nail cleaner under running water (II) (*14,417*).

C. Surgical hand antisepsis using either an antimicrobial soap or an alcohol-based hand rub with persistent activity is recommended before donning sterile gloves when performing surgical procedures (IB) (*115,159,232,234,237,418*).

D. When performing surgical hand antisepsis using an antimicrobial soap, scrub hands and forearms for the length of time recommended by the manufacturer, usually 2–6 minutes. Long scrub times (e.g., 10 minutes) are not necessary (IB) (*117,156,205, 207,238-241*).

E. When using an alcohol-based surgical hand-scrub product with persistent activity, follow the manufacturer's instructions. Before applying the alcohol solution, prewash hands and forearms with a non-antimicrobial soap and dry hands and forearms completely. After application of the alcohol-based product as recommended, allow hands and forearms to dry thoroughly before donning sterile gloves (IB) (*159,237*).

4. Selection of hand-hygiene agents

A. Provide personnel with efficacious hand-hygiene products that have low irritancy potential, particularly when these products are used multiple times per shift (IB) (*90,92,98,166,249*). This recommendation applies to products used for hand antisepsis before and after patient care in clinical areas and to products used for surgical hand antisepsis by surgical personnel.

B. To maximize acceptance of hand-hygiene products by HCWs, solicit input from these employees regarding the feel, fragrance, and skin tolerance of any products under consideration. The cost of hand-hygiene products should not be the primary factor influencing product selection (IB) (*92,93,166, 274,276-278*).

C. When selecting non-antimicrobial soaps, antimicrobial soaps, or alcohol-based hand rubs, solicit information from manufacturers regarding any known interactions between products used to clean hands, skin care products, and the types of gloves used in the institution (II) (*174,372*).

D. Before making purchasing decisions, evaluate the dispenser systems of various product manufacturers or distributors to ensure that dispensers function adequately and deliver an appropriate volume of product (II) (*286*).

E. Do not add soap to a partially empty soap dispenser. This practice of "topping off" dispensers can lead to bacterial contamination of soap (IA) (*187,419*).

5. Skin care

A. Provide HCWs with hand lotions or creams to minimize the occurrence of irritant contact dermatitis associated with hand antisepsis or handwashing (IA) (*272,273*).

B. Solicit information from manufacturers regarding any effects that hand lotions, creams, or alcohol-based hand antiseptics may have on the persistent effects of antimicrobial soaps being used in the institution (IB) (*174,420,421*).

6. Other Aspects of Hand Hygiene

A. Do not wear artificial fingernails or extenders when having direct contact with patients at high risk (e.g., those in intensive-care units or operating rooms) (IA) (*350–353*).

B. Keep natural nails tips less than 1/4-inch long (II) (*350*).

C. Wear gloves when contact with blood or other potentially infectious materials, mucous membranes, and nonintact skin could occur (IC) (*356*).

D. Remove gloves after caring for a patient. Do not wear the same pair of gloves for the care of more than one patient, and do not wash gloves between uses with different patients (IB) (*50,58,321,373*).

E. Change gloves during patient care if moving from a contaminated body site to a clean body site (II) (*50,51,58*).

F. No recommendation can be made regarding wearing rings in health-care settings. Unresolved issue.

7. Health-care worker educational and motivational programs

A. As part of an overall program to improve hand-hygiene practices of HCWs, educate personnel regarding the types of patient-care activities that can result in hand contamination and the advantages and disadvantages of various methods used to clean their hands (II) (*74,292,295,299*).

B. Monitor HCWs' adherence with recommended hand-hygiene practices and provide personnel with information regarding their performance (IA) (*74,276,292,295,299,306,310*).

C. Encourage patients and their families to remind HCWs to decontaminate their hands (II) (*394,422*).

8. Administrative measures

A. Make improved hand-hygiene adherence an institutional priority and provide appropriate

administrative support and financial resources (IB) (*74,75*).

B. Implement a multidisciplinary program designed to improve adherence of health personnel to recommended hand-hygiene practices (IB) (*74,75*).

C. As part of a multidisciplinary program to improve hand-hygiene adherence, provide HCWs with a readily accessible alcohol-based hand-rub product (IA) (*74,166,283,294,312*).

D. To improve hand-hygiene adherence among personnel who work in areas in which high workloads and high intensity of patient care are anticipated, make an alcohol-based hand rub available at the entrance to the patient's room or at the bedside, in other convenient locations, and in individual pocket-sized containers to be carried by HCWs (IA) (*11,74,166,283,284,312,318,423*).

E. Store supplies of alcohol-based hand rubs in cabinets or areas approved for flammable materials (IC).

Part III. Performance Indicators

1. The following performance indicators are recommended for measuring improvements in HCWs' hand-hygiene adherence:

   A. Periodically monitor and record adherence as the number of hand-hygiene episodes performed by personnel/number of hand-hygiene opportunities, by ward or by service. Provide feedback to personnel regarding their performance.

   B. Monitor the volume of alcohol-based hand rub (or detergent used for handwashing or hand antisepsis) used per 1,000 patient-days.

   C. Monitor adherence to policies dealing with wearing of artificial nails.

   D. When outbreaks of infection occur, assess the adequacy of health-care worker hand hygiene.

Appendix

Antimicrobial Spectrum and Characteristics of Hand-Hygiene Antiseptic Agents*

Group	Gram-positive bacteria	Gram-negative bacteria	Mycobacteria	Fungi	Viruses	Speed of action	Comments
Alcohols	+++	+++	+++	+++	+++	Fast	Optimum concentration 60%–95%; no persistent activity
Chlorhexidine (2% and 4% aqueous)	+++	++	+	+	+++	Intermediate	Persistent activity; rare allergic reactions
Iodine compounds	+++	+++	+++	++	+++	Intermediate	Causes skin burns; usually too irritating for hand hygiene
Iodophors	+++	+++	+	++	++	Intermediate	Less irritating than iodine; acceptance varies
Phenol derivatives	+++	+	+	+	+	Intermediate	Activity neutralized by nonionic surfactants
Tricolsan	+++	++	+	—	+++	Intermediate	Acceptability on hands varies
Quaternary ammonium compounds	+	++	—	—	+	Slow	Used only in combination with alcohols; ecologic concerns

Note: +++ = excellent; ++ = good, but does not include the entire bacterial spectrum; + = fair; — = no activity or not sufficient.
* Hexachlorophene is not included because it is no longer an accepted ingredient of hand disinfectants.

MMWR™

Morbidity and Mortality Weekly Report

Recommendations and Reports October 25, 2002 / Vol. 51 / No. RR-16

Continuing Education Activity Sponsored by CDC
Guideline for Hand Hygiene in Health-Care Settings

Recommendations of the Healthcare Infection Control Practices Advisory Committee and the HICPAC/SHEA/APIC/IDSA Hand Hygiene Task Force

EXPIRATION — October 25, 2004

You must complete and return the response form electronically or by mail by **October 25, 2004**, to receive continuing education credit. If you answer all of the questions, you will receive an award letter for 1.75 hours Continuing Medical Education (CME) credit; 0.15 Continuing Education Units (CEUs); 1.5 hours Certified Health Education Specialist (CHES) credit; or 1.9 contact hours Continuing Nursing Education (CNE) credit. If you return the form electronically, you will receive educational credit immediately. If you mail the form, you will receive educational credit in approximately 30 days. No fees are charged for participating in this continuing education activity.

INSTRUCTIONS

By Internet

1. Read this *MMWR* (Vol. 51, RR-16), which contains the correct answers to the questions beginning on the next page.
2. Go to the *MMWR* Continuing Education Internet site at <http://www.cdc.gov/mmwr/cme/conted.html>.
3. Select which exam you want to take and select whether you want to register for CME, CEU, CHES, or CNE credit.
4. Fill out and submit the registration form.
5. Select exam questions. To receive continuing education credit, you must answer all of the questions. Questions with more than one correct answer will instruct you to "Indicate all that apply."
6. Submit your answers no later than **October 25, 2004**.
7. Immediately print your Certificate of Completion for your records.

By Mail or Fax

1. Read this *MMWR* (Vol. 50, RR-16), which contains the correct answers to the questions beginning on the next page.
2. Complete all registration information on the response form, including your name, mailing address, phone number, and e-mail address, if available.
3. Indicate whether you are registering for CME, CEU, CHES, or CNE credit.
4. Select your answers to the questions, and mark the corresponding letters on the response form. To receive continuing education credit, you must answer all of the questions. Questions with more than one correct answer will instruct you to "Indicate all that apply."
5. Sign and date the response form or a photocopy of the form and send no later than **October 25, 2004**, to
   Fax: 404-639-4198 Mail: MMWR CE Credit
   Office of Scientific and Health Communications
   Epidemiology Program Office, MS C-08
   Centers for Disease Control and Prevention
   1600 Clifton Rd, N.E.
   Atlanta, GA 30333
6. Your Certificate of Completion will be mailed to you within 30 days.

ACCREDITATION

Continuing Medical Education (CME). CDC is accredited by the Accreditation Council for Continuing Medical Education (ACCME) to provide continuing medical education for physicians. CDC designates this educational activity for a maximum of 1.75 hours in category 1 credit toward the AMA Physician's Recognition Award. Each physician should claim only those hours of credit that he/she actually spent in the educational activity.

Continuing Education Unit (CEU). CDC has been approved as an authorized provider of continuing education and training programs by the International Association for Continuing Education and Training and awards 0.15 Continuing Education Units (CEUs).

Certified Health Education Specialist (CHES). CDC is a designated provider of continuing education contact hours in health education by the National Commission for Health Education Credentialing, Inc. This program is a designated event for CHES to receive 1.5 hours in category 1 credit in health education, CDC provider number GA0082.

Continuing Nursing Education (CNE). This activity for 1.9 contact hours is provided by CDC, which is accredited as a provider of continuing education in nursing by the American Nurses Credentialing Center's Commission on Accreditation.

Goal and Objectives

This *MMWR* provides evidence-based recommendations for hand hygiene in health-care settings. These recommendations were developed by the Healthcare Infection Control Practices Advisory Committee (HICPAC), the Society for Healthcare Epidemiology of America, the Association for Professionals in Infection Control and Epidemiology, and the Infectious Diseases Society of America Hand Hygiene Task Force. The goal of this report is to provide guidance for clinicians and other health-care practitioners regarding strategies to improve hand-hygiene practices and reduce transmission of microorganisms in health-care settings. Upon completion of this educational activity, the reader should be able to 1) describe the indications for hand hygiene in health-care settings; 2) list the advantages of alcohol-based hand rubs; and 3) describe the barriers to hand hygiene in health-care settings.

To receive continuing education credit, please answer all of the following questions.

1. Hand hygiene refers to . . .
- A. handwashing using plain soap and water.
- B. using an antiseptic hand rub (e.g alcohol, chlorhexidine, iodine).
- C. handwashing using antimicrobial soap and water.
- D. all of the above.

2. Hand hygiene adherence in health-care facilities might be improved by . . .
- A. providing personnel with individual containers of alcohol-based hand rubs.
- B. providing personnel with hand lotions or creams.
- C. providing personnel with feedback regarding hand-hygiene adherence/performance.
- D. all of the above.

3. Alcohol-based hand rubs have good or excellent antimicrobial activity against all of the following except . . .
- A. viruses.
- B. fungi.
- C. mycobacteria.
- D. bacterial spores.
- E. gram-positive and gram-negative bacteria.

4. Alcohol-based hand rubs are indicated for all of the following clinical situations except . . .
- A. when the hands are visibly soiled.
- B. preoperative cleaning of hands by surgical personnel.
- C. before inserting urinary catheters, intravascular catheters, or other invasive devices.
- D. after removing gloves.

5. Each of the following statements regarding alcohol-based hand rubs is true except . . .
- A. alcohol-based hand rubs reduce bacterial counts on the hands of health-care personnel more effectively than plain soaps.
- B. alcohol-based hand rubs can be made more accessible than sinks or other handwashing facilities.
- C. alcohol-based hand rubs require less time to use than traditional handwashing.
- D. alcohol-based hand rubs have been demonstrated to cause less skin irritation and dryness than handwashing using soap and water.
- E. alcohol-based hand rubs are only effective if they are applied for ≥60 seconds.

6. Which of the following statements regarding preoperative surgical hand antisepsis is true?
- A. Antimicrobial counts on hands are reduced as effectively with a 5-minute scrub as with a 10-minute scrub.
- B. A brush or sponge must be used when applying the antiseptic agent to adequately reduce bacterial counts on hands.
- C. Alcohol-based hand rubs for preoperative surgical scrub have been associated with increased surgical site infection rates.
- D. A and B are true.
- E. A and C are true.

7. Antimicrobial-impregnated wipes (i.e., towelettes) . . .
- A. might be considered as an alternative to handwashing with plain soap and water.
- B. are as effective as alcohol-based hands rubs.
- C. are as effective as washing hands with antimicrobial soap and water.
- D. A and C.

8. The following statements regarding hand hygiene in health-care settings are true except . . .
- A. Overall adherence among health-care personnel is approximately 40%.
- B. Poor adherence to hand-hygiene practice is a primary contributor to health-care–associated infection and transmission of antimicrobial-resistant pathogens.
- C. Personnel wearing artificial nails or extenders have been linked to nosocomial outbreaks.
- D. Hand hygiene is not necessary if gloves are worn.

9. Indicate your work setting.
- A. State/local health department.
- B. Other public health setting.
- C. Hospital clinic/private practice.
- D. Managed care organization.
- E. Academic institution.
- F. Other.

10. Which best describes your professional activities?
- A. Patient care — emergency/urgent care department.
- B. Patient care — inpatient.
- C. Patient care — primary-care clinic or office.
- D. Laboratory/pharmacy.
- E. Public health.
- F. Other.

11. I plan to use these recommendations as the basis for . . . (*Indicate all that apply.*)
- A. health education materials.
- B. insurance reimbursement policies.
- C. local practice guidelines.
- D. public policy.
- E. other.

12. Each month, approximately how many patients do you examine?
- A. None.
- B. 1–5.
- C. 6–20.
- D. 21–50.
- E. 51–100.
- F. >100.

13. How much time did you spend reading this report and completing the exam?
- A. 1–1.5 hours.
- B. More than 1.5 hours but fewer than 2 hours.
- C. 2–2.5 hours.
- D. More than 2.5 hours.

14. After reading this report, I am confident I can describe the guidance for clinicians and other health-care practitioners regarding strategies to improve hand-hygiene practices and reduce transmission of microorganisms in health-care settings.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

15. After reading this report, I am confident I can describe the indications for hand hygiene in health-care settings.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

16. After reading this report, I am confident I can list the advantages of alcohol-based hand rubs.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

17. After reading this report, I am confident I can describe the barriers to hand hygiene in health-care settings.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

18. The objectives are relevant to the goal of this report.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

19. The tables and text boxes are useful.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

20. Overall, the presentation of the report enhanced my ability to understand the material.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

MMWR Response Form for Continuing Education Credit
October 25, 2002/Vol. 51/No. RR-16
Guideline for Hand Hygiene in Health-Care Settings
Recommendations of the Healthcare Infection Control Practices Advisory Committee and the HICPAC/SHEA/APIC/IDSA Hand Hygiene Task Force

To receive continuing education credit, you must
1. provide your contact information;
2. indicate your choice of CME, CEU, CHES, or CNE credit;
3. answer all of the test questions;
4. sign and date this form or a photocopy;
5. submit your answer form by October 25, 2004.
Failure to complete these items can result in a delay or rejection of your application for continuing education credit.

Detach or photocopy.

Last Name *First Name*

Street Address or P.O. Box

Apartment *or* *Suite*

City *State* *ZIP Code*

Phone Number *Fax Number*

E-Mail Address

Check One
☐ *CME Credit*
☐ *CEU Credit*
☐ *CHES Credit*
☐ *CNE Credit*

Fill in the appropriate blocks to indicate your answers. Remember, you must answer all of the questions to receive continuing education credit!

1. [ ] A [ ] B [ ] C [ ] D	14. [ ] A [ ] B [ ] C [ ] D [ ] E	
2. [ ] A [ ] B [ ] C [ ] D	15. [ ] A [ ] B [ ] C [ ] D [ ] E	
3. [ ] A [ ] B [ ] C [ ] D [ ] E	16. [ ] A [ ] B [ ] C [ ] D [ ] E	
4. [ ] A [ ] B [ ] C [ ] D	17. [ ] A [ ] B [ ] C [ ] D [ ] E

13. [ ] A [ ] B [ ] C [ ] D		

Signature ***Date I Completed Exam***

21. These recommendations will affect my practice.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

22. The availability of continuing education credit influenced my decision to read this report.

A. Strongly agree.
B. Agree.
C. Neither agree nor disagree.
D. Disagree.
E. Strongly disagree.

23. How did you learn about this continuing education activity?

A. Internet.
B. Advertisement (e.g., fact sheet, *MMWR* cover, newsletter, or journal).
C. Coworker/supervisor.
D. Conference presentation.
E. *MMWR* subscription.
F. Other.

Correct answers for questions 1–8

1. D; 2. D; 3. D; 4. A; 5. E; 6. A; 7. A; 8. D.

Hospital Infection Control Practices Advisory Committee Members

Chair: Robert A. Weinstein, M.D., Cook County Hospital, Chicago, Illinois.

Co-Chair: Jane D. Siegel, M.D., University of Texas Southwestern Medical Center, Dallas, Texas.

Executive Secretary: Michele L. Pearson, M.D. CDC, Atlanta, Georgia.

Members: Raymond Y.W. Chinn, M.D., Sharp Memorial Hospital, San Diego, California; Alfred DeMaria, Jr, M.D., Massachusetts Department of Public Health, Jamaica Plain, Massachusetts; Elaine L. Larson, Ph.D., Columbia University School of Nursing, New York, New York; James T. Lee, M.D., Ph.D., University of Minnesota, Minneapolis, Minnesota; Ramon E. Moncada, M.D., Coronado Physician's Medical Center, Coronado, California; William A. Rutala, Ph.D., University of North Carolina, Chapel Hill, North Carolina; William E. Scheckler, M.D., University of Wisconsin, Madison, Wisconsin; and Marjorie A. Underwood, Mt. Diablo Medical Center, Concord, California.

Hand Hygiene Task Force Members

Chair: John M. Boyce, M.D., Hospital of Saint Raphael, New Haven, Connecticut.

Members: Barry M. Farr, M.D., University of Virginia, Charlottesville, Virginia; William R. Jarvis, M.D., CDC, Atlanta, Georgia; Elaine L. Larson, Ph.D., Columbia School of Nursing, New York, New York; Maryanne McGuckin, DrScEd, University of Pennsylvania, Philadelphia, Pennsylvania; Carol O'Boyle, Ph.D., Minnesota Department of Health, Minneapolis, Minnesota; Didier Pittet, M.D., University of Geneva, Geneva, Switzerland; Jane D. Siegel, M.D., University of Texas Southwestern Medical Center, Dallas, Texas; Marjorie A. Underwood, Mt. Diablo Medical Center, Concord, California; Andreas F. Widmer, M.D., University Hospitals, Basel, Switzerland; Jolynn Zeller, Avera St. Lukes Hospital, Aberdeen, South Dakota; and Beth H. Stover, Kosair Children's Hospital, Louisville, Kentucky.

Disclosure of Financial Interests and Relationships

John Boyce: Research and educational grants from Gojo Industries; honorarium from Procter and Gamble; and consultant to Bode Chemical.

Barry Farr: Research support from Gojo Industries.

Elaine Larson: Received products for testing in research studies from Procter and Gamble, 3M Corporation, and Steris.

Carol O'Boyle: Honorarium from 3M Corporation.

Ozone Data for CFP 2023 (2012)

This document includes excerpts from “Ozone in Food Processing, First Edition” book written by P. J. Cullen and Rip Rice, published in 2012. In addition, there is a list of references used in developing this book, published efficacy lab testing and other relevant information summarized for the council to support the submitted issue.

Ozone in Food Processing, First Edition. Edited by Colm O’Donnell, B.K. Tiwari, P.J. Cullen, and Rip G. Rice.

15.3.3 Safety history of ozone in commercial/industrial applications

Ozone has been in commercial use for the treatment of drinking water since 1906, when the city of Nice, France installed ozone to disinfect mountain spring water. This Mediterranean resort town has now used ozone continually for the treatment of its drinking water for over 100 years without incident, and today thousands of potable water plants throughout the world

are also using this technology. Many of the most recent new-construction industrial plants, and even many older upgraded plants, use high-purity oxygen to generate ozone, without experiencing hazards, either from the ozone or from the high-purity oxygen. In these many drinking water plants, ozone is generated routinely in quantities ranging from grams per hour (small plants) up to tons per day (large municipal plants). Many other commercial/industrial applications for ozone also exist throughout the world, including pulp bleaching, kaolin bleaching, wastewater treatment and reuse, bottled water treatment, swimming pools, cooling towers, synthesis of nylon intermediates, air treatment, marine aquaria, aquaculture, food storage and processing plants, wineries and so on.

In the century that has passed since ozone was first installed in Nice, there has never been a reported death due to ozone exposure. Why? Because engineers were quick to recognize the potential danger to humans of ozone exposure. Consequently, processes involving ozone are routinely designed with appropriate precautions to avoid exposure of workers to ozone.

The situation is analogous to that of chlorine, also a very strong disinfectant and oxidizing agent, and a chlorinating agent as well. This chemical was used as a poison gas during World War I, and many troops were killed on both sides of the trenches when exposed to it. But today, chlorine is an essential industrial chemical used safely in tons/day quantities for a variety of commercial/industrial processes, all as a result of attention to the safety of humans handling this strong disinfecting, oxidizing and chlorinating material.

Ozone Data for CFP 2023 (2012)

15.2 Points of application of ozone during food processing

Specific health and safety aspects of ozone in food processing are direct functions of the presence of ozone at specific points in the processing plant. Because of ozone's great versatility as an oxidant/disinfectant, there are a great number of places within any food processing plant where it can be and is being utilized. These applications can be considered in the two primary categories of aqueous ozone and gaseous ozone phases. Wherever ozone is applied in a food processing plant there is a resultant safety responsibility.

15.2.1 Aqueous phase ozone applications

Ozone in aqueous solution can be used to process plant influent water and product water (such as juice products), to provide ozone-containing water for spray washing of incoming food products prior to processing, for treatment of process water (sometimes for reuse, sometimes prior to discharge), for spray washing food products, for sanitizing plant equipment (clean-in-place, CIP) and for spray sanitation of floors and drains, as well as of food contact and non-food contact surfaces (surface sanitation). Food transportation trucks can also benefit from spray washing of empty food containers and the truck interiors, not only to reduce levels of microorganisms present, but also to destroy odors, colors and flavors and prevent odor transfers between foods during shipments. Ozone-containing water can be fed to an ice-making machine, where the small amount of ozone that off-gasses then gathers at the bottom of the ice storage chamber (the density of ozone gas is slightly higher than that of air) and its presence maintains the ice and chamber slime-free. When ozone is applied to treat a food processing plant's influent or effluent waters or to treat food processing waters for reuse, the water/ wastewater equipment is usually designed and operated as a mini-water/ wastewater treatment plant. Such subunits normally will be an adjunct to, but not an integral part of, the food storage and food processing lines. Consequently, system equipment will be designed with all of the necessary controls to ensure that no ozone will escape to come in contact with humans in those subunit areas.

Surface Sanitation. Another common application of ozone is for food contact surface sanitation. The inclusion of ozone-containing water within clean-in-place (CIP) cycles offers opportunities to food processors to treat manufacturing plant surfaces more efficiently and with greater efficacy. Aqueous ozone can also be used as a sanitizing rinse for food contact surfaces, such as cutting tables, as well as for nonfood contact surfaces, such as floors. Ozone can also be used to treat aseptic food packaging materials for surface disinfection.

Ozone Data for CFP 2023 (2012)

Opportunities for the Future

Interest in ozone is expected to continue to rise in response to consumer demands for environmentally friendly food processing technologies. A recent publication mapped trends in implementation or potential for implementation of ozone in the food industry. It found that ozone scored very high in terms of potential applications for fresh produce, seafood, and beverages. Another potential future application for ozone is its use to degrade pesticide residues, including organophosphates and organochlorinated compounds. As with many process technologies, ozone also has good potential for use as a hurdle technology to be combined with other sanitation and disinfection technologies to improve the safety of foods and beverages while extending their shelf life.

15.4.4 Third-party evaluation of aqueous ozone spray wash equipment

In 2002, the Toxicology Group, a wholly owned company of NSF International (Ann Arbor MI), conducted detailed third-party efficacy and hazard assessments and analyses for DEL Agricultural (a subsidiary of DEL Ozone, San Luis Obispo, CA) and Air Liquide America. Two devices (DEL AGW-0500 Mobile Ozone Surface Sanitation System, AL SSS 0500 Mobile Ozone Surface Sanitation System, and the DEL AGW-1500G Mobile Recirculating Ozone Sanitation System, AL SSS 1500 Mobile Recirculating Ozone Sanitation System) are manufactured by DEL Ozone and marketed by these two firms for spray washing applications in food processing plants. Both models are mobile. One provides a 10 gal/min water spray with a 3.0–3.5 ppm applied ozone dose, and is designed to sanitise equipment, walls, floors, drains, tables, conveyors, containers, tanks and barrels. The other, designed for CIP and COP (clean-out-of-place) processes, recirculates ozone-containing water at 35 gal/min with a 3.0 ppm applied ozone dose through tanks ranging in size from 50 to 2500 gallons. In any of these systems, the residual ozone dose that is applied as a spray is in the range of 1.5–2.0 ppm; and in the case of the recirculation system, the residual ozone dose is monitored and controlled at 2.0–2.5 ppm.

Third-party efficacy testing:

The methods used for the efficacy tests were AOAC Official Methods 960.09, Germicidal and Detergent Sanitizing Action of Disinfectants, and 961.02, Germicidal Spray Products as Disinfectants (Boisrobert 2002). Ozone spray washing was conducted on samples of individual microorganisms listed in Table 15.3, which also shows the number of log reductions obtained for each microorganism tested. Each microorganism received an ozone dosage of 1.85–2.25 ppm from the spray nozzle, except for *Escherichia coli*, which received an ozone dosage of 2.1 ppm.

Table 15.3 Efficacy testing of mobile ozone surface washing system (Boisrobert 2002; cited in Pascual et al. 2007).:

Microorganism	Log reduction
Trichophyton mentagrophytes (ATCC 9533)	6
Salmonella choleraesuis (ATCC 9533)	6
Staphylococcus aureus (ATCC 6358)	6
Pseudomonas aeruginosa (ATCC 15442)	6
Campylobacter jejuni (ATCC 33250)	4
Listeria monocytogenes (ATCC 7644)	4
Aspergillus flavus (ATCC 9296)	4
Brettanomyces bruxellensis (ATCC 10560)	4
Escherichia coli (ATCC 11229)	5

The results obtained (log reductions of 4–6 for the nine microorganisms tested) substantiate the efficacy of these two systems in sanitising previously cleaned nonporous surfaces, including processing equipment, which has come into contact with food (Pascual et al. 2007).

Efficacy of Ozonated Water against Various Food-Related Microorganisms

LAWRENCE RESTAINO,[1]* ELON W. FRAMPTON,[1] JENIFER B. HEMPHILL,[1] AND PAUL PALNIKAR[2]

R & F Laboratories, Inc., Bridgeview, Illinois,[1] and Apex Associates, Southfield, Michigan[2]

Received 15 February 1995/Accepted 8 June 1995

The antimicrobial effects of ozonated water in a recirculating concurrent reactor were evaluated against four gram-positive and four gram-negative bacteria, two yeasts, and spores of *Aspergillus niger*. More than 5 log units each of *Salmonella typhimurium* and *Escherichia coli* cells were killed instantaneously in ozonated water with or without addition of 20 ppm of soluble starch (SS). In ozonated water, death rates among the gram-negative bacteria—*S. typhimurium*, *E. coli*, *Pseudomonas aeruginosa*, and *Yersinia enterocolitica*—were not significantly different ($P > 0.05$). Among gram-positive bacteria, *Listeria monocytogenes* was significantly ($P < 0.05$) more sensitive than either *Staphylococcus aureus* or *Enterococcus faecalis*. In the presence of organic material, death rates of *S. aureus* compared with *L. monocytogenes* and *E. coli* compared with *S. typhimurium* in ozonated water were not significantly ($P > 0.05$) affected by SS addition but were significantly reduced ($P < 0.05$) by addition of 20 ppm of bovine serum albumin (BSA). More than 4.5 log units each of *Candida albicans* and *Zygosaccharomyces bailii* cells were killed instantaneously in ozonated water, whereas less than 1 log unit of *Aspergillus niger* spores was killed after a 5-min exposure. The average ozone output levels in the deionized water (0.188 mg/ml) or water with SS (0.198 mg/ml) did not differ significantly ($P < 0.05$) but were significantly lower in water containing BSA (0.149 mg/ml).

"The treatment of domestic water to provide a microbiologically safe, aesthetic, potable end product has been normal practice since before the turn of the twentieth century" (5). Chlorine at low concentrations has been the usual agent of choice in drinking-water purification. At the low concentrations of chlorine used, however, its limitations as a bactericide (3, 4) as well as limitations in its effectiveness against certain eukaryotic pathogens and viruses (18, 20, 21, 25, 27) have been recognized. Furthermore, chlorine at low concentrations may alter certain organic compounds in water producing off tastes and odors as well as forming chloro-organic compounds with carcinogenic potential (22).

As an alternative to chlorination in drinking-water disinfection, ozonation of water supplies, which was done first a century ago (29), has become an established means of disinfection and has been reviewed by Rice et al. (25). Bacteria, including *Escherichia coli*, *Staphylococcus aureus*, *Bacillus cereus*, *Bacillus megaterium*, *Salmonella typhimurium*, *Shigella flexneri*, and *Vibrio cholerae* are sensitive to ozonated water under various conditions (5, 6, 13, 17). Limited information on ozone's effectiveness against bacterial endospores (5, 17) and viruses (6, 20) as well as against eukaryotic pathogens including *Cryptosporidium parvum* (11, 21, 24) and *Giardia lamblia* and *Giardia muris* (12, 31, 32) also exists.

The use of ozone in the food industry has been investigated for food preservation, shelf life extension, equipment sterilization, and improvement of food plant effluents (9, 14, 19, 28).

The purpose of this investigation was to determine the antimicrobial efficacy of ozonated deionized water (with and without added organic material) generated by a recirculating ozone reactor (Lifex EV 2000R) against various heterotrophic bacteria and fungi important in the food industry as pathogens, spoilage organisms, and indicators of fecal contamination.

Pseudomonas aeruginosa ATCC 15442, *E. coli* ATCC 25922, *S. typhimurium* ATCC 6994, *S. aureus* ATCC 6538, *B. cereus* (food isolate), *Listeria monocytogenes* 4b (courtesy of Silliker Laboratories, Chicago Heights, Ill.), *Enterococcus faecalis* (food isolate), *Yersinia enterocolitica* ATCC 27729, *Candida albicans* ATCC 22572, *Zygosaccharomyces bailii* (purchased from Silliker Laboratories; isolated from mayonnaise), and *Aspergillus niger* (courtesy of James Grosklags, Northern Illinois University, DeKalb) were used in this investigation. The bacterial cultures were maintained on Difco (Detroit, Mich.) brain heart infusion agar slants except for *E. faecalis*, which was stored on Difco APT agar slants. All the bacterial cultures were stored at 4 to 6°C and transferred every 4 weeks. The two yeast cultures and *A. niger* were maintained on Difco potato dextrose agar slants, stored at 4 to 6°C, and transferred every 12 weeks. Loopfuls of cells from each of the bacterial strains except *E. faecalis* were aseptically transferred into 40 ml of brain heart infusion broth in 250-ml Erlenmeyer flasks and incubated at 35°C for 24 h, whereas *B. cereus* cells were incubated at 30°C for 24 h. *E. faecalis* cells were transferred to 40 ml of Difco APT broth in 250-ml Erlenmeyer flasks and incubated at 30°C for 24 h. For *C. albicans* and *Z. bailii*, loopfuls of cells were transferred to 40 ml of Difco potato dextrose broth in 250-ml Erlenmeyer flasks, placed in a gyratory water bath shaker model G76 (New Brunswick Scientific, Edison, N.J.) (100 to 125 rpm), and incubated at room temperature (18 to 22°C) for 48 h. After incubation, 30-ml volumes of each culture were centrifuged at 1,450 × *g* for 25 min at room temperature. The pellets were resuspended in 20 ml of sterile saline and centrifuged again at 1,450 × *g* for 25 min. After the second centrifugation, the pellets were resuspended in 10 ml of sterile saline. For the tests with soluble starch (SS; Fischer Chemical, Fairlawn, N.J.) and bovine serum albumin (BSA; Fraction V 96 to 99% albumin; Sigma, St. Louis, Mo.), the pellets were

* Corresponding author. Mailing address: R & F Laboratories, Inc., 7510 W. 99th Pl. Bridgeview, IL 60455. Phone: (708) 598-2410. Fax: (708) 430-2161.

resuspended in 10 ml of sterile saline containing 20 ppm (20 mg/liter) of the corresponding organic material.

For *A. niger*, the spores from the stock culture were aseptically transferred to two potato dextrose agar slants and incubated at room temperature (18 to 22°C) for 8 days. After incubation, 15 ml of sterile 0.05% Triton X-100 (Sigma) was added to each tube and the spores were resuspended by using a vortex mixer (Baxter, McGaw Park, Ill.). The spore suspensions were centrifuged as described above, and the final pellet was resuspended in 15 ml of sterile saline. All washed cells and spores were chilled before use.

Ozone levels (in milligrams per liter) were measured by the indigo colorimetric method (1). Ozonated water was generated by a Lifex ozone apparatus (model EV 2000 R; Life Ozone Corp., Southfield, Mich.) using a 115 to 120 variable alternating current power source.

Duplicate ozone determinations of uninoculated solutions were performed directly at the generator outlet faucet and in the reservoir near the inlet tube before each organism was passed through the ozone apparatus. A concurrent system in which the ozone gas and water flowed in the same direction was used in this investigation. According to Lev and Regli (23), ozone concentrations (in milligrams per liter) can be conservatively measured in a "cocurrent" (sic) system in two ways: (i) outlet faucet concentration (C_{out}) and (ii) average concentration (C_{avg}), calculated as (C_{out} + inlet C_0)/2, where C_0 is the concentration near the inlet. Since C_0 was substantially lower in our system, C_{out} was a better measure for determining overall ozone concentration versus antimicrobial efficacy (23).

The antimicrobial effects of ozone were determined in deionized water with or without added organic material in the form of 20 ppm of SS or BSA, which may simulate organic levels in treated wastewater (30). BSA was dissolved directly in the deionized water, whereas SS was first dissolved by boiling a concentrated solution in deionized water before diluting. All solutions were ozonated at room temperature (19 to 21°C). The pH levels of nonozonated deionized water and ozonated deionized water were 5.7 and 6.1, respectively, whereas before and after ozonation in the presence of SS the pH remained at 6.0. In the presence of BSA, the pH was reduced from 6.4 to 6.0 after ozonation.

To a previously sanitized (70% ethanol followed by air drying) polyethylene container (capacity, 3.785 liters), 1.5 liters of deionized water with or without 20 ppm of SS or BSA was added. Four milliliters of washed cells or spores was pipetted into the polyethylene container, and the contents were stirred, yielding approximately 10^6 cells or spores per ml. Triplicate samples were extracted from the container to determine the initial cell or spore concentrations before ozonation. The ozone apparatus was equipped with a peristaltic pump producing a constant flow rate of 660 ml/30.0 s and an outlet faucet with an on-and-off lever. The hoses attached to and contained inside the ozone apparatus had a total volume of 150 ml. The hose attached to the peristaltic pump was primed and placed in uninoculated water while the faucet in the open position was placed over an empty container. The ozone apparatus was turned on, and the uninoculated water was pumped through the machine for 15 s, allowing approximately 330 ml to flush through the system. While still on, the inlet hose was momentarily blocked aseptically, removed from the uninoculated deionized water, and immediately immersed into the inoculated menstruum. After the uninoculated deionized water was allowed to purge the system for 25 s, a minimum of 400 ml of the inoculated suspension was flushed through the system and a sample designated "time zero" was taken. Immediately after the time zero sample, the faucet was placed in the inoculated container just over the water level, forming a recirculation loop. During inoculum recirculation, samples were taken after 1, 2, and 5 min. Final volumes in the container and ozone apparatus ranged from 1.0 to 1.1 liter with a recirculation rate of 47 s. A minimum of two separate evaluations were made for each organism.

After each run, the inlet hose was immersed in 1.0 liter of deionized water and the ozone apparatus was completely cleansed and rinsed. The apparatus was disassembled, and all hoses, the polyethylene container, beakers, and screens were sanitized with 70% ethanol and air dried. The apparatus was reassembled, and 1 liter of uninoculated deionized water was pumped through the system. Samples taken to check for residual contamination showed <10 cells or spores per ml.

Samples were collected from the ozone faucet into sterile test tubes (16 by 125 mm) and 1.1 ml was immediately pipetted into 10 ml of Difco D/E neutralizing broth and subjected to vortex mixing. Sterile deionized water was used for all subsequent dilutions. The pour plate technique was used to enumerate the surviving cells and spores. All platings were performed in duplicate. For all bacterial strains, except *E. faecalis*, Difco tryptic soy agar was used, whereas Difco APT agar was used to enumerate *E. faecalis*. All tryptic soy agar plates were incubated at 35°C for 48 h except for *B. cereus* plates, which were incubated at 30°C for 48 h. Potato dextrose agar plates incubated at room temperature (18 to 22°C) for 4 to 7 days were used to enumerate surviving yeast and mold spores.

Data were converted to $\log_{10}$ values, and the geometric means of duplicate plates per organism from at least two separate experiments were calculated. The log number of cells or spores killed per milliliter equaled the geometric mean before exposure to ozone minus the corresponding geometric mean after treatment for the various time periods. By using general linear-model procedures, the means and ranges for the C_{out} and C_{avg} ozone levels in the deionized water with 20 ppm of SS or BSA and deionized water without SS or BSA were calculated.

Statistical analysis programs PROC GLM (26) were used to test the significance of the data. Repeated-measures analysis of variance (univariate tests of the hypotheses) was used to compare survivorship of *E. coli*, *S. typhimurium*, *S. aureus*, and *L. monocytogenes* cells in ozonated deionized water containing SS or BSA with survivorship in ozonated deionized water without SS or BSA. The survival comparisons for each cell wall type were made in ozonated deionized water without SS and BSA. The conservative Greenhouse-Geisser adjustments were used to modify the F values. Bonferroni adjustments were used for multiple pairwise contrasts (0.017). Tukey's studentized range test (95% confidence level) was used to test the ozone concentrations for all possible comparisons of deionized water with and without added 20 ppm of SS or BSA. Ozone levels in deionized water, deionized water plus SS, and deionized water plus BSA were compared by a one-way analysis of variance.

The antimicrobial effects of ozone against two gram-positive bacteria, *S. aureus* and *L. monocytogenes*, are shown in Fig. 1. Statistical analyses of the curves indicated that neither organism showed a significant difference ($P > 0.05$) in a paired death rate comparison between the antimicrobial effect of ozonated deionized water with SS and the effect of that without SS or in the comparison between ozonated deionized water containing SS and that containing BSA. When the death rates in ozonated deionized water and ozonated water containing BSA were compared, however, the antimicrobial effects with no added organic material were significantly ($P < 0.05$) greater than in the presence of BSA. Overall, more than 4 log units of *L. monocytogenes* cells per ml was killed at time zero (instanta-

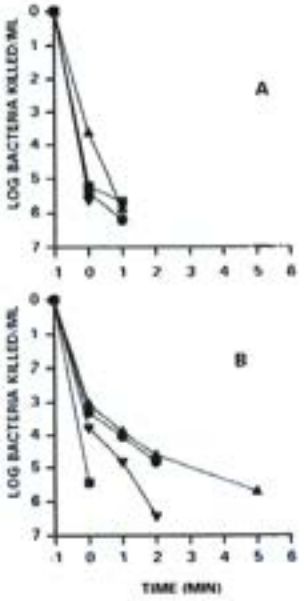

FIG. 3. Antimicrobial efficacy of ozone in deionized water against gram-negative bacteria *E. coli* (●), *S. typhimurium* (■), *P. aeruginosa* (▲), and *Y. enterocolitica* (▼) (A) and gram-positive bacteria *S. aureus* (●), *L. monocytogenes* (■), *B. cereus* (▲), and *E. faecalis* (▼) (B). The data are means for at least two replicate experiments.

neously) in the absence or presence of added organic material (Fig. 1A).

The death rate curves of ozonated deionized water with and without added organic material for *S. typhimurium* and *E. coli* are shown in Fig. 2. No significant difference ($P > 0.05$) between ozonated deionized water with SS and that without SS in the death rates or in the patterns of the curves for these two gram-negative bacteria was observed. For each bacterium, however, the death rates as well as the overall pattern of death

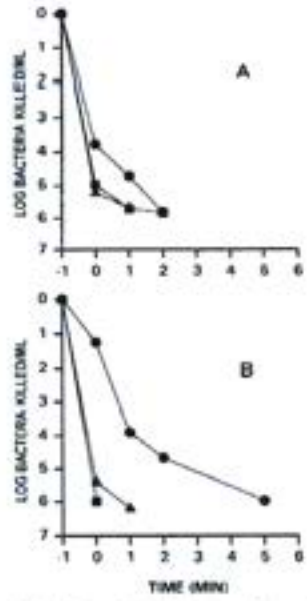

FIG. 2. Killing of viable cells of *S. typhimurium* (A) and *E. coli* (B) by ozone in deionized water containing no added organic material (▲) or 20 ppm of SS (■) or BSA (●). The data are means for at least two replicate experiments.

obtained in ozonated water with or without SS were significantly greater ($P < 0.05$) than in ozonated water containing BSA. More than 5 log units each of *S. typhimurium* and *E. coli* cells per ml was killed instantaneously (time zero) after exposure to ozonated water or to ozonated water containing SS, whereas equivalent levels of death for *S. typhimurium* and *E. coli* in the presence of BSA occurred only after 2- and 5-min exposures, respectively (Fig. 2).

The antimicrobial effects of ozonated deionized water without added organic material against eight bacterial strains are presented in Fig. 3. With respect to the amount of death and the overall patterns of the death curves, no significant difference ($P > 0.05$) among the four gram-negative bacteria was observed (Fig. 3A). Among the gram-positive bacteria, the extent of death as well as the death rate curves for *S. aureus* and *E. faecalis* cells did not differ significantly ($P > 0.05$); however, *L. monocytogenes* displayed a significantly greater ($P < 0.05$) rate of death than *S. aureus* and *E. faecalis* (Fig. 3B). For *L. monocytogenes* cells, at time zero, more than 5 log units was killed by ozonated deionized water, whereas for *S. aureus*, *E. faecalis*, and *B. cereus*, 3 log units of bacteria or more was killed (Fig. 3B). Overall, except where instantaneous death occurred, most bacteria displayed biphasic death curves which were enhanced when effective ozone levels were reduced in the presence of BSA (Fig. 1 to 3).

The antimycotic effects of ozonated deionized water against yeasts of two genera and *S. niger* spores are shown in Fig. 4. Ozonated deionized water without added organic material caused more than 4.5 log units of killed cells per ml for the two yeasts, *C. albicans* and *Z. bailii*, at time zero. Less than 1 log unit of *A. niger* spores per ml was killed under the same conditions after 5 min of exposure.

Ozone concentrations in deionized water and deionized water containing 20 ppm of SS or BSA are presented in Table 1. Ozone concentrations were determined in two ways: at the outlet of the ozone apparatus (C_{out}) and over the whole system

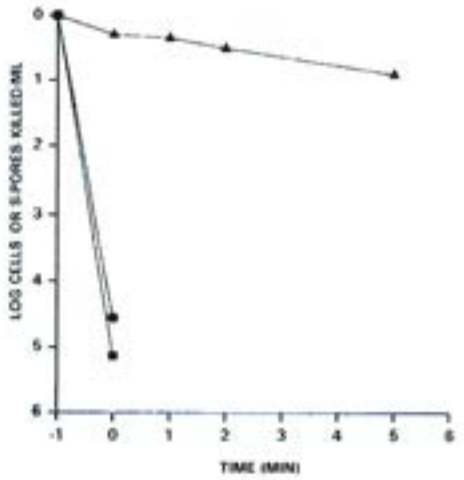

FIG. 4. Killing of fungal spores and viable yeast cells by ozone in deionized water with no added organic material. Symbols: ▲, *A. niger* spores; ●, *C. albicans*; ■, *Z. bailii*. The data are means for at least two replicate experiments.

(C_{avg}). No significant difference ($P > 0.05$) in the ozone levels (for C_{out} and C_{avg}) in deionized water and deionized water containing SS was observed. The ozone levels of C_{out} in deionized water and deionized water with SS added were 0.188 and 0.198 mg/liter, respectively, whereas C_{avg} levels were 0.064 and 0.068 mg/liter, respectively. The ozone levels for the deionized water containing BSA were significantly less ($P < 0.05$) than the ozone levels (C_{out} and C_{avg}) for deionized water and water containing SS. Average ozone concentrations in deionized water containing 20 ppm of BSA were 0.149 and 0.044 mg/liter for C_{out} and C_{avg}, respectively.

The results obtained in this study have shown that ozonated water is highly effective in killing both gram-positive and gram-negative food-associated bacteria. With the exception of *L. monocytogenes*, the gram-negative bacteria were substantially more sensitive to ozonated water than the gram-positive bacteria either in the absence or in the presence of added organic material. Yeast cells displayed sensitivity to ozonated water, whereas fungal spores were highly resistant.

Previous studies on the effects of ozone on microbes have involved the use of pure cultures and organisms naturally contaminating foods and water. Broadwater et al. (5), studying the effects of ozone on washed vegetative cells, reported that 0.12 mg/liter for *B. cereus* and 0.19 mg/liter for *E. coli* and *B. megaterium* were the minimal lethal threshold concentrations after 5 min of exposure. Fetner and Ingols (10) reported 0.4 to 0.5 mg/liter as the threshold concentration for *E. coli* after 1 min at 1°C. Both studies used varying ozone concentrations at a single time period and suggested that ozone killed microbes via an all-or-none phenomenon. Thus, in these studies either high ozone concentrations for a short period (1 min) or lower ozone concentrations for a single extended period (5 min) provided sufficient activity to reach the minimal threshold for complete killing. In the present study, however, ozone effectiveness determined by repeated sampling over a 5-min period at a single ozone concentration (0.15 to 0.20 mg/liter) indicated that an all-or-none killing phenomenon does not occur. Finch et al. (13) showed that *E. coli* in ozone demand-free phosphate water exhibited a disinfection rate consisting of an initial rapid stage followed by a slower inactivation stage. Several other studies using ozone have also shown that death rate kinetics for a variety of bacteria and viruses exhibit a biphasic process over an extended time period (6, 16, 20). In this study, biphasic death curves were observed for the majority of the gram-positive and gram-negative bacteria ozonated in the absence of added organic material (Fig. 3). This phenomenon was even more apparent wherever residual ozone levels were reduced by the presence of BSA (Fig. 1 and 2).

The sensitivity of microorganisms to ozone is profoundly affected by the organic nature of the medium, with protection caused both by physical factors, as in the case of agar, and by reduced ozone levels due to ozone demand of organic nutrients in the medium or in environmental waters (2, 8, 15, 16). This study shows that the type of organic material present during ozonation is more important than the amount present. Residual ozone levels in deionized water were significantly reduced only in the presence of 20 ppm of BSA, whereas 20 ppm of SS was without effect (Table 1). Consequently, death rates in the presence of BSA were reduced substantially but were not significantly affected in the presence of SS (Fig. 1 and 2).

The potential uses of ozone in the food industry include reduction of microorganisms on meat and poultry carcasses and in chilling water (19, 28), extension of shelf life of marine fish (14), reduction of atmospheric mold levels in meat and in small fruit storage rooms (9), and antimicrobial effects in bulk food items such as shelled eggs, bacon, beef, bananas, butter, mushrooms, cheese, and fruits (19). Additionally, ozone has been used synergistically with other antimicrobial agents (7, 14–16). The present study shows that ozonated water can effectively kill spoilage organisms (*P. aeruginosa* and *Z. bailii*), fecal contaminants (*E. faecalis* and *E. coli*), and food-borne pathogens (*L. monocytogenes*, *B. cereus*, *S. typhimurium*, *Y. enterocolitica*, and *S. aureus*). The sensitivity of the gram-negative pathogens and *L. monocytogenes* suggests that ozonated water might be especially applicable for killing these organisms on food surfaces such as fruits and vegetables where interference by organics may be minimal. Additionally, gaseous ozone might be effective in controlling *L. monocytogenes* in food environments. Although pure cultures of various food-borne pathogens and spoilage bacteria were used in this investigation, the ozone sensitivity data obtained on pure cultures used in this study should provide guidelines for further studies on ozone applications in the food and environmental industries.

TABLE 1. Mean concentrations and ranges of ozone in deionized water in the absence and presence of organic material

Additive (20 ppm)	Ozone (ppm) [mean (range)]	
	C_{out}	C_{avg}
None	0.188 (0.166–0.225)	0.064 (0.043–0.084)
SS	0.198 (0.166–0.246)	0.068 (0.052–0.092)
BSA	0.149[a] (0.131–0.168)	0.044[b] (0.036–0.053)

[a] Significantly less ($P < 0.05$) than the other C_{out} values.
[b] Significantly less ($P < 0.05$) than the other C_{avg} values.

We thank Nicole Pavaltos and Richard L. Bluestein for technical assistance and the Life Ozone Corp. for supplying the ozonator.
